Ms. Hall and Ms. Bazyk,

In accordance with EPA's letter, "Approval of Higher Operating Temperature Values of Landfill Gas Wells and Submission of Gas Treatment Alternatives at the Bristol Virginia Integrated Solid Waste Facility" from August 2021, I am providing the November 15th, 2022 status update on the existing wells, expansion of the gas collection system, and continuing operating and monitoring results, covering the period from November 1-15, 2022.

Thank you,

D. Brandon King

MEMORANDUM

TO: Kristin Hall, EPA Region III Crystal Bayzk, VDEQ-SWRO

FROM: D. Brandon King, SCS Engineers Robert E. Dick, SCS Engineers

SUBJECT: Semi-monthly Status Update – November 1st through November 15th, 2022 Bristol Integrated Waste Management Facility, Bristol, Virginia

In accordance with the Environmental Protection Agency (EPA) Region III letter, *Approval of Higher Operating Temperature Values for Landfill Gas Wells and Submission of Gas Treatment Alternatives at the Bristol Virginia Integrated Solid Waste Management Facility*, dated 8/23/21, SCS is submitting this semi-monthly status update to satisfy the condition of compliance provision #2. This compliance provision report includes daily temperature readings of the existing and new wells installed. In addition, this report includes a summary of work accomplished during this reporting period of 10/1/22 through 10/15/22, pursuant of compliance provision #2.

DAILY TEMPERATURE READINGS

The City recorded daily temperature readings throughout the first half of November and displayed on the attached table. Existing well GW-37 began this reporting period with temperatures greater than 145F and GW-46 had a couple intermittent readings above 145F during this period. However, well GW-37 recorded a temperature of 145F by the end of the reporting period according to the City's data, while GW-46 read below 145F. New wells GW-51, GW-53, GW-57, and GW-67 began this reporting period with temperatures greater than 145F. Well GW-53 did not exceed 145F the previous reporting period, but remained greater than 145F throughout this period. New wells GW-57 and GW-67 recorded temperatures greater than 145F during the first half of November and remained greater than 145F at the end of this reporting period according to the City's data. New well GW-51 recorded temperatures below 145F until the last day of this reporting period according to the City's data. GW-54 and GW-56 had a few daily readings greater than 145F during this reporting period. The City's daily LFG wellhead temperature data is attached. SCS conducted the November monthly wellfield monitoring on 11/3/22.

LFG ANALYTICAL DATA REVIEW

The City and SCS are still awaiting the EPA's evaluation of the Higher Operating Value for Temperature Request letter submitted to EPA on 3/8/22. According to SCS November 2022 LFG monthly wellfield data, exceedance temperatures continue in HOV requested wells GW-31R and GW-37. In addition, LFG wells GW-51, GW-52, GW-53, and GW-67 recorded a temperature above 145F on 11/3/22.

Wells GW-31R and GW-37 recorded temperatures of 165F and 148F respectively by SCS during initial monthly wellfield activities on 11/3/22. Wells GW-51, GW-52, GW-53, and GW-67 recorded temperatures of 164F, 168F, 151F and 154F respectively on 11/3/22 by SCS. However, SCS

recorded readings below 145F in GW-51 on 11/10/22 and below 145F in GW-53 on 11/4/22. SCS recorded a temperature of 154F in GW-46 on 11/3/22, but it is under a temperature HOV. SCS collected CO samples via 1.5L Summa Canister at well GW-57 on 10/26/22, and at wells GW-51, GW-52, GW-46, and GW-67 on 11/4/22. GW-46 recorded CO below the detection limit. Wells GW-51 and GW-67 recorded 539 ppm and 780 ppm respectively. Wells GW-57 and GW-52 recorded CO below 500 ppm. SCS personnel did not observe any signs of SSO events while performing the routine wellfield monitoring on November 3. SCS looked for smoke, settlements, discolored or deformed piping, but observed no evidence at any wellhead. The CO laboratory analytical results are attached.

NON-ROUTINE O&M

City personnel have continued hauling cover soil into Permit #498 Landfill and spreading over exposed areas of waste during the first half of November, weather permitting. The City is conducting soil cover testing in Permit #498 to evaluate progress. The Permit No. 498 Landfill had previously been subject to intermittent reclamation mining activities prior to the closing of the Permit No. 588 Landfill. See photo for reference.

SCS and the City's O&M contractor are currently investigating the 6-inch LFG header to the Permit No. 498 Landfill being blocked with liquid or damaged between the access road and well GW-19. The City's contractor excavated an area of the LFG header near GW-19 and drilled a test port in the 6-inch LFG header, which demonstrated condensate seeping through the test port. The contractor will divert around this compromised area to provide vacuum to GW-19, GW-20, and GW-21. The City's contractor completed a road crossing between GW-19 and GW-20 where haul trucks have been dumping soil in Permit #498. This investigation and repair effort is ongoing.

The City's O&M contractor has cleaned, tested and replaced nine pumps in LFG wells in the south end of Permit #588 during this reporting period. SCS has strategically selected LFG wells near current temperature probe drilling operations to switch out pumps to dewater the drilling area. The O&M contractor has an additional three pumps on hand to switch out in wells located in the central portion of Permit #588 this week.

The City's 0&M contractor excavated the 8-inch LFG header at the road crossing just south of the leachate collection tank (LCT-1) on 11/14/22. The contractor elevated the header to drain a blockage to wells GW-36 and GW-65, thus restoring vacuum to these wells. This project is still ongoing.

Connelly is continuing with the drilling and installation of the dedicated temperature probes. Thus far, Connelly has bored and installed casings in TP-1 through TP-4. There was an instance where Connelly moved equipment from TP-2 to TP-3 and a skidsteer loader damaged a 2" airline late afternoon on 11/8/22. This section of airline was isolated from the remainder of the dewatering system. The City's O&M contractor repaired the airline and restored operations on this section of the dewatering system. See photo below.

SCS-FS 0&M is on-site conducting work on the south cleanout improvements. SCS fused the 12" and 8" LFG header pipe during the week of 11/7/22. SCS-FS 0&M started excavation work, but the majority of this south leachate cleanout improvement project will occur during the second half of November. Inclement weather has impeded progress early in the week of 11/14/22.

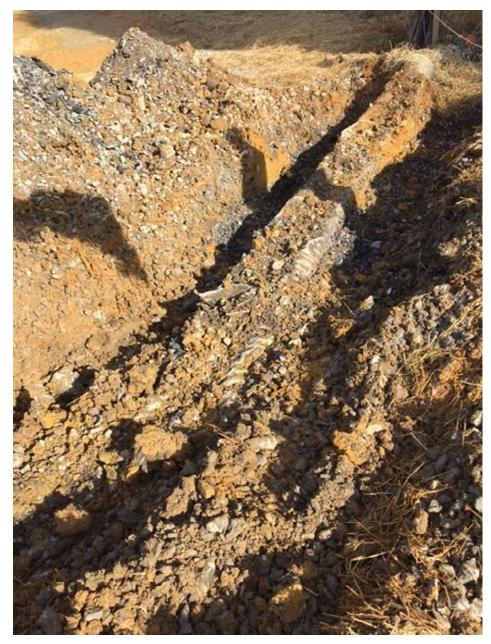

View of Permit No. 498 cover conditions on 11-11-22. Camera facing southeast.

View of airline repair adjacent to temperature probe TP-3.

Settlement plate installed near leachate collection tank (LCT-1).

LFG header (8-inch) road crossing to wells GW-36 and GW-65. Header regraded and vacuum reestablished to wells.

EVALUATION OF LFG SYSTEM

The City is equipped with several functional dedicated pneumatic dewatering pumps available on standby to be switched out in the event a well has a non-functioning pump. The City has set up a dedicated pump cleaning and testing station allowing SCS-FS 0&M access to the City's wash bay. This includes an air compressor from a service truck and a water barrel to test the pneumatic pumps to satisfy this need from 0&M. SCS-FS 0&M will continue to use this testing and cleaning station to clean select pumps based on cycle counter data. SCS recommends the City procure four additional

MEMORANDUM November 15, 2022 Page 7

Pump One pumps at this time. Some of the pumps pulled were deemed non-repairable upon inspection by the City's O&M contractor and SCS recommends having several pumps on standby.

SCS is continuing weekly surface emissions monitoring per the Plan of Action Report dated 7/6/22. The City has provided daily cover throughout the Permit No. 588 Landfill based on soil boring testing results, including soil cover over the LFG, airline, and forcemain piping. This resulted in a couple damaged areas of the dewatering system piping, which were repaired on 10/12/22. Subsequent to the installation of the foam seals to nine select LFG wells for pipe penetrations monitored greater than 500 ppm during weekly SEM events, SCS monitoring data has shown continuing locations greater than 500 ppm. The City has procured well bore skirts per SCS recommendation for installation around the wells as an alternative to reduce LFG emissions around pipe penetrations. The O&M contractor will begin installation of these skirts during the next reporting period.

SCS conducted the initial monthly LFG wellfield monitoring on 11/3/22 and recorded the pump stroke counter data. SCS updated the pump stroke counter analysis table. SCS provided 0&M a list of wells to perform maintenance, cleaning, and testing activities at the City's dedicated pump servicing station. The City's 0&M contractor replaced the pump in the poly leachate collection tank (LCT-1), as well as replaced the pump in condensate sump CPS-2 with refurbished pumps the City had on standby. The Contractor installed a second pump in LCT-1 to enhance the City's dewatering efforts.

SCS Engineers understands the south end leachate cleanouts are connected to the existing LFG System from a pilot-scale collection system SCS installed on behalf of Ingenco in 2020. SCS-FS 0&M is currently working on the south cleanout LFG collection system upgrade, which will enhance LFG collection from the Permit #588 Landfill. Furthermore, SCS is assessing additional LFG components for future installation in the Permit #588 Landfill at this time.

Please contact SCS or City personnel if you have any questions or require additional information.

Ted Sovars

Technical Director

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the

NIST spectral library. A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern.

Compound concentrations are estimated and are calculated using an internal standard response factor of 1.

All EPA method 3C results are reported as normalized values when the sum total of all evaluated constituents is outside ± 10% of the absolute.

Enclosed are the results of analyses for samples received by the laboratory on 11/08/2022 10:20. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

Ted Sovars

Technical Director

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Enthalpy Analytical, Inc.

TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the

NIST spectral library. A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern.

Compound concentrations are estimated and are calculated using an internal standard response factor of 1.

All EPA method 3C results are reported as normalized values when the sum total of all evaluated constituents is outside ± 10% of the absolute.
