	exceed its carbon reduction target, reducing emissions from the generation sector to approximately 19.7 million tons per year in 2030. The revised rule proposes a starting cap of 28 million tons, with an annual reduction of 3%. We support this revised cap. Per our analysis, using advanced energy resources such as efficiency and renewable generation, Virginia should be able to meet cap reductions each year through 2030 with little to no adverse impact upon rates, even with a lower starting cap. In fact, depending upon the mix of energy resources utilized in compliance, Virginia consumers may see their rates decrease as a result of this rule. By reducing the quantity of carbon credits in the marketplace, this cap reduction should raise the value of zero carbon resources, such as renewable generation and energy efficiency. This may, in turn, prompt the deployment of such resources above and beyond what we projected in our analysis last year. Added deployment of advanced energy is good news for Virginians. As our prior analysis indicates, investment in renewables and efficiency is a source of net job creation for Virginia. Additional investment should, therefore, help to create still more jobs in Virginia. Such projects, be they wind and solar farms or efficiency investments, are likewise shown to generate new in-state investment and tax revenue for the state and locality in which such projects are located. Additional investment should, therefore, produce more in-state investment and revenues. Virginia has the opportunity to adopt a regulatory system that allows the state to meet its environmental goals while creating new jobs, investment, and tax revenues and leaving rates largely unchanged. As our analysis demonstrates, we have at our disposal the advanced energy resources necessary to accomplish	

	this balancing act. Therefore we encourage the board to approve the revised draft rule, and for policymakers throughout Virginia to advance rules and regulations that allow Virginians to fully access the advanced energy economy.	
88. Virginia Agribusiness Council (VAC)	We ask that you restore the language clarifying that CO_2 emissions from CO_2 budget units that do not exclusively combust fossil fuels are exempt from the proposed rule. VAC has consistently opposed any regulation that does not treat biomass as carbon-neutral, regardless of whether or not it is co-fired with fossil fuels. A study by NCASI found that there are substantial GHG reduction benefits in using forest products manufacturing residuals for energy in the pulp, paper, packaging and wood products industry. Accounting for fossil fuel displacement and avoided emissions associated with disposal, the use of biomass residuals each year avoids the emission of approximately 181 million metric tons of CO_2. Indeed, just last month, Congress enacted, and the President signed appropriations legislation reaffirming that federal regulatory policy should reflect the carbon neutrality of forest-based renewable biomass. Therefore, we ask that the board restore the clarifying language for biomass emissions and ensure there is a strong exemption for existing industrial facilities.	The biomass issue has been addressed accordingly; see the current responses to current comments 24 and 40. See current comment 28 for further discussion of industrials.
89. Virginia Chamber of Commerce	In December 2017, the Virginia Chamber released Blueprint Virginia 2025, a comprehensive business plan outlining the business community's recommendations for making Virginia the best state in the nation for business. Throughout the stakeholder engagement process, the Chamber heard from business leaders on how reliable, affordable energy sources are paramount to improving Virginia's business climate. RGGI is not consistent with the recommendations in Blueprint Virginia and could jeopardize future business investment and economic growth in Virginia. As such, we encourage the board to not	The analyses conducted by ICF and Analysis Group suggest that impacts to power prices will be minimal, especially considering the allowance allocation approach that will benefit electricity consumers. RGGI has been in operation for 10 years and has been studied extensively for its impacts on public health, the economy and jobs. A number of independent analyses are available at the RGGI Project Series website: rggiprojectseries.org. DEQ has identified several issues with the SCC analysis; see the current

	move forward with finalizing this regulation, or amend the proposal to alleviate the concerns of the business community. Ensuring competitive, affordable energy rates for businesses and residents is a central component of Blueprint Virginia's energy chapter. Energy rates factor into state business rankings, and Virginia's affordable electric rates, which were 12% lower than the national average in 2017, provide a competitive advantage compared to surrounding states, thus incentivizing businesses to expand and relocate to Virginia. That said, joining RGGI or establishing a cap-and-trade program would eliminate that advantage by increasing electric rates for residents and businesses. An SCC analysis concluded that average residential customer bills could increase by $7-12 per month if Virginia joined RGGI. Increased energy costs would also prevent existing Virginia-based companies from investing in more productive uses of their capital, such as facility improvements and hiring additional workers. Finalizing the proposal and joining RGGI would likely lead to job loss in the power generation sector and have a negative impact on rural Virginia. Forcing the premature closure of coal-fired power plants and other carbon-intensive generating units would result in the unemployment of union and non-union workers, who could face difficulty finding similar employment opportunities in the energy field. Further, many of the large coal-burning generation units in Virginia are in rural areas, which depend on these facilities for a sizable portion of their tax revenue. If plant closures were to occur in the short term as a result of RGGI, counties and municipalities would have to recoup that revenue by raising taxes on residents and businesses or cutting their budgets and reducing available services.	response to current comment 20 for further discussion. Leakage is not likely to occur; see the current response to current comment 31.

	Reductions in Virginia power generation would likely fail to accomplish region-wide environmental benefits due to carbon leakage, where emissions are moved from nearby states that have not implemented similar carbon regulations. Modeling performed for DEQ by ICF projects that joining RGGI would result in a net decline of in-state generation in Virginia of approximately 2.3 terawatt hours in 2030 and a 33% increase of net electricity imports. Most of those imports would come from surrounding states in PJM that have higher carbon-intensive profiles than Virginia. Virginia's carbon footprint from power generation is already significantly cleaner than most other states in PJM, so it is alarming that the board would pursue a policy action that increases energy costs and jeopardizes job creation while not making significant progress on reducing carbon emissions throughout the mid-Atlantic region.	
90. Virginia Chamber of Commerce	The re-proposal reduces the starting emissions cap to 28 million tons, a more than 15% reduction from the board's original proposal. Under this revised base line, electric generators in Virginia would have to scale back or completely shutter existing facilities powered by fossil fuels at a faster rate. Utility companies and other businesses in the energy supply chain have already made significant investments to curtail carbon emissions, and this proposal would require more drastic emissions reductions and result in higher investments costs, which would be passed along to ratepayers. Joining RGGI and imposing an initial 28-million-ton carbon emissions cap would inevitably increase costs to consumers and threaten energy stability. We request that the board increase the 2020 and subsequent emissions cap to a significantly higher threshold. The revised proposal allows for	The cap is addressed in current responses to current comments 30, 39, and 71. Post-2030 reductions are addressed in current response to current comment 54. Biomass is addressed in current responses to current comments 24 and 40. New industrial facilities will be subject to the regulation. This is because of long-standing clean air regulatory policy: new facilities are better positioned to be aware of, and to apply controls, in response to new regulations. Existing facilities have less advance planning ability and reduced ability to more effectively control pollution than new facilities. The industrial exemption is intended to enable existing facilities to better comply with the regulation. Applying the regulation to new facilities is needed to address carbon pollution from facilities that will be better able to comply, and not serve as an incentive for the construction of new fossil

	adjustments to the emissions cap each year after 2030 and includes a default option whereby the annual cap is lowered by 840,000 tons each year from 2031-2040 if the board fails to make any adjustments. Not only does this provision create uncertainty for utilities looking to make long-term investments but it is also inconsistent with the RGGI model rule, a concern addressed in comments submitted by the RGGI states themselves. It is important that regulations promulgated to join a larger framework should not be more restrictive than the existing requirements of such framework, which is why we urge the board to remove this provision. To reduce uncertainty, the final regulation should explicitly state that the emissions from biomass do not require emission allowances. Earlier this year, Congress passed legislation recognizing the benefits of biomass as a carbon-neutral energy source, and even RGGI does not require allowances for emissions from eligible biomass combustion. The board should clarify that the proposal only regulates emissions from fossil fuel combustion, which has been our understanding throughout the rulemaking process. Several of our members have suggested that the board re-insert the phrase "that have been generated as a result of combusting fossil fuel," which was included in the original version, to confirm that the regulation does not apply to biomass. Although the regulation includes an exemption for carbon emissions from certain industrial facilities, the exemption only applies to units in existence as of January 2019. As a result, future industrial facilities with on-site generation above 25 MW would be subject to the carbon program, which would raise compliance costs on manufacturers and other industry-related businesses. This provision would disadvantage	fuel units that would not be covered by this rule.

	those businesses that decide to construct on-site generation facilities after 2019 and could undermine the state's ability to attract larger manufacturers, thus harming our business climate compared to other states. We request that the board amend its industrial exemption to include existing and future on-site generating facilities.	
91. Virginia Energy Efficiency Council (VAEEC)	Energy efficiency can play an important role in reducing carbon emissions as one of the most practical, no-cost/low-cost tools to spur economic development and to reduce energy consumption and dependency on fossil fuels. Many analyses have found energy efficiency measures to be the most cost-effective and quickest way to address climate change while simultaneously reducing energy usage and cutting utility bills. According to a report by the American Council for an Energy-Efficient Economy (ACEEE), energy efficiency programs across the U.S. have reduced carbon pollution by 490 million tons and saved individual households an average of $840 in 2015. We applaud the 5% carve out for energy efficiency programs in the Carbon Trading Rule. Last year, ACEEE ranked Virginia 26th out of 50 in their 2018 State Energy Efficiency Scorecard. Moving up three places from 2017 underscores the work we have done to advance smart energy efficiency policies and initiatives. However, even more can be done to help Virginia break into the top 25. The passage of the Grid Transformation and Security Act of 2018 paves the way for greater opportunities as well. This legislation provides tremendous opportunities for energy-saving programs over the next decade, including a combined commitment by the electric utilities to spend over $1 billion on energy efficiency programs. Energy efficiency has tremendous potential to drive economic growth, create jobs, shrink utility bills, conservation natural resources, and reduce pollution across the state. These new	Support for the proposal is appreciated. DEQ agrees that energy efficiency will play an important role in reducing carbon pollution in the Commonwealth.

	programs, in addition to the energy efficiency carve out of the revised rule, will propel Virginia into the spotlight as a leader on energy efficiency while protecting the health and welfare of all Virginians.	
92. Virginia Forestry Association (VFA)	The revised proposal would provide unfavorable outcomes that significantly differ from the intent of the original version. These results, in fact, would be detrimental for forest products industry operations and important biomass markets for forest landowners. The revised regulation would apply to biomass-fueled utilities that co-fire with 5% or more fossil fuel. Also, biomass-based CO_2 emissions from those facilities are not recognized as carbon neutral. In addition, it does not clearly exempt all existing and potential new industrial facilities from the program, erroneously regulating new industrial boilers that burn carbon neutral biomass. We urge DEQ to revise the regulation to clarify that it only applies to GHG emissions from fossil fuel combustion and not from biomass combustion, officially recognizing biogenic carbon dioxide emissions as carbon neutral irrespective of whether other fuels are co-fired, and clarify that new and existing industrial facilities and boilers are clearly exempt from any allowance obligations. Because of the confusion created by the changing policy in the process of developing this regulation and the potential for detrimental outcomes to the forestry community, VFA also opposes Virginia's participation in RGGI at this time.	See the current comments 24, 38 and 40 for more detailed discussion of how biomass will be treated in the final rule.
93. Virginia League of Conservation Voters	We support the 28 million ton cap, a substantially stronger baseline that will result in immediate carbon reductions from power plants in 2020. Over the course of its 10-year span, from 2020 to 2030, this rule will result in approximately a 30% reduction in carbon emissions, which according to EPA's GHG Equivalencies Calculator is the same as taking 1.6 million cars off the road. This is an ambitious	Support for the proposal is appreciated.

	program and by far the largest step forward Virginia's taken to address climate change. We also recognize that carbon cap-and-trade programs are a long-term commitment and that this is the first phase of a much longer effort that we hope will result in a carbon-neutral electricity sector by 2050. While we understand the need for a statutory solution to formally join RGGI, and are supportive of such efforts, the regulation before the board is nonetheless an important step forward in the climate fight. We share concerns of the environmental community that this rule does not apply to facilities that burn biomass, which is also a carbon intensive fuel source. This is a limitation of the RGGI model altogether and one that can and should be dealt with under a future rulemaking here in Virginia aside from the regulation currently before this board. This criticism aside, we support Virginia's participation in the nation's most proven, effective, multi-state carbon market. Take for example the following facts from Acadia Center's 2017 report "Outpacing the Nation: RGGI's Environmental and Economic Success: --In 2016 RGGI states emitted 79,228,039 tons of CO_2, falling 8.4% below the RGGI cap, and emissions have fallen 40% since RGGI launched. --Average electricity prices across the region have decreased by 6.4% since RGGI took effect, while electricity prices in other states have increased by 6.2%. --Since RGGI launched member states have reduced emissions by 15% more than other states and experienced 4.3% more economic growth. --The RGGI states have proposed to strengthen the program through 2030, supporting the program's continued environmental and economic success. --Proposed RGGI reforms will result in 130 million fewer tons of CO_2 and	

	$1.28 billion in avoided health impacts. On top of these economic benefits, Abt Associates, in their 2017 study, "Analysis of the Public Health Impacts of the Regional Greenhouse Gas Initiative, 2009-2014," outlined the strong public health benefits of capping carbon emissions. They found RGGI had resulted in up to 830 lives saved, more than 8,200 asthma attacks avoided, and 39,000 lost work days averted due to reductions in harmful air pollution from power plants. Abt estimates the economic value of RGGI's health and productivity benefits at a cumulative $5.7 billion. By adopting this regulation, the board is setting Virginia on a trajectory to cleaner air, a healthier population, and increased innovation in the clean, renewable energy sector that will in turn drive our economy forward. At the same time, Virginia will be doing its part alongside the other RGGI states to cut carbon emissions and address climate change, even in an era of federal inaction on the largest environmental threat we've ever seen. The tide is turning in this fight, and Virginia is at the forefront. This important rule is for the good of clean air, public health and Virginia's economy.	
94. Virginia Manufacturers Association (VMA)	The original proposed rule included a CO_2 allowance budget of either 33 or 34 million tons. The re-proposal reduces the CO_2 allowance budget to 28 million tons. DEQ originally calculated significant cost increases to Dominion's customers. These cost projections estimated that costs to industrial customers would increase from 0.5% to 1.1 % annually. The chief assumptions made in this analysis were: 1. Natural gas prices would increase slightly; 2. Future demand would increase substantially; and 3. Some additional solar will be added, but not the 5,000 MW included in GTSA policy goals. These assumptions were derived from the	See the current response to current comment 89. The commenter is correct that the Analysis Group bill impacts analysis shows that bill impacts to customers are expected to be very small or even net positive after taking into account the allowance allocation approach that will return the value of 95% of the allowances to regulated entities for the benefit of customers. The commenter questions the assumption that auction revenues will be returned to regulated entities and that the revenue will inure to the benefit of customers. The rule provides that the allowances will be allocated to regulated entities and that the allowances cannot

	Dominion IRP in place at the time. Dominion is now in the process of revising its IRP, thus preventing the economic analysis of the re-proposed rule from using IRP assumptions. The original analysis assumed that any revenue from selling allowances in the RGGI market or to third parties will be returned to customers. It is important to distinguish this revenue from the flow back that regulated utilities will receive as reimbursement for the purchase of the consigned allowances. DEQ now analyzes a 28 million ton allowance budget scenario and predicts no cost increase for any Dominion customers. The DEQ cost analysis adopted by DEQ predicts no rate increases because it is based on indefensible assumptions. DEQ never explains why the original analysis was abandoned, except to state "things can change a lot in a year" and to "foster better integration into RGGI." Better integration into RGGI can only mean that RGGI wants fewer allowances auctioned in its market to minimize dilution and resulting allowance price decreases. The DEQ cost study assumes that: 1. The reimbursement of consignment auction costs will be passed to customers. 2. The policy goals in 2018 GTSA are in place by 2030: 5,000 MW of solar, 30 MW of battery storage, and $870 MM of spending on energy efficiency programs. 3. Renewable generation offsets generation from affected units. 4. Further reduction in natural gas prices. 5. Demand reductions because demand is down in other RGGI states. 6. 12-18% reductions in firm power price projections from the prices modeled in 2017. On the first point, there is nothing in the rule that requires cost flow back from the consignment auction to regulated utilities to flow down to customers. In fact, there is no mechanism in the rule for how the flow back to the regulated utilities will	be used for compliance purposes until they have been submitted to and purchased at auction. Because the allowances belong to the regulated entities the revenue from the sale of the allowances also belongs to regulated entities. In the normal course, regulated utilities subject to economic regulation by the SCC will be required to account for the value of the allowances in ratemaking cases. The comment acknowledges this flow of value. The commenter is correct that there is nothing in the rule that requires cost flow back to regulated utilities and then to consumers. That is because Virginia's regulated utilities are governed by the SCC, an independent state agency established by the Constitution of Virginia. In a regulated state such as Virginia, state law mandates the the electric utilities function in this manner. Furthermore, because SCC is a separate branch of government, there is no obligation for SCC to consult with DEQ. With respect to the modeling analysis that concludes that the emissions level in 2020 will be 28 million tons, see the current response to current comment 46. With respect to the SCC statements based on Dominion modeling, note that there are a number of issues in this analysis; see the current response to current comment 20. With respect to the specific statements about the SCC analysis: the SCC analysis was carried out by Dominion, and the Dominion modeling appears to use assumptions similar to those used by Dominion for its 2019 IRP—an analysis that was rejected by the SCC. The commenter makes several mistaken observations about the assumptions used in DEQ's IPM modeling, including: (1) DEQ does not assume gas prices will decrease from current levels, but rather uses the well-accepted projections of the federal Energy Information Administration AEO 2018; (2) DEQ uses the demand forecast of the regional transmission organization PJM in its analysis; and (3)

	work, let alone the flow down to the customers. Obviously, this assumption must be removed from the analysis. The removal of this assumption alone will result in a projection of substantial increased costs to industrial and residential consumers. These costs are significant to Virginia manufacturers. The SCC performed its own study and provided a summary of the study to Delegate Kilgore and VMA. The SCC does make DEQ's assumption of full implementation of the GTSA policy goals of 5,000 MW of solar, 30 MW of battery storage and $870 million spending on energy efficiency programs. The SCC analysis does not assume the flow back of consignment auction costs to customers. The SCC testified before a subcommittee of the Virginia House Labor and Commerce Committee, on January 24, 2019, that the flow back will be returned to customers "one way or another ultimately," but this assumes that in a future rate proceeding before the SCC, the flow back will be credited to customers. There is no basis to predict whether, how or when this will happen. The SCC concludes that the total cost to Dominion from 2020-2030 will increase $3.3 billion if only linked to RGGI and $5.9 billion if Virginia joins RGGI. Experience informs our members that a substantial portion of these increased costs will be passed to industrial customers. DEQ must adopt the SCC analysis. Areas of difference are mainly, that: 1. Even if the full GTSA policy goals are implemented, renewables will not necessarily offset generation from Virginia fossil fuel units. Virginia is a member of PJM, which dispatches units over a large region. Additional renewables are likely to displace older, higher cost units in other states. 2. These renewables and fossil fuel units are two different types of generation and are not interchangeable. Solar is intermittent,	DEQ assumes nothing about the allowance prices and power prices—these are outputs of the IPM model. The IPM model is a well-accepted tool used by utilities (including those operating in Virginia). The commenter incorrectly states that DEQ never explained why the 28 million ton cap was proposed. DEQ discussed its reasoning in great detail; see, for example, the initial response to initial comment 37. The revised cap was the result of modeling and forecasting exercises undertaken by a variety of parties, including DEQ, after the original caps were proposed using updated data. These data are readily publically available. The commenter is mistaken that the record is incomplete. DEQ has met every requirement of the Administrative Process Act in a transparent process to explain the development of the regulation. The fact that the commenter disagrees with the agency's analysis and supporting documentation does not render the regulatory action improper.

	and fossil fuel is continuous. 3. The DEQ analysis assumes that natural gas prices will decrease below the very low current prices. DEQ only cites general EIA analyses over decades to support this assumption. The DEQ analysis assumes demand will reduce in Virginia because demand is down in other RGGI states. No Virginia demand analysis is made. Demand in RGGI states appears to decrease because RGGI raised the cost of generation, and electricity is now imported into these states. 5. The DEQ analysis also assumes that firm power price projections from the prices modeled in 2017 will drop 12% to 28% from 2020 to 2030. No explanation supporting this assumption is given. SCC provided a detailed analysis of the DEQ cost analysis, and found DEQ's conclusion that there would be no rate impact to be completely incorrect. SCC concluded that the costs to Dominion will be $3.3 billion if Virginia only links (e.g., consignment) to RGGI. If Virginia joins RGGI, the cost will be $5.9 billion. SCC finds that the most significant mistake that DEQ makes is to misunderstand Dominion Energy's operation and rate structure. DEQ's analysis treats Dominion as only a buyer of electricity and effectively a merchant company with only shareholders to bear costs. In doing so, DEQ ignores the fact that Dominion is an integrated utility, with substantial generation to serve customer load. Obviously, the allowance structure is designed to increase the cost of generation by reducing allowance allocations by 3% a year. Customers will pay for the increased operating costs for fossil fuel units to continue to run. Furthermore, these costs will be borne by the customers whether the units run or not. None of these costs are included in the DEQ analysis. SCC models show that Chesterfield Units 5 and 6 and Clover Units 1 and 2 will be forced to retire prematurely	

	(2022 and 2025, respectively). Dominion's customers will pay for the retired units and will also pay for the construction of 1,500 MW that must be built earlier than anticipated to replace the retired units and meet PJM capacity requirements. Thus, Virginia customers effectively pay twice for the same 1,500 MW of generation. As noted above, even if GTSA policy goals are achieved, Dominion will not meet its CO_2 emissions reduction goals. The additional renewables, battery capacity and efficiency projects will displace the least efficient, highest cost units in PJM. These are not Dominion units. Dominion is still likely to have to prematurely retire 1,500 MW of coal and replace those MW with natural gas to meet PJM's capacity needs. DEQ also modeled a CO_2 emissions allowance price that is lower than the ECR trigger price. The rule and the RGGI market establish the ECR trigger price to act as the market floor for allowance prices. If the allowance price drops below the ECR trigger price, then allowances are removed from the market until the price moves up. DEQ's allowance cost assumption that the CO_2 emissions allowances will always clear at a price lower than the ECR trigger price requires explanation, as the ECR mechanism in the RGGI model rule and incorporated in the proposal is designed to prevent this pricing assumption from happening. In its analysis, DEQ assumed a 2.1% discount rate. SCC assumed 6.31 % discount rate, which reflects Dominion Energy's after tax weighted average cost of capital. DEQ's use of the lower discount rate understates the true costs of future capital investments. SCC's use of the 6.31% discount rate reflects Dominion's actual cost of funding large capital projects. Again, DEQ makes a fundamentally flawed assumption that understates the	

	actual cost of the rule. None of these DEQ assumptions are supported by actual analysis of the Virginia energy landscape, and DEQ does not attempt to provide any insight. At this point, the record is incomplete, because the actual cost impact of the rule is not included. The fact that the DEQ analysis did not capture any of these costs, more than demonstrates that it cannot be the basis for the rule. DEQ must withdraw the rule and adopt the SCC cost analysis. Without accurate cost data, an accurate cost-benefit analysis cannot be made. The public is denied the right to notice and comment on the rule. Making false assumptions to achieve an inaccurate cost impact is unacceptable and skirts the Joint Legislative Audit & Review Commission review process. Only re-issuing the proposal with an accurate cost analysis will meet notice and comment requirements and allow the board to make an informed decision.	
95. VMA	The proposal revises the definition of "fossil fuel-fired CO_2 budget source" to change the amount of fuel comprised of fossil fuel from 10% to 5%. This revision places manufacturing plants at risk of becoming subject to the rule without any CO_2 allowance allocations. VMA urges DEQ to retain the 10% fossil fuel combustion threshold. Non-fossil fired fuel units require some amount of fossil fuel as a backup fuel and for periods of startup, shutdown, and for flame stability. These units are traditionally operated well below 10% fossil fuel. However, they do typically vary from year-to-year in the 3-7% range. By lowering the threshold to 5%, DEQ could be creating a situation where units might be subject to the standards one year and not another. Retaining the 10% fossil fuel combustion in this definition is essential to keep operational flexibility intact for these units and not unnecessarily creating confusion over applicability to the rule. The proposal must allow more flexibility for com busting other environmentally-friendly fuels, while continuing to retain the	Reducing the fossil fuel threshold from 10% to 5% is needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program. See the current response to current comment 90 for more information on the applicability of the rule to new industrial facilities. The industrial exemption has been designed to clearly exempt certain facilities from the regulation. A regulation only describes facilities to which the regulation applies, not everything to which it does not apply. By extension, an exemption can only be offered if the defined regulatory entity is subject to the regulation in the first place. As discussed in current response to current comments 24 and 40, the applicability of the rule to fossil fuel-fired facilities has been clarified. See the current response to current comment 105 regarding fees.

	industrial exemption for those units. VMA sees the proposal as overly restricting manufacturing growth in Virginia. As VMA articulated in its original comments, Virginia has a $112.3 billion economic output from its robust manufacturing sector and has prospered from a strong competitive position. Our original comments focused on the damage to that position due to the increase in electricity costs expected from a cap and trade rule. The re-proposal goes much further. It overtly clips Virginia's upward trajectory by forcing new manufacturing sources to comply with this CO_2 cap and trade rule. Specifically, the proposal diverges from the original rule by providing that the exemption only applies to sources that meet the exemption requirements prior to January 1, 2019. The re-proposed rule grandfathers existing sources, but any new facility will have to contend with the CO_2 cap and trade rule. The result of further narrowing the exemption is clear. New manufacturers will choose to locate facilities requiring an electric generating unit greater than 25 MWe in another state. A decline in manufacturing has already been measured in other RGGI states. The decline in manufacturing in RGGI states can be seen by comparing the industrial electricity demand. RGGI states' demand fell 17% in comparison with non-RGGI comparison states that fell only 3%. Although CO_2 may be reduced locally by having fewer manufacturing sources in the RGGI states, those CO_2 emissions are simply occurring in non-RGGI states. This is not the solution to global CO_2 emissions. The damage to the manufacturing sector is tangible. The Virginia Economic Development Partnership provides "cost of doing business" as a primary consideration for businesses looking to enter the state. That cost is composed of the cost of electricity, to be impacted by the rule, as well as the cost of compliance. The rule will	

	cause industry members considering a Virginia siting to choose less expensive siting choices outside of Virginia. Putting Virginia at a competitive disadvantage for attracting larger manufacturers is completely contrary to the goals of the Governor to bring more manufacturers to Virginia, increase jobs, and enhance the economy. For these reasons, VMA strongly advocates for the removal of the January 1, 2019 grandfathering clause from the industrial exemption. All manufacturers, regardless of when they come to Virginia, should be able to use the exemption. We believe that the exemption is intended by DEQ to apply on a facility basis given that the exemption refers to exempting any "CO_2 budget source located at or adjacent to and physically interconnected with a manufacturing facility." The rule defines a "CO_2 budget source" as "one or more budget units," contemplating that a source can include more than one unit. However, since the term CO_2 budget source is used in multiple contexts throughout the rule, clarification is needed to ensure the exemption's consistent application. We recommend that the exemption substitute "source" for "CO_2 budget source" because "source" is defined in the proposal as "a source with multiple units." The exemption provides a calculation to determine annual net electrical generation. The exemption does not apply when a source supplies more than 10% of its annual net electrical generation to the electric grid. That calculation in the exemption should be clarified to note that the sales, purchases, and generation should be expressed in MW. The exemption also requires that the source supply less than 15% of its annual total useful energy to another entity. "Total useful energy" is defined as "the sum of gross electrical generation and useful net thermal energy." We	

	recommend that the definition of "total useful energy" and "useful net thermal energy" also be expressed in megawatts for consistency. We suggest that exemption applicability should be determined on an annual basis at the end of the calendar year to dictate applicability for the following calendar year. For example, if an industrial source exceeds the 10% annual net electrical generation to the electric grid requirement, as determined using data from January 1 to December 31, then that source would not retain the exemption for the next calendar year. Given that the proposal does not provide allowances for non-fossil fuel CO_2 emissions, the proposal should clarify that these emissions are excluded. Treatment of CO_2 emissions from biogenic sources should not depart from federal and internationally accepted accounting protocols. The changes to the definition of "CO_2 allowance" should be reversed. Previously, the definition of CO_2 allowance included a clarification that the allowance is an authorization "to emit up to one ton of CO_2 that has been generated as a result of combusting fossil fuel .. . " The underlined phrase should be re-inserted into this definition to clarify that the re-proposal does not require that allowances must be obtained for CO_2 emissions from non-fossil fuels. Any redundancy perceived in making this change is outweighed by the risk of different regulatory interpretations on this important point. The language in the industrial exemption requires qualifying facilities to obtain a permit. Since this is an exemption to the regulation that DEQ wants to include in facility operating permits, DEQ should ensure that the facility is not required to pay the permit modification fee for such inclusion. DEQ could elect to incorporate this language as an administrative change. Further, DEQ	

	should provide some guidance to facilities as to how it intends to facilitate inclusion of this language into existing permits.	
96. VMA	The rule includes a number of provisions from the RGGI model rule but does not provide adequate detail on how the auction will work in Virginia. Although many revisions to original proposed rule supposedly better reflect the provisions of the RGGI model rule, they do not clarify how RGGI will run the auction and integrate with participants and customers. Among the missing details are: How the CO_2 allowances will be consigned and auctioned? How will the reimbursement of consigned allowance auction costs be returned to regulated entities? Will the reimbursed consigned allowance auction costs flow down to customers? If so, how? How will auction prices be set? Will there be a mechanism for sales of excess allowance to third parties? These omissions are not de minimis. Failure to provide these details violates the APA because, without these details, there can be no real opportunity for notice and comment. This fact is reinforced by comments filed by RGGI making the same observation. It is arbitrary and capricious to not include the actual requirements of the rule in the proposed rule. The lack of the opportunity for notice and comment cannot be cured through guidance or by a cross-reference. DEQ must withdraw the rule and revise it to provide adequate detail to allow the regulated community to adequately comment.	Details as to how the specifics of the auction will operate will be addressed in auction "instructions" which are developed separately from the regulation. DEQ will take the commenter's concerns into account when those instructions are developed. DEQ believes that most of these issues are described within the regulation or are self evident, for example, the fact the reimbursed consigned allowance auction costs flow down to customers in accordance with the SCC and the applicable state code.
97. VMA	Without any basis, the board departed from the RGGI 2017 Model Rule by committing Virginia's program to continued reductions in CO_2 allowances from 2030 "and each year thereafter." This has no legal or practical basis and further, it is unclear whether further reductions in CO_2 allowances and, therefore, in the state budget cap, will be necessary in 2031. The RGGI states have already provided comments that disapprove of	As discussed in the current response to current comment 54, the proposal has been modified to return to consistency with the RGGI Model Rule.

	this inconsistency. RGGI has an interest in the full compatibility of Virginia's program design with the other RGGI states. To address future caps, RGGI has set forth a periodic RGGI program review process for the participating states to consider the appropriate future trajectories by consensus. Even though VMA strongly disapproves of Virginia's steps to enter the RGGI program, if Virginia pursues this path, Virginia's plan should be compatible with the RGGI model rule.	
98. VMA	DEQ bases its authority to adopt a CO_2 cap and trade program upon an Attorney General opinion. This opinion actually provides DEQ with no authority to issue the rule. The basis of the opinion is that CO_2 fits within the definition of "air pollution" under Virginia law and regulations. The opinion assumes that because the board has the authority to regulate air pollutants, it can legally adopt this rule, which significantly reduces CO_2 emissions through a Virginia market-based program linked to RGGI. The opinion bases its opinion that CO_2 is an air pollutant, which the board has the authority to regulate, on two arguments. First, the opinion states that GHG, which include CO_2, are currently regulated by the Clean Air Act's PSD program, which is administrated by the board. Second, it opines that there is a "growing consensus" among scientists that CO_2 contributes to elevated global temperatures that maybe harmful to the welfare of people, animals, and property. The PSD program does not provide the board with the authority to regulate CO_2. In 2014, the U.S. Supreme Court held in UARG v. EPA, that neither EPA nor states have authority under the NAAQS to regulate CO_2. Likewise, the UARG v. EPA decision held that CO_2 is not a pollutant that can be regulated alone under the PSD program. The decision found that CO_2 cannot be regulated under the NAAQS because it has potential global impacts, not state impacts. The NAAQS are	DEQ notified the appropriate legislative committees of this regulatory action in accordance with § 10.1-1308 in November 2017. To state that the board can only regulate air pollutants subject to NAAQS and specific emissions limits is inaccurate. The source of the board's authority, the State Air Pollution Control Law (§ 10.1-1300 et seq.) is broad, and apart from numerous non-NAAQS Clean Air Act pollutants, the board may also promulgate regulations in the absence of a specific federal requirement to address a state-specific need. This is demonstrated by, for example, the board's air toxics and odor regulations. Greenhouse gases are not covered by a NAAQS but they are covered in other areas of the federal Clean Air Act and other existing board regulations. The proposed ACE would impose certain GHG requirements on coal plants, including an hourly NSR applicability trigger. ACE is not an emissions trading program, and it is unlikely that it will conflict with existing emissions trading programs. The ACE rule has not been finalized, may or may not be issued, and may or may not withstand legal scrutiny; under the circumstances it is not appropriate for the board to consider ACE in the context of this regulatory action.

	administered on a state-by-state basis. The UARG decision nullifies the opinion and the board's authority to issue the rule. The board's own regulations extend the application of the UARG decision (9VAC5-10-20). The board can only regulate air pollutants subject to NAAQS and specific emissions limits. A CO_2 cap and trade program is neither part of Virginia's NAAQS program or a specific emissions limit. § 10.1-1308 still limits DEQ's ability to issue any regulations more stringent than federal requirements without providing notice to the appropriate standing committee of the General Assembly. No such notice has been made. While at this point EPA is not directly regulating CO_2 emissions, the Affordable Clean Energy Rule (ACE) will regulate CO_2 under § 111(d). Once ACE is issued, § 10.1-1308 will clearly apply to the rule, and notice requirements must be satisfied.	
99. William L. Hodges, Chairman, Board of Supervisors, King William County	I am writing to provide comments to DEQ and the board in opposition to the re-proposed regulation. I have previously submitted comments and would ask that they be incorporated by reference. As a resident of King William County and the Chairman of the Board of Supervisors, I can attend to the critical importance of the West Point Paper Mill to our county. The Mill is one of the largest employers, one of the largest taxpayers, and one of the most significant corporate members of our community. The hundreds of jobs that the mill provides, the hundreds more that it supports, and the millions of dollars that it injects into the local economy are irreplaceable. With that in mind, I oppose the re-proposed regulation because it does not exempt emissions from biomass, which is widely considered to be a carbon-neutral fuel source and is the lifeblood of the West Point mill. While DEQ states that the rule is designed to address CO_2 emissions from fossil fuel combustion, the rule as it is currently written would go well beyond that and regulate CO_2 emissions from non-fossil sources	The commenter's concerns are well taken. The cap-and-trade program has been designed to meet the goal of reducing carbon pollution--which will be beneficial to the manufacturing sector--while protecting the economy. Industrial generation (current comment 28) and biomass (current comments 24 and 40) are discussed in greater detail elsewhere.

	when those sources are co-fired with fossil fuels. The board should adopt language that specifically and clearly exempts non-fossil fuel sources from the regulation. Further, I would encourage the board to extend the exemption for industrial generation to new facilities. Should the exemption apply only to existing facilities, the board should adopt any language necessary to clarify that the exemption applies at the facility level (rather than to individual boilers) to allow facilities to conduct proper maintenance and grow.	
100. Jonathan A. Lanford, County Administrator, Alleghany County	I on behalf of the Alleghany County Board of Supervisors in opposition to the re-proposed rule. The West Rock Paper Mill in Covington is a significant economic driver for our community, providing over 1100 jobs and supporting over $200,000,000 in local investment through supplier purchases, payroll, and taxes every year. If care is not taken, the proposal could have a serious and negative impact on the mill. One of our chief concerns is the treatment of energy from biomass, which is critical to the mill's operation. Unfortunately, despite the rule's nominal focus on fossil fuel emissions, the current language would apply to biomass (and other non-fossil fuel sources) when they are co-fired with fossil fuels. Biomass is widely considered to be a carbon-neutral fuel source, and this fact is not changed when biomass is co-fired. Moreover, by including non-fossil fuel sources, the regulation would greatly exceed its stated scope. Accordingly, we are opposed to the rule as currently drafted and encourage DEQ to correct this issue by including in the rule a clear and specific exemption for CO_2 emissions from non-fossil fuel sources, such as biomass.	The commenter's concerns are well taken. The cap-and-trade program has been designed to meet the goal of reducing carbon pollution--which will be beneficial to the manufacturing sector--while protecting the economy. Industrial generation (current comment 28) and biomass (current comments 24 and 40) are discussed in greater detail elsewhere.
101. About 200 sponsored letters	I am writing to provide comments in opposition to the re-proposed regulation for the CO_2 Budget Trading Program. I work at a WestRock Mill which has been in operation for over 100 years. The Mill is the economic backbone of our community, supporting over 1000 jobs and	The commenters' concerns are well taken; please see the current response to current comment 99.

	injecting hundreds of millions of dollars a year into our local economy. I am concerned that the regulation, and specifically the treatment of biomass, could have a serious and negative impact on the mill. DEQ has said that the intent of the rule is to focus on fossil fuels, but as written, it would apply to biomass (and other non-fossil fuel sources) when they are co-fired with fossil fuels. Biomass is a carbon-neutral fuel source, and it should not be included in a rule designed to deal with fossil fuels. With that in mind, the rule should be amended to specifically exclude non-fossil fuel emissions. Additionally, the exemption for industrial facilities should not be restricted to existing facilities. If the restriction remains, the rule should have language that clearly allows for exempted facilities to conduct maintenance and upgrades without losing their exemption.	
102. Richard Watro, Vice President, Covington Operations, WestRock	On behalf of the nearly 1,100 employees of WestRock's Covington paper mill, I appreciate the opportunity to provide comments. In addition to the jobs the mill provides, and the hundreds more it supports, the mill contributes over $270,000,000 to Virginia's economy through local purchases, and roughly $11,000,000 in property and sales tax payments every year. The products we make at Covington are exported around the world, primarily through the Port of Virginia. Papermaking is an energy-intensive process, and the mill produces a significant portion of its own power, primarily through the use of renewable biomass. The proposal should be amended to treat all biomass as carbon-neutral so long as carbon stocks are stable or increasing. The use of biomass is recognized as carbon-neutral by well-supported science, regardless of whether or not it is co-fired with a fossil fuel source. The failure to recognize our primary fuel source as carbon neutral would deviate from the practice of other states that participate in RGGI, as well as widely accepted	The commenter's concerns are well taken; please see the current response to current comment 99. The cap-and-trade program has been designed to meet the goal of reducing carbon pollution--which will be beneficial to the manufacturing sector--while protecting the economy.

	international carbon accounting protocols, and could have negative long-term consequences. The regulation consistently has been aimed at reducing GHG emissions from only "fossil fuel" combustion like all other RGGI states. We recommend that regardless of how "fossil-fuel fired" is defined, and whether a unit co-fires biomass with fossil fuel, the regulation should be explicit in that allowances are only required for emissions from the combustion of fossil fuel and that none are required for emissions from combustion of biomass fuel. This change will provide necessary clarity and prevent unintended consequences that might result from a misinterpretation. In light of the competitive disadvantage that Virginia industrial facilities would face if they were subject to the regulation, it should clearly exempt those facilities. Our facilities are subject to Clean Air Act and other federal and state regulatory programs which impose stringent standards and permitting requirements. Those costly investments have dramatically reduced emissions and we often exceed the standard requirements. While the regulation includes an exemption for certain existing industrial facilities, it only applies to units in service as of 2019. That limitation should be removed, as there is no reason that new industrial facilities should subject to the adverse economic impact of having to obtain allowances for their emissions. Again, this would put those facilities at a serious competitive disadvantage and will make it much more difficult to attract new investments to the state. If the limitation is retained, the regulation should be clear that any modifications or replacements of machinery and equipment do not cause the facility to lose the exemption.	
103. WestRock	The rule changes do not address our	DEQ believes that the biomass

	primary concern, which is that the regulation undermines internationally accepted principles of carbon accounting and in some cases regulates emissions from non-fossil fuels when they are co-fired with fossil fuels. As stated in our comments on the original proposal, emissions from non-fossil fuels, particularly those that are renewable and biogenic like biomass, should be unequivocally exempted from this rulemaking. DEQ has requested comments on whether and how the current language of the proposed rule should apply to "CO_2 emissions from CO_2 budget units that do not combust fossil fuels exclusively." In the re-proposed rule, DEQ has altered the definition of "fossil fuel fired" to lower the threshold of fossil fuel from 10% of fuels combusted to 5%, the revised rule is even more likely to include non-fossil (including renewable biomass) fuel emissions. The following language should be reinserted in the final rule to ensure that the re-proposed rule so that the final regulation does not exceed the scope established by RGGI: "The owners and operators of each CO_2 budget source and each CO_2 budget unit at the source shall hold CO_2 allowances <u>from the combustion of fossil fuel</u> available for compliance deductions under 9VAC5-140-6260, . . . " Further, DEQ should revise the definition of "CO_2 Budget Source" to reinsert the phrase "that has been generated as a result of combusting fossil fuel" and clarify the applicability of CO_2 allowances for emissions resulting from fossil fuels. In summary, the proposed definitions of "fossil fuel fired" or "CO_2 allowance" clearly exclude CO_2 emissions from non-fossil sources from regulation, and we strongly urge DEQ to amend the regulation to ensure it remains consistent with the fossil-fuel focus of EO 11 and the rulemaking process to date.	applicability has been properly addressed; see current responses to current comments 24 and 40.
104. WestRock	The re-proposed rule states that if biomass (or some other non-fossil fuel) comprises a threshold percentage of the total heat input into	DEQ believes that the biomass applicability has been properly addressed; see current responses to current comments 24 and 40.

	an electric generating unit, the unit and its biogenic CO_2 emissions are not regulated. However, if biomass comprises less than a threshold percentage, biogenic CO_2 emissions are regulated, and a facility must remit allowances for all CO_2 emissions from that unit. This treatment of biogenic CO_2 emissions is arbitrary and capricious. Biomass carbon neutrality does not change based on the amount of biomass fired, nor does it change when biomass is co-fired with other fuels. The rule's treatment of CO_2 emissions from the combustion of biomass represents a significant departure from current U.S. federal law, internationally-accepted carbon accounting protocols, and the existing RGGI model rule. Moreover, by regulating CO_2 emissions from biomass, the regulation exceeds the stated scope of the RGGI Rule, which is specifically intended to "Reduce and Cap Carbon Dioxide from Fossil Fuel Fired Electric Generating Units."	
105. WestRock	The intent of the re-proposed rule is to regulate emissions of fossil fuels from utility electric generating units. We appreciate DEQ's efforts to clarify that manufacturing facilities are exempt from regulation and offer three suggestions for ensuring that § 6040 B of the re-proposed rule clearly exempts industrial facilities that generate steam and electricity. First, we propose that the reference to "CO_2 budget source" be removed and the first segment of this language refer to "source." Removal of this language offers more clarity to manufacturers as it more clearly distinguishes between those facilities impacted by the rule and those that are not. We also recommend that the definition of CO_2 budget source be amended for consistency to read: "'CO_2 budget source" [except as exempted in 9VAC5-140-6040 B] means a source that includes one or more CO_2 budget units." This language would further clarify how facilities that qualify for this exemption are affected under the rule.	Support for the proposal is appreciated. See the current response to current comment 12 for more information on details related to applicability. More information on the applicability of new sources is available in the current response to current comment 90. See the current response to current comment 90 for more information on the applicability of the rule to new industrial facilities. Exemptions are allowed throughout the board's regulations, and, as necessary, permits must be modified in order for a facility to claim the exemption and then demonstrate compliance with the exemption's requirements. These permit modifications cost money to develop and implement. There is no reason to treat facilities that are meeting the requirements of this regulation to be treated any differently from any other permitted facility.

	Second, the language dealing with the industrial exemption should extend to facilities regardless of the date they commenced operation; megawatt units of measure should be included with respect to the sales, purchases, and generation; and permitting requirements should be clarified to ensure that the facility is not required to pay a permit modification fee. Further, DEQ should provide guidance to facilities as to how it intends to facilitate inclusion of this language into existing permits. Overall, WestRock supports the concept of net electrical generation. We recognize that many manufacturers generate and consume electricity on site, but also are able to sell a portion to the grid. In addition to the specific recommendations offered above, we support higher thresholds for net electrical generation and total useful energy due to the benefits that CHP offer. Third, we request that DEQ remove the reference to "CO_2 budget source" and retain "source" to be consistent with our previous recommendation. Since this is an exemption to the regulation that DEQ wants to include in a facility's operating permit, DEQ must ensure that the facility is not required to pay the permit modification fee for such inclusion. DEQ could incorporate this language as an administrative change. DEQ should provide guidance to facilities as to how it intends to facilitate inclusion of this language into existing permits. We also support the incorporation of the proposed the industrial exemption as it applies on a facility basis and not to individual emission units. As such, modifications or newly constructed units at an exempt facility would be exempt as long as the facility still qualifies for the exemption.	
106. The Windaction Group	I have tracked the electricity market in the RGGI states closely since the program's inception. Claims that	The comment suggests that the emissions reductions accomplished in the power sector in the RGGI region are

	RGGI is responsible for precipitous declines in carbon emissions while saving consumers in energy costs, creating new jobs, and enhancing public health, are simply not accurate according to RGGI's own numbers. Citing from the September 2018 report by RGGI (The Investment of RGGI Proceeds in 2016), RGGI allowances cost electricity consumers over $2.65 billion in the period from 2008 to 2016 to be spent on programs meant to reduce carbon emissions. Of these funds, the states seized $93.1 million to meet budget shortfalls, allocated $245.1 million for future programs and "invested" $2.17 billion in projects that by 2016 reportedly trained 8,150 workers and promised a lifetime reduction in carbon of just 27.8 million short tons. In the same period, the free market reduced electric sector carbon emissions in the RGGI states by 49 million short tons--2 times the claimed lifetime reduction RGGI touted--and at no additional cost to ratepayers. In other words, by 2016 the free market had already exceeded the claimed lifetime reduction in carbon emissions documented by RGGI. With regard to cost per ton, the numbers are worse. From 2008 to the end of 2016, the clearing price for RGGI allowances averaged $3.03 per ton. At the highest, the allowances reached $7.50 in December 2015 before tumbling to $3.55 per ton at the end of 2016. In the most recent auction held in December 2018, allowances cleared at $5.35. Yet, state regulators approved investing $2.17 billion to lower emissions by just 27.8 million short tons which equates to $78 per ton. In other words, RGGI sold allowances for well under $10/ton and then RGGI states built offset projects costing $78/ton. On specific projects, the cost per allowance was often much higher. RGGI proponents are asking the public to believe that the program is delivering on a global environmental promise, but the reality is that it is a colossal failure of resource allocation that should be	attributable to market forces and not to the RGGI program, but the comment provides no evidence or analysis to support this assertion. Based on data from the U.S. Energy Information Administration, power sector emissions in 2016 in the RGGI region were approximately 50% lower than they were in 2005, while in the U.S. as a whole, power sector emissions were only 25% lower than they were in 2005 (EIA 2018). This suggests that the RGGI program and other actions by and in the RGGI region have succeeded in reducing emissions beyond what the market would have accomplished on its own. Also note that an independent team of economists at Duke University analyzed the factors contributing to emissions reductions in the RGGI region and concluded that the RGGI program was responsible for at least half of the emissions reductions achieved in the region This evidence would seem to directly contradict commenter's assertions that market forces alone achieved the reductions. The comment also suggests that RGGI has "extracted billions from ratepayers" without explaining the math that led the commenter to this conclusion. The Analysis Group has conducted 3 independent and comprehensive economic impact analyses of the RGGI program since RGGI's inception in 2009. The reports can be found here: https://www.rggiprojectseries.org/reports. Together, the reports conclude that RGGI has resulted in net economic benefits to the region of approximately $4 billion from 2009 to 2017. Here, "net economic benefits" refers to the benefits after the costs of the program were taken into account. These independent analyses would seem to contradict the comment's assertions. In Virginia, allowances are to be allocated to the entities that have a compliance obligation under the program. These entities will submit the allowance to a consignment auction and will receive the proceeds from the auction for the benefit of their customers. In effect, the value of the allowances will be used to offset the

	repealed to leave more efficient market forces. There are far more productive options for lowering emissions that do not involve extracting billions from ratepayers. I encourage Virginia to look past ideology behind RGGI and look at the numbers.	cost of the program. In its bill impacts analysis, the Analysis Group concluded that the program would result in a small net benefit to consumers in Virginia.

Detail of Changes Made Since the Previous Stage

*Please list all changes that made to the text since the previous stage was published in the Virginia Register of Regulations and the rationale for the changes. Explain the new requirements and what they mean rather than merely quoting the text of the regulation. * Please put an asterisk next to any substantive changes.*

Changes made after the original proposal:

Current chapter-section number	New chapter-section number, if applicable	New requirement from previous stage	Updated new requirement since previous stage	Change, intent, rationale, and likely impact of updated requirements
None	Article 1	CO_2 Budget Trading Program General Provisions	--	--
None	9VAC5-140-6010	Purpose	Amended to state that the rule is to be effected in a manner protective of health and the environment.	Needed for clarity.
None	9VAC5-140-6020 C	Definition of "allocate"	Amended to reflect relocation and renumbering of DMME provisions (see 9VAC5-140-6211).	Needed for clarity.
None	9VAC5-140-6020 C	Definition of "allowance"	Deleted.	Replaced with the new term "CO_2 allowance." Needed to ensure the proper functioning of the RGGI allowance market.
None	9VAC5-140-6020 C	Definition of "alternate CO_2 authorized account representative"	Deleted.	Needed in order to be consistent with new RGGI terminology.
None	9VAC5-140-6020 C	Definition of "CO_2 allowance"	Added.	Replacing "allowance." Needed to ensure the proper functioning of the RGGI allowance market
None	9VAC5-140-6020 C	Definition of "CO_2 authorized alternate account	Added.	Needed in order to be consistent with new RGGI terminology.

		representative"		
None	9VAC5-140-6020 C	Definition of "CO_2 Budget Trading Program"	Amended.	Needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.
None	9VAC5-140-6020 C	Definition of "CCR allowance"	Amended to indicate that the CCR allowance is conditional.	Needed for clarity.
None	9VAC5-140-6020 C	Definition of "CO_2 CCR trigger price"	Amended to include the correct prices.	Needed in order for the program to operate properly.
None	9VAC5-140-6020 C	Definition of "CO_2 ECR trigger price"	Amended to include the correct prices.	Needed in order for the program to operate properly.
None	9VAC5-140-6020 C	Definition of "CO_2 offset allowance"	Added.	Needed in order for offsets from other states to be recognized.
None	9VAC5-140-6020 C	Definition of "conditional allowance"	Amended to clarify the relationship between a conditional allowance and a CO_2 allowance.	Needed in order for the program to operate properly.
None	9VAC5-140-6020 C	Definition of "conditional CCR allowance"	Added.	Needed for clarity and in order for the program to operate properly.
None	9VAC5-140-6020 C	Definition of "consignment auction"	Amended to refer to the correct auction entity.	Needed for clarity.
None	9VAC5-140-6020 C	*Definition of "fossil fuel-fired"	Amended to change the amount of fuel comprised of fossil fuel from 10% to 5%.	Needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.
None	9VAC5-140-6020 C	Definition of "maximum design heat input"	Deleted.	This term is not used in the proposal and must be removed.
None	9VAC5-140-6020 C	Definition of "minimum reserve price"	Amended to change the price from $2.00 to $2.32.	Needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.
None	9VAC5-140-6020 C	Definition of "receive"	Amended to be more specific.	Needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.
None	9VAC5-140-6020 C	Definition of "RGGI, Inc."	Deleted.	Needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.
None	9VAC5-140-6020 C	Definition of "state"	Deleted.	Needed in order for clarity. "Participating state"

				replaces this more general term.
None	9VAC5-140-6020 C	*Definition of "total useful energy"	Added.	Needed in order for the industrial exemption (9VAC5-140-6040 B) to operate properly.
None	9VAC5-140-6020 C	*Definition of "useful net thermal energy"	Added.	Needed in order for the industrial exemption (9VAC5-140-6040 B) to operate properly.
None	9VAC5-140-6030	Measurements, abbreviations and acronyms.	Unused terms removed.	Needed for clarity.
None	9VAC5-140-6040 B	*Applicability.	Amended to clarify industrial facilities exempt from the rule.	Needed to address third-party industrial suppliers while maintaining consistency with the RGGI Model Rule.
None	9VAC5-140-6050 C 1	CO_2 requirements, holding allowances for compliance		The department sought comment on whether an amendment is needed to 9VAC5-140-6050 C 1 to specify that the total CO_2 emissions related to CO_2 allowances only includes emissions resulting from the combustion of fossil fuel.
None	Article 2	CO_2 Authorized Account Representative for CO_2 Budget Sources.	--	--
None	9VAC5-140-6090	Alternate CO_2 authorized account representative.	The term "alternate CO_2 authorized account representative" is amended to "CO_2 authorized alternate account representative."	Needed in order to be consistent with new RGGI terminology.
None	9VAC5-140-6100	Changing the CO_2 authorized account representatives and the alternate CO_2 authorized account representative; changes in the owners and operators.	The term "alternate CO_2 authorized account representative" is amended to "CO_2 authorized alternate account representative."	Needed in order to be consistent with new RGGI terminology.
None	9VAC5-140-6110	Account certificate of representation.	The term "alternate CO_2 authorized account representative" is amended to "CO_2	Needed in order to be consistent with new RGGI terminology.

			authorized alternate account representative."	
None	9VAC5-140-6130	Delegation by CO_2 authorized account representative and alternate CO_2 authorized account representative.	The term "alternate CO_2 authorized account representative" is amended to "CO_2 authorized alternate account representative." In subsection H, "must" has been changed to "shall."	Needed in order to be consistent with new RGGI terminology, and to reflect correct regulatory style.
None	Article 5	CO_2 Allowance Allocations	--	--
None	9VAC5-140-6190 A	*Base budgets.	The initial CO_2 base budget has been set at 28 million tons, declining by 3% per year through 2030.	Needed in order to realize the program goal of reducing carbon pollution at a certain rate of a specified time period.
None	9VAC5-140-6190 C	*Base budgets.	Amended to establish specific post-2030 adjustments.	Needed to ensure continuing compliance into the future.
None	9VAC5-140-6200	Undistributed and unsold CO_2 allowances.	Amended to correct the term "conditional allowance" and to replace "may" with "will."	Needed for clarity and in order for the program to operate properly.
None	9VAC5-140-6210 A	CO_2 allowance allocations.	Amended to clarify the allocation of allowances.	Needed for clarity.
None	9VAC5-140-6210 B	CO_2 allowance allocations.	DMME provisions have been moved to a separate new section (9VAC5-140-6211); succeeding sections renumbered accordingly.	Needed for clarity.
None	9VAC5-140-6210 ~~D~~ C	*CO_2 allowance allocations.	Amended to more clearly explain how the CCR allowances will be allocated, including a new equation for calculating the pro rata distribution of CCR allowances.	Needed for clarity and in order for the program to operate properly.
None	9VAC5-140-6210 ~~E~~ D	CO_2 allowance allocations.	Amended to more clearly explain how the ECR allowances will be allocated.	Needed for clarity and in order for the program to operate properly.
None	9VAC5-140-6210 ~~F~~ E	CO_2 allowance allocations.	Minor corrections.	Needed for clarity.
None	9VAC5-140-	CO_2 allowance	Timing requirements	Needed for clarity.

	6210 ~~I~~ H	allocations.	amended in order to provide more detail as to how and when conditional allowances will be allocated.	
None	9VAC5-140-6210 I	None.	New subsection added to clarify that implementation of the CCR, ECR and banking adjustment will depend on the extent of the CO_2 trading program.	Needed for clarity.
None	9VAC5-140-6211	None.	Section added for DMME provisions moved from 9VAC5-140-6040 A 2.	Needed for clarity.
None	Article 6	CO_2 Allowance Tracking System	--	--
None	9VAC5-140-6230	Establishment of accounts.	The term "alternate CO_2 authorized account representative" is amended to "CO_2 authorized alternate account representative."	Needed in order to be consistent with new RGGI terminology.
None	9VAC5-140-6260 A 3	*Compliance.	Amended in order for Virginia to recognize offsets generated by other RGGI states.	Needed in order to participate in the RGGI program.
None	Article 8	Monitoring, Reporting and Recordkeeping	--	--
None	9VAC5-140-6330 A	General requirements.	Minor correction.	Needed for clarity.
None	Article 9	Auction of CO_2 CCR and ECR allowances	--	--
None	9VAC5-140-6430	Consignment auction.	Amended to indicate that one quarter of the annual conditional allowance allocation will be consigned by the CO_2 budget source or the holder of a public contract with DMME to each auction. At the completion of the consignment auction, a conditional allowance sold at auction becomes a CO_2 allowance.	Needed for clarity and in order for the program to operate properly.

None	9VAC5-140-6435	None.	New section added to enable the use of a direct auction without consignment in accordance with requirements established by the Virginia General Assembly.	Needed in order for the program to operate properly in the event of a legislative requirement.
None	Article 10	Program Monitoring and Review	--	--
None	9VAC5-140-6440	None.	Article added.	Specifies that in conjunction with program monitoring and review, impacts specific to Virginia will be evaluated, including economic, energy and environmental impacts, and impacts on vulnerable and environmental justice communities. Needed in order to clarify that these specific impacts will be monitored and evaluated.

Changes made after the re-proposal:

Current chapter-section number	**New chapter-section number, if applicable**	**New requirement from previous stage**	**Updated new requirement since previous stage**	**Change, intent, rationale, and likely impact of updated requirements**
None	Article 1	CO_2 Budget Trading Program General Provisions	--	--
None.	9VAC5-140-6020 C	Definition of "adjustment for banked allowances"	Initial control period specified and control period date corrected.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definition of "allocate"	Use consistent and accurate terminology to refer to conditional allowances. Revise to avoid using the word "allocate" within the definition.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definitions of "allocation year"; "allowance auction"	Use consistent and accurate terminology to refer to conditional allowances.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.

None.	9VAC5-140-6020 C	Definition of "CO_2 allowance deduction"; "CO_2 allowance transfer deadline"; "CO_2 budget emissions limitation"	Include "initial control period" when referencing requirements for a control period.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definition of "CO_2 CCR allowance"	Revise to reflect the fact that conditional CCR allowances become CO_2 cost containment reserve allowances after being sold at auction.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definition of "CO_2 ECR allowance"; "CO_2 ECR trigger price"	Use consistent and accurate terminology to refer to conditional allowances; correct minor typos.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definition of "compliance account"	Include "initial control period" when referencing requirements for a control period.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definition of "conditional allowance"	Correct "sources" to "source," and strike the last sentence which is redundant (there is already a separate definition for "conditional CCR allowance").	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definition of "conditional allowance account"	Add definition. §§ 6230 A and 6250 A 1 refer to a "conditional allowance account," but there is no corresponding definition	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definition of "conditional CCR allowance"	Remove reference to a "CCR account" and revise to indicate that an allowance that may be offered for sale when the CCR is triggered	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.

None.	9VAC5-140-6020 C	Definition of "control period"	Refer to the control period from 2021-2023 as the "fifth control period" in order to align with the term used in the existing program. The interim control period start date should be 2021.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definition of "excess emissions"	Include "initial control period" when referencing requirements for a control period.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definition of "reserve price"	Use consistent and accurate terminology to refer to conditional allowances.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definition of "ton" or "tonnage"	Include "initial" and "interim" control periods when referencing requirements for a control period.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6020 C	Definitions of "undistributed CO_2 allowances"; "unsold CO_2 allowances"; "Virginia CO_2 Budget Trading Program adjusted budget"; "Virginia CO_2 Budget Trading Program base budget"	Use consistent and accurate terminology to refer to conditional allowances.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6040 B	*Applicability, exemptions	Restore previously removed term "fossil fuel."	Needed in order to clearly delineate applicability of the regulation, i.e., only fossil fuel-fired facilities are subject to the rule and therefore only fossil fuel-fired facilities can be deemed exempt.
None	9VAC5-140-6045	*Add new section CO_2 Budget Trading Program Implementation	--	Enables the program to proceed should a disruption in the allocation schedule occur. Needed in order to provide an orderly implementation process and certainty to affected facilities and the department should such contingency be necessary.

None.	9VAC5-140-6050 C 1	*General CO_2 requirements	(i) Restore previously removed term "that has been generated as a result of combusting fossil fuel;" (ii) add initial and interim control periods.	Needed in order to (i) clearly delineate applicability of the regulation, and (ii) accurately referencing requirements for various control periods. Needed to meet state requirements, and in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6050 C 2; 9VAC5-140-6050 C 3 and D;	*General CO_2 requirements	Restore previously removed term "that has been generated as a result of combusting fossil fuel" (ii) add initial and interim control periods as appropriate.	Needed in order to (i) clearly delineate applicability of the regulation, and (ii) accurately referencing requirements for various control periods. Needed to meet state requirements, and in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None	Article 4	Compliance certification	--	--
None.	9VAC5-140-6170 A	General CO_2 requirements	Include "initial control period" when referencing requirements for a control period.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None	Article 5	CO_2 Allowance Allocations	--	--
None.	9VAC5-140-6190 B	Base budgets	Amend in order to match the definition of a conditional allowance.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6190 C	*Base budgets	Remove reference to post-2030 requirements and add the updated base budget of 19.60 million tons based on the new 28 million ton cap; specify that the post-2031 base budget may be modified as a result of program review and regulatory action	Needed in order to assure a consistent budget trajectory to the other RGGI participating states and therefore ensure Virginia's ability to participate in the RGGI Program; needed in order to clarify that the post-2031 base budget may be modified as a result of certain actions.

None.	9VAC5-140-6200 A and B	Undistributed and unsold allowances	Include "initial control period" when referencing requirements for a control period.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6210 A through K	CO_2 allowance allocations	Use consistent and accurate terminology to refer to conditional allowances.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6210 C, D, D 1, D 4, D 5, K	CO_2 allowance allocations	Added or modified to describe how allowances flow through the consignment auction account, and to ensure consistent use of the term "Virginia Consignment Auction Account."	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6210 F	CO_2 allowance allocations	Banked allowance adjustment date corrected.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6210 I 1-3	CO_2 allowance allocations	Specific dates replaced with a date within 60 days after the effective date of the rule.	Needed in order for realistic and certain dates to be met.
None.	9VAC5-140-6211; 9VAC5-140-6215 and 6215 A and B 1-3	CO_2 allowance allocations, DMME allowances; CO_2 allocation methodology	Use consistent and accurate terminology to refer to conditional allowances.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6215 C 1 and 2	CO_2 allocation methodology	Specific dates replaced with a date within 60 days after the effective date of the rule.	Needed in order for realistic and certain dates to be met.
None	Article 6	CO_2 Allowance Tracking System	--	--
None.	9VAC5-140-6220 A	CO_2 Allowance Tracking System accounts	Use consistent and accurate terminology to refer to conditional allowances.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6230 A	Establishment of accounts	Because DMME would not need a compliance account, revise to refer to a "conditional allowance account."	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.

None.	9VAC5-140-6250 (entire section)	Recordation of CO_2 allowance allocations	Use consistent and accurate terminology to refer to conditional allowances.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	9VAC5-140-6260 (entire section)	Compliance	Include "initial control period" as appropriate when referencing requirements for a control period.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.
None.	Article 9	Auction of CO_2 CCR and ECR allowances	--	--
None.	9VAC5-140-6420	General requirements	(i) Use consistent and accurate terminology to refer to conditional allowances.; (ii) correct subdivision reference in A 2; (iii) correct term "Virginia Consignment Auction Account" in B 2 and 3; (iv) correct typos in B 4 and 5.	Needed in order for the Virginia consignment auction to operate correctly with the RGGI Program.

Memorandum

To: David K. Paylor

From: Michael G. Dowd, Director, Air and Renewable Energy Division

Date: June 16, 2020

Subject: Clean Energy and Community Flood Preparedness Act, § 10.1-1329 et seq., RGGI Program Regulation (Part VII of 9VAC5-140)

Introduction

Chapter 1219 of the 2020 Acts of Assembly amends the Air Pollution Control Law to add a new Article 4, the Clean Energy and Community Flood Preparedness Act. Under § 10.1-1330 A, Clean Energy and Community Flood Preparedness, "[T]he provisions of this article shall be incorporated by the Department, without further action by the Board, into the final regulation adopted by the Board on April 19, 2019, and published in the Virginia Register on May 27, 2019. Such incorporation by the Department shall be exempt from the provisions of the Virginia Administrative Process Act (§ 2.2-4000 et seq.)."

Accordingly, we have drafted revisions to Part VII of 9VAC5-140, Regulation for Emissions Trading such that it comports with the full Regional Greenhouse Gas Initiative (RGGI) CO_2 emissions trading program and associated auction as mandated by Chapter 1219 (see Attachment 1). To this end, the draft (i) removes references to a "consignment" auction and its associated mechanisms, such as conditional allowances; (ii) removes DMME allowances; (iii) removes program backstops and other transitional provisions that have been resolved, such as "initial control periods"; and (iv) removes the concept of "linking" to RGGI instead of being a "participating state." (See Attachment 2.)

Additionally, Chapter 1219 adds a new § 10.1-1331, which requires that (i) the definition a "life-of-the-unit contractual arrangement" include any energy conversion or energy tolling agreement that has a primary term of 20 years or more and pursuant to which the purchaser is required to deliver fuel to the CO_2 budget source or unit and is entitled to receive all of the nameplate

capacity and associated energy generated by such source or unit for the entire contractual period and (ii) any purchaser under an energy conversion or energy tolling agreement is responsible for acquiring any CO_2 allowances required in relation to a CO_2 budget source or unit that is subject to such agreement. The regulation has been amended accordingly (see Attachment 2).

The regulation has been reviewed by the Assistant Attorney General, who concurs that the revisions comport with the RGGI program and thus Chapter 1219 (see Attachment 3). Additionally, the participating RGGI states have reviewed these revisions and agree that they are consistent with the requirements of the RGGI program for full participation.

The final regulation will submitted to the Registrar of Regulations for publication in the Virginia Register at the earliest possible filing date, to become effective upon such filing date.

Recommendation

I recommend that the Director adopt the attached amendments to Part VII of 9VAC5-140 in accordance with Chapter 1219 of the 2020 Acts of Assembly, to be effective upon filing of the amendments with the Virginia Register of Regulations.

Recommendation approved by: David K Paylor

David K. Paylor

CHAPTER 140. REGULATION FOR EMISSIONS TRADING

Part VII. CO_2 Budget Trading Program

Article 1. CO_2 Budget Trading Program General Provisions

9VAC5-140-6010. Purpose.

This part establishes the Virginia component of the CO_2 Budget Trading Program, which is designed to reduce anthropogenic emissions of CO_2, a greenhouse gas, from CO_2 budget sources in a manner that is protective of human health and the environment and is economically efficient.

9VAC5-140-6020. Definitions.

A. As used in this part, all words or terms not defined here shall have the meanings given them in 9VAC5-10 (General Definitions), unless otherwise required by the context.

B. For the purpose of this part and any related use, the words or terms shall have the meanings given them in this section.

C. Terms defined.

"Account number" means the identification number given by the department or its agent to each COATS account.

"Acid ~~rain~~ Rain emission limitation" means, as defined in 40 CFR 72.2, a limitation on emissions of sulfur dioxide (SO_2) or nitrogen oxides (NO_x) under the Acid Rain Program under Title IV of the CAA.

"Acid Rain Program" means a multistate SO_2 and NO_x air pollution control and emission reduction program established by the administrator under Title IV of the CAA and 40 CFR Parts 72 through 78.

"Adjustment for banked allowances" means an adjustment applied to the Virginia CO_2 Budget Trading Program base budget for allocation years 2021 through 2025 to address allowances held in general and compliance accounts, including compliance accounts established pursuant to the CO_2 Budget Trading Program, but not including accounts opened by participating states~~, that are in addition to the aggregate quantity of emissions from all CO_2 budget sources in all of the participating states at the end of the initial control period in 2020 and as reflected in the CO_2 Allowance Tracking System on March 15, 2021~~.

"Administrator" means the administrator of the U.S. Environmental Protection Agency or the administrator's authorized representative.

"Allocate" or "allocation" means the determination by the department of the number of ~~conditional~~ CO_2 allowances recorded in the ~~conditional~~ allowance account of a CO_2 budget unit ~~or to the Department of Mines, Minerals and Energy (DMME) pursuant to 9VAC5-140-6211~~.

"Allocation year" means a calendar year for which the department allocates ~~conditional~~ CO_2 allowances pursuant to Article 5 (9VAC5-140-6190 et seq.) of this part. The allocation year of each ~~conditional~~ CO_2 allowance is reflected in the unique identification number given to the allowance pursuant to 9VAC5-140-6250 C.

"Allowance auction" or "auction" means an auction in which the department or its agent offers ~~conditional~~ CO_2 allowances for sale.

"Attribute" means a characteristic associated with electricity generated using a particular renewable fuel, such as its generation date, facility geographic location, unit vintage, emissions output, fuel, state program eligibility, or other characteristic that can be identified, accounted for, and tracked.

"Attribute credit" means a credit that represents the attributes related to one ~~megawatthour~~ megawatt hour of electricity generation.

"Automated Data Acquisition and Handling System" or "DAHS" means that component of the Continuous Emissions Monitoring System (CEMS), or other emissions monitoring system approved for use under Article 8 (9VAC5-140-6330 et seq.) of this part, designed to interpret and convert individual output signals from pollutant concentration monitors, flow monitors, diluent gas monitors, and other component parts of the monitoring system to produce a continuous record of the measured parameters in the measurement units required by Article 8 (9VAC5-140-6330 et seq.) of this part.

"Billing meter" means a measurement device used to measure electric or thermal output for commercial billing under a contract. The facility selling the electric or thermal output shall have different owners from the owners of the party purchasing the electric or thermal output.

"Boiler" means an enclosed fossil or other fuel-fired combustion device used to produce heat and to transfer heat to recirculating water, steam, or other medium.

"CO_2 allowance" means a limited authorization by the department or ~~another~~ participating state under the CO_2 Budget Trading Program to emit up to one ton

of CO_2, subject to all applicable limitations contained in this part. ~~CO_2 offset allowances generated by other participating states will be recognized by the department.~~

"CO_2 allowance deduction" or "deduct CO_2 allowances" means the permanent withdrawal of CO_2 allowances by the department or its agent from a COATS compliance account to account for the number of tons of CO_2 emitted from a CO_2 budget source for ~~the initial control period,~~ a control period ~~,~~ or an interim control period determined in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part, or for the forfeit or retirement of CO_2 allowances as provided by this part.

"CO_2 Allowance Tracking System" or "COATS" means the system by which the department or its agent records allocations, deductions, and transfers of CO_2 allowances under the CO_2 Budget Trading Program. The tracking system may also be used to track CO_2 allowance prices and emissions from affected sources.

"CO_2 Allowance Tracking System account" means an account in COATS established by the department or its agent for purposes of recording the allocation, holding, transferring, or deducting of CO_2 allowances.

"CO_2 allowance transfer deadline" means midnight of March 1 occurring after the end of the ~~initial~~ relevant control period~~, the control period,~~ and each relevant interim control period, or if that March 1 is not a business day, midnight of the first business day thereafter and is the deadline by which CO_2 allowances shall be submitted for recordation in a CO_2 budget source's compliance account for the source to meet the CO_2 requirements of 9VAC5-140-6050 C for ~~the initial control period,~~ a control period ~~,~~ and each interim control period immediately preceding such deadline.

"CO_2 allowances held" or "hold CO_2 allowances" means the CO_2 allowances recorded by the department or its agent, or submitted to the department or its agent for recordation, in accordance with Article 6 (9VAC5-140-6220 et seq.) and Article 7 (9VAC5-140-6300 et seq.) of this part, in a COATS account.

"CO_2 authorized account representative" means, for a CO_2 budget source and each CO_2 budget unit at the source, the natural person who is authorized by the owners and operators of the source and all CO_2 budget units at the source, in accordance with Article 2 (9VAC5-140-6080 et seq.) of this part, to represent and legally bind each owner and operator in matters pertaining to the CO_2 Budget Trading Program or, for a general account, the natural person who is authorized, under Article 6 (9VAC5-140-6220 et seq.) of this part, to transfer or otherwise dispose of CO_2 allowances held in the general account. If the CO_2 budget source is also subject to the Acid Rain Program, CSAPR NO_X Annual Trading Program, CSAPR NO_X Ozone Season Trading Program, CSAPR SO_2 Group 1 Trading Program, or CSAPR SO_2 Group 2 Trading Program, then for a CO_2 Budget Trading Program compliance account, this natural person shall be the same person as the designated representative as defined in the respective program.

"CO_2 authorized alternate account representative" means, for a CO_2 budget source and each CO_2 budget unit at the source, the alternate natural person who is authorized by the owners and operators of the source and all CO_2 budget units at the source, in accordance with Article 2 (9VAC5-140-6080 et seq.) of this part, to represent and legally bind each owner and operator in matters pertaining to the CO_2 Budget Trading Program or, for a general account, the alternate natural person who is authorized, under Article 6 (9VAC5-140-6220 et seq.) of this part, to transfer or otherwise dispose of CO_2 allowances held in the general account. If the CO_2 budget source is also subject to the Acid Rain Program, CSAPR NO_x Annual Trading Program, CSAPR NO_x Ozone Season Trading Program, CSAPR SO_2 Group 1 Trading Program, or CSAPR SO_2 Group 2 Trading Program then, for a CO_2 Budget Trading Program compliance account, this alternate natural person shall be the same person as the alternate designated representative as defined in the respective program.

"CO_2 budget emissions limitation" means, for a CO_2 budget source, the tonnage equivalent, in CO_2 emissions in ~~the initial control period,~~ a control period ~~,~~ or an interim control period of the CO_2 allowances available for compliance deduction for the source for a control period or an interim control period.

"CO_2 budget permit" means the portion of the legally binding permit issued by the department pursuant to 9VAC5-85 (Permits for Stationary Sources of Pollutants Subject to Regulation) to a CO_2 budget source or CO_2 budget unit that specifies the CO_2 Budget Trading Program requirements applicable to the CO_2 budget source, to each CO_2 budget unit at the CO_2 budget source, and to the owners and operators and the CO_2 authorized account representative of the CO_2 budget source and each CO_2 budget unit.

"CO_2 budget source" means a source that includes one or more CO_2 budget units.

"CO_2 Budget Trading Program" means a multistate CO_2 air pollution control and emissions reduction program established according to this part and corresponding regulations in other states as a means of reducing emissions of CO_2 from CO_2 budget sources.

"CO_2 budget unit" means a unit that is subject to the CO_2 Budget Trading Program requirements under 9VAC5-140-6040.

"CO_2 cost containment reserve allowance" or "CO_2 CCR allowance" means an allowance that has been sold at an auction for the purpose of containing the cost of CO_2 allowances. CO_2 CCR allowances offered for sale at an auction are separate from and additional to CO_2 allowances allocated from the Virginia CO_2 Budget Trading Program base and adjusted budgets. CO_2 CCR allowances are subject to all applicable limitations contained in this part.

"CO_2 cost containment reserve trigger price" or "CCR trigger price" means the minimum price at which CO_2 CCR allowances are offered for sale by the department or its agent at an auction. The CCR trigger price in calendar year ~~2020~~ 2021 shall be ~~$10.77~~ $13.00. The CCR trigger price in calendar year ~~2021~~ 2022 shall be ~~$13~~ $13.91. Each calendar year thereafter, the CCR trigger price shall be 1.07 multiplied by the CCR trigger price from the previous calendar year, rounded to the nearest whole cent, as shown in Table 140-1A.

Table 140-1A
CO_2 CCR Trigger Price

~~2020~~	~~$10.77~~
2021	$13.00
2022	$13.91
2023	$14.88
2024	$15.92
2025	$17.03
2026	$18.22
2027	$19.50
2028	$20.87
2029	$22.33
2030	$23.89

"CO_2 emissions containment reserve allowance" or "CO_2 ECR allowance" means a ~~conditional~~ CO_2 allowance that is withheld from sale at an auction by the department for the purpose of additional emission reduction in the event of lower than anticipated emission reduction costs.

"CO_2 emissions containment reserve trigger price" or "ECR trigger price" means the price below which ~~conditional~~ CO_2 allowances will be withheld from sale by the department or its agent at an auction. The ECR trigger price in calendar year 2021 shall be $6.00. Each calendar year thereafter, the ECR trigger price shall be 1.07 multiplied by the ECR trigger price from the previous calendar year, rounded to the nearest whole cent, as shown in Table 140-1B.

Table 140-1B
CO_2 ECR Trigger Price

2021	$ 6.00
2022	$ 6.42
2023	$ 6.87
2024	$ 7.35
2025	$ 7.86
2026	$8.41
2027	$ 9.00

2028	$ 9.63
2029	$10.30
2030	$11.02

"CO_2 offset allowance" means a CO_2 allowance that is awarded to the sponsor of a CO_2 emissions offset project by a participating state and is subject to the relevant compliance deduction limitations of the participating state's corresponding offset regulations as a means of reducing CO_2 from CO_2 budget sources.

"Combined cycle system" means a system comprised of one or more combustion turbines, heat recovery steam generators, and steam turbines configured to improve overall efficiency of electricity generation or steam production.

"Combustion turbine" means an enclosed fossil or other fuel-fired device that is comprised of a compressor (if applicable), a combustor, and a turbine, and in which the flue gas resulting from the combustion of fuel in the combustor passes through the turbine, rotating the turbine.

"Commence commercial operation" means, with regard to a unit that serves a generator, to have begun to produce steam, gas, or other heated medium used to generate electricity for sale or use, including test generation. For a unit that is a CO_2 budget unit under 9VAC5-140-6040 on the date the unit commences commercial operation, such date shall remain the unit's date of commencement of commercial operation even if the unit is subsequently modified, reconstructed, or repowered. For a unit that is not a CO_2 budget unit under 9VAC5-140-6040 on the date the unit commences commercial operation, the date the unit becomes a CO_2 budget unit under 9VAC5-140-6040 shall be the unit's date of commencement of commercial operation.

"Commence operation" means to begin any mechanical, chemical, or electronic process, including, with regard to a unit, start-up of a unit's combustion chamber. For a unit that is a CO_2 budget unit under 9VAC5-140-6040 on the date of commencement of operation, such date shall remain the unit's date of commencement of operation even if the unit is subsequently modified, reconstructed, or repowered. For a unit that is not a CO_2 budget unit under 9VAC5-140-6040 on the date of commencement of operation, the date the unit becomes a CO_2 budget unit under 9VAC5-140-6040 shall be the unit's date of commencement of operation.

"Compliance account" means a COATS account, established by the department or its agent for a CO_2 budget source under Article 6 (9VAC5-140-6220 et seq.) of this part, in which CO_2 allowances available for use by the source for ~~the initial control period,~~ a control period ~~,~~ and each interim control period are held for the purpose of meeting the CO_2 requirements of 9VAC5-140-6050 C.

~~"Conditional allowance" means an allowance allocated by the department to a CO_2 budget source or to DMME. Such conditional allowance shall be consigned by~~

~~the entity to whom it is allocated to the consignment auction as specified under Article 9 (9VAC5-140-6410 et seq.) of this part, after which the conditional allowance becomes a CO_2 allowance once it is sold to an auction participant.~~

~~"Conditional allowance account" means a general COATS account established by the department for CO_2 budget sources and DMME or its contractor where conditional allowances allocated to CO_2 budget sources and DMME are held until auction.~~

~~"Conditional cost containment reserve allowance" or "conditional CCR allowance" means an allowance that may be offered for sale when the CCR is triggered. If any conditional CCR allowances are unsold, they may be offered for sale in future auctions during the same year. Conditional CCR allowances offered for sale at an auction are separate from and additional to conditional allowances allocated from the Virginia CO_2 Budget Trading Program base and adjusted budgets. Conditional CCR allowances are subject to all applicable limitations contained in this part.~~

~~"Consignment auction" or "auction" means the CO_2 auction conducted on a quarterly basis by the CO_2 Budget Trading Program, in which CO_2 budget sources and DMME are allocated a share of allowances by the department that CO_2 budget sources and the holder of a public contract with DMME consign into the auction, and auction revenue is returned to CO_2 budget sources and the holder of a public contract with DMME in accordance with procedures established by the department.~~

"Continuous Emissions Monitoring System" or "CEMS" means the equipment required under Article 8 (9VAC5-140-6330 et seq.) of this part to sample, analyze, measure, and provide, by means of readings recorded at least once every 15 minutes (using an automated DAHS), a permanent record of stack gas volumetric flow rate, stack gas moisture content, and oxygen or carbon dioxide concentration (as applicable), in a manner consistent with 40 CFR Part 75 and Article 8 (9VAC5-140-6330 et seq.) of this part. The following systems are types of CEMS required under Article 8 (9VAC5-140-6330 et seq.) of this part:

a. A flow monitoring system, consisting of a stack flow rate monitor and an automated DAHS and providing a permanent, continuous record of stack gas volumetric flow rate, in standard cubic feet per hour;

b. A NO_X emissions rate (or NO_X-diluent) monitoring system, consisting of a NO_X pollutant concentration monitor, a diluent gas (CO_2 or O_2) monitor, and an automated DAHS and providing a permanent, continuous record of NO_X concentration, in parts per million (ppm), diluent gas concentration, in percent CO_2 or O_2, and NO_X emissions rate, in pounds per million British thermal units (lb/MMBtu);

c. A moisture monitoring system, as defined in 40 CFR 75.11(b)(2) and providing a permanent, continuous record of the stack gas moisture content, in percent H_2O;

d. A CO_2 monitoring system, consisting of a CO_2 pollutant concentration monitor (or an O_2 monitor plus suitable mathematical equations from which the CO_2 concentration is derived) and an automated DAHS and providing a permanent, continuous record of CO_2 emissions, in percent CO_2; and

e. An O_2 monitoring system, consisting of an O_2 concentration monitor and an automated DAHS and providing a permanent, continuous record of O_2, in percent O_2.

"Control period" means a three-calendar-year time period. The fifth control period is from January 1, 2021, to December 31, 2023, inclusive, which is the first control period of Virginia's participation in the CO_2 Budget Trading Program. The first two calendar years of each control period are each defined as an interim control period, beginning on January 1, 2021.

"Cross State Air Pollution Rule (CSAPR) NO_X Annual Trading Program" means a multistate NO_X air pollution control and emission reduction program established in accordance with Subpart AAAAA of 40 CFR Part 97 and 40 CFR 52.38(a), including such a program that is revised in a SIP revision approved by the administrator under 40 CFR 52.38(a)(3) or (4) or that is established in a SIP revision approved by the administrator under 40 CFR 52.38(a)(5), as a means of mitigating interstate transport of fine particulates and NO_X.

"Cross State Air Pollution Rule (CSAPR) NO_X Ozone Season Trading Program" means a multistate NO_X air pollution control and emission reduction program established in accordance with Subpart BBBBB of 40 CFR Part 97 and 40 CFR 52.38(b), including such a program that is revised in a SIP revision approved by the administrator under 40 CFR 52.38(b)(3) or (4) or that is established in a SIP revision approved by the administrator under 40 CFR 52.38(b)(5), as a means of mitigating interstate transport of ozone and NO_X.

"Cross State Air Pollution Rule (CSAPR) SO_2 Group 1 Trading Program" means a multistate SO_2 air pollution control and emission reduction program established in accordance with Subpart CCCCC of 40 CFR Part 97 and 40 CFR 52.39(a), (b), (d) through (f), (j), and (k), including such a program that is revised in a SIP revision approved by the administrator under 40 CFR 52.39(d) or (e) or that is established in a SIP revision approved by the administrator under 40 CFR 52.39(f), as a means of mitigating interstate transport of fine particulates and SO_2.

"Cross State Air Pollution Rule (CSAPR) SO_2 Group 2 Trading Program" means a multistate SO_2 air pollution control and emission reduction program

established in accordance with Subpart DDDDD of 40 CFR Part 97 and 40 CFR 52.39(a), (c), and (g) through (k), including such a program that is revised in a SIP revision approved by the administrator under 40 CFR 52.39(g) or (h) or that is established in a SIP revision approved by the administrator under 40 CFR 52.39(i), as a means of mitigating interstate transport of fine particulates and SO_2.

"Department" means the Virginia Department of Environmental Quality.

~~"DMME" means the Virginia Department of Mines, Minerals and Energy.~~

"Excess emissions" means any tonnage of CO_2 emitted by a CO_2 budget source during ~~the initial~~ an interim control period or a control period that exceeds the CO_2 budget emissions limitation for the source.

"Excess interim emissions" means any tonnage of CO_2 emitted by a CO_2 budget source during an interim control period multiplied by 0.50 that exceeds the CO_2 budget emissions limitation for the source.

"Fossil fuel" means natural gas, petroleum, coal, or any form of solid, liquid, or gaseous fuel derived from such material.

"Fossil fuel-fired" means the combustion of fossil fuel, alone or in combination with any other fuel, where the fossil fuel combusted comprises, or is projected to comprise, more than 5.0% of the annual heat input on a Btu basis during any year.

"General account" means a COATS account established under Article 6 (9VAC5-140-6220 et seq.) of this part that is not a compliance account.

"Gross generation" means the electrical output in MWe at the terminals of the generator.

~~"Initial control period" means the period beginning January 1, 2020, and ending December 31, 2020.~~

"Interim control period" means a one-calendar-year time period during each of the first and second calendar years of each three-year control period. The first interim control period starts January 1, 2021, and ends December 31, 2021, inclusive. The second interim control period starts January 1, 2022, and ends December 31, 2022, inclusive. Each successive three-year control period will have two interim control periods, comprised of each of the first two calendar years of that control period.

"Life-of-the-unit contractual arrangement" means either:

~~a~~ a. A unit participation power sales agreement under which a customer reserves, or is entitled to receive, a specified amount or percentage of nameplate capacity or associated energy from any specified unit pursuant to a contract:

~~a.~~ 1. For the life of the unit;

~~b.~~ 2. For a cumulative term of no less than 30 years, including contracts that permit an election for early termination; or

~~c.~~ 3. For a period equal to or greater than 25 years or 70% of the economic useful life of the unit determined as of the time the unit is built, with option rights to purchase or release some portion of the nameplate capacity and associated energy generated by the unit at the end of the period~~.~~ ; or

b. For any energy conversion or energy tolling agreement that has a primary term of 20 years or more and pursuant to which the purchaser is required to deliver fuel to the CO_2 budget source or CO_2 budget unit and is entitled to receive all of the nameplate capacity and associated energy generated by such source or unit for the entire contractual period. Such agreements shall be subject to 9VAC5-140-6325. Such purchaser shall not be considered an "owner" as defined under this subsection.

"Maximum potential hourly heat input" means an hourly heat input used for reporting purposes when a unit lacks certified monitors to report heat input. If the unit intends to use Appendix D of 40 CFR Part 75 to report heat input, this value shall be calculated, in accordance with 40 CFR Part 75, using the maximum fuel flow rate and the maximum gross calorific value. If the unit intends to use a flow monitor and a diluent gas monitor, this value shall be reported, in accordance with 40 CFR Part 75, using the maximum potential flow rate and either the maximum CO_2 concentration in percent CO_2 or the minimum O_2 concentration in percent O_2.

"Minimum reserve price" means, in calendar year ~~2020, $2.32~~ 2021, $2.38. Each calendar year thereafter, the minimum reserve price shall be 1.025 multiplied by the minimum reserve price from the previous calendar year, rounded to the nearest whole cent.

"Monitoring system" means any monitoring system that meets the requirements of Article 8 (9VAC5-140-6330 et seq.) of this part, including a CEMS, an excepted monitoring system, or an alternative monitoring system.

"Nameplate capacity" means the maximum electrical output in MWe that a generator can sustain over a specified period of time when not restricted by seasonal or other deratings as measured in accordance with the U.S. Department of Energy standards.

"Net-electric output" means the amount of gross generation in MWh the generators produce, including output from steam turbines, combustion turbines, and gas expanders, as measured at the generator terminals, less the electricity used to operate the plant (i.e., auxiliary loads); such uses include fuel handling equipment, pumps, fans, pollution control equipment, other electricity needs, and transformer losses as measured at the transmission side of the step up transformer (e.g., the point of sale).

"Non-CO_2 budget unit" means a unit that does not meet the applicability criteria of 9VAC5-140-6040.

"Operator" means any person who operates, controls, or supervises a CO_2 budget unit or a CO_2 budget source and shall include any holding company, utility system, or plant manager of such a unit or source.

"Owner" means any of the following persons:

a. Any holder of any portion of the legal or equitable title in a CO_2 budget unit;

b. Any holder of a leasehold interest in a CO_2 budget unit, other than a passive lessor, or a person who has an equitable interest through such lessor, whose rental payments are not based, either directly or indirectly, upon the revenues or income from the CO_2 budget unit;

c. Any purchaser of power from a CO_2 budget unit under a life-of-the-unit contractual arrangement in which the purchaser controls the dispatch of the unit; or

d. With respect to any general account, any person who has an ownership interest with respect to the CO_2 allowances held in the general account and who is subject to the binding agreement for the CO_2 authorized account representative to represent that person's ownership interest with respect to the CO_2 allowances.

"Participating state" means a state that ~~participates in~~ has established a corresponding regulation as part of the CO_2 Budget Trading Program.

"Receive" or "receipt of" means, when referring to the department or its agent, to come into possession of a document, information, or correspondence (whether sent in writing or by authorized electronic transmission) as indicated in an official correspondence log, or by a notation made on the document, information, or correspondence by the department or its agent in the regular course of business.

"Recordation," "record," or "recorded" means, with regard to CO_2 allowances, the movement of CO_2 allowances by the department or its agent from one COATS account to another, for purposes of allocation, transfer, or deduction.

"Reserve price" means the minimum acceptable price for each ~~conditional~~ CO_2 allowance in a specific auction. The reserve price at an auction is either the minimum reserve price or the CCR trigger price, as specified in Article 9 (9VAC5-140-6410 et seq.) of this part.

"Serial number" means, when referring to CO_2 allowances, the unique identification number assigned to each CO_2 allowance by the department or its agent under 9VAC5-140-6250 C.

"Source" means any governmental, institutional, commercial, or industrial structure, installation, plant, building, or facility that emits or has the potential to emit any air pollutant. A source, including a source with multiple units, shall be considered a single facility.

"Submit" or "serve" means to send or transmit a document, information, or correspondence to the person specified in accordance with the applicable regulation:

a. In person;

b. By United States Postal Service; or

c. By other means of dispatch or transmission and delivery.

Compliance with any "submission," "service," or "mailing" deadline shall be determined by the date of dispatch, transmission, or mailing and not the date of receipt.

"Ton" or "tonnage" means any short ton, or 2,000 pounds. For the purpose of determining compliance with the CO_2 requirements of 9VAC5-140-6050 C, total tons for ~~the initial control period,~~ an interim control period , or a control period shall be calculated as the sum of all recorded hourly emissions, or the tonnage equivalent of the recorded hourly emissions rates, in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part, with any remaining fraction of a ton equal to or greater than 0.50 ton deemed to equal one ton and any fraction of a ton less than 0.50 ton deemed to equal zero tons. A short ton is equal to 0.9072 metric tons.

"Total useful energy" means the sum of gross electrical generation and useful net thermal energy.

"Undistributed ~~conditional~~ CO_2 allowances" means ~~conditional~~ CO_2 allowances originally allocated to a set aside account as pursuant to 9VAC5-140-6210 that were not distributed.

"Unit" means a fossil fuel-fired stationary boiler, combustion turbine, or combined cycle system.

"Unit operating day" means a calendar day in which a unit combusts any fuel.

"Unsold ~~conditional~~ CO_2 allowances" means ~~conditional~~ CO_2 allowances that have been made available for sale in an auction conducted by the department or its agent, but not sold.

"Useful net thermal energy" means energy:

~~1.~~ a. In the form of direct heat, steam, hot water, or other thermal form that is used in the production and beneficial measures for heating, cooling, humidity control, process use, or other thermal end use energy requirements, excluding thermal energy used in the power production process (e.g., house loads and parasitic loads); and

~~2.~~ b. For which fuel or electricity would otherwise be consumed.

"Virginia CO_2 Budget Trading Program adjusted budget" means an adjusted budget determined in accordance with 9VAC5-140-6210 and is the annual amount of CO_2 tons available in Virginia for allocation in a given allocation year, in accordance with the CO_2 Budget Trading Program. ~~Conditional~~ CO_2 CCR allowances offered for sale at an auction are separate from and additional to ~~conditional~~ CO_2 allowances allocated from the Virginia CO_2 Budget Trading Program adjusted budget.

"Virginia CO_2 Budget Trading Program base budget" means the budget specified in 9VAC5-140-6190. ~~Conditional~~ CO_2 CCR allowances offered for sale at an auction are separate from and additional to ~~conditional~~ CO_2 allowances allocated from the Virginia CO_2 Budget Trading Program base budget.

9VAC5-140-6030. Measurements, abbreviations, and acronyms.

Measurements, abbreviations, and acronyms used in this part are defined as follows:

Btu - British thermal unit.
CAA - federal Clean Air Act.
CCR - cost containment reserve.
CEMS - Continuous Emissions Monitoring System.
COATS - CO_2 Allowance Tracking System.
CO_2 - carbon dioxide.
DAHS - Data Acquisition and Handling System.
H2O - water.
lb - pound.
LME - low mass emissions.

MMBtu - million British thermal units.
MW - megawatt.
MWe - megawatt electrical.
MWh - megawatt hour.
NO_X - nitrogen oxides.
O2 - oxygen.
ORIS - Office of Regulatory Information Systems.
QA/QC - quality assurance/quality control.
ppm - parts per million.
SO_2 - sulfur dioxide.

9VAC5-140-6040. Applicability.

A. Any fossil fuel-fired unit that serves an electricity generator with a nameplate capacity equal to or greater than 25 MWe shall be a CO_2 budget unit, and any source that includes one or more such units shall be a CO_2 budget source, subject to the requirements of this part.

B. Exempt from the requirements of this part is any fossil fuel CO_2 budget source located at or adjacent to and physically interconnected with a manufacturing facility that, prior to January 1, ~~2019~~ 2020, and in every subsequent calendar year, met either of the following requirements:

1. Supplies less than or equal to 10% of its annual net electrical generation to the electric grid; or

2. Supplies less than or equal to 15% of its annual total useful energy to any entity other than the manufacturing facility to which the CO_2 budget source is interconnected.

For the purpose of subdivision 1 of this subsection, annual net electrical generation shall be determined as follows:

$$(ES - EP) / EG \times 100$$

Where:

ES = electricity sales to the grid from the CO_2 budget source
EP = electricity purchases from the grid by the CO_2 budget source and the manufacturing facility to which the CO_2 budget source is interconnected
EG = electricity generation

Such exempt CO_2 budget source shall have an operating permit containing the applicable restrictions under this subsection. An application for such operating permit shall be submitted to the department no later than January 1, 2022.

9VAC5-140-6045. ~~CO_2 Budget Trading Program implementation.~~ (Repealed.)

~~In the event the allocation of conditional allowances by the department as required by 9VAC5-140-6190 B has not occurred by January 1, 2020, the program will be considered to be operating and effective as of the calendar year following the date on which the department allocates the conditional allowances as it corresponds to the schedule of 9VAC5-140-6190 A. Permitting and compliance dates, including the due date for a permit as required by 9VAC5-140-6150 , shall be adjusted to be in force six months after the date the department allocates the conditional allowances. Any excess emissions tonnage identified by the new program implementation date may be addressed through program review and regulatory action as necessary to ensure compliance with the final compliance date. The department will notify the board and each affected CO_2 budget source accordingly.~~

9VAC5-140-6050. Standard requirements.

A. Permit requirements shall be as follows.

1. The CO_2 authorized account representative of each CO_2 budget source required to have an operating permit pursuant to 9VAC5-85 (Permits for Stationary Sources of Pollutants Subject to Regulation) and each CO_2 budget unit required to have an operating permit pursuant to 9VAC5-85 shall:

a. Submit to the department a complete CO_2 budget permit application under 9VAC5-140-6160 in accordance with the deadlines specified in 9VAC5-140-6150; and

b. Submit in a timely manner any supplemental information that the department determines is necessary in order to review the CO_2 budget permit application and issue or deny a CO_2 budget permit.

2. The owners and operators of each CO_2 budget source required to have an operating permit pursuant to 9VAC5-85 (Permits for Stationary Sources of Pollutants Subject to Regulation) and each CO_2 budget unit required to have an operating permit pursuant to 9VAC5-85 for the source shall have a CO_2 budget permit and operate the CO_2 budget source and the CO_2 budget unit at the source in compliance with such CO_2 budget permit.

B. Monitoring requirements shall be as follows.

1. The owners and operators and, to the extent applicable, the CO_2 authorized account representative of each CO_2 budget source and each CO_2 budget unit at the source shall comply with the monitoring requirements of Article 8 (9VAC5-140-6330 et seq.) of this part.

2. The emissions measurements recorded and reported in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part shall be used to determine compliance by the unit with the CO_2 requirements under subsection C of this section.

C. CO_2 requirements shall be as follows.

1. The owners and operators of each CO_2 budget source and each CO_2 budget unit at the source shall hold CO_2 allowances available for compliance deductions under 9VAC5-140-6260, as of the CO_2 allowance transfer deadline, in the source's compliance account in an amount not less than the total CO_2 emissions that have been generated as a result of combusting fossil fuel for ~~the initial control period,~~ an interim control period ~~,~~ or control period from all CO_2 budget units at the source, less the CO_2 allowances deducted to meet the requirements of subdivision 2 of this subsection, with respect to the previous two interim control periods as determined in accordance with Article 6 (9VAC5-140-6220 et seq.) and Article 8 (9VAC5-140-6330 et seq.) of this part.

2. The owners and operators of each CO_2 budget source and each CO_2 budget unit at the source shall hold CO_2 allowances available for compliance deductions under 9VAC5-140-6260, as of the CO_2 allowance transfer deadline, in the source's compliance account in an amount not less than the total CO_2 emissions that have been generated as a result of combusting fossil fuel for ~~the initial control period, an interim control period, or for~~ the interim control period from all CO_2 budget units at the source multiplied by 0.50, as determined in accordance with Article 6 (9VAC5-140-6220 et seq.) and Article 8 (9VAC5-140-6330 et seq.) of this part.

3. Each ton of CO_2 emitted in excess of the CO_2 budget emissions limitation for ~~the initial control period or~~ a control period shall constitute a separate violation of this part and applicable state law.

4. Each ton of excess interim emissions shall constitute a separate violation of this part and applicable state law.

5. A CO_2 budget unit shall be subject to the requirements under subdivision 1 of this subsection starting on the later of January 1, ~~2020~~ 2021, or the date on which the unit commences operation.

6. CO_2 allowances shall be held in, deducted from, or transferred among COATS accounts in accordance with Article 5 (9VAC5-140-6190 et seq.), Article 6 (9VAC5-140-6220 et seq.), and Article 7 (9VAC5-140-6300 et seq.) of this part.

7. A CO_2 allowance shall not be deducted, to comply with the requirements under subdivision 1 or 2 of this subsection, for a control period that ends prior to the year for which the CO_2 allowance was allocated.

8. A CO_2 allowance under the CO_2 Budget Trading Program is a limited authorization by the department to emit one ton of CO_2 in accordance with the CO_2 Budget Trading Program. No provision of the CO_2 Budget Trading Program, the CO_2 budget permit application, or the CO_2 budget permit or any provision of law shall be construed to limit the authority of the department or a participating state to terminate or limit such authorization.

9. A CO_2 allowance under the CO_2 Budget Trading Program does not constitute a property right.

D. The owners and operators of a CO_2 budget source that has excess emissions in ~~an initial control period or~~ a control period shall:

1. Forfeit the CO_2 allowances required for deduction under 9VAC5-140-6260 D 1; and

2. Pay any fine, penalty, or assessment or comply with any other remedy imposed under 9VAC5-140-6260 D 2.

E. Recordkeeping and reporting requirements shall be as follows:

1. Unless otherwise provided, the owners and operators of the CO_2 budget source and each CO_2 budget unit at the source shall keep on site at the source each of the following documents for a period of 10 years from the date the document is created. This period may be extended for cause, at any time prior to the end of 10 years, in writing by the department.

a. The account certificate of representation for the CO_2 authorized account representative for the source and each CO_2 budget unit at the source and all documents that demonstrate the truth of the statements in the account certificate of representation, in accordance with 9VAC5-140-6110, provided that the certificate and documents shall be retained on site at the source beyond such 10-year period until such documents are superseded because of the submission of a new account certificate of representation changing the CO_2 authorized account representative.

b. All emissions monitoring information, in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part and 40 CFR 75.57.

c. Copies of all reports, compliance certifications, and other submissions and all records made or required under the CO_2 Budget Trading Program.

d. Copies of all documents used to complete a CO_2 budget permit application and any other submission under the CO_2 Budget Trading Program or to demonstrate compliance with the requirements of the CO_2 Budget Trading Program.

2. The CO_2 authorized account representative of a CO_2 budget source and each CO_2 budget unit at the source shall submit the reports and compliance certifications required under the CO_2 Budget Trading Program, including those under Article 4 (9VAC5-140-6170 et seq.) of this part.

F. Liability requirements shall be as follows.

1. No permit revision shall excuse any violation of the requirements of the CO_2 Budget Trading Program that occurs prior to the date that the revision takes effect.

2. Any provision of the CO_2 Budget Trading Program that applies to a CO_2 budget source, including a provision applicable to the CO_2 authorized account representative of a CO_2 budget source, shall also apply to the owners and operators of such source and of the CO_2 budget units at the source.

3. Any provision of the CO_2 Budget Trading Program that applies to a CO_2 budget unit, including a provision applicable to the CO_2 authorized account representative of a CO_2 budget unit, shall also apply to the owners and operators of such unit.

G. No provision of the CO_2 Budget Trading Program, a CO_2 budget permit application, or a CO_2 budget permit shall be construed as exempting or excluding the owners and operators and, to the extent applicable, the CO_2 authorized account representative of the CO_2 budget source or CO_2 budget unit from compliance with any other provisions of applicable state and federal law or regulations.

9VAC5-140-6060. Computation of time.

A. Unless otherwise stated, any time period scheduled, under the CO_2 Budget Trading Program, to begin on the occurrence of an act or event shall begin on the day the act or event occurs.

B. Unless otherwise stated, any time period scheduled, under the CO_2 Budget Trading Program, to begin before the occurrence of an act or event shall be computed so that the period ends the day before the act or event occurs.

C. Unless otherwise stated, if the final day of any time period, under the CO_2 Budget Trading Program, falls on a weekend or a state or federal holiday, the time period shall be extended to the next business day.

9VAC5-140-6070. Severability.

If any provision of this part, or its application to any particular person or circumstances, is held invalid, the remainder of this part, and the application thereof to other persons or circumstances, shall not be affected thereby.

Article 2. CO_2 Authorized Account Representative for CO_2 Budget Sources

9VAC5-140-6080. Authorization and responsibilities of the CO_2 authorized account representative.

A. Except as provided under 9VAC5-140-6090, each CO_2 budget source, including all CO_2 budget units at the source, shall have one and only one CO_2 authorized account representative, with regard to all matters under the CO_2 Budget Trading Program concerning the source or any CO_2 budget unit at the source.

B. The CO_2 authorized account representative of the CO_2 budget source shall be selected by an agreement binding on the owners and operators of the source and all CO_2 budget units at the source and must act in accordance with the account certificate of representation under 9VAC5-140-6110.

C. Upon receipt by the department or its agent of a complete account certificate of representation under 9VAC5-140-6110 , the CO_2 authorized account representative of the source shall represent and, by his representations, actions, inactions, or submissions, legally bind each owner and operator of the CO_2 budget source represented and each CO_2 budget unit at the source in all matters pertaining to the CO_2 Budget Trading Program, notwithstanding any agreement between the CO_2 authorized account representative and such owners and operators. The owners and operators shall be bound by any decision or order issued to the CO_2 authorized account representative by the department or a court regarding the source or unit.

D. No CO_2 budget permit shall be issued, and no COATS account shall be established for a CO_2 budget source, until the department or its agent has received a complete account certificate of representation under 9VAC5-140-6110 for a CO_2 authorized account representative of the source and the CO_2 budget units at the source.

E. Each submission under the CO_2 Budget Trading Program shall be submitted, signed, and certified by the CO_2 authorized account representative for each CO_2 budget source on behalf of which the submission is made. Each such submission shall include the following certification statement by the CO_2 authorized account representative: "I am authorized to make this submission on behalf of the owners and operators of the CO_2 budget sources or CO_2 budget units for which the submission is made. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting

false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

F. The department or its agent will accept or act on a submission made on behalf of owners or operators of a CO_2 budget source or a CO_2 budget unit only if the submission has been made, signed, and certified in accordance with subsection E of this section.

9VAC5-140-6090. CO_2 authorized alternate account representative.

A. An account certificate of representation may designate one and only one CO_2 authorized alternate account representative who may act on behalf of the CO_2 authorized account representative. The agreement by which the CO_2 authorized alternate account representative is selected shall include a procedure for authorizing the CO_2 authorized alternate account representative to act in lieu of the CO_2 authorized account representative.

B. Upon receipt by the department or its agent of a complete account certificate of representation under 9VAC5-140-6110, any representation, action, inaction, or submission by the CO_2 authorized alternate account representative shall be deemed to be a representation, action, inaction, or submission by the CO_2 authorized account representative.

C. Except in this section and 9VAC5-140-6080 A, 9VAC5-140-6100, 9VAC5-140-6110, and 9VAC5-140-6230, whenever the term "CO_2 authorized account representative" is used in this part, the term shall be construed to include the CO_2 authorized alternate account representative.

9VAC5-140-6100. Changing the CO_2 authorized account representatives and the CO_2 authorized alternate account representative; changes in the owners and operators.

A. The CO_2 authorized account representative may be changed at any time upon receipt by the department or its agent of a superseding complete account certificate of representation under 9VAC5-140-6110. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CO_2 authorized account representative or CO_2 authorized alternate account representative prior to the time and date when the department or its agent receives the superseding account certificate of representation shall be binding on the new CO_2 authorized account representative and the owners and operators of the CO_2 budget source and the CO_2 budget units at the source.

B. The CO_2 authorized alternate account representative may be changed at any time upon receipt by the department or its agent of a superseding complete account certificate of representation under 9VAC5-140-6110. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CO_2 authorized

alternate account representative or CO_2 authorized alternate account representative prior to the time and date when the department or its agent receives the superseding account certificate of representation shall be binding on the new CO_2 authorized alternate account representative and the owners and operators of the CO_2 budget source and the CO_2 budget units at the source.

C. Changes in the owners and operators shall be addressed as follows.

1. In the event a new owner or operator of a CO_2 budget source or a CO_2 budget unit is not included in the list of owners and operators submitted in the account certificate of representation, such new owner or operator shall be deemed to be subject to and bound by the account certificate of representation, the representations, actions, inactions, and submissions of the CO_2 authorized account representative and any CO_2 authorized alternate account representative of the source or unit, and the decisions, orders, actions, and inactions of the department, as if the new owner or operator were included in such list.

2. Within 30 days following any change in the owners and operators of a CO_2 budget source or a CO_2 budget unit, including the addition of a new owner or operator, the CO_2 authorized account representative or CO_2 authorized alternate account representative shall submit a revision to the account certificate of representation amending the list of owners and operators to include the change.

9VAC5-140-6110. Account certificate of representation.

A. A complete account certificate of representation for a CO_2 authorized account representative or a CO_2 authorized alternate account representative shall include the following elements in a format prescribed by the department or its agent:

1. Identification of the CO_2 budget source and each CO_2 budget unit at the source for which the account certificate of representation is submitted;

2. The name, address, email address, telephone number, and facsimile transmission number of the CO_2 authorized account representative and any CO_2 authorized alternate account representative;

3. A list of the owners and operators of the CO_2 budget source and of each CO_2 budget unit at the source;

4. The following certification statement by the CO_2 authorized account representative and any CO_2 authorized alternate account representative: "I certify that I was selected as the CO_2 authorized account representative or CO_2 authorized alternate account representative, as applicable, by an agreement binding on the owners and operators of the CO_2 budget source and each CO_2 budget unit at the source. I certify that I have all the necessary authority to carry out my duties and responsibilities under

the CO_2 Budget Trading Program on behalf of the owners and operators of the CO_2 budget source and of each CO_2 budget unit at the source and that each such owner and operator shall be fully bound by my representations, actions, inactions, or submissions and by any decision or order issued to me by the department or a court regarding the source or unit."; and

5. The signature of the CO_2 authorized account representative and any CO_2 authorized alternate account representative and the dates signed.

B. Unless otherwise required by the department or its agent, documents of agreement referred to in the account certificate of representation shall not be submitted to the department or its agent. Neither the department nor its agent shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

9VAC5-140-6120. Objections concerning the CO_2 authorized account representative.

A. Once a complete account certificate of representation under 9VAC5-140-6110 has been submitted and received, the department and its agent will rely on the account certificate of representation unless and until the department or its agent receives a superseding complete account certificate of representation under 9VAC5-140-6110.

B. Except as provided in 9VAC5-140-6100 A or B, no objection or other communication submitted to the department or its agent concerning the authorization, or any representation, action, inaction, or submission of the CO_2 authorized account representative shall affect any representation, action, inaction, or submission of the CO_2 authorized account representative or the finality of any decision or order by the department or its agent under the CO_2 Budget Trading Program.

C. Neither the department nor its agent will adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of any CO_2 authorized account representative, including private legal disputes concerning the proceeds of CO_2 allowance transfers.

9VAC5-140-6130. Delegation by CO_2 authorized account representative and CO_2 authorized alternate account representative.

A. A CO_2 authorized account representative may delegate, to one or more natural persons, his authority to make an electronic submission to the department or its agent under this part.

B. A CO_2 authorized alternate account representative may delegate, to one or more natural persons, his authority to make an electronic submission to the department or its agent under this part.

C. To delegate authority to make an electronic submission to the department or its agent in accordance with subsections A and B of this section, the CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, shall submit to the department or its agent a notice of delegation, in a format prescribed by the department that includes the following elements:

1. The name, address, email address, telephone number, and facsimile transmission number of such CO_2 authorized account representative or CO_2 authorized alternate account representative;

2. The name, address, email address, telephone number, and facsimile transmission number of each such natural person, referred to as the "electronic submission agent";

3. For each such natural person, a list of the type of electronic submissions under subsection A or B of this section for which authority is delegated to him; and

4. The following certification statement by such CO_2 authorized account representative or CO_2 authorized alternate account representative: "I agree that any electronic submission to the department or its agent that is by a natural person identified in this notice of delegation and of a type listed for such electronic submission agent in this notice of delegation and that is made when I am a CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, and before this notice of delegation is superseded by another notice of delegation under 9VAC5-140-6130 D shall be deemed to be an electronic submission by me. Until this notice of delegation is superseded by another notice of delegation under 9VAC5-140-6130 D, I agree to maintain an email account and to notify the department or its agent immediately of any change in my email address unless all delegation authority by me under 9VAC5-140-6130 is terminated."

D. A notice of delegation submitted under subsection C of this section shall be effective, with regard to the CO_2 authorized account representative or CO_2 authorized alternate account representative identified in such notice, upon receipt of such notice by the department or its agent and until receipt by the department or its agent of a superseding notice of delegation by such CO_2 authorized account representative or CO_2 authorized alternate account representative as appropriate. The superseding notice of delegation may replace any previously identified electronic submission agent, add a new electronic submission agent, or eliminate entirely any delegation of authority.

E. Any electronic submission covered by the certification in subdivision C 4 of this section and made in accordance with a notice of delegation effective under subsection D of this section shall be deemed to be an electronic submission by the CO_2 authorized account representative or CO_2 authorized alternate account representative submitting such notice of delegation.

F. A CO_2 authorized account representative may delegate, to one or more natural persons, his authority to review information in the CO_2 allowance tracking system under this part.

G. A CO_2 authorized alternate account representative may delegate, to one or more natural persons, his authority to review information in the CO_2 allowance tracking system under this part.

H. To delegate authority to review information in the CO_2 allowance tracking system in accordance with subsections F and G of this section, the CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, shall submit to the department or its agent a notice of delegation, in a format prescribed by the department that includes the following elements:

1. The name, address, email address, telephone number, and facsimile transmission number of such CO_2 authorized account representative or CO_2 authorized alternate account representative;

2. The name, address, email address, telephone number, and facsimile transmission number of each such natural person, referred to as the "reviewer";

3. For each such natural person, a list of the type of information under subsection F or G of this section for which authority is delegated to him; and

4. The following certification statement by such CO_2 authorized account representative or CO_2 authorized alternate account representative: "I agree that any information that is reviewed by a natural person identified in this notice of delegation and of a type listed for such information accessible by the reviewer in this notice of delegation and that is made when I am a CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, and before this notice of delegation is superseded by another notice of delegation under subsection I of this section shall be deemed to be a reviewer by me. Until this notice of delegation is superseded by another notice of delegation under subsection I of this section, I agree to maintain an email account and to notify the department or its agent immediately of any change in my email address unless all delegation authority by me under this section is terminated."

I. A notice of delegation submitted under subsection H of this section shall be effective, with regard to the CO_2 authorized account representative or CO_2 authorized alternate account representative identified in such notice, upon receipt of such notice by the department or its agent and until receipt by the department or its agent of a superseding notice of delegation by such CO_2 authorized account representative or CO_2 authorized alternate account representative as appropriate. The superseding notice of

delegation may replace any previously identified reviewer, add a new reviewer, or eliminate entirely any delegation of authority.

Article 3. Permits

9VAC5-140-6140. CO_2 budget permit requirements.

A. Each CO_2 budget source shall have a permit issued by the department pursuant to 9VAC5-85 (Permits for Stationary Sources of Pollutants Subject to Regulation).

B. Each CO_2 budget permit shall contain all applicable CO_2 Budget Trading Program requirements and shall be a complete and distinguishable portion of the permit under subsection A of this section.

9VAC5-140-6150. Submission of CO_2 budget permit applications.

For any CO_2 budget source, the CO_2 authorized account representative shall submit a complete CO_2 budget permit application under 9VAC5-140-6160 covering such CO_2 budget source to the department by the later of January 1, ~~2020~~ 2021, or 12 months before the date on which the CO_2 budget source, or a new unit at the source, commences operation.

9VAC5-140-6160. Information requirements for CO_2 budget permit applications.

A complete CO_2 budget permit application shall include the following elements concerning the CO_2 budget source for which the application is submitted, in a format prescribed by the department:

1. Identification of the CO_2 budget source, including plant name and the ORIS (Office of Regulatory Information Systems) or facility code assigned to the source by the Energy Information Administration of the U.S. Department of Energy if applicable;

2. Identification of each CO_2 budget unit at the CO_2 budget source; and

3. The standard requirements under 9VAC5-140-6050.

Article 4. Compliance Certification

9VAC5-140-6170. Compliance certification report.

A. For ~~the initial control period and~~ each control period in which a CO_2 budget source is subject to the CO_2 requirements of 9VAC5-140-6050 C, the CO_2 authorized account representative of the source shall submit to the department by March 1 following the relevant control period, a compliance certification report. A compliance

certification report is not required as part of the compliance obligation during an interim control period.

B. The CO_2 authorized account representative shall include in the compliance certification report under subsection A of this section the following elements, in a format prescribed by the department:

1. Identification of the source and each CO_2 budget unit at the source;

2. At the CO_2 authorized account representative's option, the serial numbers of the CO_2 allowances that are to be deducted from the source's compliance account under 9VAC5-140-6260 for the control period; and

3. The compliance certification under subsection C of this section.

C. In the compliance certification report under subsection A of this section, the CO_2 authorized account representative shall certify, based on reasonable inquiry of those persons with primary responsibility for operating the source and the CO_2 budget units at the source in compliance with the CO_2 Budget Trading Program, whether the source and each CO_2 budget unit at the source for which the compliance certification is submitted was operated during the calendar years covered by the report in compliance with the requirements of the CO_2 Budget Trading Program, including:

1. Whether the source was operated in compliance with the CO_2 requirements of 9VAC5-140-6050 C;

2. Whether the monitoring plan applicable to each unit at the source has been maintained to reflect the actual operation and monitoring of the unit, and contains all information necessary to attribute CO_2 emissions to the unit, in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part;

3. Whether all the CO_2 emissions from the units at the source were monitored or accounted for through the missing data procedures and reported in the quarterly monitoring reports, including whether conditional data were reported in the quarterly reports in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part. If conditional data were reported, the owner or operator shall indicate whether the status of all conditional data has been resolved and all necessary quarterly report resubmissions have been made;

4. Whether the facts that form the basis for certification under Article 8 (9VAC5-140-6330 et seq.) of this part of each monitor at each unit at the source, or for using an excepted monitoring method or alternative monitoring method approved under Article 8 (9VAC5-140-6330 et seq.) of this part, if any, have changed; and

5. If a change is required to be reported under subdivision 4 of this subsection, specify the nature of the change, the reason for the change, when the change occurred, and how the unit's compliance status was determined subsequent to the change, including what method was used to determine emissions when a change mandated the need for monitor recertification.

9VAC5-140-6180. Action on compliance certifications.

A. The department or its agent may review and conduct independent audits concerning any compliance certification or any other submission under the CO_2 Budget Trading Program and make appropriate adjustments of the information in the compliance certifications or other submissions.

B. The department or its agent may deduct CO_2 allowances from or transfer CO_2 allowances to a source's compliance account based on the information in the compliance certifications or other submissions, as adjusted under subsection A of this section.

Article 5. CO_2 Allowance Allocations

9VAC5-140-6190. Base budgets.

A. The Virginia CO_2 Budget Trading Program base budget shall be as follows:

1. ~~For 2020, the Virginia CO_2 Budget Trading Program base budget is 28 million tons.~~

~~2.~~ For 2021, the Virginia CO_2 Budget Trading Program base budget is 27.16 million tons.

~~3.~~ 2. For 2022, the Virginia CO_2 Budget Trading Program base budget is 26.32 million tons.

~~4.~~ 3. For 2023, the Virginia CO_2 Budget Trading Program base budget is 25.48 million tons.

~~5.~~ 4. For 2024, the Virginia CO_2 Budget Trading Program base budget is 24.64 million tons.

~~6.~~ 5. For 2025, the Virginia CO_2 Budget Trading Program base budget is 23.80 million tons.

~~7.~~ 6. For 2026, the Virginia CO_2 Budget Trading Program base budget is 22.96 million tons.

~~8.~~ 7. For 2027, the Virginia CO_2 Budget Trading Program base budget is 22.12 million tons.

~~9.~~ 8. For 2028, the Virginia CO_2 Budget Trading Program base budget is 21.28 million tons.

~~10.~~ 9. For 2029, the Virginia CO_2 Budget Trading Program base budget is 20.44 million tons.

~~11.~~ 10. For 2030, the Virginia CO_2 Budget Trading Program base budget is 19.60 million tons.

B. ~~The department will allocate conditional allowances to CO_2 budget units and to DMME. After a conditional allowance has been consigned in an auction by a CO_2 budget unit or the holder of a public contract with DMME as specified under Article 9 (9VAC5-140-6410 et seq.) of this part, the conditional allowance becomes a CO_2 allowance once it is sold to an auction participant.~~

~~C.~~ For 2031 and each succeeding calendar year, the Virginia CO_2 Budget Trading Program base budget is 19.60 million tons unless modified as a result of a program review and future regulatory action.

9VAC5-140-6200. Undistributed and unsold ~~conditional~~ CO_2 allowances.

A. The department will retire undistributed ~~conditional~~ CO_2 allowances at the end of ~~the initial control period and~~ each ~~subsequent~~ control period.

B. The department will retire unsold ~~conditional~~ CO_2 allowances at the end of ~~the initial control period and~~ each ~~subsequent~~ control period.

9VAC5-140-6210. ~~Conditional~~ CO_2 allowance allocations.

A. The department will allocate the Virginia CO_2 Budget Trading Program base budget ~~conditional~~ CO_2 allowances ~~to CO_2 budget sources to be consigned to auction~~ to the Virginia ~~Consignment~~ Auction Account.

B. For allocation years ~~2020~~ 2021 through ~~2031~~ 2030, the Virginia CO_2 Budget Trading Program adjusted budget shall be the maximum number of allowances available for allocation in a given allocation year, except for ~~conditional~~ CO_2 CCR allowances.

C. ~~Conditional allowances allocated for a calendar year will be automatically transferred to the Virginia Consignment Auction Account to be consigned to auction. Following each auction, all conditional allowances sold at the auction will be transferred~~

~~from the Virginia Consignment Auction Account to winning bidders' accounts as CO_2 allowances.~~

~~D. The cost containment reserve (CCR) allocation shall be managed as follows.~~ ~~The~~ In the event that the CCR is triggered during an auction, the department will allocate ~~conditional~~ CO_2 CCR allowances, separate from and additional to the Virginia CO_2 Budget Trading Program base budget set forth in 9VAC5-140-6190 to the Virginia ~~Consignment~~ Auction Account. The CCR allocation is for the purpose of containing the cost of CO_2 allowances. The department will allocate ~~conditional~~ CO_2 CCR allowances as follows:

1. ~~Beginning in calendar year 2020, the department will initially allocate, on a pro rata basis to CO2 budget sources, 2.8 million conditional CO2 CCR allowances.~~

~~2.~~ On or before January 1, 2021, and each year thereafter, the department will allocate~~, on a pro rata basis to CO2 budget sources, current vintage year conditional~~ CO_2 CCR allowances equal to the quantity in Table 140-5A.

Table 140-5A
~~Conditional~~ CO_2 CCR Allowances from 2021 Forward

2021	2.716 million tons
2022	2.632 million tons
2023	2.548 million tons
2024	2.464 million tons
2025	2.380 million tons
2026	2.296 million tons
2027	2.212 million tons
2028	2.128 million tons
2029	2.044 million tons
2030 and each year thereafter	1.960 million tons

~~3. The pro rata calculation to be used for the distribution of conditional CO2 CCR allowances is as follows:~~

~~$SAA/TAA * CCR = SCCR$~~

~~Where:~~

~~SAA = source adjusted allocation~~
~~TAA = total adjusted allocation~~
~~SCCR = source CCR~~

~~4.~~ 2. ~~Conditional~~ CCR allowances allocated for a calendar year will be automatically transferred to the Virginia ~~Consignment~~ Auction Account to be ~~consigned to auction~~ auctioned. Following each auction, all ~~conditional~~ CO_2 CCR allowances sold at auction will be transferred to winning bidders' accounts as CO_2 CCR allowances.

~~5.~~ 3. Unsold ~~conditional~~ CO_2 CCR allowances will remain in the Virginia ~~Consignment~~ Auction Account to be re-offered for sale at auction within the same calendar year. ~~Conditional~~ CO_2 CCR allowances remaining unsold at the end of the calendar year in which they were originated will be made unavailable for sale at future auctions.

~~E.~~ D. In the event that the ECR is triggered during an auction, the department will authorize its agent to withhold ~~conditional~~ CO_2 allowances as needed. The department will further authorize its agent to convert and transfer any ~~conditional~~ CO_2 allowances that have been withheld from any auction into the Virginia ECR account. The ECR withholding is for the purpose of additional emission reduction in the event of lower than anticipated emission reduction costs. The department's agent will withhold CO_2 ECR allowances as follows:

1. If the condition in 9VAC5-140-6420 ~~D 1~~ C 1 is met at an auction, then the maximum number of CO_2 ECR allowances that will be withheld from that auction will be equal to the quantity shown in Table 140-5B minus the total quantity of CO_2 ECR allowances that have been withheld from any prior auction in that calendar year. Any CO_2 ECR allowances withheld from an auction will be transferred into the Virginia ECR account.

Table 140-5B
ECR Allowances from 2021 Forward

2021	2.716 million tons
2022	2.632 million tons
2023	2.548 million tons
2024	2.464 million tons
2025	2.380 million tons
2026	2.296 million tons
2027	2.212 million tons
2028	2.128 million tons
2019	2.044 million tons
2030 and each year thereafter	1.960 million tons

2. Allowances that have been transferred into the Virginia ECR account shall not be withdrawn.

~~F.~~ E. The adjustment for banked allowances will be as follows. On March 15, 2021, the department may determine the adjustment for banked allowances quantity for allocation years 2021 through 2025 through the application of the following formula:

$$TABA = ((TA - TAE)/5) \times RS\%$$

Where:

TABA is the adjustment for banked allowances quantity in tons.

TA, adjustment, is the total quantity of allowances of vintage years prior to 2021 held in general and compliance accounts, including compliance accounts established pursuant to the CO_2 Budget Trading Program but not including accounts opened by participating states, as reflected in the CO_2 Allowance Tracking System on March 15, 2021.

TAE, adjustment emissions, is the total quantity of 2018, 2019, and 2020 emissions from all CO_2 budget sources in all participating states, reported pursuant to CO_2 Budget Trading Program as reflected in the CO_2 Allowance Tracking System on March 15, 2021.

RS% is Virginia budget divided by the regional budget.

~~G.~~ F. CO_2 Budget Trading Program adjusted budgets for 2021 through 2025 shall be determined as follows: on April 15, 2021, the department will determine the Virginia CO_2 Budget Trading Program adjusted budgets for the 2021 through 2025 allocation years by the following formula:

$$AB = BB - TABA$$

Where:

AB is the Virginia CO_2 Budget Trading Program adjusted budget.

BB is the Virginia CO_2 Budget Trading Program base budget.

TABA is the adjustment for banked allowances quantity in tons.

~~H.~~ G. The department or its agent will publish the CO_2 trading program adjusted budgets for the 2021 through 2025 allocation years.

~~I. Timing requirements for conditional allowance allocations shall be as follows:~~

~~1. By August 25, 2019, the department will submit to its agent the conditional allowance allocations in accordance with 9VAC5-140-6215 A and B, for the initial control period, 2020.~~

~~2. By the month and day established by subdivision 1 of this subsection, 2020, the department will submit to its agent 50% of the conditional allowance allocations in accordance with 9VAC5-140-6215 A and B, for the 2021 control period.~~

~~By the month and day one month before the date established by subdivision 1 of this subsection, 2021, the department will submit to its agent the remainder of the conditional allowance allocations in accordance with 9VAC5-140-6215 A and B, for 2021.~~

~~3. By the month and day established by subdivision 1 of this subsection, 2021, and the month and day established by subdivision 1 of this subsection of every subsequent year thereafter, the department will submit to its agent the conditional allowance allocations for the applicable control period in accordance with 9VAC5-140-6215 A and B.~~

~~J. Implementation of the CCR (subsection C of this section), the ECR (subsection D of this section) and the banking adjustment (subsection E of this section) shall be determined based on the extent of the CO2 trading program.~~

~~K. Conditional allowances and conditional CCR allowances allocated for a calendar year will be automatically transferred to the Virginia Consignment Auction Account to be consigned to auction. Following each auction, all conditional allowances sold at the auction will be transferred from the Virginia Consignment Auction Account to winning bidders' accounts as CO_2 allowances. Conditional CCR allowances sold at auction will be transferred to winning bidders' accounts as CO_2 CCR allowances. Unsold conditional CCR allowances will remain in the Virginia Consignment Auction Account to be re-offered for sale at auction within the same calendar year. Conditional CCR allowances remaining unsold at the end of the calendar year in which they were originated will be made unavailable for sale at future auctions.~~

9VAC5-140-6211. ~~Conditional allowance allocations, DMME allowances.~~ (Repealed.)

~~Notwithstanding 9VAC5-140-6210, the department will allocate 5.0% of the Virginia CO_2 Budget Trading Program base or adjusted budget allowances, as applicable, to DMME to be consigned to auction by the holder of a public contract with DMME to assist the department for the abatement and control of air pollution, specifically CO_2, by the implementation of programs that lower base and peak electricity demand and reduce the cost of the program to consumers and budget sources.~~

9VAC5-140-6215. ~~Conditional allocation methodology.~~ (Repealed.)

~~A. The net electric output in MWh used with respect to conditional allowance allocations under subsection B of this section for each CO_2 budget unit shall be:~~

~~1. For units operating on or before January 1, 2020, the average of the three amounts of the unit's net electric output during 2016, 2017, and 2018 to determine allocations for the initial control period.~~

~~2. For all units operating in each control period after 2020, the average of the three amounts of the unit's total net-electric output during the three most recent years for which data are available prior to the start of the control period.~~

~~B. 1. For each control period beginning in 2020 and thereafter, the department will allocate to all CO_2 budget units that have a net-electric output, as determined under subsection A of this section, a total amount of conditional allowances equal to the CO2 base budget.~~

~~2. The department will allocate conditional allowances to each conditional budget unit under subdivision 1 of this subsection in an amount determined by multiplying the total amount of CO_2 allowances allocated under subdivision 1 of this subsection by the ratio of the baseline electrical output of such CO_2 budget unit to the total amount of baseline electrical output of all such CO_2 budget units and rounding to the nearest whole allowance as appropriate.~~

~~3. New CO_2 budget units will be allocated conditional allowances once they have established electrical output data to be used in the conditional allowance allocation process.~~

~~C. For the purpose of the allocation process as described in subsections A and B of this section, CO_2 budget units shall report the unit's net-electric output to the department on a yearly basis as follows:~~

~~1. By August 25, 2019, each CO_2 budget unit shall report yearly net-electric output data during 2016, 2017, and 2018.~~

~~2. By the month and day established by subdivision 1 of this subsection, 2020, and each year thereafter, each CO_2 budget unit shall report yearly net-electric output data for the previous year.~~

Article 6. CO_2 Allowance Tracking System

9VAC5-140-6220. CO_2 allowance tracking system accounts.

A. Consistent with 9VAC5-140-6230 A, the department or its agent will establish one compliance account for each CO_2 budget source. Allocations of ~~conditional~~ CO_2 allowances pursuant to Article 5 (9VAC5-140-6190 et seq.) of this part and deductions or transfers of ~~conditional~~ CO_2 allowances pursuant to 9VAC5-140-6180, 9VAC5-140-6260, 9VAC5-140-6280, or Article 7 (9VAC5-140-6300 et seq.) of this part will be recorded in the compliance accounts in accordance with this section.

B. Consistent with 9VAC5-140-6230 B, the department or its agent will establish, upon request, a general account for any person. Transfers of CO_2 allowances pursuant

to Article 7 (9VAC5-140-6300 et seq.) of this part will be recorded in the general account in accordance with this article.

9VAC5-140-6230. Establishment of accounts.

A. Upon receipt of a complete account certificate of representation under 9VAC5-140-6110, the department or its agent will establish ~~a conditional~~ an allowance account and a compliance account for each CO_2 budget source for which an account certificate of representation was submitted ~~and a conditional allowance account for DMME~~.

B. General accounts shall operate as follows.

1. Any person may apply to open a general account for the purpose of holding and transferring CO_2 allowances. An application for a general account may designate one and only one CO_2 authorized account representative and one and only one CO_2 authorized alternate account representative who may act on behalf of the CO_2 authorized account representative. The agreement by which the CO_2 authorized alternate account representative is selected shall include a procedure for authorizing the CO_2 authorized alternate account representative to act in lieu of the CO_2 authorized account representative. A complete application for a general account shall be submitted to the department or its agent and shall include the following elements in a format prescribed by the department or its agent:

a. Name, address, email address, telephone number, and facsimile transmission number of the CO_2 authorized account representative and any CO_2 authorized alternate account representative;

b. At the option of the CO_2 authorized account representative, organization name and type of organization;

c. A list of all persons subject to a binding agreement for the CO_2 authorized account representative or any CO_2 authorized alternate account representative to represent their ownership interest with respect to the CO_2 allowances held in the general account;

d. The following certification statement by the CO_2 authorized account representative and any CO_2 authorized alternate account representative: "I certify that I was selected as the CO_2 authorized account representative or the CO_2 authorized alternate account representative, as applicable, by an agreement that is binding on all persons who have an ownership interest with respect to CO_2 allowances held in the general account. I certify that I have all the necessary authority to carry out my duties and responsibilities under the CO_2 Budget Trading Program on behalf of such persons and that each such person shall be fully bound by my representations, actions, inactions, or submissions and by any order or decision issued to me by the department or its agent or a court regarding the general account.";

e. The signature of the CO_2 authorized account representative and any CO_2 authorized alternate account representative and the dates signed; and

f. Unless otherwise required by the department or its agent, documents of agreement referred to in the application for a general account shall not be submitted to the department or its agent. Neither the department nor its agent shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

2. Authorization of the CO_2 authorized account representative shall be as follows:

a. Upon receipt by the department or its agent of a complete application for a general account under subdivision 1 of this subsection:

(1) The department or its agent will establish a general account for the person for whom the application is submitted.

(2) The CO_2 authorized account representative and any CO_2 authorized alternate account representative for the general account shall represent and, by his representations, actions, inactions, or submissions, legally bind each person who has an ownership interest with respect to CO_2 allowances held in the general account in all matters pertaining to the CO_2 Budget Trading Program, notwithstanding any agreement between the CO_2 authorized account representative or any CO_2 authorized alternate account representative and such person. Any such person shall be bound by any order or decision issued to the CO_2 authorized account representative or any CO_2 authorized alternate account representative by the department or its agent or a court regarding the general account.

(3) Any representation, action, inaction, or submission by any CO_2 authorized alternate account representative shall be deemed to be a representation, action, inaction, or submission by the CO_2 authorized account representative.

b. Each submission concerning the general account shall be submitted, signed, and certified by the CO_2 authorized account representative or any CO_2 authorized alternate account representative for the persons having an ownership interest with respect to CO_2 allowances held in the general account. Each such submission shall include the following certification statement by the CO_2 authorized account representative or any CO_2 authorized alternate account representative: "I am authorized to make this submission on behalf of the persons having an ownership interest with respect to the CO_2 allowances held in the general account. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry

of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

c. The department or its agent will accept or act on a submission concerning the general account only if the submission has been made, signed, and certified in accordance with subdivision 2 b of this subsection.

3. Changing CO_2 authorized account representative and CO_2 authorized alternate account representative, and changes in persons with ownership interest, shall be accomplished as follows:

a. The CO_2 authorized account representative for a general account may be changed at any time upon receipt by the department or its agent of a superseding complete application for a general account under subdivision 1 of this subsection. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CO_2 authorized account representative, or the previous CO_2 authorized alternate account representative, prior to the time and date when the department or its agent receives the superseding application for a general account shall be binding on the new CO_2 authorized account representative and the persons with an ownership interest with respect to the CO_2 allowances in the general account.

b. The CO_2 authorized alternate account representative for a general account may be changed at any time upon receipt by the department or its agent of a superseding complete application for a general account under subdivision 1 of this subsection. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CO_2 authorized account representative, or the previous CO_2 authorized alternate account representative, prior to the time and date when the department or its agent receives the superseding application for a general account shall be binding on the new alternate CO_2 authorized account representative and the persons with an ownership interest with respect to the CO_2 allowances in the general account.

c. In the event a new person having an ownership interest with respect to CO_2 allowances in the general account is not included in the list of such persons in the application for a general account, such new person shall be deemed to be subject to and bound by the application for a general account, the representations, actions, inactions, and submissions of the CO_2 authorized account representative and any CO_2 authorized alternate account representative, and the decisions, orders, actions, and inactions of the department or its agent, as if the new person were included in such list.

d. Within 30 days following any change in the persons having an ownership interest with respect to CO_2 allowances in the general account, including the addition or deletion of persons, the CO_2 authorized account representative or any CO_2 authorized alternate account representative shall submit a revision to the application for a general account amending the list of persons having an ownership interest with respect to the CO_2 allowances in the general account to include the change.

4. Objections concerning CO_2 authorized account representative shall be governed as follows:

a. Once a complete application for a general account under subdivision 1 of this subsection has been submitted and received, the department or its agent will rely on the application unless and until a superseding complete application for a general account under subdivision 1 of this subsection is received by the department or its agent.

b. Except as provided in subdivisions 3 a and 3 b of this subsection, no objection or other communication submitted to the department or its agent concerning the authorization, or any representation, action, inaction, or submission of the CO_2 authorized account representative or any CO_2 authorized alternate account representative for a general account shall affect any representation, action, inaction, or submission of the CO_2 authorized account representative or any CO_2 authorized alternate account representative or the finality of any decision or order by the department or its agent under the CO_2 Budget Trading Program.

c. Neither the department nor its agent will adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of the CO_2 authorized account representative or any CO_2 authorized alternate account representative for a general account, including private legal disputes concerning the proceeds of CO_2 allowance transfers.

5. Delegation by CO_2 authorized account representative and CO_2 authorized alternate account representative shall be accomplished as follows:

a. A CO_2 authorized account representative may delegate, to one or more natural persons, his authority to make an electronic submission to the department or its agent provided for under this article and Article 7 (9VAC5-140-6300 et seq.) of this part.

b. A CO_2 authorized alternate account representative may delegate, to one or more natural persons, his authority to make an electronic submission to the department or its agent provided for under this article and Article 7 (9VAC5-140-6300 et seq.) of this part.

c. To delegate authority to make an electronic submission to the department or its agent in accordance with subdivisions 5 a and 5 b of this subsection, the CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, shall submit to the department or its agent a notice of delegation, in a format prescribed by the department that includes the following elements:

(1) The name, address, email address, telephone number, and facsimile transmission number of such CO_2 authorized account representative or CO_2 authorized alternate account representative;

(2) The name, address, email address, telephone number, and facsimile transmission number of each such natural person, referred to as "electronic submission agent";

(3) For each such natural person, a list of the type of electronic submissions under subdivision 5 c (1) or 5 c (2) of this subsection for which authority is delegated to him; and

(4) The following certification statement by such CO_2 authorized account representative or CO_2 authorized alternate account representative: "I agree that any electronic submission to the department or its agent that is by a natural person identified in this notice of delegation and of a type listed for such electronic submission agent in this notice of delegation and that is made when I am a CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, and before this notice of delegation is superseded by another notice of delegation under 9VAC5-140-6230 B 5 d shall be deemed to be an electronic submission by me. Until this notice of delegation is superseded by another notice of delegation under 9VAC5-140-6230 B 5 d, I agree to maintain an email account and to notify the department or its agent immediately of any change in my email address unless all delegation authority by me under 9VAC5-140-6230 B 5 is terminated."

d. A notice of delegation submitted under subdivision 5 c of this subsection shall be effective, with regard to the CO_2 authorized account representative or CO_2 authorized alternate account representative identified in such notice, upon receipt of such notice by the department or its agent and until receipt by the department or its agent of a superseding notice of delegation by such CO_2 authorized account representative or CO_2 authorized alternate account representative as appropriate. The superseding notice of delegation may replace any previously identified electronic submission agent, add a new electronic submission agent, or eliminate entirely any delegation of authority.

e. Any electronic submission covered by the certification in subdivision 5 c (4) of this subsection and made in accordance with a notice of delegation effective under subdivision 5 d of this subsection shall be deemed to be an

electronic submission by the CO_2 authorized account representative or CO_2 authorized alternate account representative submitting such notice of delegation.

C. The department or its agent will assign a unique identifying number to each account established under subsection A or B of this section.

9VAC5-140-6240. CO_2 allowance tracking system responsibilities of CO_2 authorized account representative.

Following the establishment of a COATS account, all submissions to the department or its agent pertaining to the account, including submissions concerning the deduction or transfer of CO_2 allowances in the account, shall be made only by the CO_2 authorized account representative for the account.

9VAC5-140-6250. Recordation of ~~conditional~~ CO_2 allowance allocations.

A. By January 1 of each calendar year, the department or its agent will record in the following accounts:

1. In each CO_2 budget source's ~~and DMME's conditional~~ allowance account, the ~~conditional~~ CO_2 allowances allocated to those sources ~~and DMME~~ by the department prior to being ~~consigned to auction~~ auctioned; and

2. In each CO_2 budget source's compliance account, the ~~CO_2~~ allowances purchased at auction by CO_2 budget units at the source under 9VAC5-140-6210 A.

B. Each year the department or its agent will record ~~conditional~~ CO_2 allowances, as allocated to the unit under Article 5 (9VAC5-140-6190 et seq.) of this part, in the compliance account for the year after the last year for which ~~conditional~~ CO_2 allowances were previously allocated to the compliance account. Each year, the department or its agent will also record ~~conditional~~ CO_2 allowances, as allocated under Article 5 (9VAC5-140-6190 et seq.) of this part, in an allocation set-aside for the year after the last year for which ~~conditional~~ CO_2 allowances were previously allocated to an allocation set-aside.

C. Serial numbers for allocated ~~conditional~~ CO_2 allowances shall be managed as follows. When allocating ~~conditional~~ CO_2 allowances to and recording them in an account, the department or its agent will assign each ~~conditional~~ CO_2 allowance a unique identification number that will include digits identifying the year for which the ~~conditional~~ CO_2 allowance is allocated.

9VAC5-140-6260. Compliance.

A. CO_2 allowances that meet the following criteria are available to be deducted for a CO_2 budget source to comply with the CO_2 requirements of 9VAC5-140-6050 C for ~~the initial control period,~~ a control period , or an interim control period.

1. The CO_2 allowances are of allocation years that fall within ~~an initial control period,~~ a prior control period, the same control period, or the same interim control period for which the allowances will be deducted.

2. The CO_2 allowances are held in the CO_2 budget source's compliance account as of the CO_2 allowance transfer deadline for that ~~initial control period,~~ control period , or interim control period or are transferred into the compliance account by a CO_2 allowance transfer correctly submitted for recordation under 9VAC5-140-6300 by the CO_2 allowance transfer deadline for that ~~initial control period,~~ control period , or interim control period.

3. For CO_2 offset allowances generated by other participating states, the number of CO_2 offset allowances that are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of 9VAC5-140-6050 C for a control period or an ~~initial~~ interim control period shall not exceed 3.3% of the CO_2 budget source's CO_2 emissions for that control period, or may not exceed 3.3% of 0.50 times the CO_2 budget source's CO_2 emissions for an interim control period, as determined in accordance with this article and Article 8 (9VAC5-140-6330 et seq.) of this part.

4. The CO_2 allowances are not necessary for deductions for excess emissions for a prior ~~initial control period or a~~ control period under subsection D of this section.

B. Following the recordation, in accordance with 9VAC5-140-6310, of CO_2 allowance transfers submitted for recordation in the CO_2 budget source's compliance account by the CO_2 allowance transfer deadline for ~~the initial control period,~~ a control period , or an interim control period, the department or its agent will deduct CO_2 allowances available under subsection A of this section to cover the source's CO_2 emissions, as determined in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part, for the ~~initial control period,~~ control period , or interim control period, as follows:

1. Until the amount of CO_2 allowances deducted equals the number of tons of total CO_2 emissions, or 0.50 times the number of tons of total CO_2 emissions for an interim control period, determined in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part, from all CO_2 budget units at the CO_2 budget source for the ~~initial control period,~~ control period , or interim control period; or

2. If there are insufficient CO_2 allowances to complete the deductions in subdivision 1 of this subsection, until no more CO_2 allowances available under subsection A of this section remain in the compliance account.

C. Identification of available CO_2 allowances by serial number and default compliance deductions shall be managed as follows:

1. The CO_2 authorized account representative for a source's compliance account may request that specific CO_2 allowances, identified by serial number, in the compliance account be deducted for emissions or excess emissions for ~~the initial control period,~~ a control period ~~,~~ or interim control period in accordance with subsection B or D of this section. Such identification shall be made in the compliance certification report submitted in accordance with 9VAC5-140-6170.

2. The department or its agent will deduct CO_2 allowances for ~~the initial control period,~~ an interim control period ~~,~~ or a control period from the CO_2 budget source's compliance account, in the absence of an identification or in the case of a partial identification of available CO_2 allowances by serial number under subdivision 1 of this subsection, as follows: Any CO_2 allowances that are available for deduction under subdivision 1 of this subsection. CO_2 allowances shall be deducted in chronological order (i.e., CO_2 allowances from earlier allocation years shall be deducted before CO_2 allowances from later allocation years). In the event that some, but not all, CO_2 allowances from a particular allocation year are to be deducted, CO_2 allowances shall be deducted by serial number, with lower serial number allowances deducted before higher serial number allowances.

D. Deductions for excess emissions shall be managed as follows.

1. After making the deductions for compliance under subsection B of this section, the department or its agent will deduct from the CO_2 budget source's compliance account a number of CO_2 allowances equal to three times the number of the source's excess emissions. In the event that a source has insufficient CO_2 allowances to cover three times the number of the source's excess emissions, the source shall be required to immediately transfer sufficient allowances into its compliance account.

2. Any CO_2 allowance deduction required under subdivision 1 of this subsection shall not affect the liability of the owners and operators of the CO_2 budget source or the CO_2 budget units at the source for any fine, penalty, or assessment, or their obligation to comply with any other remedy, for the same violation, as ordered under applicable state law. The following guidelines will be followed in assessing fines, penalties, or other obligations:

a. For purposes of determining the number of days of violation, if a CO_2 budget source has excess emissions for a control period, each day in the control period constitutes a day in violation unless the owners and operators of the unit demonstrate that a lesser number of days should be considered.

b. Each ton of excess emissions is a separate violation.

c. For purposes of determining the number of days of violation, if a CO_2 budget source has excess interim emissions for an interim control period, each day in the interim control period constitutes a day in violation unless the owners and operators of the unit demonstrate that a lesser number of days should be considered.

d. Each ton of excess interim emissions is a separate violation.

3. The propriety of the department's determination that a CO_2 budget source had excess emissions and the concomitant deduction of CO_2 allowances from that CO_2 budget source's account may be later challenged in the context of the initial administrative enforcement, or any civil or criminal judicial action arising from or encompassing that excess emissions violation. The commencement or pendency of any administrative enforcement, or civil or criminal judicial action arising from or encompassing that excess emissions violation will not act to prevent the department or its agent from initially deducting the CO_2 allowances resulting from the department's original determination that the relevant CO_2 budget source has had excess emissions. Should the department's determination of the existence or extent of the CO_2 budget source's excess emissions be revised either by a settlement or final conclusion of any administrative or judicial action, the department will act as follows:

a. In any instance where the department's determination of the extent of excess emissions was too low, the department will take further action under subdivisions 1 and 2 of this subsection to address the expanded violation.

b. In any instance where the department's determination of the extent of excess emissions was too high, the department will distribute to the relevant CO_2 budget source a number of CO_2 allowances equaling the number of CO_2 allowances deducted which are attributable to the difference between the original and final quantity of excess emissions. Should such CO_2 budget source's compliance account no longer exist, the CO_2 allowances will be provided to a general account selected by the owner or operator of the CO_2 budget source from which they were originally deducted.

E. The department or its agent will record in the appropriate compliance account all deductions from such an account pursuant to subsections B and D of this section.

F. Action by the department on submissions shall be as follows:

1. The department may review and conduct independent audits concerning any submission under the CO_2 Budget Trading Program and make appropriate adjustments of the information in the submissions.

2. The department may deduct CO_2 allowances from or transfer CO_2 allowances to a source's compliance account based on information in the submissions, as adjusted under subdivision 1 of this subsection.

9VAC5-140-6270. Banking.

Each CO_2 allowance that is held in a compliance account or a general account will remain in such account unless and until the CO_2 allowance is deducted or transferred under 9VAC5-140-6180, 9VAC5-140-6260, 9VAC5-140-6280, or Article 7 (9VAC5-140-6300 et seq.) of this part.

9VAC5-140-6280. Account error.

The department or its agent may, at its sole discretion and on its own motion, correct any error in any COATS account. Within 10 business days of making such correction, the department or its agent will notify the CO_2 authorized account representative for the account.

9VAC5-140-6290. Closing of general accounts.

A. A CO_2 authorized account representative of a general account may instruct the department or its agent to close the account by submitting a statement requesting deletion of the account from the COATS and by correctly submitting for recordation under 9VAC5-140-6300 a CO_2 allowance transfer of all CO_2 allowances in the account to one or more other COATS accounts.

B. If a general account shows no activity for a period of one year or more and does not contain any CO_2 allowances, the department or its agent may notify the CO_2 authorized account representative for the account that the account will be closed in the COATS 30 business days after the notice is sent. The account will be closed after the 30-day period unless before the end of the 30-day period the department or its agent receives a correctly submitted transfer of CO_2 allowances into the account under 9VAC5-140-6300 or a statement submitted by the CO_2 authorized account representative demonstrating to the satisfaction of the department or its agent good cause as to why the account should not be closed. The department or its agent will have sole discretion to determine if the owner or operator of the unit demonstrated that the account should not be closed.

Article 7. CO_2 Allowance Transfers

9VAC5-140-6300. Submission of CO_2 Allowance Transfers.

The CO_2 authorized account representatives seeking recordation of a CO_2 allowance transfer shall submit the transfer to the department or its agent. To be

considered correctly submitted, the CO_2 allowance transfer shall include the following elements in a format specified by the department or its agent:

1. The numbers identifying both the transferor and transferee accounts;

2. A specification by serial number of each CO_2 allowance to be transferred;

3. The printed name and signature of the CO_2 authorized account representative of the transferor account and the date signed;

4. The date of the completion of the last sale or purchase transaction for the allowance, if any; and

5. The purchase or sale price of the allowance that is the subject of a sale or purchase transaction under subdivision 4 of this section.

9VAC5-140-6310. Recordation.

A. Within five business days of receiving a CO_2 allowance transfer, except as provided in subsection B of this section, the department or its agent will record a CO_2 allowance transfer by moving each CO_2 allowance from the transferor account to the transferee account as specified by the request, provided that:

1. The transfer is correctly submitted under 9VAC5-140-6300; and

2. The transferor account includes each CO_2 allowance identified by serial number in the transfer.

B. A CO_2 allowance transfer into or out of a compliance account that is submitted for recordation following the CO_2 allowance transfer deadline and that includes any CO_2 allowances that are of allocation years that fall within a control period prior to or the same as the control period to which the CO_2 allowance transfer deadline applies will not be recorded until after completion of the process pursuant to 9VAC5-140-6260 B.

C. Where a CO_2 allowance transfer submitted for recordation fails to meet the requirements of subsection A of this section, the department or its agent will not record such transfer.

9VAC5-140-6320. Notification.

A. Within five business days of recordation of a CO_2 allowance transfer under 9VAC5-140-6310 , the department or its agent will notify each party to the transfer. Notice will be given to the CO_2 authorized account representatives of both the transferor and transferee accounts.

B. Within 10 business days of receipt of a CO_2 allowance transfer that fails to meet the requirements of 9VAC5-140-6310 A, the department or its agent will notify the CO_2 authorized account representatives of both accounts subject to the transfer of (i) a decision not to record the transfer and (ii) the reasons for such nonrecordation.

C. Nothing in this section shall preclude the submission of a CO_2 allowance transfer for recordation following notification of nonrecordation.

9VAC5-140-6325. Life-of-the-unit contractual arrangements.

A. A power purchaser entered into a life-of-the-unit contractual arrangement as described in subdivision b of the definition of "life-of-the-unit contractual arrangement" with a CO_2 budget source or unit shall be responsible for acquiring and transferring all allowances to the CO_2 budget source or unit that are necessary for demonstrating compliance with the CO_2 budget trading program.

B. The CO_2 budget source or unit shall provide a copy of the energy conversion or energy tolling agreement to the department within six months of the effective date of this part. If such agreement is subject to third-party disclosure restrictions, the CO_2 budget source or unit shall provide purchaser with 10 days prior written notice of its intention to disclose the agreement to the department and request confidential treatment from the public disclosure of such agreement. The department will grant a request for confidential treatment pursuant to applicable statutory and regulatory requirements addressing confidential information.

C. The CO_2 budget source or unit shall be responsible for compliance with and otherwise be subject to all other requirements of this part and the CO_2 budget trading program.

Article 8. Monitoring, Reporting, and Recordkeeping

9VAC5-140-6330. General requirements.

A. The owners and operators, and to the extent applicable, the CO_2 authorized account representative of a CO_2 budget unit shall comply with the monitoring, recordkeeping, and reporting requirements as provided in this section and all applicable sections of 40 CFR Part 75. Where referenced in this article, the monitoring requirements of 40 CFR Part 75 shall be adhered to in a manner consistent with the purpose of monitoring and reporting CO_2 mass emissions pursuant to this part. For purposes of complying with such requirements, the definitions in 9VAC5-140-6020 and in 40 CFR 72.2 shall apply, and the terms "affected unit," "designated representative," and "CEMS" in 40 CFR Part 75 shall be replaced by the terms "CO_2 budget unit," "CO_2 authorized account representative," and "CEMS," respectively, as defined in 9VAC5-140-6020. For units not subject to an ~~acid rain~~ Acid Rain emissions limitation, the term

"administrator" in 40 CFR Part 75 shall be replaced with "the department or its agent." Owners or operators of a CO_2 budget unit who monitor a non-CO_2 budget unit pursuant to the common, multiple, or bypass stack procedures in 40 CFR 75.72(b)(2)(ii), or 40 CFR 75.16 (b)(2)(ii)(B) pursuant to 40 CFR 75.13, for purposes of complying with this part, shall monitor and report CO_2 mass emissions from such non-CO_2 budget units according to the procedures for CO_2 budget units established in this article.

B. The owner or operator of each CO_2 budget unit shall meet the following general requirements for installation, certification, and data accounting.

1. Install all monitoring systems necessary to monitor CO_2 mass emissions in accordance with 40 CFR Part 75, except for equation G-1. Equation G-1 in Appendix G shall not be used to determine CO_2 emissions under this part. This may require systems to monitor CO_2 concentration, stack gas flow rate, O_2 concentration, heat input, and fuel flow rate.

2. Successfully complete all certification tests required under 9VAC5-140-6340 and meet all other requirements of this section and 40 CFR Part 75 applicable to the monitoring systems under subdivision 1 of this subsection.

3. Record, report, and quality-assure the data from the monitoring systems under subdivision 1 of this subsection.

C. The owner or operator shall meet the monitoring system certification and other requirements of subsection B of this section on or before the following dates. The owner or operator shall record, report, and quality-assure the data from the monitoring systems under subdivision B 1 of this section on and after the following dates:

1. The owner or operator of a CO_2 budget unit, except for a CO_2 budget unit under subdivision 2 of this subsection, shall comply with the requirements of this section by January 1, ~~2020~~ 2021.

2. The owner or operator of a CO_2 budget unit that commences commercial operation July 1, ~~2020~~ 2021, shall comply with the requirements of this section by (i) January 1, ~~2021~~ 2022, or (ii) the earlier of 90 unit operating days after the date on which the unit commences commercial operation or 180 calendar days after the date on which the unit commences commercial operation.

3. For the owner or operator of a CO_2 budget unit for which construction of a new stack or flue installation is completed after the applicable deadline under subdivision 1 or 2 of this subsection by the earlier of (i) 90 unit operating days after the date on which emissions first exit to the atmosphere through the new stack or flue or (ii) 180 calendar days after the date on which emissions first exit to the atmosphere through the new stack or flue.

D. Data shall be reported as follows:

1. Except as provided in subdivision 2 of this subsection, the owner or operator of a CO_2 budget unit that does not meet the applicable compliance date set forth in subsection C of this section for any monitoring system under subdivision B 1 of this section shall, for each such monitoring system, determine, record, and report maximum potential, or as appropriate minimum potential, values for CO_2 concentration, CO_2 emissions rate, stack gas moisture content, fuel flow rate, heat input, and any other parameter required to determine CO_2 mass emissions in accordance with 40 CFR 75.31(b)(2) or (c)(3) or Section 2.4 of Appendix D of 40 CFR Part 75 as applicable.

2. The owner or operator of a CO_2 budget unit that does not meet the applicable compliance date set forth in subdivision C 3 of this section for any monitoring system under subdivision B 1 of this section shall, for each such monitoring system, determine, record, and report substitute data using the applicable missing data procedures in Subpart D, or Appendix D of 40 CFR Part 75, in lieu of the maximum potential, or as appropriate minimum potential, values for a parameter if the owner or operator demonstrates that there is continuity between the data streams for that parameter before and after the construction or installation under subdivision C 3 of this section.

a. CO_2 budget units subject to an ~~acid rain~~ Acid Rain emissions limitation or CSAPR NO_x Ozone Season Trading Program that qualify for the optional SO_2, NO_x, and CO_2 (for ~~acid rain~~ Acid Rain) or NO_x (for CSAPR NO_x Ozone Season Trading Program) emissions calculations for low mass emissions (LME) units under 40 CFR 75.19 and report emissions for such programs using the calculations under 40 CFR 75.19, shall also use the CO_2 emissions calculations for LME units under 40 CFR 75.19 for purposes of compliance with these regulations.

b. CO_2 budget units subject to an ~~acid rain~~ Acid Rain emissions limitation that do not qualify for the optional SO_2, NO_x, and CO_2 (for ~~acid rain~~ Acid Rain) or NO_x (for CSAPR NO_x Ozone Season Trading Program) emissions calculations for LME units under 40 CFR 75.19 shall not use the CO_2 emissions calculations for LME units under 40 CFR 75.19 for purposes of compliance with these regulations.

c. CO_2 budget units not subject to an ~~acid rain~~ Acid Rain emissions limitation shall qualify for the optional CO_2 emissions calculation for LME units under 40 CFR 75.19, provided that they emit less than 100 tons of NO_x annually and no more than 25 tons of SO_2 annually.

3. The owner or operator of a CO_2 budget unit shall report net-electric output data to the department as required by Article 5 (9VAC5-140-6190 et seq.) of this part.

E. Prohibitions shall be as follows.

1. No owner or operator of a CO_2 budget unit shall use any alternative monitoring system, alternative reference method, or any other alternative for the required CEMS without having obtained prior written approval in accordance with 9VAC5-140-6380.

2. No owner or operator of a CO_2 budget unit shall operate the unit so as to discharge, or allow to be discharged, CO_2 emissions to the atmosphere without accounting for all such emissions in accordance with the applicable provisions of this article and 40 CFR Part 75.

3. No owner or operator of a CO_2 budget unit shall disrupt the CEMS, any portion thereof, or any other approved emissions monitoring method, and thereby avoid monitoring and recording CO_2 mass emissions discharged into the atmosphere, except for periods of recertification or periods when calibration, quality assurance testing, or maintenance is performed in accordance with the applicable provisions of this article and 40 CFR Part 75.

4. No owner or operator of a CO_2 budget unit shall retire or permanently discontinue use of the CEMS, any component thereof, or any other approved emissions monitoring system under this article, except under any one of the following circumstances:

a. The owner or operator is monitoring emissions from the unit with another certified monitoring system approved, in accordance with the applicable provisions of this article and 40 CFR Part 75, by the department for use at that unit that provides emissions data for the same pollutant or parameter as the retired or discontinued monitoring system; or

b. The CO_2 authorized account representative submits notification of the date of certification testing of a replacement monitoring system in accordance with 9VAC5-140-6340 D 3 a.

9VAC5-140-6340. Initial certification and recertification procedures.

A. The owner or operator of a CO_2 budget unit shall be exempt from the initial certification requirements of this section for a monitoring system under 9VAC5-140-6330 B 1 if the following conditions are met:

1. The monitoring system has been previously certified in accordance with 40 CFR Part 75; and

2. The applicable quality-assurance and quality-control requirements of 40 CFR 75.21 and Appendix B and Appendix D of 40 CFR Part 75 are fully met for the certified monitoring system described in subdivision 1 of this subsection.

B. The recertification provisions of this section shall apply to a monitoring system under 9VAC5-140-6330 B 1 exempt from initial certification requirements under subsection A of this section.

C. Notwithstanding subsection A of this section, if the administrator has previously approved a petition under 40 CFR 75.72(b)(2)(ii), or 40 CFR 75.16(b)(2)(ii)(B) as pursuant to 40 CFR 75.13 for apportioning the CO_2 emissions rate measured in a common stack or a petition under 40 CFR 75.66 for an alternative requirement in 40 CFR Part 75, the CO_2 authorized account representative shall submit the petition to the department under 9VAC5-140-6380 A to determine whether the approval applies under this program.

D. Except as provided in subsection A of this section, the owner or operator of a CO_2 budget unit shall comply with the following initial certification and recertification procedures for a CEMS and an excepted monitoring system under Appendix D of 40 CFR Part 75 and under 9VAC5-140-6330 B 1. The owner or operator of a unit that qualifies to use the low mass emissions excepted monitoring methodology in 40 CFR 75.19 or that qualifies to use an alternative monitoring system under Subpart E of 40 CFR Part 75 shall comply with the procedures in subsection E or F of this section, respectively.

1. For initial certification, the owner or operator shall ensure that each CEMS required under 9VAC5-140-6330 B 1, which includes the automated DAHS, successfully completes all of the initial certification testing required under 40 CFR 75.20 by the applicable deadlines specified in 9VAC5-140-6330 C. In addition, whenever the owner or operator installs a monitoring system to meet the requirements of this article in a location where no such monitoring system was previously installed, initial certification in accordance with 40 CFR 75.20 is required.

2. For recertification, the following requirements shall apply.

a. Whenever the owner or operator makes a replacement, modification, or change in a certified CEMS under 9VAC5-140-6330 B 1 that the administrator or the department determines significantly affects the ability of the system to accurately measure or record CO_2 mass emissions or to meet the quality-assurance and quality-control requirements of 40 CFR 75.21 or Appendix B to 40 CFR Part 75, the owner or operator shall recertify the monitoring system according to 40 CFR 75.20(b).

b. For systems using stack measurements such as stack flow, stack moisture content, CO_2 or O_2 monitors, whenever the owner or operator makes a replacement, modification, or change to the flue gas handling system or the unit's operation that the administrator or the department determines to significantly change the flow or concentration profile, the owner or operator shall recertify the CEMS according to 40 CFR 75.20(b). Examples of changes that require recertification include

replacement of the analyzer, change in location or orientation of the sampling probe or site, or change of flow rate monitor polynomial coefficients.

3. The approval process for initial certifications and recertification shall be as follows: subdivisions 3 a through 3 d of this subsection apply to both initial certification and recertification of a monitoring system under 9VAC5-140-6330 B 1. For recertifications, replace the words "certification" and "initial certification" with the word "recertification," replace the word "certified" with "recertified," and proceed in the manner prescribed in 40 CFR 75.20(b)(5) and (g)(7) in lieu of subdivision 3 e of this subsection.

a. The CO_2 authorized account representative shall submit to the department or its agent, the appropriate EPA Regional Office and the administrator a written notice of the dates of certification in accordance with 9VAC5-140-6360.

b. The CO_2 authorized account representative shall submit to the department or its agent a certification application for each monitoring system. A complete certification application shall include the information specified in 40 CFR 75.63.

c. The provisional certification date for a monitor shall be determined in accordance with 40 CFR 75.20(a)(3). A provisionally certified monitor may be used under the CO_2 Budget Trading Program for a period not to exceed 120 days after receipt by the department of the complete certification application for the monitoring system or component thereof under subdivision 3 b of this subsection. Data measured and recorded by the provisionally certified monitoring system or component thereof, in accordance with the requirements of 40 CFR Part 75, will be considered valid quality assured data, retroactive to the date and time of provisional certification, provided that the department does not invalidate the provisional certification by issuing a notice of disapproval within 120 days of receipt of the complete certification application by the department.

d. The department will issue a written notice of approval or disapproval of the certification application to the owner or operator within 120 days of receipt of the complete certification application under subdivision 3 b of this subsection. In the event the department does not issue such a notice within such 120-day period, each monitoring system that meets the applicable performance requirements of 40 CFR Part 75 and is included in the certification application will be deemed certified for use under the CO_2 Budget Trading Program.

(1) If the certification application is complete and shows that each monitoring system meets the applicable performance requirements of 40 CFR Part 75, then the department will issue a written notice of approval of the certification application within 120 days of receipt.

(2) If the certification application is incomplete, then the department will issue a written notice of incompleteness that sets a reasonable date by which the CO_2 authorized account representative shall submit the additional information required to complete the certification application. If the CO_2 authorized account representative does not comply with the notice of incompleteness by the specified date, then the department may issue a notice of disapproval under subdivision 3 d (3) of this subsection. The 120-day review period shall not begin before receipt of a complete certification application.

(3) If the certification application shows that any monitoring system or component thereof does not meet the performance requirements of 40 CFR Part 75, or if the certification application is incomplete and the requirement for disapproval under subdivision 3 d (2) of this subsection is met, then the department will issue a written notice of disapproval of the certification application. Upon issuance of such notice of disapproval, the provisional certification is invalidated by the department and the data measured and recorded by each uncertified monitoring system or component thereof shall not be considered valid quality assured data beginning with the date and hour of provisional certification. The owner or operator shall follow the procedures for loss of certification in subdivision 3 e of this subsection for each monitoring system or component thereof, which is disapproved for initial certification.

(4) The department may issue a notice of disapproval of the certification status of a monitor in accordance with 9VAC5-140-6350 B.

e. If the department issues a notice of disapproval of a certification application under subdivision 3 d (3) of this subsection or a notice of disapproval of certification status under subdivision 3 d (3) of this subsection, then:

(1) The owner or operator shall substitute the following values for each disapproved monitoring system, for each hour of unit operation during the period of invalid data beginning with the date and hour of provisional certification and continuing until the time, date, and hour specified under 40 CFR 75.20(a)(5)(i) or 40 CFR 75.20(g)(7): (i) for units using or intending to monitor for CO_2 mass emissions using heat input or for units sing the low mass emissions excepted methodology under 40 CFR 75.19, the maximum potential hourly heat input of the unit; or (ii) for units intending to monitor for CO_2 mass emissions using a CO_2 pollutant concentration monitor and a flow monitor, the maximum potential concentration of CO_2 and the maximum potential flow rate of the unit under Section 2.1 of Appendix A of 40 CFR Part 75;

(2) The CO_2 authorized account representative shall submit a notification of certification retest dates and a new certification application in accordance with subdivisions 3 a and 3 b of this subsection; and

(3) The owner or operator shall repeat all certification tests or other requirements that were failed by the monitoring system, as indicated in the department's notice of disapproval, no later than 30 unit operating days after the date of issuance of the notice of disapproval.

E. The owner or operator of a unit qualified to use the low mass emissions excepted methodology under 9VAC5-140-6330 D 3 shall meet the applicable certification and recertification requirements of 40 CFR 75.19(a)(2), 40 CFR 75.20(h), and this section. If the owner or operator of such a unit elects to certify a fuel flow meter system for heat input determinations, the owner or operator shall also meet the certification and recertification requirements in 40 CFR 75.20(g).

F. The CO_2 authorized account of each unit for which the owner or operator intends to use an alternative monitoring system approved by the administrator and, if applicable, the department under Subpart E of 40 CFR Part 75 shall comply with the applicable notification and application procedures of 40 CFR 75.20(f).

9VAC5-140-6350. Out-of-control periods.

A. Whenever any monitoring system fails to meet the quality assurance/quality control (QA/QC) requirements or data validation requirements of 40 CFR Part 75, data shall be substituted using the applicable procedures in Subpart D or Appendix D of 40 CFR Part 75.

B. Whenever both an audit of a monitoring system and a review of the initial certification or recertification application reveal that any monitoring system should not have been certified or recertified because it did not meet a particular performance specification or other requirement under 9VAC5-140-6340 or the applicable provisions of 40 CFR Part 75, both at the time of the initial certification or recertification application submission and at the time of the audit, the department or administrator will issue a notice of disapproval of the certification status of such monitoring system. For the purposes of this subsection, an audit shall be either a field audit or an audit of any information submitted to the department or the administrator. By issuing the notice of disapproval, the department or administrator revokes prospectively the certification status of the monitoring system. The data measured and recorded by the monitoring system shall not be considered valid quality-assured data from the date of issuance of the notification of the revoked certification status until the date and time that the owner or operator completes subsequently approved initial certification or recertification tests for the monitoring system. The owner or operator shall follow the initial certification or recertification procedures in 9VAC5-140-6340 for each disapproved monitoring system.

9VAC5-140-6360. Notifications.

The CO_2 authorized account representative for a CO_2 budget unit shall submit written notice to the department and the administrator in accordance with 40 CFR 75.61.

9VAC5-140-6370. Recordkeeping and reporting.

A. The CO_2 authorized account representative shall comply with all recordkeeping and reporting requirements in this section, the applicable recordkeeping and reporting requirements under 40 CFR 75.73, and the requirements of 9VAC5-140-6080 E.

B. The owner or operator of a CO_2 budget unit shall submit a monitoring plan in the manner prescribed in 40 CFR 75.62.

C. The CO_2 authorized account representative shall submit an application to the department within 45 days after completing all CO_2 monitoring system initial certification or recertification tests required under 9VAC5-140-6340 , including the information required under 40 CFR 75.63 and 40 CFR 75.53(e) and (f).

D. The CO_2 authorized account representative shall submit quarterly reports, as follows:

1. The CO_2 authorized account representative shall report the CO_2 mass emissions data for the CO_2 budget unit, in an electronic format prescribed by the department unless otherwise prescribed by the department for each calendar quarter.

2. The CO_2 authorized account representative shall submit each quarterly report to the department or its agent within 30 days following the end of the calendar quarter covered by the report. Quarterly reports shall be submitted in the manner specified in Subpart H of 40 CFR Part 75 and 40 CFR 75.64. Quarterly reports shall be submitted for each CO_2 budget unit, or group of units using a common stack, and shall include all of the data and information required in Subpart G of 40 CFR Part 75, except for opacity, heat input, NO_x, and SO_2 provisions.

3. The CO_2 authorized account representative shall submit to the department or its agent a compliance certification in support of each quarterly report based on reasonable inquiry of those persons with primary responsibility for ensuring that all of the unit's emissions are correctly and fully monitored. The certification shall state that:

a. The monitoring data submitted were recorded in accordance with the applicable requirements of this article and 40 CFR Part 75, including the quality assurance procedures and specifications;

b. For a unit with add-on CO_2 emissions controls and for all hours where data are substituted in accordance with 40 CFR 75.34(a)(1), the add-on emissions controls were operating within the range of parameters listed in the QA/QC program under Appendix B of 40 CFR Part 75 and the substitute values do not systematically underestimate CO_2 emissions; and

c. The CO_2 concentration values substituted for missing data under Subpart D of 40 CFR Part 75 do not systematically underestimate CO_2 emissions.

9VAC5-140-6380. Petitions.

A. Except as provided in subsection C of this section, the CO_2 authorized account representative of a CO_2 budget unit that is subject to an ~~acid rain~~ Acid Rain emissions limitation may submit a petition to the administrator under 40 CFR 75.66 and to the department requesting approval to apply an alternative to any requirement of 40 CFR Part 75. Application of an alternative to any requirement of 40 CFR Part 75 is in accordance with this article only to the extent that the petition is approved in writing by the administrator, and subsequently approved in writing by the department.

B. Petitions for a CO_2 budget unit that is not subject to an ~~acid rain~~ Acid Rain emissions limitation shall meet the following requirements.

1. The CO_2 authorized account representative of a CO_2 budget unit that is not subject to an ~~acid rain~~ Acid Rain emissions limitation may submit a petition to the administrator under 40 CFR 75.66 and to the department requesting approval to apply an alternative to any requirement of 40 CFR Part 75. Application of an alternative to any requirement of 40 CFR Part 75 is in accordance with this article only to the extent that the petition is approved in writing by the administrator and subsequently approved in writing by the department.

2. In the event that the administrator declines to review a petition under subdivision 1 of this subsection, the CO_2 authorized account representative of a CO_2 budget unit that is not subject to an ~~acid rain~~ Acid Rain emissions limitation may submit a petition to the department requesting approval to apply an alternative to any requirement of this article. That petition shall contain all of the relevant information specified in 40 CFR 75.66. Application of an alternative to any requirement of this article is in accordance with this article only to the extent that the petition is approved in writing by the department.

C. The CO_2 authorized account representative of a CO_2 budget unit that is subject to an ~~acid rain~~ Acid Rain emissions limitation may submit a petition to the administrator under 40 CFR 75.66 and to the department requesting approval to apply an alternative to a requirement concerning any additional CEMS required under the common stack provisions of 40 CFR 75.72 or a CO_2 concentration CEMS used under 40 CFR 75.71(a)(2). Application of an alternative to any such requirement is in

accordance with this article only to the extent the petition is approved in writing by the administrator and subsequently approved in writing by the department.

9VAC5-140-6390. (Reserved.)

9VAC5-140-6400. (Reserved.)

Article 9. Auction of CO_2 CCR and ECR Allowances

9VAC5-140-6410. Purpose.

The following requirements shall apply to each allowance auction. The department or its agent may specify additional information in the auction notice for each auction. Such additional information may include the time and location of the auction, auction rules, registration deadlines, and any additional information deemed necessary or useful.

9VAC5-140-6420. General requirements.

A. The department's agent will include the following information in the auction notice for each auction:

1. The number of ~~conditional~~ CO_2 allowances offered for sale at the auction, not including any ~~conditional~~ CO_2 CCR allowances;

2. The number of ~~conditional~~ CO_2 CCR allowances that will be offered for sale at the auction if the condition of subdivision B 1 of this section is met;

3. The minimum reserve price for the auction;

4. The CCR trigger price for the auction;

5. The maximum number of ~~conditional~~ CO_2 allowances that may be withheld from sale at the auction if the condition of subdivision D 1 of this section is met; and

6. The ECR trigger price for the auction.

B. The department's agent will follow these rules for the sale of ~~conditional~~ CO_2 CCR allowances.

1. ~~Conditional~~ CO_2 CCR allowances shall only be sold at an auction in which total demand for allowances, above the CCR trigger price, exceeds the number of ~~conditional~~ CO_2 allowances available for purchase at the auction, not including any ~~conditional~~ CO_2 CCR allowances.

2. If the condition of subdivision 1 of this subsection is met at an auction, then the number of ~~conditional~~ CO_2 CCR allowances offered for sale by the department or its agent at the auction shall be equal to the number of ~~conditional~~ CO_2 CCR allowances in the Virginia ~~Consignment~~ Auction Account at the time of the auction.

3. After all of the ~~conditional~~ CO_2 CCR allowances in the Virginia ~~Consignment~~ Auction Account have been sold in a given calendar year, no additional ~~conditional~~ CO_2 CCR allowances will be sold at any auction for the remainder of that calendar year, even if the condition of subdivision 1 of this subsection is met at an auction.

4. At an auction in which ~~conditional~~ CO_2 CCR allowances are sold, the reserve price for the auction shall be the CCR trigger price.

5. If the condition of subdivision 1 of this subsection is not satisfied, no ~~conditional~~ CO_2 CCR allowances shall be offered for sale at the auction, and the reserve price for the auction shall be equal to the minimum reserve price.

C. The department's agent shall implement the reserve price as follows: (i) no allowances shall be sold at any auction for a price below the reserve price for that auction and (ii) if the total demand for allowances at an auction is less than or equal to the total number of allowances made available for sale in that auction, then the auction clearing price for the auction shall be the reserve price.

D. The department's agent will meet the following rules for the withholding of CO_2 ECR allowances from an auction.

1. CO_2 ECR allowances shall only be withheld from an auction if the demand for allowances would result in an auction clearing price that is less than the ECR trigger price prior to the withholding from the auction of any ECR allowances.

2. If the condition in subdivision 1 of this subsection is met at an auction, then the maximum number of CO_2 ECR allowances that may be withheld from that auction will be equal to the quantity shown in Table 140-5B of 9VAC5-140-6210 E minus the total quantity of CO_2 ECR allowances that have been withheld from any prior auction in that calendar year. Any CO_2 ECR allowances withheld from an auction will be transferred into the Virginia ECR Account.

9VAC5-140-6430. ~~Consignment auction.~~ (Repealed.)

~~In accordance with Article 5 (9VAC5-140-6190 et seq.) of this part, one quarter of the annual conditional allowance allocation shall be consigned by the CO_2 budget source to whom they are allocated or the holder of a public contract with DMME to each auction in accordance with procedures specified by the department. At the~~

~~completion of the consignment auction, a conditional allowance sold at auction shall become a CO_2 allowance.~~

9VAC5-140-6435. ~~Other auction~~. (Repealed.)

~~Notwithstanding the requirements of 9VAC5-140-6430 , the department may participate in a direct auction of allowances without consignment in accordance with requirements established by the Virginia General Assembly. A "direct auction" means a CO_2 auction conducted by a CO_2 Budget Trading Program in which Virginia is a participating state.~~

Article 10. Program Monitoring and Review

9VAC5-140-6440. Program monitoring and review.

In conjunction with the CO_2 Budget Trading Program program monitoring and review process, the department will evaluate impacts of the program specific to Virginia, including economic, energy, and environmental impacts and impacts on vulnerable and environmental justice and underserved communities. The department will, in evaluating the impacts on environmental justice communities, including low income, minority, and tribal communities, develop and implement a plan to ensure increased participation of environmental justice communities in the review.

April 2020

townhall.virginia.gov

Exempt Action: Final Regulation
Agency Background Document

Agency name	Department of Environmental Quality for State Air Pollution Control Board
Virginia Administrative Code (VAC) Chapter citation(s)	Part VII of 9VAC5-140
VAC Chapter title(s)	Regulation for Emissions Trading
Action title	Amend CO_2 Budget Trading Program to comport with RGGI Model Rule as required by Chapter 1219, 2020 Acts of Assembly (Revision A20).
Final agency action date	
Date this document prepared	

Although a regulatory action may be exempt from executive branch review pursuant to § 2.2-4002 or § 2.2-4006 of the *Code of Virginia*, the agency is still encouraged to provide information to the public on the Regulatory Town Hall using this form. However, the agency may still be required to comply with the Virginia Register Act, Executive Order 14 (as amended, July 16, 2018), the Regulations for Filing and Publishing Agency Regulations (1VAC7-10), and the *Form and Style Requirements for the Virginia Register of Regulations and Virginia Administrative Code.*

Brief Summary

Provide a brief summary (preferably no more than 2 or 3 paragraphs) of this regulatory change (i.e., new regulation, amendments to an existing regulation, or repeal of an existing regulation). Alert the reader to all substantive matters. If applicable, generally describe the existing regulation.

Chapter 1219 of the 2020 Acts of Assembly amends the Air Pollution Control Law to add a new Article 4, the Clean Energy and Community Flood Preparedness Act. Under § 10.1-1330 A, Clean Energy and Community Flood Preparedness, "[T]he provisions of this article shall be incorporated by the Department, without further action by the Board, into the final regulation adopted by the Board on April 19, 2019, and published in the Virginia Register on May 27, 2019. Such incorporation by the Department shall be exempt from the provisions of the Virginia Administrative Process Act (§ 2.2-4000 et seq.)."

Accordingly, Part VII of 9VAC5-140, Regulation for Emissions Trading, has been amended such that it comports with the full Regional Greenhouse Gas Initiative (RGGI) CO_2 emissions trading program and associated auction as mandated by Chapter 1219.

Mandate and Impetus

Identify the mandate for this regulatory change and any other impetus that specifically prompted its initiation (e.g., new or modified mandate, internal staff review, petition for rulemaking, periodic review, or board decision). "Mandate" is defined as "a directive from the General Assembly, the federal government, or a court that requires that a regulation be promulgated, amended, or repealed in whole or part."

The mandate for this regulatory action is a directive from the General Assembly (Chapter 1219, 2020 Acts of Assembly).

Statement of Final Agency Action

Provide a statement of the final action taken by the agency including: 1) the date the action was taken; 2) the name of the agency taking the action; and 3) the title of the regulation.

On #[date], the Director of the Virginia Department of Environmental Quality (DEQ) incorporated the provisions of Chapter 1219 of the 2020 Acts of Assembly, without further action by the State Air Pollution Control Board, into the final regulation adopted by the board on April 19, 2019, and published in the Virginia Register on May 27, 2019, by amending the Regulation for Emissions Trading, specifically, the CO_2 Budget Trading Program (Part VII of 9VAC5-140). The regulatory action is to be effective on #[date].

The regulation amendments are exempt from the state administrative procedures for adoption of regulations contained in the Administrative Process Act by the provisions of Chapter 1219 of the 2020 Acts of Assembly

REG\DEV\A20-09TF

NOTE

The preceding Director's Package document references an Attachment 3 on page 2. That attachment is protected from disclosure by attorney-client privilege, and is therefore not included. The memorandum following this page from the Office of Attorney General is that publically available.

MEMORANDUM

FROM: Gray O'Dwyer
Assistant Attorney General

DATE: July 09, 2020

RE: Proposed Exempt Regulations - 9 Va. Admin. Code §§ 5-140 *et seq.*

Please note that this memorandum does not constitute an opinion, formal or informal, of the Attorney General. Rather, this memorandum contains the legal analysis of the individual staff member providing it.

It is my view that the Department of Environmental Quality ("Department") on behalf of the Virginia Air Pollution Control Board ("Board") has the authority to promulgate these proposed amendments to its regulations in 9 Va. Admin. Code §§ 5-140 *et seq.*

It is also my view that this regulation is exempted from the Virginia Administrative Process Act, §§ 2.2-4000 *et seq.*, by its enabling legislation. Chapter 1219 of the 2020 Acts of Assembly amended the Air Pollution Control Law to add a new Article 4, the Clean Energy and Community Flood Preparedness Act. Under § 10.1-1330 A, Clean Energy and Community Flood Preparedness, "[T]he provisions of this article shall be incorporated by the Department, without further action by the Board, into the final regulation adopted by the Board on April 19, 2019, and published in the Virginia Register on May 27, 2019. Such incorporation by the Department shall be exempt from the provisions of the Virginia Administrative Process Act (§ 2.2-4000 et seq.)."

The foregoing conclusion is my own. It does not constitute an opinion, formal or informal, of the Attorney General.

COMMONWEALTH OF VIRGINIA

BEFORE THE STATE AIR POLLUTION CONTROL BOARD

IN RE: State Air Pollution Control Board
Final Regulation 9 VAC §§ 5-140 *et seq.*
Regulation for Emissions Trading Programs
Amending 9 VAC § 5-140-6010 through 9 VAC § 5-140-6440

NOTICE OF APPEAL

In accordance with Rule 2A:2 of the Rules of the Supreme Court of Virginia, the Virginia Manufacturers Association ("Appellant" or "VMA") hereby files this notice of appeal with David K. Paylor, Executive Secretary of the Virginia State Air Pollution Control Board, for judicial review of the Virginia Department of Environmental Quality's amendments of the Regulation for Emissions Trading Programs (9 VAC §§ 5-140 *et seq.*) as a final regulation, effective on July 10, 2020.

The appeal of this case decision will be taken to the Circuit Court for the City of Richmond, 13th Judicial Circuit of Virginia, located at 400 North Ninth Street, Richmond, Virginia 23219. Under Rule 2A:3 of the Rules of the Supreme Court of Virginia, the agency record should be forwarded to the Clerk of the Circuit Court for the City of Richmond as soon as possible.

As required by Rule 2A:2(b) of the Rules of the Supreme Court of Virginia, the Appellant provides the following information:

1. The Appellant is:

   Virginia Manufacturers Association
   2108 W. Laburnam Ave, Suite 230
   Richmond, VA 23227

2. Counsel for the Appellant is:

Elizabeth C. Williamson, Esq.
John M. Holloway, Esq.
Williams Mullen
200 South 10th Street
Richmond, VA 23219

3. The Appellee is:

Virginia State Air Pollution Control Board
Virginia Department of Environmental Quality
c/o David K. Paylor, Executive Secretary and Director
1111 East Main Street St., Suite 1400
Richmond, VA 23219

4. Counsel for the Appellee is:

Mark R. Herring, Attorney General of Virginia
Gray O'Dwyer, Assistant Attorney General
Office of the Attorney General of Virginia
202 North Ninth Street
Richmond, VA 23219

Dated: September 2, 2020

Respectfully submitted,

Virginia Manufacturers Association

Elizabeth C. Williamson, Esq.
John M. Holloway, Esq.

Williams Mullen
200 South 10th Street

The Washington Post
Democracy Dies in Darkness

Youngkin says he will take Virginia out of the Regional Greenhouse Gas Initiative to save ratepayers money

By Laura Vozzella

Updated December 8, 2021 at 8:08 p.m. EST | Published December 8, 2021 at 6:37 p.m. EST

CORRECTION

A previous version of this article incorrectly calculated the amount ratepayers would save yearly on electric bills if Virginia pulled out of a regional greenhouse gas compact. They would save $52.44 per year, not $227.24 per year. This article has been corrected.

RICHMOND — Gov.-elect Glenn Youngkin (R) told a business group Wednesday that he will use executive action to pull Virginia out of a regional greenhouse gas compact, a plan that Democrats said would cost the state hundreds of millions a year in flooding and energy-assistance funding.

The typical residential customer would save $4.37 a month on electric bills, or $52.44 per year, if Virginia pulled out, Youngkin's transition office said.

Nearly two years ago, as Democrats took control of the House of Delegates, Virginia joined the Regional Greenhouse Gas Initiative — a carbon cap-and-trade market among states in the Northeast and Mid-Atlantic. It was part of sweeping environmental legislation that also set a goal of going carbon-free by 2050.

In a speech to the Hampton Roads Chamber of Commerce, Youngkin said he will take the state out of the RGGI, as the regional initiative is known.

“RGGI describes itself as a regional market for carbon. It is really a carbon tax that is fully passed on to ratepayers,” he said. “It’s a bad deal for Virginians. It’s a bad deal for Virginia businesses. And as governor, I will withdraw us from RGGI by executive action. I promised to lower the cost of living in Virginia, and this is just the beginning.”

Del. Todd Gilbert (R-Shenandoah), who is slated to become House speaker when Republicans take back control of the chamber in January, cheered the news, saying RGGI’s impact on climate change has been “negligible at best.”

“Virginia was reducing carbon emissions from power plants at a rate comparable to RGGI states before joining the cap and trade group,” Gilbert said in a written statement. “When a policy costs the public a significant amount of money for no tangible benefit, that policy should be examined carefully, and if practical, rolled back.”

Some RGGI supporters said they were disappointed and questioned Youngkin’s authority to single-handedly pull the state out.

“I can assure you there’s a lot of lawyers … that are busy going to the books right now,” said Sen. Lynwood W. Lewis Jr. (D-Accomack), who sponsored the legislation in the Senate.

Regardless of Youngkin’s action on RGGI, the carbon targets will remain in state code — something that cannot be changed without new legislation from the General Assembly, said Cale Jaffe, an associate professor at the University of Virginia School of Law and director of the school’s Environmental Law and Community Engagement Clinic. The Senate remains under narrow Democratic control.

“You might leave this multistate trading program but still have to meet the zero-carbon mandate in the code,” Jaffe said. “Leaving the trading program just seems like cutting off your nose to spite your face. … I don’t know why you would relinquish a market that is helping to make the Clean Economy Act more affordable.”

Lewis said Virginia raised $227 million early this year in its first auction of carbon credits — money earmarked for flood preparedness across the state and energy-efficiency programs for low-income ratepayers.

“Regardless of your political party, if you’re a legislator in an area that’s impacted by sea-level rise of just recurrent flooding … you should be very reluctant and cautious in completely devastating that fund,” Lewis said. “This was going to provide a significant source of revenue.”

In his remarks to the chamber, Youngkin pledged to formulate a plan to “combat sea-level rise” before vowing to get the state out of RGGI via executive action. Asked about his authority to do so, Youngkin’s transition office issued a statement saying, “Virginia’s participation is governed by a contract agreement, signed by the Department of Environmental Quality and other regulations.”

Language in the statute directs the Department of Environmental Quality to manage the auction program under RGGI, Jaffe said, so that may be the avenue Youngkin is exploring, because the governor has the authority to direct the department’s actions. But under the legislation, the state’s Air Pollution Control Board has already promulgated regulations establishing a multistate trading program, he said.

“The governor cannot just undo regulations that he might not like via executive order,” Jaffe said, noting that it would be up to the seven-member board, currently all Democratic appointees, to change the regulations. Youngkin will not have the chance to put his own appointees on the board until July, when two seats will become open.

The members’ staggered four-year terms are “designed so you avoid this kind of whiplash,” Jaffe said.

The Honorable Charniele L. Herring
Member, Virginia House of Delegates
Post Office Box 11779
Alexandria, Virginia 22312

The Honorable Richard "Rip" Sullivan
Member, Virginia House of Delegates
Post Office Box 50753
Arlington, Virginia 22205

Dear Delegates Herring and Sullivan:

I am responding to your request for an official advisory opinion in accordance with § 2.2-505 of the Code of Virginia.

Issue Presented

You ask whether the Governor, solely through an executive order or other executive action, can repeal or eliminate the regulatory requirement that electric utilities and other electricity producers hold carbon dioxide allowances that equal the amount of their carbon dioxide emissions.

Discussion and Analysis

The Clean Energy and Community Flood Preparedness Act (the "Act") was passed by the General Assembly in 2020, amended Va. Code § 10.1-1330. The Act directs the Virginia Department of Environmental Quality to amend its regulations that established a carbon dioxide cap and trade program to reduce carbon dioxide emissions. Section 10.1-1330(B) authorizes the Director of DEQ "to establish, implement, and manage an auction program to sell allowances into a market-based trading program consistent with the [Regional Greenhouse Gas Initiative] program and this article."[1]

Consistent with the Act's requirements, DEQ issued amendments to its CO_2 Budget Trading Program regulations. Pursuant to those regulations, an owner or operator of a CO_2 budget source, such as an electric utility, must "hold CO2 allowances . . . in an amount not less than CO2 emissions that have been

[1] VA. CODE ANN. § 10.1-1300(B). This and other citations to the Code of Virginia herein are from the electronic version of the Code on LexisNexis and are current through the 2021 Regular Session and Special Session I and II of the General Assembly.

generated as a result of combusting fossil fuel" for a given time period.[2] Put differently, in order to lawfully produce electricity in Virginia by combusting fossil fuels, producers must now hold carbon dioxide allowances that equal the amount of their carbon dioxide emissions. One of the ways producers obtain CO_2 allowances in order to comply with this regulation is by purchasing them through the Regional Greenhouse Gas Initiative auction. You have asked whether the Governor may, through an executive order or other executive action, do away with this regulatory requirement.

A recent Attorney General opinion discussed the separation of powers doctrine with respect to the Governor's power to alter tax laws.[3] The same rationale applies to validly enacted laws. The Constitution of Virginia does not grant the Governor the power to suspend laws, and in fact, it requires the opposite that "[t]he Governor shall take care that the laws be faithfully executed."[4] Article I, § 7 of the Constitution of Virginia provides "[t]hat all power of suspending laws, or the execution of laws, by any authority, without consent of the representatives of the people, is injurious to their rights, and ought not to be exercised."

A previous Attorney General opinion explained the interplay between these sections of the Constitution. "Thus, the prohibition that is implicit in Article V, § 7's 'take care' clause is made explicit by Article I, § 7: the Governor may not unilaterally direct, by any means, that a validly adopted regulation that has the force of law be suspended or ignored."[5] In my opinion, the Governor may not repeal or eliminate, through an executive order or other action, the enacted statutes and regulations pertaining to the Commonwealth's participation in the Regional Greenhouse Gas Initiative and/or a market-based trading program like the Regional Greenhouse Gas Initiative, or do away with the requirement that electricity producers hold carbon dioxide allowances that equal the amount of their carbon dioxide emissions.

Conclusion

Accordingly, it is my opinion that the Governor may not, solely through an executive order or other executive action, repeal or eliminate the regulatory requirement that electric utilities and other electricity producers hold carbon dioxide allowances that equal the amount of their carbon dioxide emissions.

With kindest regards, I am,

Very truly yours,

Mark R. Herring

Attachment 15

Commonwealth of Virginia
Office of the Governor

Executive Order

NUMBER NINE (2022)

PROTECTING RATEPAYERS FROM THE RISING COST OF LIVING DUE TO THE REGIONAL GREENHOUSE GAS INITIATIVE

By virtue of the authority vested in me as Governor, I hereby issue this Executive Order to re-evaluate Virginia's participation in the Regional Greenhouse Gas Initiative and immediately begin regulatory processes to end it.

Importance of the Initiative

Reliable and affordable access to electricity is imperative to the health and safety of all Virginians. Our hospitals, schools, businesses, and homes all rely on this essential service. And the unpredictable and rising cost of electricity poses a significant and immediate threat to our Commonwealth and its citizens. In 2019, alone, over 100,000 Virginian households required Energy Assistance with a cost of $46 million to the Commonwealth.

Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI) risks contributing to the increased cost of electricity for our citizens. Virginia's utilities have sold over $227 million in allowances in 2021 during the RGGI auctions, doubling the initial estimates. Those utilities are allowed to pass on the costs of purchasing allowances to their ratepayers. Under the initial bill "RGGI rider" created for Dominion Energy customers, typical residential customer bills were increased by $2.39 a month and the typical industrial customer bill by was raised by $1,554 per month. In a filling before the State Corporation Commission, Dominion Energy stated that RGGI will cost ratepayers between $1 billion and $1.2 billion over the next four years.

Simply stated, the benefits of RGGI have not materialized, while the costs have skyrocketed. Re-evaluation of the Initiative represents a meaningful step toward alleviating this financial burden on the Commonwealth's businesses and households. Regulations must be evaluated in view of the costs and benefits to all Virginians.

Directive

Accordingly, by virtue of the authority vested in me as the Chief Executive Officer of the Commonwealth, and pursuant to Article V of the Constitution and the laws of Virginia, I hereby direct the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural and Historic Resources, to take the following actions in accordance with the provisions and requirements of § 10.1-1300, et seq. and § 2.2-4000, et seq. of the *Code of Virginia*:

1. Provide me a full report re-evaluating the costs and benefits of participation in the Regional Greenhouse Gas Initiative Inc. in view of all available data, within 30 days.

2. During this same period, develop a proposed emergency regulation for the State Air Pollution Control Board's consideration to repeal 9VAC5-140.

3. During this same period, take all necessary steps to so that any proposed regulation to the State Air Pollution Control Board can be immediately presented for consideration for approval for public comment in accordance with the Board's authority pursuant to § 10.1-1308 of the *Code of Virginia*.

4. During this same period, notify the Regional Greenhouse Gas Initiative Inc. (RGGI Inc.) of the review and the Governor's intent to withdraw from RGGI, whether by legislative or regulatory action.

Effective Date

This Executive Order shall be effective upon its signing and shall remain in force and effect unless amended or rescinded by further executive order or directive.

Given under my hand and under the Seal of the Commonwealth of Virginia, this 15th day of January 2022.

Glenn Youngkin, Governor

Attest:

Kelly Thomasson, Secretary of the Commonwealth

ENERGY + ENVIRONMENT

Youngkin administration outlines plan to withdraw Virginia from carbon market by regulation

Opponents insist legislation is required for RGGI withdrawal

By: Charlie Paullin - September 1, 2022 12:04 am

Environmental activists rally outside of Community College Workforce Alliance in Richmond before a Air Pollution Control Board meeting in which Secretary of Natural and Historic Resources Travis Voyles announced the plan to withdrawal Virginia from the Regional Greenhouse Gas Initiative, or RGGI. RGGI aims to reduce energy producer carbon emissions. The activists want to stay in it. (Charlie Paullin/The Mercury).

Gov. Glenn Youngkin's administration announced their newest plans for how they intend to withdraw Virginia from a regional carbon market Wednesday, a move critics say is not allowed by law, would drain important state programs of funding and would hurt the fight against climate change.

Acting Secretary of Natural and Historic Resources Travis Voyles said at a State Air Pollution Control Board meeting that the administration plans to withdraw Virginia from the Regional Greenhouse Gas Initiative through changes to the regulations that govern the state's participation in the market.

The regulatory process typically takes 18 to 24 months from start to finish, after which the air board will vote on repealing the regulation.

The move is a pivot from the approach outlined in an executive order Youngkin issued at the start of his term. That plan called for a two-track approach that would first repeal the regulation through an emergency provision and then eliminate it permanently through the normal regulatory process.

The full regulatory process "will allow for public comment … provides some certainty and times well with the contractual period," Voyles told the Virginia Mercury after the meeting.

Virginia's three-year contract with RGGI, Inc., the body that coordinates the market, ends next year.

RGGI is a carbon reduction market involving 10 other Mid-Atlantic and New England states in which energy producers must buy allowances for the carbon they emit, and a cap is placed on overall carbon emissions.

The proceeds of purchasing those allowances are then returned to the state. In Virginia, they're funneled into flood assistance and low-income energy efficiency programs. Virginia has received some $379 million in RGGI proceeds to date.

Under state law, electric utilities are permitted to pass on the costs of RGGI participation to ratepayers. The Youngkin administration has said those increased costs, which averaged $2.39 per month for Dominion residential customers, are a burden on ratepayers. Dominion has since stopped charging customers a specific fee for RGGI participation.

"RGGI is a bad deal for Virginia," Voyles said, adding that the state can't control the market costs for allowances, which have increased.

But groups like the Southern Environmental Law Center continue to say the Youngkin administration can't withdraw Virginia from RGGI by changing regulations because the regulations were the result of legislation passed by the General Assembly in 2020.

"That's not consistent with the law," SELC attorney Nate Benforado said.

From 2010 to 2020, before Virginia joined RGGI, power plant emissions did not decrease, Benforado stated, referencing a March report on the program that the Department of Environmental Quality completed at Youngkin's request. Emissions dropped over 30% with RGGI participation, he added.

"Virginia needs RGGI," Benforado said.

Board response

Reactions from the seven-member board differed among the four appointees made by Youngkin, a Republican, and the three appointees made by former Gov. Ralph Northam, a Democrat.

Northam appointee Hope Cupit, president and CEO of SERCAP, an organization that helps low- to moderate-income people in the southeastern U.S, asked whether it was constitutional to override the RGGI law passed by the General Assembly through regulations.

Cupit has previously said she received an email from an attorney with the Office of the Attorney General saying the air board doesn't have the authority to withdraw Virginia from RGGI. A lawsuit seeking to force the release of that email under the state's Freedom of Information Act is still awaiting an order from a judge in Charlottesville Circuit Court.

She also noted the benefits of flood protection programs funded by RGGI given recent flooding in Buchanan County.

"We feel forgotten sometimes," said Cupit, who lives in Bedford.

Another Northam appointee, retired pulmonologist Lornel Tompkins, said one year's worth of data on Virginia's participation in RGGI is not enough to determine its effectiveness. She also questioned why the RGGI fee was being attacked, versus other fees utility customers pay, and said costs could be lower in the long run.

"Why are we not going after the General Assembly to change the rules, rather than taking away something from the state or the commonwealth which is turning out by some factors to be a positive?" Tompkins said.

Conversely, Youngkin appointee David Hudgins, executive director for the Virginia Energy Consumer Trust, an advocacy group skeptical of renewables, said he was concerned about RGGI's impact on the state's ability to appeal to business because of rising energy costs. Virginia has previously been able to attract businesses from the Northeast by touting its lower electricity rates, he said.

"If we get affiliated (with) the Northeast, southern states are going to start sending their economic development teams up here because our cost structure is changing and reflecting more of the Northeast than we do with the people to the south," Hudgins said.

Another Youngkin appointee, retired attorney Jay Holloway, asked whether RGGI actually caps carbon emissions because it allows producers to buy allowances beyond the cap.

But Michael Dowd, director of DEQ's Air and Renewable Energy Division, clarified that allowances can only exceed the cap by a certain percentage.

"There is a cap, in a general sense, because it is a regional cap. There is a finite number of allowances for sale," Dowd said.

Environmental outcry

Several environmental groups rallied outside the meeting's location at the Community College Workforce Alliance in Richmond, with rallies also held throughout the state in Roanoke, Harrisonburg, Woodbridge, Abingdon and Virginia Beach.

In Richmond, activists displayed caricatures of Youngkin and former Environmental Protection Agency chief Andrew Wheeler while chanting "RGGI is the law."

Wheeler, who is serving as an adviser to Youngkin, was appointed to his current position after Senate Democrats stymied his nomination to be secretary of natural and historic resources. The Democrats' move led to Republicans blocking 11 other Northam-era appointments, including two air board members.

Leah Jones, a coordinator with Virginia Interfaith Power & Light, a group focused on climate and environmental justice, called RGGI "an important stepping stone for our state to provide funds to those affected by energy burden and severe flooding while also providing an incentive … to act on climate and reduce Virginia's carbon emissions."

Jones and five other public speakers spoke in support of RGGI during Wednesday's meeting. Virginia Manufacturers Association executive director Brett Vassey spoke against it, calling RGGI a tax and accusing it of being redundant given Virginia's emission reduction efforts through the Virginia Clean Economy Act.

While the Virginia Clean Economy Act sets aggressive carbon reduction goals for the state's regulated utilities, it does not apply to non-utility power producers, who generate more than a quarter of the state's carbon emissions subject to RGGI.

Proposed Regulation
Agency Background Document

Agency name	State Air Pollution Control Board
Virginia Administrative Code (VAC) Chapter citation(s)	Part VII of 9VAC5-140
VAC Chapter title(s)	Regulation for Emissions Trading
Action title	Repeal CO_2 Budget Trading Program as required by Executive Order 9 (Revision A22)
Date this document prepared	December 7, 2022

This information is required for executive branch review and the Virginia Registrar of Regulations, pursuant to the Virginia Administrative Process Act (APA), Executive Order 19 (2022) (EO 19), any instructions or procedures issued by the Office of Regulatory Management (ORM) or the Department of Planning and Budget (DPB) pursuant to EO 19, the Regulations for Filing and Publishing Agency Regulations (1 VAC 7-10), and the *Form and Style Requirements for the Virginia Register of Regulations and Virginia Administrative Code*.

Brief Summary

Provide a brief summary (preferably no more than 2 or 3 paragraphs) of this regulatory change (i.e., new regulation, amendments to an existing regulation, or repeal of an existing regulation). Alert the reader to all substantive matters. If applicable, generally describe the existing regulation.

Executive Order 9 (2022), "Protecting Ratepayers from the Rising Cost of Living Due to the Regional Greenhouse Gas Initiative," requires that the department re-evaluate Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI) and begin regulatory processes to end it. Specifically, the order requires that the department develop a regulation for the State Air Pollution Control Board's consideration to repeal the implementing regulation implementing participation in RGGI (Part VII of 9VAC5-140), and take all necessary steps so that any proposed regulation to the State Air Pollution Control Board can be immediately presented for consideration for approval for public comment in accordance with the Board's authority pursuant to § 10.1-1308 of the Code of Virginia. This regulatory action repeals Part VII of 9VAC-140, and adds transition language in a new section in order that the repeal be implemented without disruption to affected facilities or the market.

Acronyms and Definitions

Define all acronyms used in this form, and any technical terms that are not also defined in the "Definitions" section of the regulation.

APA - Virginia Administrative Process Act
ASNH - Affordable and Special Needs Housing
CFPF - Community Flood Preparedness Fund
CO_2 - carbon dioxide
DCR - Virginia Department of Conservation and Recreation
DEQ - Virginia Department of Environmental Quality
DHCD - Virginia Department of Housing and Community Development
DOE - Virginia Department of Energy
GHG - greenhouse gas
HIEE - Housing Innovations in Energy Efficiency
EO-9 - Executive Order 9 (2022)
kWh - kilowatt hour
MWe - megawatt electrical
NO_X - nitrogen oxides
PDC - planning district commission
PJM - PJM Interconnection
REC - renewable energy certificate
RGGI - Regional Greenhouse Gas Initiative
RPS - Renewable Energy Portfolio Standards
SCC - State Corporation Commission
SO_2 - sulfur dioxide
U.S. DOE - U.S. Department of Energy
VCEA - Virginia Clean Economy Act
WAP - Weatherization Assistance Program
WDR - Weatherization Deferral Repair

Mandate and Impetus

Identify the mandate for this regulatory change and any other impetus that specifically prompted its initiation (e.g., new or modified mandate, petition for rulemaking, periodic review, or board decision). For purposes of executive branch review, "mandate" has the same meaning as defined in the ORM procedures, "a directive from the General Assembly, the federal government, or a court that requires that a regulation be promulgated, amended, or repealed in whole or part."

The mandate and necessity for this regulatory change are described in EO-9 as follows:

> Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI) risks contributing to the increased cost of electricity for our citizens. Virginia's utilities have sold over $227 million in allowances in 2021 during the RGGI auctions, doubling the initial estimates. Those utilities are allowed to pass on the costs of purchasing allowances to their ratepayers. Under the initial bill "RGGI rider" created for Dominion Energy customers, typical residential customer bills were increased by $2.39 a month and the typical industrial customer bill by was raised by $1,554 per month. In a filling before the State Corporation Commission, Dominion Energy stated that RGGI will cost ratepayers between $1 billion and $1.2 billion over the next four years.
>
> Simply stated, the benefits of RGGI have not materialized, while the costs have skyrocketed. Re-evaluation of the Initiative represents a meaningful step toward alleviating this financial burden on the

Commonwealth's businesses and households. Regulations must be evaluated in view of the costs and benefits to all Virginians.

According to the U.S. DOE, Virginians pay on average $2,323 per year in non-transportation energy costs, which is higher than the national average of $1,850. The index for electricity rose by more than 13% over the last 12 months, the largest single-year increase since 2006, while the natural gas index rose by 38.4%--the biggest 12-month jump since October 2005. In July 2022 alone, electricity prices rose 1.7% and natural gas prices 8.2%. Considering that Virginia obtains most of its electricity from natural gas, rising natural gas prices have forced electricity prices even higher.

Dominion Energy has filed for 16 rate adjustments over a 12-month period ending July 1, 2022. In May 2022 alone, Dominion filed for a rate increase with the State Corporation Commission (SCC) that could result in monthly rate increases between 12-20% due to rising fuel costs. The cumulative impact of those adjustments results in an increase of $0.022423/kilowatt hour or 18% in Dominion's rates that it charges for delivered electricity. This assumes final SCC approval of the fuel rate adjustment and its agreement to Dominion's request to amortize the fuel adjustment over three years.

According to the most recent data supplied by the Federal Energy Information Administration (2020), the average annual household consumption of electricity in Virginia is 13,140 kilowatt hours. Historically, the average energy consumption in Virginia has increased by 1.38% per year. The cumulative impact of the adjustments described above would increase the average household's bill by approximately $294 per year, but will increase as consumption continues to increase.

The current energy framework in Virginia allows energy providers to also charge ratepayers for the transition and expansion of clean energy infrastructure. For example, the SCC recently approved an application by Dominion for cost recovery associated with its proposed Coastal Virginia Offshore Wind Project. The project consists of 176 wind turbines, each designed to generate 14.7 megawatts, to be located about 27 miles off the coast of Virginia Beach. The project is expected to have a capital cost of $9.8 billion and will likely be the largest capital investment, and single largest project, in Dominion's history. The SCC approved a revenue requirement of $78.702 million for the rate year of September 1, 2022, to August 31, 2023, to be recovered through a new rate adjustment clause. Over the projected 35-year lifetime of the project, for a residential customer using 1,000 kilowatt-hours of electricity per month, the rate adjustment is projected to result in an average monthly bill increase of $4.72 and a peak monthly bill increase of $14.22 in 2027. This is another instance of upward pressure on utility costs with a direct impact on consumers.

These energy cost increases are coming at a time that Virginians can least afford them. As of June 2022, inflation has risen 9.1% on an annual basis, the highest increase in over 40 years. According to the Bureau of Labor Statistics, consumer energy prices are up 41.6% in the last year. The rate of inflation for energy is more than four times the inflation rate of all food items and the Consumer Price Index.

Real wage growth has not kept pace with this rapid inflation, and real wages decreased by 1% in June 2022; over the last year they have decreased 3.6%. This hurts Virginia families, and those families and individuals who can least afford increases in energy costs. According to the American Council for an Energy Efficient Economy, "Black households spend 43% more of their income on energy costs, Hispanic households spend 20% more, and Native American households spend 45% more. Low-income households (those with incomes 200% of the federal poverty level) spend three times more of their income on energy costs than non-low income households."

EO-9 directed the department to provide the Governor with a full report re-evaluating the costs and benefits of participation in RGGI in view of all available data. As detailed above, it is clear that in effect participation in RGGI operates as a direct tax on households and businesses. Since the consumers are utility-captive ratepayers that do not have the opportunity to switch electric providers, they are unable to avoid the pass-through of RGGI costs—whether through a direct rate adjustment clause or incorporation into the base rate of their electricity bill. Emission allowance prices have increased over 146% since Virginia joined RGGI in 2020, and these substantial increases are expected to continue, which in turn will result in increased rates to ratepayers.

The original analysis and consignment auction approach for RGGI was designed on the basis that proceeds would be returned to offset the cost of compliance, and have little impact on electricity prices. However, since this is not how the program was implemented in Virginia, the costs of compliance with RGGI have materialized in higher electricity rates for Virginians. The impact of RGGI and the other factors discussed above on the current state of electricity costs shows a substantial burden placed on Virginians that must be addressed.

Legal Basis

Identify (1) the promulgating agency, and (2) the state and/or federal legal authority for the regulatory change, including the most relevant citations to the Code of Virginia and Acts of Assembly chapter number(s), if applicable. Your citation must include a specific provision, if any, authorizing the promulgating agency to regulate this specific subject or program, as well as a reference to the agency's overall regulatory authority.

Statutory Authority

Section 10.1-1308 of the Virginia Air Pollution Control Law (Title 10.1, Chapter 13 of the Code of Virginia) authorizes the State Air Pollution Control Board to promulgate regulations abating, controlling and prohibiting air pollution in order to protect public health and welfare.

Promulgating Entity

The promulgating entity for this regulation is the State Air Pollution Control Board.

State Requirements

EO-9 specifically directs the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural and Historic Resources, to present to the State Air Pollution Control Board a regulation amendment to repeal 9VAC5-140 in accordance with the board's authority pursuant to § 10.1-1308 of the Code of Virginia.

Purpose

Explain the need for the regulatory change, including a description of: (1) the rationale or justification, (2) the specific reasons the regulatory change is essential to protect the health, safety or welfare of citizens, and (3) the goals of the regulatory change and the problems it is intended to solve.

As described in the Mandate and Impetus section of this document, EO-9 describes the necessity for this regulatory change in order to protect public health, safety, and welfare.

Substance

Briefly identify and explain the new substantive provisions, the substantive changes to existing sections, or both. A more detailed discussion is provided in the "Detail of Changes" section below.

The purpose of this regulatory action is to repeal Part VII of 9VAC5-140 in its entirety, while adding a new transition section so that the repeal will be effected smoothly.

Issues

Identify the issues associated with the regulatory change, including: 1) the primary advantages and disadvantages to the public, such as individual private citizens or businesses, of implementing the new or amended provisions; 2) the primary advantages and disadvantages to the agency or the Commonwealth; and 3) other pertinent matters of interest to the regulated community, government officials, and the public. If there are no disadvantages to the public or the Commonwealth, include a specific statement to that effect.

The primary advantage to the public include reduced residential and commercial energy costs.

The primary advantages to the Commonwealth are reduced energy costs. The Commonwealth will also benefit from greater certainty and transparency in the energy markets.

There are no disadvantages to the public or the Commonwealth associated with this regulatory change.

Requirements More Restrictive than Federal

Identify and describe any requirement of the regulatory change which is more restrictive than applicable federal requirements. Include a specific citation for each applicable federal requirement, and a rationale for the need for the more restrictive requirements. If there are no applicable federal requirements, or no requirements that exceed applicable federal requirements, include a specific statement to that effect.

There are no applicable federal requirements.

Agencies, Localities, and Other Entities Particularly Affected

Consistent with § 2.2-4007.04 of the Code of Virginia, identify any other state agencies, localities, or other entities particularly affected by the regulatory change. Other entities could include local partners such as tribal governments, school boards, community services boards, and similar regional organizations. "Particularly affected" are those that are likely to bear any identified disproportionate material impact which would not be experienced by other agencies, localities, or entities. "Locality" can refer to either local governments or the locations in the Commonwealth where the activities relevant to the regulation or regulatory change are most likely to occur. If no agency, locality, or entity is particularly affected, include a specific statement to that effect.

Other State Agencies Particularly Affected

Department of Housing and Community Development (DHCD); Department of Conservation and Recreation (DCR) Flood Preparedness Fund.

Localities Particularly Affected

No locality will be particularly affected by this action.

Other Entities Particularly Affected

Organizations that receive funding from DHCD and DCR; any fossil fuel-fired unit that serves an electricity generator with a nameplate capacity equal to or greater than 25 MWe (megawatt electrical).

Economic Impact

Consistent with § 2.2-4007.04 of the Code of Virginia, identify all specific economic impacts (costs and/or benefits) anticipated to result from the regulatory change. When describing a particular economic impact, specify which new requirement or change in requirement creates the anticipated economic impact. Keep in mind that this is the proposed change versus the status quo.

Impact on State Agencies

For your agency: projected costs, savings, fees, or revenues resulting from the regulatory change, including: a) fund source / fund detail; b) delineation of one-time versus on-going expenditures; and c) whether any costs or revenue loss can be absorbed within existing resources.	It is expected that repealing the regulation will not result in any cost to the department. The sources of department funds to carry out this regulation are currently the general fund and RGGI funds (3% of total auction proceeds for administrative needs), which will no longer be generated. The activities are budgeted under the following programs (codes): Air Protection Permitting (513025); Air Protection Compliance and Enforcement (513026); Air Protection Planning and Policy (513028); and Air Protection Monitoring and Assessment (513029). The ongoing costs will cease with the program.
For other state agencies: projected costs, savings, fees, or revenues resulting from the regulatory change, including a delineation of one-time versus on-going expenditures.	DHCD: Any ongoing expenses associated with administering the program will cease with the program. DCR: Any ongoing expenses associated with administering the program will cease with the program.
For all agencies: Benefits the regulatory change is designed to produce.	The primary benefits of the regulatory change are reduced energy costs, and greater certainty and transparency in the energy markets.

Impact on Localities

If this analysis has been reported on the ORM Economic Impact form, indicate the tables (1a or 2) on which it was reported. Information provided on that form need not be repeated here.

Projected costs, savings, fees, or revenues resulting from the regulatory change.	See ORM Economic Impact form.
Benefits the regulatory change is designed to produce.	See ORM Economic Impact form.

Impact on Other Entities

If this analysis has been reported on the ORM Economic Impact form, indicate the tables (1a, 3, or 4) on which it was reported. Information provided on that form need not be repeated here.

Description of the individuals, businesses, or other entities likely to be affected by the regulatory change. If no other entities will be affected, include a specific statement to that effect.	See ORM Economic Impact form.

Agency's best estimate of the number of such entities that will be affected. Include an estimate of the number of small businesses affected. Small business means a business entity, including its affiliates, that: a) is independently owned and operated, and; b) employs fewer than 500 full-time employees or has gross annual sales of less than $6 million.	See ORM Economic Impact form.
All projected costs for affected individuals, businesses, or other entities resulting from the regulatory change. Be specific and include all costs including, but not limited to: a) projected reporting, recordkeeping, and other administrative costs required for compliance by small businesses; b) specify any costs related to the development of real estate for commercial or residential purposes that are a consequence of the regulatory change; c) fees; d) purchases of equipment or services; and e) time required to comply with the requirements.	See ORM Economic Impact form.
Benefits the regulatory change is designed to produce.	See ORM Economic Impact form.

Alternatives to Regulation

Describe any viable alternatives to the regulatory change that were considered, and the rationale used by the agency to select the least burdensome or intrusive alternative that meets the essential purpose of the regulatory change. Also, include discussion of less intrusive or less costly alternatives for small businesses, as defined in § 2.2-4007.1 of the Code of Virginia, of achieving the purpose of the regulatory change.

1. Repeal the regulation to satisfy the provisions of EO-9. This option is being selected because it meets the stated purpose of the regulatory action.

2. Make alternative regulatory changes to those required by EO-9. This option is not being selected because it would not meet the stated purpose of the regulatory action.

3. Take no action. This option is not being selected because it would not satisfy the provisions of EO-9.

Regulatory Flexibility Analysis

Consistent with § 2.2-4007.1 B of the Code of Virginia, describe the agency's analysis of alternative regulatory methods, consistent with health, safety, environmental, and economic welfare, that will accomplish the objectives of applicable law while minimizing the adverse impact on small business. Alternative regulatory methods include, at a minimum: 1) establishing less stringent compliance or reporting requirements; 2) establishing less stringent schedules or deadlines for compliance or reporting requirements; 3) consolidation or simplification of compliance or reporting requirements; 4) establishing performance standards for small businesses to replace design or operational standards required in the proposed regulation; and 5) the exemption of small businesses from all or any part of the requirements contained in the regulatory change.

See ORM Economic Impact form.

Periodic Review and Small Business Impact Review Report of Findings

If you are using this form to report the result of a periodic review/small business impact review that is being conducted as part of this regulatory action, and was announced during the NOIRA stage, indicate whether the regulatory change meets the criteria set out in EO 19 and the ORM procedures, e.g., is necessary for the protection of public health, safety, and welfare; minimizes the economic impact on small businesses consistent with the stated objectives of applicable law; and is clearly written and easily understandable. In addition, as required by § 2.2-4007.1 E and F of the Code of Virginia, discuss the agency's consideration of: (1) the continued need for the regulation; (2) the nature of complaints or comments received concerning the regulation; (3) the complexity of the regulation; (4) the extent to the which the regulation overlaps, duplicates, or conflicts with federal or state law or regulation; and (5) the length of time since the regulation has been evaluated or the degree to which technology, economic conditions, or other factors have changed in the area affected by the regulation. Also, discuss why the agency's decision, consistent with applicable law, will minimize the economic impact of regulations on small businesses.

This form is not being used to report the result of a periodic review/small business impact review.

Public Comment

Summarize all comments received during the public comment period following the publication of the previous stage, and provide the agency's response. Include all comments submitted: including those received on Town Hall, in a public hearing, or submitted directly to the agency. If no comment was received, enter a specific statement to that effect.

Commenter	Comment	Agency response
1. About 50 Town Hall commenters	General support for the proposal. Key topics included the effectiveness of the program, and whether the program constitutes a tax and unneeded financial burden.	Support for the proposal is appreciated.
2. About 745 Town Hall commenters, and about 16 individual emails	General opposition to the proposal. Key topics included the legality of the regulatory action, the need for utility structure reform, protection of public health and welfare, and the need to fund resiliency and energy efficiency programs.	The commenters' concerns are acknowledged; detailed responses to specific issues are noted below.
3. About 225 identical emails sponsored by Virginia League of Conservation Voters	In a time of extreme weather and climate impacts, and rising energy costs, RGGI is bringing hundreds of millions of dollars to our state every year to help localities address flooding and sea level rise; and fund energy efficiency improvements for low-income households. An estimated 60% of total proceeds help either low-	The commenters' concerns are acknowledged; detailed responses to specific issues are noted below.

	income individuals directly, or low-income communities. Since January 2021, RGGI has generated upward of $378M for these efforts. With no Plan B to make up this revenue, this action would leave localities without funding to adapt to climate change and protect their communities, while also leaving low-income Virginians behind. Taking Virginia out of RGGI undermines our ability to cut harmful pollution from power plants; dirty air threatens us all, and RGGI is helping drive down pollution. This misguided repeal also imperils our economy. We are one of the fastest growing states for clean energy jobs because of strong policies like membership in RGGI, and we must stay the course to advance the clean energy transition. Lastly, Governor Youngkin lacks the authority to leave RGGI through the regulatory process--our participation is mandated by the General Assembly and only the General Assembly can legally take us out.	
4. Ceres	To reaffirm the sentiments of leading businesses in Virginia, we recognize that climate change poses a material risk to business operations, the livelihood of employees, and the health of Virginia's communities. In March 2020, a coalition of our Virginia based member companies and other large Virginia employers sent a letter in support of Virginia joining RGGI. In January 2022, 11 companies and educational institutions wrote a letter in support of maintaining and building upon Virginia's climate legislation. RGGI is one of many important tools that exist in Virginia to help businesses cut energy costs, avoid the volatility of fuel prices, and stay competitive. Our companies are motivated to make investments in places where we can continue to access these types of policies. We hope Virginia will continue to provide a hospitable environment for spurring clean energy adoption and expansion by	DEQ agrees with the commenters that that climate change represents a serious threat to Virginia's public health and welfare. We note that emissions of CO_2 and other pollutants have been and continue to decrease within Virginia's borders. Such decreases are not directly attributable to participation in RGGI but are primarily the result of other ongoing programs, thus, the health benefits resulting from reduced pollution are not attributable to RGGI participation. These programs include market-driven trends toward cleaner electricity generation (fuel switching, use of solar, etc.) and federal emissions reduction mandates (such as the suite of clean power rules and motor vehicle standards).

	not leaving RGGI. We appreciate the many economic opportunities presented by Virginia's continued transition to a clean energy economy. It is critical that these programs persist to ensure both the state and our companies achieve the shared goals of driving new in-state investment, encouraging innovation, and fostering long-term economic health.	
5. Ceres	RGGI is a cooperative agreement among 11 states; there is no abandonment or relinquishment of state sovereignty or responsibility. RGGI is implemented through a CO_2 Budget Trading Program specific to each member state. Virginia's DEQ coordinates Virginia's participation. Due to the structure of RGGI, member states are allowed to bank emission allowances for future use, which yields substantial flexibility in the trading program.	Participating RGGI states must follow a model rule which is agreed to by all states. Very little flexibility may be realized by states in changes to the model rule, and rightly so--such a regional agreement could not function effectively if there were significant differences among the participants. The fact remains that once a state enters into RGGI, that state must follow in step with every other state with respect to CO_2 budgets, compliance mechanisms, and the overall structure of RGGI. As previously noted, there are additional costs and steps associated with participating in RGGI that are avoided through direct implementation of Virginia programs by Virginia agencies.
6. Ceres	After decades of overinvestment in fossil fuels, Virginia's electric rates have climbed higher than every neighboring regulated state. Under the leadership of both Republicans and Democrats, RGGI states have seen their economies grow faster while utility rates are lower. RGGI states have agreed that at least 25% of the emission allowance value will be distributed for consumer benefit, which is predominantly used for energy efficiency and renewable energy investments. Studies have indicated that this provides multiple benefits of emission reductions, lower electricity bills, and regional job creation. Any adjustment in the utility rate structure should come through legislative reform and not the proven and successful RGGI program.	Virginia is currently a participating RGGI state, and has yet to see the lower utility rates. Over the past 15 years, an average monthly residential bill for a Dominion customer has increased by over $30 (roughly 34%). Consumer energy prices were up by 41.6% in the last year, with an increase in June 2022 alone of 9%. Natural gas is the predominant fuel in Virginia, and the natural gas price index is sharply higher (+38%), resulting in rate increases amounting to 18%. Furthermore, the cost of allowances continues to increase; these costs are being passed down directly to Virginia consumers. Given the current climate of economic distress, including increasing energy costs to every household and business in Virginia, the benefits of certain carbon control programs must be weighed against their costs, and their effectiveness carefully reviewed. It is important to note that all RGGI costs are passed through to the ratepayers as required by state law. By design, utilities are not penalized for failure to meet RGGI CO_2 emissions limits since they can pass on the costs to the ratepayers. Consumers are unable to avoid these costs because they do

		not have the opportunity to switch electric providers. Other states designed their systems to provide rebates to ratepayers, while the Virginia General Assembly chose to disburse the funds through grant programs. The costs of compliance with the trading rule and participation in RGGI are materializing in higher electricity rates for all ratepayers, and future rate increases due to RGGI are expected and will be tied to the allowance prices which are difficult to predict. We agree that any adjustments to the utility rate structure would require changes to state law that are beyond the purview of this regulatory action or the legal authority of DEQ to implement; however, the fact remains that participation in RGGI is not helping bring utility rates down in Virginia. Moreover, RGGI participation does not comport with the "all of the above" strategy espoused by the Commonwealth's 2022 Energy Plan.
7. Ceres	The market-based mechanisms of RGGI not only ensure that Virginia pursues the most economically efficient carbon reduction pathways, but that the proceeds from RGGI allow for the establishment of energy efficiency programs and the creation and expansion of flood mitigation programs in every corner of the state. Virginia has received approximately $452M in cumulative proceeds since its first auction in March 2021. In terms of health benefits, for the first six years of the RGGI program, RGGI states' improvement in air quality had a cumulative economic value of $5.7B. RGGI accounts for nearly half of the northeastern U.S. post-2009 emissions reductions, which is far greater than those achieved in the rest of the U.S. The estimated avoided cases of adverse children health outcomes from 2009-2020, includes an avoided cost ranging from $191-$350M. This monetary figure represents the prevention of infant mortality, preterm births, respiratory illness, and asthma among our most vulnerable Virginians.	Energy efficiency programs and resiliency measures are indeed needed throughout the state. These programs are obviously costly, and the money to fund them must be obtained one way or another; regardless, such programs should be funded in an open and transparent way, not through a third party. Other sources of funding are available, both state and federal, without the additional costs and complex means of creating and distributing the revenue that the RGGI program imposes. The Virginia General Assembly will also fund important resiliency and energy efficiency programs in future sessions.

8. Virginia Energy Efficiency Council (VEEC); City of Charlottesville; Virginia Conservation Network	RGGI provides unprecedented and irreplaceable funding for energy efficiency improvements in low income residences. Virginia is the only RGGI state that dedicates 50% of its carbon-trading funds to make both new and existing low-income housing more energy efficient, allowing weatherization providers and affordable housing developers to provide safe, affordable and energy-efficient homes to low-income families like never before. Only the General Assembly has the authority to cut off this vital funding source. Virginia's first year in RGGI provided nearly $114M in revenue for low-income energy efficiency housing. Administered by DHCD, the HIEE fund provides capital to make energy efficiency upgrades to residential buildings. From major health and safety repairs on existing housing to the construction of affordable, energy-efficient homes, money from RGGI is being used in every region of Virginia--and is creating high-paying jobs that cannot be outsourced. Along the Eastern Shore, weatherization provider Project:HOMES was able to use RGGI dollars to help the most vulnerable in this community. But something was standing in the way--hazardous living conditions. While the federal weatherization program helps provide energy-efficient upgrades, homes that require major repairs are disqualified from receiving services. That means weatherization providers have had to walk away, or "defer," houses in such disrepair, leaving those most in need living in unsafe, unhealthy and energy-inefficient homes. This is where the state Weatherization Deferral Repair (WDR) program comes in. This RGGI-funded program works in tandem with the federal weatherization program to provide funds specifically for health and	As discussed in the response to comment 7, we agree that these types of projects are important for protecting public health and welfare; however, RGGI is not the only possible source of funding for these types of projects, nor is it the most efficient or transparent means of obtaining this type of funding.

	safety repairs to help vulnerable citizens qualify for weatherization services. Project:HOMES took advantage of this program to make extensive health and safety repairs to 12 homes. The organization hired more than 30 local subcontractors to fix roofs, repair heating and cooling systems and address major mold, electrical and plumbing problems. Once repairs were made through WDR, those homes received weatherization services through the federal program. Those residents now reap on average 20% savings on their utility bills, in addition to living in safer, healthier homes. The Senior Deerfield Apartments in Crewe VA received $93,195 in repairs, including replacement roofs and new HVAC systems. In Shenandoah County, Community Housing Partners used RGGI funds to help weatherize 52 units of low-income housing and put 24 subcontractors to work in the process. And that's just on existing housing stock. RGGI dollars also provide affordable housing developers the financial capital to build and renovate energy-efficient housing for low-income families. In Charlottesville, Piedmont Housing Alliance was awarded RGGI money through the Affordable and Special Needs Housing program to renovate and build over 230 homes. They are committed to making all future housing units more energy-efficient, but that may not be feasible if RGGI funding disappears. People Inc. Housing Group is building a new, energy-efficient 22-unit complex in Abingdon for low-income families, which will include five accessible units for those with disabilities. The RGGI funding received for this project ensures that these units will be as energy-efficient as possible. RGGI funding is a game-changer for the most vulnerable in our communities. While administration	

	officials have suggested that other funding sources could be found to replace RGGI funds, that would be a herculean task. In 2021, the RGGI auctions brought in millions of dollars more than every other energy efficiency program in the state--combined. Virginians can't afford to have these programs disappear.	
9. Northern Virginia Regional Commission (NVRC)	NVRC strongly encourages maintaining participation in RGGI because of the benefits to northern Virginia and the rest of the state from RGGI funding and programing. RGGI funds and programs have helped make northern Virginia climate resilient, socially equitable and economically sustainable. The 2020 law gave DEQ the authority it had lacked previously--to sell allowances directly into the quarterly RGGI auctions and raise revenue for Virginia. But it also requires DEQ to use that new authority, mandating that DEQ "shall seek to sell 100 percent of allowances" in a trading program consistent with RGGI. Thus, Virginia's participation in RGGI is required by the statute. Therefore, any effort to withdraw Virginia from the RGGI program must be approved by the General Assembly. This position was acknowledged by an Attorney General's Opinion dated January 11, 2022. Participation by Virginia in RGGI has led to the establishment of two important funding sources: CFPF, and HIEE. These programs have been provided vital--and at times the only--financial support to help financially-pressed local governments protect marginalized and low-income communities from economic hardship, health threats and environmental degradation. These funds also promote proactive climate resilient planning that supports public, ecologic and commercial health, rather than costly reactive and unplanned remediation. Local governments in	As discussed in the response to comment 7, we agree that these types of projects are important and necessary. We disagree that RGGI is the best means of achieving them. § 10.1-1330 A of the Clean Energy and Community Flood Preparedness Act does require that the department adopt the provisions of Article 4 into the final regulation previously adopted by the board. However, § 10.1-1330 B then goes on merely to authorize the Director to establish an auction program. This is an authorization, not a mandate, and that provision of the code is therefore discretionary.

	northern Virginia have used and will continue to use these funds to support resiliency planning that aids the operations of our region's hospitals, energy and water infrastructure, schools, businesses, and residences. Withdrawing Virginia from RGGI would seriously limit local governments a vital financial mechanism that cannot be replaced. For example, in RGGI funds from CFPF will support these critical resiliency planning activities in 2022: - $3,241,200 City of Alexandria Waterfront Improvement Project Design - $516,500 City of Alexandria Flood Mitigation, Edison and Dale Street Capacity Project Phase I - $11,250 Northern Virginia Regional Commission, Flood Prevention and Protection Study: Northern Virginia Rain Gauge Network Evaluation Alexandria's waterfront is already highly vulnerable flooding from storm events and sea level rise. Funds from the CFPF will help the city and region prevent loss of property, infrastructure, and economic stress. NVRC analysis points to the current threats from flooding: a rise in the water levels of the Potomac River between 3-5 feet would impact property values of parcels along Alexandria's waterfront between the northern boundary of Jones Point Park and Oronoco Park between $35-100M. The ties between Alexandria's flood protection efforts, affordable housing planning and support from CFPF can also be seen in NVRC's Social and Housing Vulnerable Populations interactive mapping tool. This information indicates that the Alexandria flood mitigation project not only supports flood mitigation, but it also is supporting a socially vulnerable community in need of housing support. Alexandria has one of northern	

	Virginia's largest concentrations of socially vulnerable populations. Alexandria is a majority-minority community with approximately 51.5% of renter households over-burdened by housing costs. Flood mitigation planning like that supported by RGGI and CFPF, give the city greater opportunities to protect the low-income families of Alexandria from the threats of flooding. Despite its affluence, northern Virginia has sizeable concentrations of low-income households vulnerable to high energy costs. NVRC has analyzed the number of households earning below 50% of Area Median Income. It is estimated that there are over 170,000 households below this threshold. Since July 2021, RGGI on a statewide basis has invested $27.8M in funds to help 2335 families residing in affordable housing projects. It is estimated that some of these families have incomes as low as 40% of area median income. RGGI funds via HIEE for 2021-2022 also will help low-income households in northern Virginia receive weatherization services: $1.2M for 80 units in Fairfax County and $2.0M for 163 units in Arlington County Currently, RGGI provides long-term, institutional, and reliable funding across the state. As the stressors from climate change escalate, reliance on RGGI-funded programs will rise. Virginia was the first southern state to participate in RGGI and RGGI-funded programs have helped Virginia reduce carbon emissions, create a more stable business environment, protect the state's infrastructure and improve public health at unprecedented rates. It would be unfortunate to slow or halt this progress.	
10. Virginia Chapter, American	Market-driven reductions in air and water pollution have proven highly successful at preserving a healthy environment for children. Building	The commenters' concerns are acknowledges and shared. As discussed elsewhere, these issues must be addressed;

Academy of Pediatrics	on the success of prior programs in the northeast, RGGI reduces air pollution and thereby protects children's health. The health outcomes of RGGI have been characterized in two studies. The first analyzed RGGI's health effects from 2009-2014. Reductions in air pollution associated with the program prevented adverse health outcomes across the northeast from 2009-2014, including 420-510 instances of acute bronchitis, over 200 asthma emergency department visits, more than 8200 asthma exacerbations, and tens of thousands of lost work days. These and other health benefits have resulted in over $5.7B in health and productivity savings. A second study published in 2020 focused on children and the developing fetus. This study found that from 2009-2014, RGGI-associated reductions in air pollution prevented 537 cases of child asthma, 98 instances of autism spectrum disorder and 112 pre-term births. While reducing criteria air pollutants, the program also has reduced carbon emissions from power plants in participating states by almost 50%, a 90% greater reduction than in non-participating states. Protecting children from climate change is a priority of this organization. RGGI is working to protect the health of current and future children. We therefore support Virginia's continued participation in this program.	however, RGGI participation is not the best approach for doing so.
11. Hampton Roads Planning District Commission (HRPDC)	On behalf of the HRPDC board and 17 member jurisdictions, I write to oppose the proposed actions to remove Virginia from RGGI. HRPDC appreciates the concern regarding the increase in energy costs, part of which are due to the state's participation in RGGI. We recognize that any increase in energy costs places significant burdens on Virginia residents and businesses. Securing more	As discussed in the response to comment 6, a balance must be struck between the need for pollution control to protect public health and welfare, and the reasonableness of the costs needed to achieve it. Energy efficiency and resiliency are indeed important concerns that must be addressed--they must be achieved in the most efficient and fiscally responsible means possible.

	affordable energy will help Virginia remain economically competitive and protect our quality of life. However, we also believe that energy costs cannot be the only factor in reconsidering whether the participation in RGGI continues. Crucially, the NOIRA does not consider that Virginia's proceeds from RGGI auctions fund both the HIEE program and the CFPF. RGGI auctions have provided nearly $430M to these programs since March 2021, funding that would not have been possible without participation in RGGI. The Hampton Roads region is significantly vulnerable to both current and future flooding. The CFPF is the only significant source of state funding for local resiliency initiatives and projects. Having a reliable, ongoing, and adequate funding source is critical for addressing resiliency and flooding issues. Until an alternative source of revenue is identified, any decision to remove the state from RGGI will be premature. The HRPDC therefore opposes the regulatory action. We encourage the Administration to consider Virginia's participation in RGGI in the broader context of resiliency and energy efficiency goals.	
12. Town of Blacksburg	The Mayor and Town Council of the Town of Blacksburg urge the board to reject attempts to remove Virginia from RGGI. Participation in RGGI is already yielding tremendous economic benefit and has put the state on a predictable, market-driven path to a clean energy economy. The 10 other states that have participated in RGGI have reduced climate-warming emissions 90% faster than the rest of the country while growing 31% faster economically. Furthermore, it has been asserted that the board does not have clear authority to take this action as detailed in a recent letter signed by 61 state lawmakers.	As discussed elsewhere, DEQ acknowledges that the impacts of carbon and other forms of pollution must be addressed to protect public health and welfare; there are means of achieving this other than participating in RGGI. See the response to comment 9 for further discussion of the board's authority to address this issue by means of the APA regulatory process.

	Evidence continues to mount that continued inaction on GHG emissions could lead to catastrophic changes for Virginians, destabilizing the systems that support and sustain our communities. Millions of people will experience these changes through threats to public health, disruption of national and local economies, and food and water insecurity. Buildings and infrastructure will be increasingly impacted by the severity and frequency of weather events with enormous response and recovery costs falling on resource-strapped local governments. For coastal communities, these threats will be amplified by rising sea levels. We know that nearly early every element of our society is impacted by energy. A step-wise, predictable transition to a clean energy future will preserve our quality of life, improve economic resilience and foster an ethic of responsible stewardship of our shared natural resources and climate. RGGI provides the state policy framework and structure needed to support that transition. Beyond its climate implications, participation in RGGI benefits Virginia in other ways. Residents of RGGI states enjoy lower energy prices: electricity prices in RGGI states dropped by almost 6% while they went up almost 9% throughout the rest of the country. And RGGI has generated $452M to support much-needed low-income energy efficiency programs and flood resilience infrastructure in Virginia. We urge the board to embrace the numerous economic and environmental benefits of Virginia's continued participation in RGGI.	
13. American Lung Association (ALA) Virginia	We strongly oppose the efforts to repeal the regulation implementing Virginia's participation in RGGI. ALA believes that Virginia must continue participation in RGGI to	The commenter's concerns are acknowledged. As discussed elsewhere, the protection of public health and welfare through the control of GHG and other forms

	make meaningful reductions in GHG emissions that protect the health and well-being of Virginians. Our 2022 State of the Air report revealed that some of Virginia's metro areas were named the top places to live while others had much worse results. Ozone and particle pollution can harm the health of all Virginia's residents and of particular risk are children, older adults, pregnant people and those living with chronic diseases – approximately 140,000 children and 580,000 adults are living with asthma in Virginia. Both ozone and particle pollution can cause premature death and other serious health effects such as asthma attacks, cardiovascular damage, and developmental and reproductive harm. Climate change is one of the most urgent threats to human health of the 21st century. Reduction of harmful pollutants caused by burning fossil fuels is critical to improving the local health today and ensuring a stable climate for future generations. Climate change is first and foremost a public health issue and one that creates disproportionate impacts across Virginia's diverse communities. Climate change is making the job of cleaning our air much more difficult as temperatures rise and drive conditions for unhealthy ozone pollution days, among other health challenges. In 2020, Virginia became the first southern state to join RGGI. The RGGI states have established a regional cap on CO_2 emissions. Over time these caps will decline and so will CO_2 and other harmful emissions. For example, a July 2020 study published in Environmental Health Perspectives concluded, "RGGI has provided considerable child health benefits to participating and neighboring states beyond those conventionally considered. Moreover, those health	of air pollution can be better realized outside of the RGGI program.

	benefits are estimated to have significant economic value." Participation in RGGI allows for CO_2 emission to decline in a planned and predictable way to protect health and safeguard our children's future. Since RGGI started emissions have already reduced more than 50%. Through the auction process, it allows funds to be raised to be reinvested into local communities. When the General Assembly passed legislation authorizing participation in RGGI it also outlined initiatives where the revenues should be invested, including 50% for low-income energy efficiency programs, and 45% for the CFPF to address recurrent flooding and rising sea levels. All people are entitled to breathe healthy air and to be free of the adverse health effects of air pollution, especially those who suffer disproportionate exposure from local sources of emissions. ALA strongly opposes efforts to repeal Virginia's participation in RGGI.	
14. James River Association (JRA)	Every two years, JRA releases a comprehensive assessment of the health of the river and ongoing efforts to restore the James. Our 2021 State of the James report found that the effects of climate change, including heavier and more frequent rainfall, will increasingly impact the overall health of the river and our watershed communities. Virginia's participation in RGGI plays a key role in addressing these impacts by reducing carbon emissions and helping communities prepare for flooding. Absent viable alternatives for an emissions reduction program and dedicated flood resilience funding, removing Virginia from RGGI would leave the river and our communities at greater risk, and we urge you to abandon this path. As a market-based, cap and invest cooperative initiative, RGGI has	DEQ recognizes that the continued health of the James River and our other natural resources is essential, as is the protection of human health. See the responses to comments 4 and 7 for a discussion of program effectiveness, and the availability if sources to fund energy efficiency and resiliency programs.

	produced results. DEQ's report to Governor Youngkin regarding the costs and benefits of the Virginia Carbon Trading Rule and RGGI participation agrees that "the RGGI region has a long track record of emissions reductions . . . Since its inception, RGGI emissions have reduced by more than 50%--twice as fast as the nation as a whole--and raised over $4B to invest in local communities." While Virginia's participation is too nascent for data to show state-specific trends, modeling predicts that RGGI participation, with closure of coal electric facilities and renewable energy generation, will put the state on a path to net-zero carbon emissions by 2045. An emissions reduction program akin to RGGI is not just complimentary but, in fact, necessary to meet our carbon free power sector targets. As DEQ's cost-benefit report makes clear, "[i]n the absence of any such program, emissions may not reduce sufficiently to achieve these goals." Removing Virginia from RGGI would cripple our ability to reach our emissions reduction needs, and it would significantly handicap the resources available for communities facing localized flood risks as a result of climate change. Currently, 45% of the proceeds received from RGGI allowances are invested in the statewide CFPF, the only dedicated state funding for critical flood resilience planning and projects. RGGI is the sole source of revenue for the CFPF and has successfully generated over $203M since Virginia's first allowance auction. Of this amount, nearly $46M has been awarded to localities--$28M of which was to localities completely or partially within the James River watershed. This level of state investment, unheard of until now, is greatly needed by communities from our headwaters to our coastal regions. CFPF, and the RGGI	

	proceeds fueling its success, can remove obstacles for localities needing new sources of investment. For example, CFPF can be used for capacity-building and planning initiatives that most federal grant programs will not support. These planning initiatives will help to identify and prioritize where investments can be most impactful. With these plans in place, localities can go on to pursue larger project implementation funds made available through other state and federal initiatives. CFPF dollars can also be used as a match for federal grant programs, increasing Virginia's competitiveness on the national stage. And one out of every four dollars invested in CFPF is set aside for low-income geographic areas. Gutting CFPF's sole source of funding without a viable, reliable alternative in place would make it much harder for localities, particularly low income communities, to address the current and future flood risks. No feasible alternative to RGGI has been proposed that will maintain Virginia's trajectory toward a carbon-free future and guarantee much-needed state funding for local flood resilience efforts. Accordingly, RGGI remains the best bet for mitigating the impacts of and preparing localities for a changing climate, which will increasingly put our rivers and our watershed communities at risk. We urge DEQ to maintain Virginia's participation within RGGI.	
15. National Parks Conservation Association (NPCA)	Virginia is fortunate to host 22 national park sites. Over 20M visitors come to national parks in Virginia and contribute over $1.5B in economic benefit from tourism. Our parks must have clean, healthy air to thrive. RGGI reduces GHG emissions and improves air quality. Decreased pollution translates into public health benefits for all Virginians. Not only does RGGI improve our public health by improving air quality, it generates	Public health and welfare, including the continuing health of Virginia's national parks, are indeed important, and must be protected from the effects of carbon and other forms of pollution. See the response to comment 7 for a discussion of funding, and the response to comment 6 for a discussion of utility structure reform.

	funding for important programs. RGGI funding allows low-income families to have access to energy-efficient homes and localities to better plan for and prevent the flooding we continue to experience during recurrent coastal storms. Rather than repeal this successful program, we urge you to reform Dominion's current monopoly on utility rates that hurt consumers. RGGI is working in Virginia to clean our air, improve our health, and fund important programs that help our citizens. We urge you to continue to build upon the success of this program by keeping Virginia enrolled in RGGI.	
16. The Nature Conservancy	The Nature Conservancy strongly supports Virginia's continued full participation in RGGI and the full distribution of revenue of RGGI funds as prescribed in Code of Va § 10.1-1330. The benefits of RGGI to the state are numerous. Half of the revenue that Virginia acquires through RGGI auctions is designated for low-income energy efficiency programs, including programs for eligible housing developments, administered by DHCD, which has created the HIEE program with the RGGI funds. 1. Using RGGI revenue to reduce wasted energy through energy efficiency is a direct way to lower unnecessary pollution. Since energy efficiency upgrades are being done on households that could not otherwise afford the upgrades, RGGI is directly causing cleaner air through improved energy efficiency. 2. Through energy efficiency improvements, the HIEE program reduces the high energy bills of low-income households. This is a wise investment in Virginia households. Rather than relying on bill assistance programs which must go on indefinitely, HIEE fixes the underlying root of the problem to help families consume less energy in the first place. 3. The HIEE program can provide health benefits to program	We agree that resiliency and energy efficiency projects are essential for protecting public health and welfare throughout the state, however, we do not believe that the RGGI program is the best way to effectuate such programs; see the response to comments 4 and 7 for further discussion.

	participants. Energy efficiency and weatherization improves ventilation and regulates indoor temperature and moisture, leading to lower rates of asthma, allergies, hypertension, heart disease, and other costly medical conditions. 4: The HIEE program is generating economic benefits by hiring local contractors and subcontractors across the state, creating local jobs that cannot be outsourced. There are two components to the HIEE program. First, DHCD uses HIEE funds to make new Affordable and Special Needs Housing more efficient. This investment keeps this housing affordable while also lowering the monthly energy bills for its residents. The second is the innovative WDR program. DHCD administers the federal WAP to low-income households. However, almost 20% of WAP applicants in Virginia are turned down or "deferred" for this program because their home needs repair before it can support the weatherization. Because the residents do not have the funds to repair the building, it does not qualify for WAP upgrades, perpetuating the cycle of paying too-high energy bills. The WDR program invests RGGI revenue to make those repairs in order to unlock the federal WAP dollars. Given that all the benefits of WAP had previously been out of reach for many, leveraging RGGI revenue to tap into federal dollars is important and should continue. The longer Virginia stays in RGGI and puts RGGI revenue to work as designed, the more these benefits will accrue for society. That's important, because the need to improve energy efficiency for low-income households is huge, and the benefits extend beyond the families living in them. There are no other sources of funds that comes close to matching RGGI if these funds are revoked--in 2021, the	

	RGGI auctions brought in millions of dollars more than every other energy efficiency program in the state, combined. The HIEE program has only just begun. The potential benefits of what it can achieve for Virginians with RGGI revenue is substantial. We ask the board to reject proposals to end Virginia's participation in RGGI.	
17. William Penniman	Climate change and air pollution generally are strongly driven by combustion of fossil fuels, and electric utilities are among the largest sources of those emissions. CO_2 is the largest cause of climate change and must be rapidly reduced if we are to have any chance of protecting our children and future generations from severe harm. The Governor's proposal, the rapidly drafted March 11 report to support it and the Agency Background Document are badly flawed. They ignore the dangers and harms from CO_2 emissions and are based on flawed claims about RGGI, electric utilities and consumers. They also ignore the reality that states participating in RGGI have substantially reduced CO_2 emissions while growing their economies faster than non-RGGI states and while improving health outcomes through reduced pollution from electric utilities. The March 11 report makes many sweeping assertions based on very little actual data. It acknowledges that the availability of data is "limited since Virginia has just completed its first year of participation." It ignores the actual benefits achieved by states that have participated longer in RGGI. The NOIRA Background Document repeats many of the same mistakes and adds a collection of prices-are-rising statistics that have nothing to do with RGGI and its benefits and do not differentiate electricity from other parts of the economy. Indeed, the rising cost of natural gas is a good reason to reduce reliance on	Resiliency and energy efficiency projects are indeed essential for protecting public health and welfare throughout the state from the effects of carbon and other air pollution, however, the RGGI program is not the best way to effectuate such programs; see the response to comments 4 and 7 for further discussion.

	fossil fuels, which is one of RGGI's benefits. The report asserts that "participation in RGGI is in effect a direct carbon tax on all households and businesses." One could more accurately characterize it as a fee for emissions, which all economists would agree is a sensible way to link price to causation in order to mitigate harms from an activity like combusting fossil fuels. Moreover, after surveying the recent climate-driven disasters in southwestern Virginia, the Governor said he intended to fund disaster relief and efficiency programs, which would require taxing Virginians based on income or transactions without any linkage to the CO_2 emissions they cause. That general taxation would cost all taxpayers without the incentives from a carbon-based emission fee. It would be still worse to gut funding designed to help residents to reduce their energy bills through energy efficiency improvements or to gut funding to help communities threatened or harmed by accelerating climate change. Gutting such funding is likely what would result from trying to shift such measures to general taxation. The report claims that "RGGI fails to achieve its goal as a carbon 'cap-and-trade' system because it lacks any incentive for power generators to actually reduce carbon-intensive gas emissions." That claim is built on two other misleading claims: that utilities have no incentive to reduce emissions due to cost-based ratemaking and that customers have no ability to reduce their purchases because Virginia's market has not yet open to full competition. Those claims are wrong for several reasons. (a) Utilities' rates are subject to review for imprudent incurrence of costs which can result in limiting recovery of costs that a prudent utility would	

	have avoided. (b) Utilities always have incentives to grow load, which requires them to seek to mitigate costs. (c) Virginia utilities are directed by existing law to reduce their CO_2 emissions over the next 20 years which fits well with RGGI's system. (d) Small and large customers can reduce their purchases of electricity from utilities through greater energy efficiency or conservation practices, by installing solar on their property or by joining a community solar program. Utility prices, including CO_2 charges, will help to drive those consumer decisions, which is what we want in order to mitigate global warming. The report makes the misleading claim that other states return RGGI revenues through rebates. Most offer rebates to support energy efficiency investments by residents, which is what much of what Virginia would do. Some use funds to support adaptation and recovery measures, which is part of what Virginia would do. It is misleading to imply that most or any other states use most of their RGGI revenues to simply return cash to residents. Although it is possible that CO_2 emission charges will raise utilities' per-KWH rates for sales, that would likely be a temporary impact. As utilities shift to zero-carbon energy sources their operating costs will decline both because wind and solar have near-zero operating costs and because that switch will reduce incurrence of RGGI charges. Also, customers' reduced purchases from utilities through energy efficiency or solar energy would offset rate increases and lower bills, while cutting CO_2 emissions. In other words, RGGI's CO_2 charges will do what they are supposed to do: provide incentives to reduce emissions and mitigate climate change.	

	The report says that Virginia's CO_2 emission rates per MWH have been reduced but "mass emissions levels of CO_2 from the Virginia power sector have remained fairly constant over the last 10 years despite a 30% increase in power production." However, continuing to emit the same total amount of CO_2 as in the past will destroy the future for our children. We need to achieve total reductions to limit the accelerating climate change. It is fortunate that renewable energy options have become the cheapest fuel and that there still remains much that can be done to improve energy efficiency. But there is no guarantee that past trends will continue. RGGI's targeting CO_2 emissions is vital to moving Virginia to the net-zero emissions level. The report and Background Document focus on hypothesized utility rate impacts in a vacuum. They ignore the external costs of fossil fuel emissions to human health and climate harms. The primary recommendation of these documents is to turn the clock back to higher emissions. GHG must be cut now and cut rapidly. Virginia's citizens and economy will be badly harmed by removing RGGI's incentives for more rapidly reducing CO_2 and for accelerating energy efficiency.	
18. Climate Action Alliance of the Valley	We take issue with EO-9, which requires DEQ to re-evaluate Virginia's participation in RGGI and begin the regulatory processes to end it. As we noted in our letter of August 25, 2022 to the Governor, in our view DEQ and the board, cannot legally withdraw Virginia from RGGI. The 2022 General Assembly declined to repeal RGGI; therefore the law stands. As VAEEC noted in its October 13 submission, RGGI is performing as intended and many low and middle income Virginians are benefiting from RGGI's revenues. Other funding sources could be found to replace RGGI funds, but finding	As discussed in the response to comment 9, § 10.1-1330 B of the Clean Energy and Community Flood Preparedness Act authorizes the Director to establish an auction program. This is an authorization, not a mandate. We agree that resiliency and energy efficiency projects are essential for protecting public health and welfare throughout the state, however, we do not believe that the RGGI program is the best way to effectuate such programs; see the responses to comment 4 and 7.

	those funds would be a herculean task. Even if other funding sources are identified, there will be a gap in the forward progress made to date and in all likelihood the new sources would not provide the added benefit of reducing Virginia's carbon emissions. We concur with VAEEC's comments. We provided two opinion pieces addressing our substantive concerns with the proposal for Virginia to withdraw from RGGI. Our January 26, 2022 piece argued that Virginia Should Remain In RGGI; our March 25, 2022 open letter to Valley Legislators pointed out that there is no logical reason to withdraw Virginia from RGGI and that the decision to do so must come from the legislature. We stand by our previous opinions. The RGGI auction proceeds that go to the CFPF is and will remain sorely needed. The Governor has pointed out that the need for community resiliency is real and urgent. RGGI is the sole source of revenue for the statewide CFPF, which represents the only dedicated state funding source for flood resilience planning and project implementation for localities, tribes, and soil and water conservation districts across Virginia. The CFPF provides money for capacity-building efforts not usually funded through federal grants and that CFPF dollars can serve as a match for such programs. The need for long-term planning and action—and funding—for recurrent flooding inland and on the coast is real, ongoing, and increasing. There is no justification for pulling Virginia out of RGGI because critical funding that local governments need would disappear, be greatly reduced or be available episodically subject to annual and biennial decisions. The obvious result would mean disproportionate harm to under-resourced, small,	

	rural cities, towns, and counties who cannot address flood risk on their own. This is no time to deprive the CFPF of the RGGI funds. Doing so would make a mockery of the Governor's publicly expressed concerns for places like Buchanan County and certainly would greatly limit Virginia's ability to assist its many vulnerable localities when the worst happens.	
19. Virginia Clinicians for Climate Action (VCCA)	RGGI protects the health of Virginia residents from climate change and air pollution. VCCA strongly opposes efforts to remove Virginia from the program. Climate change is associated with far-reaching adverse health impacts. Worsening extreme weather events place residents of affected communities at risk of injury, death, disrupted medical services and mental health effects. Longer and more intense heat waves increase the risk of heat-related illness, particularly in the elderly, outdoor workers and athletes. More severe allergy seasons worsen exacerbations of asthma, chronic lung disease, and allergic diseases. Infectious disease patterns shift in response to changing climate conditions. Reducing carbon emissions in order to reduce climate change impacts is imperative to protecting public health. Since its inception, RGGI has effectively reduced carbon emissions from electricity generating facilities. States that participate in the RGGI program have reduced their power plant carbon emissions by 50%, outpacing the rest of the country by 90%. Electricity prices have simultaneously declined in RGGI states while increasing in the rest of the country. In addition to CO_2, fossil fuel combustion releases numerous other air pollutants including fine particulate matter, VOCs, NO_X, and SO_2 that are harmful to human health. Adverse health impacts of air pollution include heart attacks, strokes,	Reducing carbon emissions in order to reduce climate change impacts is indeed imperative to protecting public health and welfare. We note in the responses to comment 4 and 7 that the RGGI program is not the most effective means of achieving these important goals.

	asthma exacerbations, chronic obstructive pulmonary disease exacerbations, and preterm births. These harms disproportionately impact low income and racial minority populations. RGGI is already protecting health across the northeast by reducing toxic air pollution. A 2017 study found that from 2009-2014, RGGI-associated reductions in air pollution prevented 420-510 instances of acute bronchitis, 240-540 instances of adult mortality, 8,200 asthma exacerbations, over 200 asthma emergency room visits, and tens of thousands of lost work days. Prevention of these outcomes resulted in over $5.7B in health and productivity savings. A 2020 study found that air pollution reductions associated with RGGI prevented 537 cases of child asthma, 98 instances of autism spectrum disorder, and 112 preterm births in the northeast from 2009-2014. In addition to reducing air pollution, RGGI protects the health of Virginians by providing crucial funding for energy efficiency improvements to low-income families. Through major health and safety repairs on existing homes as well as the construction of affordable energy efficient homes, revenue from RGGI is being used to improve living conditions for residents across the state. These improvements create homes with reduced indoor pollutants, better controlled moisture, and reduced mold. These improvements lower the risk of heart disease, respiratory disease, severe asthma, COPD, and cancer. Since its implementation, the RGGI program has proven highly effective at reducing harmful emissions and protecting health . VCCA therefore strongly supports Virginia's continued participation in the program.	

20 The Pew Charitable Trusts	Virginia's participation in RGGI is pursuant to the Clean Energy and Community Flood Preparedness Act. Repeal of the regulations governing the state's participation in RGGI without the promulgation of replacement regulations appears to be facially inconsistent with the statutory requirements of existing law and will undermine a key flood-preparedness resource funded by RGGI auction revenue. Injecting uncertainty into Virginia's participation in RGGI would have significant adverse impacts for the state. RGGI auction receipts represent Virginia's sole source of funding for community-scale flood mitigation projects and capacity-building through its resourcing of the CFPF. The Fund has accrued more than $203M and dedicated $46M.The National Institute of Building Sciences research shows investing in mitigation has a national average benefit of $6 to every $1 invested in upfront mitigation costs. The Youngkin Administration has repeatedly raised its commitment to mitigating the risk of flooding to Virginians. Efforts to withdraw from RGGI run counter to this priority, and Pew urges the Administration to reverse course.	DEQ disagrees that this action conflicts with state law; see the response to comment 9. Rather than injecting uncertainty into the electricity market, leaving the RGGI program will protect utilities and their customers from the uncertain outcomes of RGGI auctions. As discussed elsewhere, there are other more transparent and stable means of funding important resiliency and energy efficiency projects.
21. American Council for an Energy-Efficient Economy (ACEEE)	Energy efficiency programs reduce energy costs and protect health, making them a powerful tool for mitigating longstanding inequities experienced particularly by marginalized and underserved communities. Proceeds generated from RGGI's quarterly auctions yield millions of dollars of funding that can be used to invest in energy efficiency programs in historically underserved communities. These investments can help ensure an equitable distribution of benefits and avoid placing disproportionate cost burdens on already disadvantaged communities. In short, RGGI makes energy affordable for low-income	See the responses to comments 4 and 7 for a discussion of the need to fund these types of projects, and the clearest, most effective means of obtaining and distributing funding.

	Virginians, in alignment with the objectives of the 2022 Virginia Energy Plan. In recognition of the importance of investing in energy efficiency for marginalized communities, the Clean Energy and Community Flood Preparedness Act requires Virginia to allocate half of its RGGI proceeds to low-income energy efficiency housing programs. In 2021, these proceeds amounted to $114M. These funds are administered by DHCD and go toward the HIEE program. HIEE provides funding to the WDR program and the ASNH program to tackle energy efficiency improvements for both new and existing housing. The WDR program provides crucial health and safety repairs for homes that have been deferred from the federal WAP. WAP provides funding to make low-income homes more energy efficient, but households are often deferred from the program due to health and safety hazards, that make weatherization difficult or unsafe. Using WDR to address preexisting conditions that need to be remediated prior to weatherization lowers the energy burden for low-income households and allows them to reap the benefits of living in safe homes. The ASNH program uses RGGI dollars to develop new affordable housing and renovate existing affordable housing units. Developers that receive this funding must work to greatly increase the energy efficiency performance of the units. Virginia's participation in RGGI reduces energy bills for the state's most vulnerable residents by offering affordable, healthy, and efficient housing. From 2008–2017, other states that participated in RGGI saw a decline in electricity prices by 5.7% while other non-	

	RGGI states saw electricity prices rise by 8.6% during the same time period. RGGI is also a job creator and improves overall air quality and health from decreased pollution. In 2020 alone, investments in energy efficiency using RGGI proceeds created 1,400–1,500 job-years for states involved in the cap-and-invest program. Other analyses have shown that from 2009–2017, RGGI generated over $4B in net economic benefits and resulted in more than 44,000 job-years. Virginians deserve to have these economic benefits of RGGI, and Virginia should avoid taking steps that will jeopardize these benefits. ACEEE urges the board to reject any efforts to withdraw Virginia's participation in RGGI.	
22. Arlington County Office of Sustainability and Environmental Management	RGGI is a high-performance mechanism for delivery of vital services and benefits to Virginia's citizens and businesses. Participation in this market-based program provides direct, cost-effective benefits addressing energy efficiency opportunities for the vulnerable populations and addressing community resiliency. As a cap-and-investment compact, RGGI: - Benefits utilities with a flexible and responsibly paced instrument for decarbonizing its energy resources that is cost-neutral to the utility - Has kept costs for households low, which is especially important for low-income ratepayers, by distributing the expense of investments and allowing utilities to identify the most cost-effective, high-performance approaches to reduce emissions - Funds Virginia programs that generate benefits and co-benefits at a scale that cannot be otherwise duplicated, at a conversely low-cost-of-government - Creates an investment stream that levels opportunity between high- and low-income communities and reduces profound, near- and long-term risk and cost burdens to Virginia constituents	As discussed in the responses to comments 4 and 7, we agree that these types of projects are important; we disagree that the RGGI program is the clearest, most effective means of obtaining and distributing funding to these projects.

	- Benefits utilities with a flexible and responsibly paced instrument for decarbonizing its energy resources that is cost-neutral RGGI's market-based approach allows utilities to meet electricity demands without requiring a specific mix of generation sources, while allowing for flexible decision-making. Utilities can meet the environmental performance requirements of the program in the most cost-effective manner with the flexibility to plan and phase implementation in a responsible path toward a clean energy resource portfolio. The allowance market enables utilities to optimize their approach to decarbonization, encouraging early GHG reductions through allowance banking and multi-year compliance periods. The cost containment reserve mechanism of RGGI mitigates any risk associated with high allowance costs, thus limiting price volatility so utilities can plan energy generating resources for the future with limited uncertainty. At the same time, RGGI is a tailored, mission-specific program that will cease operation once decarbonization goals and defined outcomes are achieved. RGGI has kept costs for households low, which is especially important for low-income ratepayers, by distributing the expense of investment and allowing utilities to identify the most cost-effective, high-performance approaches to reduce emissions. RGGI costs to ratepayers are exceptionally low, and its benefits to the public represent diverse and substantive returns-on-investment. A study by the Analysis Group found that during the 2015-2017 compliance period, RGGI led to $1.4B in net positive economic activity regionally through investment in energy efficiency, renewable energy, bill assistance, and other measures to reduce GHGs. RGGI has generated over	

	$4B in net economic gain over its first ten years. RGGI auction proceeds have also been used to fund research, education, and job training programs. Further, energy consumers saw a net savings of $220M on energy costs during the 2015-2017 compliance period. Over the first 10 years of the program, CO_2 emissions from RGGI power plants fell 47% regionally while electricity prices in RGGI fell 5.7%, even while prices increased in the rest of the country. The RGGI framework reduces GHGs, as well as other localized pollutants, at low cost. By reducing emissions of NOx, SO_2, and other pollutants that negatively impact air quality, RGGI achieves significant co-benefits in the form of improved public health. A report from Abt Associates found that, from 2009-2014, RGGI saved 300 to 830 lives, avoided 8,200 asthma attacks, and generated $5.7B in health savings and other benefits. Another study found that RGGI avoided 537 cases of childhood asthma. Proceeds from RGGI in Virginia are allocated to the CFPF. In its latest round, this fund provided $13.6M to local and regional governments across the state. This fund awarded over $32M in 2021. RGGI has funded critical, long-deferred investments in flood, encroachment, and subsidence mitigation projects, producing exponentially favorable, long-term returns and substantial reduction of present and future risk. The most recent auction has provided the state $452M in auction proceeds, which have been reinvested in projects and programs benefit residents and businesses across the state. Funding from RGGI auction proceeds unlock investment opportunities that can benefit communities of all income levels,	

	and can be directed to disadvantaged communities. By shifting Virginia's energy system to cleaner, low-carbon, and renewable sources, the state increases energy independence and reduces its exposure to volatility in global energy markets, providing stable energy prices to its ratepayers. These investments create jobs for Virginians. RGGI led to net job creation in all nine participating states from 2015-2017, creating over 14,500 job-years in that period. Over the first 10 years of the program, RGGI created over 44,000 job-years.	
23. Justin M. Wilson, Mayor, City of Alexandria	The City Council of Alexandria urges you to keep Virginia in RGGI. In addition to driving down GHG emissions, which improves air quality and public health, Virginia's participation brings in otherwise unavailable revenue to assist families with energy bills through weatherization funding and flood protection via projects funded by the CFPF. Flooding is the most common and costly natural disaster, and communities across Virginia are experiencing coastal, riverine and stormwater flooding more often, and with greater impacts to homes, businesses, roads, life, health and public safety, than ever before. We know that proactively investing in programs and projects to prevent flooding is a more efficient and effective use of taxpayer dollars than spending on flooding recovery, as exemplified by FEMA research showing that $1 spent on disaster prevention saves up to $7 in recovery costs. Virginia's participation in RGGI provides the sole source of funding for the CFPF, which is currently supported in its entirety by 45% of the revenue generated by our participation in RGGI. To date, the CFPF has granted just over $45M to communities across Virginia in support of flood resilience initiatives and efforts to reduce the impacts of flooding in these communities. But	See the responses to comments 4 and 7 for a discussion of the need to fund these types of projects, and the clearest, most effective means of obtaining and distributing funding.

	the demand far exceeds this level of investment, with over $93M in planning and project requests submitted during Round 3 alone. Localities across the state are working to put the infrastructure in place that can allow our communities to adapt and become more resilient in the face of the impacts of a changing climate. This significant undertaking requires a massive financial commitment that goes far beyond the ability of any single locality to fund with their own resources. As a Commonwealth, we must take advantage of every option to plan for and accelerate this work. This includes the CFPF, which is wholly funded through Virginia's participation in RGGI. In recent years, Alexandria has experienced severe impacts from multiple urban flash flooding events due to intense storms caused by climate change. The Flood Action Alexandria initiative was created in 2021 to accelerate capital projects and operating programs to help mitigate the impacts of flooding caused by these storms. The creation of this initiative coincided with a doubling of the local stormwater utility fee and a shift in resources to develop the Stormwater Management 10-Year Plan to focus on flooding mitigation capital projects and related programs. The city's commitment to investing in flood related infrastructure in Alexandria is clearly reflected in this $197M, 10-year stormwater capacity and spot improvement capital program, with $136M of investment planned over the next five years. In addition to these plans, programs and projects, the city has been awarded approximately $5.5M in CFPF grants, which have allowed us to accelerate these capital projects and bring relief to our community even faster than previously planned. For instance,	

	CFPF funding has allowed the city to begin delivering smaller flood mitigation projects in the equity area of Alexandria well in advance of the FY2026 scheduled funding for the large capacity project planned for this area. In this way, we can protect people and property from flooding ahead of our existing funding schedule while reducing the burden of the stormwater utility fee on rate payers. The CFPF is potentially even more valuable to localities across the state that otherwise would not have the financial resources or professional expertise to even take the first steps toward resilience, including developing flood vulnerability assessments and action-oriented flood mitigation plans. Communities across Virginia need to plan for, mitigate, and build resilience to the climate change impacts being felt today. The dedicated source of funding for the CFPF provided by Virginia's participation in RGGI is critical to our ability to do the work of flood mitigation and resilience planning in our communities.	
24. Levar M. Stoney, Mayor, City of Richmond Virginia	We cannot escape the environmental impacts of climate change that are taking shape in cities across the country, that's why I'm proud of the work that has gone into developing the RVAgreen 2050 plan. This framework is Richmond's equity-centered climate action and resilience planning initiative to reduce GHG emissions 45% by 2030, achieve net zero greenhouse gas emissions by 2050 and help our community adapt to climate impacts of extreme heat, precipitation, and flooding. However, local governments alone cannot solve the climate crisis. RGGI is a commonsense, market-based, cost-effective, and critically important program that cuts harmful carbon pollution while delivering a multitude of benefits to communities across Virginia. The proceeds from RGGI will fund vital	See the responses to comments 4 and 7 for a discussion of the need to fund these types of projects, and the clearest, most effective means of obtaining and distributing funding.

	programs including community flood preparedness and mitigation efforts as well as low-income energy efficiency and housing programs. Richmond has received $1,246,047 in RGGI CFPF funding that is increasing flood protection and improving public safety in some of the most vulnerable and underserved neighborhoods in our community. 80 low-income households in our community are receiving approximately $720,000 in much needed health and safety repairs from the RGGI funded WDR program. The repairs will help these households qualify for weatherization services that will lower utility bills and make the homes more comfortable. I urge the board to continue Virginia's participation in RGGI.	
25. Chesapeake Bay Foundation	RGGI has a demonstrated track record of reducing carbon emissions while funding key climate mitigation needs for the state. Before our participation in RGGI, Virginia had no funding to address the significant and costly impacts of flooding across the state and our energy efficiency programs were substantially underfunded. The cap-and-trade approach of RGGI means Virginia will continually draw down carbon emissions as it moves toward the net zero goals laid out in the VCEA. RGGI provides accountability that the state is taking the necessary steps to meet VCEA objectives while providing the resources to ensure our communities are prepared to handle climate change impacts. We know that cleaning up the bay is a priority for this Administration and so we want to highlight the importance of RGGI to bay restoration. Reducing emissions from fossil fuel production will improve air quality but those same reductions also help improve water quality. Scientists estimate that over one-third of the nitrogen that pollutes the bay comes from airborne	DEQ agrees with the commenter that the Chesapeake Bay is one of our most important natural resources; we disagree that participating in the RGGI program is the most efficient and cost-effective means of obtaining funding for bay protection projects.

	sources. Continuing to reduce NO_X emissions from the burning of coal and gas is a key component of the roadmap to a restored bay. RGGI has a demonstrated record of reducing emissions leading to cleaner air and waters. Climate change impacts such as sea level rise and increased rainfall intensity are already impacting the daily lives of Virginians, but these rising waters are also increasing nutrient and sediment loads to the bay. Increases in water temperature are reducing the bay's ability to hold dissolved oxygen. The Phase III Watershed Implementation Plan estimates 9M pounds in additional nitrogen reductions will be needed throughout the watershed to keep pace with climate impacts through 2025. As we look past 2025, sea level rise and rainfall intensity will continue to increase, bringing additional pollution loads into our waters. Virginia must do its part to reduce global emissions and the RGGI cap and trade approach ensures our numbers will continue to decline in the years ahead. Funds from RGGI are already helping communities across the state respond to climate impacts through the CFPF. The CFPF is the only source of state funding for resilience planning and project implementation, with 100% of those funds coming from RGGI auctions. RGGI has provided more than $200M to the CFPF since Virginia began receiving auction proceeds in 2021. As of today, nearly $46M has been awarded to more than 40 localities. CFPF funds capacity-building initiatives that most federal grant programs do not, providing necessary planning resources that allow localities to pursue larger projects. Grants from the CFPF can also be used as a local match for federal grant programs, making Virginia applicants more competitive for national programs.	

	Without a reliable, long-term funding source like RGGI, localities will be unable to complete flood resilience planning, studies, and implementation they need to address flood risk. CFPF also prioritizes the implementation of nature-based solutions. Major living shoreline projects, that would have otherwise not been built, will now be cleaning Virginia waters while protecting the communities around them. Our participation in RGGI supports bay restoration by funding practices that protect and enhance our waters. Without RGGI revenues localities would be forced to turn to funding sources that do not prioritize nature-based design, or worse, forego adaptation work entirely. Many of the historic approaches to water quantity have negative impacts on water quality which leads to additional financial obligations for the state. RGGI proceeds to the CFPF have an excellent return on investment to the state by prioritizing both safe communities and clean water. CFPF saves Virginia money on disaster response. The goal in building resilient communities is to avoid the catastrophic outcomes and costs in the aftermath of a flood disaster. A recent study from Old Dominion University estimated that sea level rise could cost the state $79B by the end of the century without significant intervention to assist localities. This study was limited to coastal communities but, as we have all seen in Buchanan and elsewhere, climate impacts are not limited to the shoreline. RGGI proceeds are benefitting Virginia taxpayers by addressing the pressing needs of today and mitigating the potential for crushing costs in the future. The Clean Energy and Community Flood Preparedness Act (§ 10.1-1330) includes a strong directive	

	for Virginia to participate in RGGI. We are concerned that any regulatory effort to remove Virginia from the program without clear legislative approval would be in contravention of the legislation, causing confusion, risking litigation, and undermining the deference otherwise due to DEQ.	
26. Center for Climate and Energy Solutions (C2ES)	Virginia's participation in RGGI is key to reaching the state's target of 100% clean electricity by 2050 under the Clean Economy Act. Without complementary policy like RGGI, compliance costs to meet this target will be higher. Nationally, RGGI is crucial to achieving net-zero economy-wide GHG emissions by midcentury, a necessary target to avoid the most catastrophic effects of climate change both in the United States and globally. Carbon pricing is an efficient and cost-effective way to reduce emissions because it creates accountability for environmental costs while allowing flexibility in how companies meet their obligations. Specifically with cap-and-trade programs like RGGI, policymakers can identify the proper emissions target and allow the cap to determine the most efficient price to achieve that level of abatement. Rising carbon prices increasingly unlock investments in mitigation that would have seemed uneconomical in the absence of a carbon price. Importantly, carbon pricing programs generate significant revenue that can be used to offset energy price increases for lower-income households and further support investments in technologies and programs that reduce emissions. In the case of RGGI, much of this revenue has been reinvested either in direct bill assistance for consumers or in energy efficiency measures that directly save households and businesses money. The benefits of implementing market-based	As discussed in the response to comment 7, programs to reduce carbon through direct emissions reductions and energy efficiency, and to mitigate carbon pollution through resiliency projects, are important--and expensive. Participation in RGGI is not the best means of achieving these goals in the most efficient, transparent, consumer-friendly means.

	programs rather than standalone command-and-control regulatory programs are that they provide greater compliance flexibility for covered entities and allow the market to determine the lowest-cost means of producing the greatest emissions reductions. Over the history of its operation, RGGI has demonstrated success in both reducing emissions in participating states while producing economic benefits and creating jobs. Between 2009-2020, RGGI states reduced their power sector emissions 50% from 2008 levels, a rate significantly higher than the nation's aggregate power sector emissions reductions of 39 percent during the same period. During the first three compliance periods, RGGI is estimated to have yielded a net benefit of $4.7B and more than 40,000 job years to the participating states. In 2020 alone, RGGI invested $196M across all participating states in energy efficiency, clean and renewable energy, beneficial electrification, GHG abatement, and direct bill assistance. These investments delivered more than $37Mn to 720,000 households and 38,000 businesses in direct bill assistance in 2020 and an estimated $2B in energy bill savings over their lifetime for 65,000 households and 800 businesses. Since Virginia's first auction in 2021, Virginia has received more than $452.2M in proceeds from the quarterly sale of allowances. Half of the revenue is directed toward low-income energy efficiency programs and 45% to the CFPF. Energy efficiency programs like WAP have demonstrated histories of success in reducing customers'' annual energy costs by an average of 12%, making this funding central to reducing low-income customer energy bills, rather than raising them. Support for community resilience is also increasingly	

	urgent. From 2017-2021, the total costs for weather and climate-related disaster events totaled over $788B, more than one-third of the total disaster cost of the last 43 years. With 70% of the state's population residing in coastal Virginia, funding for flood preparedness through RGGI will offer significant relief to a large portion of the state.	
27. Virginia League of Conservation Voters (VaLCV)	The VaLCV opposes removing Virginia from RGGI. Virginia's participation prevents pollution that has increased asthma rates among children, contributed to increased flooding, more frequent severe storms, rising energy costs, and deadly heat waves. At the same time, investments made from RGGI proceeds collected from pollution-emitting power plants return hundreds of millions of dollars to the state every year. These proceeds provide a market-based incentive to transition energy generation to cleaner sources while helping lower energy costs for Virginians in need and assist vulnerable localities in adapting to and mitigating flooding and sea level rise in their communities. Participation in RGGI is required by law and consistent with the official Commonwealth Clean Energy Policy (§ 45.2-1706.1) which aims to produce 30% of Virginia's electricity from renewable energy sources by 2030 and 100 percent of Virginia's electricity from carbon-free sources by 2040. RGGI has a proven track record of success, helping cut pollution at its source and reducing energy cost and volatility–driving our clean energy transition in Virginia. The data affirming RGGI's pollution-reduction success is clear, as the March 11 report issued by DEQ states: "RGGI has a long track record of emission reductions since the beginning of the program." Comparing EPA data from 2020-2021, Virginia's RGGI program slashed energy sector air pollution	See the responses to comments 4 and 7 for a discussion of the need to fund these types of projects, and the clearest, most effective means of obtaining and distributing funding. The legal authority for this regulatory action is detailed in the response to comment 9.

	by 14% in its first year. What's more, while Virginia is a relative newcomer to RGGI, in the decade-plus the program has been in operation, RGGI states have reduced climate-warming emissions reduced power plant carbon emissions by 50%, 90% faster than the rest of the country - while seeing 31% faster economic growth than non-RGGI states. RGGI is a core driver of the domestic clean energy economy, currently bringing good-paying jobs to Virginia. These jobs can benefit from emerging workforce development initiatives that transition those who were excluded from previous economic booms into meaningful, good-paying careers. RGGI directly incentivizes zero-carbon producers who benefit doubly from being able to sell electricity in the generation market at a more competitive price than carbon-emitting sources, and from selling their excess carbon allowances to polluters. This has led to a rapid expansion of clean energy jobs, as well as jobs in energy efficiency. The 2022 U.S. Energy and Employment Report shows the energy sector experienced positive job growth, increasing 4.0% from 2020-2021, outpacing overall U.S. employment. In Virginia, energy jobs increased by 8,330 jobs (4.9%), with 73,119 Virginians employed in energy efficiency. Of the 16,321 Virginians employed in power generation, over 60% (10,001) are employed by zero-carbon facilities. RGGI improves public health. Decreased air pollution results in fewer asthma attacks, premature births, and missed days of school and work. In 10 years, participating states realized $5.7B in public health benefits thanks to RGGI. These harmful pollutants are often concentrated in low-wealth and marginalized communities located more closely to emission sources–	

	causing these communities to experience higher rates of heart attacks, strokes, and asthma. Virginia uses RGGI proceeds to actively mitigate the impact of climate change for those most exposed to its effects, be it through flooding in the mountains, sea level rise along the coast, or rising energy costs during extreme heat events. These funds are designed to be disbursed equitably with an estimated 60% of total proceeds dedicated to helping either low-income individuals directly, or low-income communities. Since its first auction in March of 2021, RGGI has generated approximately $452M in cumulative proceeds. Half of these funds–paid for by polluters for each ton of CO_2 their facilities emit–help provide safe, affordable and energy-efficient homes to low-income families in ways that were never possible before RGGI. Thanks to the energy efficiency investments made to date, including $196M in 2020, consumers are on track to save $15B on their electric bills. Virginians also save money over the long term by reducing our reliance on costly fossil fuels. This summer, Virginians' monthly electric bills increased by $17-25 just to pay for the rising fuel cost associated with coal and methane gas. The RGGI-induced shift from high-cost fuels to zero-carbon sources of electricity with no fuel cost is part of the reason electricity prices have declined in RGGI states while increasing in the rest of the country. Reliance on zero-fuel-cost sources also reduces price volatility, making energy bills more predictable, in addition to more affordable. Forty-five percent of these proceeds provide flexible statewide funding dedicated to localities to plan for and prevent recurrent flooding through the CFPF. RGGI is the sole source of revenue for the statewide CFPF,	

	which is the only dedicated state funding source for critical flood resilience planning and project implementation for localities, tribes, and soil and water conservation districts across Virginia. Of the $203.5M RGGI has generated for the CFPF, nearly $46M has been awarded to more than 40 localities. There is a massive need for this funding. If left unchecked, flooding damages are projected to cost the state $79.1 B. The CFPF funds capacity-building initiatives that most federal grant programs do not, providing critical planning resources that allow localities to pursue larger project implementation requests. The CFPF can also be used as a local match for federal grant programs, making Virginia applicants more competitive for national programs. Without a reliable funding source like RGGI to keep money flowing in the CFPF, localities will be unable to complete necessary flood resilience planning to address current and future flood risk. Notably, 25% of CFPF monies are set aside for low-income geographies and the CFPF prioritizes implementation of nature-based solutions. Small and rural communities already experiencing increasing flood risk can't afford to leave this money on the table. Participation in RGGI is the product of a legislative mandate and the culmination of years of research and review. Starting in 2016, a workgroup with extensive stakeholder engagement produced recommendations for reducing carbon emissions from electric power facilities, concluding in its final report that it is "important and necessary that Virginia work through a regional model, like the established and successful RGGI, in order to both achieve lower compliance costs and address the interstate nature of the electric	

	grid." DEQ then engaged in a multi-year process of developing regulations to regulate carbon emissions from power plants through market-based means, trading allowances through a multi-state program. The original rulemaking began in 2018 and in 2020, the General Assembly passed a law requiring Virginia's participation in RGGI. Following these new requirements, the revised final regulation took effect July 2020. Governor Youngkin lacks the authority to take us out of RGGI through the regulatory process. In addition to being the culmination of a multi-year regulatory endeavor supported by a data- and stakeholder-driven report, our participation in RGGI is mandated by policies the General Assembly passed in 2020. According to an official advisory opinion from the Office of the Attorney General released January 11, 2022: "The Virginia Constitution is clear: the Governor does not have the authority to single-handedly repeal or eliminate a law or regulation that has been passed by the General Assembly." RGGI is consistent with official state policy and has clear benefits to the environment, public health, and state economy. We must not seek to take away the best and only tool Virginia has to simultaneously address climate change-inducing pollution at its source, while helping Virginians deal with effects of climate change.	
28. City of Fairfax	The Environment and Sustainability Division urges the Administration to remain a member-state under RGGI, as a high-performance mechanism for delivery of vital services and benefits to Virginia's citizens and businesses. This market-based program provides direct, cost-effective benefits addressing energy efficiency opportunities for the vulnerable	See the responses to comments 4 and 7 for a discussion of the need to fund these types of projects, and the clearest, most effective means of obtaining and distributing funding.

	populations and addressing community resiliency.	
29. City of Hampton	Currently, proceeds from RGGI allowance auctions are the sole source of funding for the CFPF. Since March 2021, RGGI has generated more than $203.5M to enable the CFPF to provide grants and loans to localities throughout the state in support of resilience projects. These funds have provided a meaningful source of financial support for localities throughout the state. Cities, towns and counties need substantial resources to adapt to changing realities of flooding driven by sea level rise, as well as shifting patterns of precipitation and storm events. The scale of this need is illustrated by the number of applications and awards CFPF has seen to date. To date, 76 applications have been awarded funds, while an additional 32 applications were selected for supplemental review. Like many localities, Hampton's existing challenges with flooding are expected to become more severe in years to come. According to modeling completed for the Virginia Coastal Resilience Master Plan, in the next forty years as much as 65% of the city's land area will be at risk of flooding from coastal events alone as a result of sea level rise. Low-lying roads and land throughout the city are already regularly underwater with nuisance tidal flooding as a result of our changing climate. Hampton has dedicated significant local resources to holistically address the increasing challenge of recurrent flooding, sea level rise, and shoreline erosion. Efforts have included completing multiple local resilience plans and identifying dozens of new implementable projects to reduce the impacts of flooding to our community now and into the future. At the same time, we must continue to invest in maintaining the city's aging	See the responses to comments 4 and 7 for a discussion of the need to fund these types of projects, and the clearest, most effective means of obtaining and distributing funding.

	infrastructure to ensure it remains functional in the face of these threats. The city's stormwater infrastructure network struggles to keep pace with increasing stormwater loads and tidal backflow. The financial burden associated with monitoring and planning for changing flooding impacts, adapting public infrastructure and lands to reduce the severity of flooding, and protecting citizens from these natural hazards far surpasses the City of Hampton's available financial resources. The scale of this challenge requires that localities, Planning District Commissions, the state, and the federal government come together to identify multiple pathways by which the built and natural environment will adapt. Hampton is grateful to have received 7 awards totaling more than $9.5M from the state through the CFPF to date. This funding option has provided us with a financial tool with fewer barriers and greater opportunity for success when compared to federal-level funding opportunities. As a result, we are advancing needed projects that are aligned with the Commonwealth's stated values and goals for coastal resilience more quickly, and are able to dedicate our limited financial resources to other identified project needs. The City of Hampton urges the Administration to continue to build upon the success of the CFPF by either keeping Virginia enrolled in RGGI, or to otherwise ensure that there remains a dedicated source of revenue to finance the CFPF, thus continuing to serve all Virginian citizens through flood mitigation benefits.	
30. William Nuckols, Town of Colonial Beach Planning Commission	As a part of my work as a Commissioner on the Planning Commission, I also head up our Resilience Committee, and as such I've come to know of the great disparity between the need and the	The commenter's concerns are recognized. The responses to comments 4 and 7 provide a discussion of the need to fund these types of projects, and the clearest, most effective means of obtaining and distributing funding.

	ability to fund projects relating to resiliency, particularly those relating to planning and addressing persistent problems of erosion and flooding in our community. I write in support of the continuation of Virginia's participation in RGGI as the linkage between the funding made available from the RGGI auctions and the funds distributed from the state to address serious funding shortfalls for resilience projects to be both logical and appropriate. We have not yet been in a place to receive RGGI funds, not because the town does not need the funding support--quite to the contrary, our needs as a coastal town to be resilient in the face of changing conditions is great. Our lack of RGGI awards is solely because our professional staff is significantly smaller than some of the larger cities who have already been awarded funds to address their coastal resiliency issues. Our town may have not yet been in a place to request funding from the state thus far, but intend to do so if the RGGI funding continues. Removing Virginia from RGGI will eliminate a crucial funding stream that can be applied to address the needs of the Colonial Beach and numerous small to medium size coastal communities like ours. While there are smaller programs that can help communities such as ours, none operate at the scale of that the RGGI fund can support. Our needs are in the millions, and so far only the RGGI program is operating at a scale that can address that level of need. I find the linkage between the rationale for the RGGI collection of funds and the use of those funds as administered by DCR. The linkage between the RGGI auctions and the resulting funds raised to address strengthening Virginia's resilience is strong and appropriate. Terminating the RGGI program in Virginia before less	

	affluent towns and counties have even had a chance to apply for RGGI funding support is not appropriate. The town needs both time to apply and the continuation of the increases to the fund from RGGI auctions. EO-9 poses that "benefits of RGGI have not materialized," and while that statement may be accurate in some sense, in large part it is because not enough time has passed to allow the need of impacted communities to receive the impact funds from the RGGI program in terms of shovel in the ground projects. Cutting off participation in RGGI now leaves our town, and small to mid-size communities like it, without any opportunity to realize the benefits of RGGI Don't kill the program before it matures enough to have a positive impact on communities such as ours. While the Governor is proposing to end Virginia's association with RGGI, neither the Director of DEQ, the Secretary of Natural and Historic Resources, nor the Governor's office have made any indications where the loss of funding from the RGGI auctions will be made up. Will there be proposals forthcoming to increase the tax burden on Virginians to made up for the loss in RGGI funds, or is the likely outcome that much needed funding for coastal resilience and flood prevention will simply dramatically shrink, leaving our people and our economy more vulnerable as a result? I fear that without RGGI there simply is no funding source available at the scale required to address the threats to Virginia from an evolving level of threats that the RGGI funds could mitigate. I ask that you please reconsider any decisions that would remove Virginia from RGGI and thereby cut off the funding stream that is so greatly needed to address a multitude of projects our town needs to	

	complete to ensure the sustainability of our historic coastal community.	
31. Southern Environmental Law Center (SELC)	Virginia's emissions reduction program took years to develop over multiple administrations. In 2016 then-Governor McAuliffe issued an executive order directing the Secretary of Natural Resources to establish a work group to study and recommend methods for reducing CO_2 emissions from the electric power sector. After almost a year of public engagement, the work group submitted its recommendations. Based on those recommendations, Governor McAuliffe issued an executive directive in 2017, which instructed DEQ to develop regulations to "abate, control, or limit carbon dioxide emissions from electric power facilities" using "market-based mechanisms" that allow for the "trading of carbon dioxide allowances through a multi-state trading program." DEQ and the board engaged in a multi-year public regulatory process that included two rounds of public comment and multiple revisions to the proposed trading program. The board ultimately approved a version of the program in 2019, although the original program's implementation was delayed due to a budget restriction in the state's 2019 budget. This original program used a consignment model, whereby DEQ would have distributed Virginia's allowances to existing power plants in proportion to their historical emissions but would not sell those allowances directly at auction. Had this been the end of the story, future administrations could have changed course by following regulatory processes without involvement of the General Assembly. The original program had been promulgated under the board's general regulatory authority, so in theory, the program could have been modified or repealed under the same general authority. But that is not the end of the story. In 2020, the General Assembly removed the budget restriction and passed a law	The commenter's summary of the background of activities leading to Virginia's current participation is appreciated. Since then, Virginia's participation in the program to date has been evaluated, and it has been determined that Virginia's participation is no longer needed. As discussed elsewhere, funding for energy efficiency and resiliency programs need not be tied to participation in RGGI.

	specifically about Virginia's Emissions Reduction Program and participation in RGGI. The 2020 Clean Energy and Community Flood Preparedness Act requires Virginia to issue the Emissions Reduction Program and participate in RGGI and requires the proceeds from the sale of Virginia's allowances to be used to help low-income families reduce energy bills and localities address recurrent flooding issues. In other words, the General Assembly decided as a matter of law that Virginia would participate in RGGI. The program was no longer subject only to the board's general regulatory authority, but also the specific requirements of the 2020 law. To comply with the new law, DEQ revised the existing 2019 program. Recognizing that the program had already gone through extensive public rulemaking, and had already been delayed a year, the General Assembly expressly exempted this revision process from the APA and required DEQ to issue the revised regulation directly. This exemption meant that the revision did not require public notice and comment, nor did it require board approval. DEQ followed the requirements set forth by the General Assembly and issued a revised regulation establishing the current program in August 2020. Since January 2021, power plants in Virginia must account for their carbon pollution in accordance with the emissions reduction program. Knowing that the supply of these allowances steadily reduces each year, power plant owners and operators must figure out the most cost-effective ways to reduce their emissions over time. Virginia's program is a critical tool to address a major cause of climate change. It also complements another piece of legislation the General Assembly passed in 2020, the VCEA, which sets forth a pathway for a carbon-free electricity sector by mid-century. Virginia's participation in RGGI helps ensure Virginia fulfills the requirements of the VCEA in a sensible, cost-	

	effective way. The program benefits all Virginians in numerous ways: - Through its proven market-based mechanism, the program is working to drive down air pollution and improve public health; - Continued participation in RGGI will help protect customers from rising fossil fuel prices as power plant owners reduce reliance on fossil fuels; - Low-income households are getting their homes weatherized and getting the energy bill relief they need; - Highly efficient affordable-housing units are under construction to help fill the severe affordable-housing gap with units that will come with low energy bills for tenants; and - Localities have access to a dedicated state fund to help address the increasingly devastating flooding that is happening across the state. Undoing the program would severely hamper efforts to reduce air pollution and improve public health, and definitively eliminate those important sources of funding.	
32. SELC	On December 8, 2021, prior to taking office, then-Governor-elect Glenn Youngkin announced his intention to withdraw Virginia from its participation in RGGI. On January 11, 2022, then-Attorney General Mark Herring issued an official advisory opinion concluding that "the Governor may not repeal or eliminate, through an executive order or other action, the enacted statutes and regulations pertaining to the Commonwealth's participation in the Regional Greenhouse Gas Initiative and/or a market-based trading program like the Regional Greenhouse Gas Initiative, or do away with the requirement that electricity producers hold carbon dioxide allowances that equal the amount of their carbon dioxide emissions." As the opinion explains, the "Constitution of Virginia does not grant the Governor the power to	The summary of past actions relevant to Virginia's participation in RGGI is recognized. The purpose of the current regulatory action is to move the Commonwealth forward in a direction that will improve our ability to develop, fund, and implement these important programs in an efficient, cost-effective, and transparent manner.

	suspend laws, and in fact, it requires the opposite that '[t]he Governor shall take care that the laws be faithfully executed.'" In addition, the opinion cites Article I, Section 7 of the Constitution of Virginia, which provides "[t]hat all power of suspending laws, or the execution of laws, by any authority, without consent of the representatives of the people, is injurious to their rights, and ought not to be exercised." On January 15, 2022, the Governor was sworn into office. That same day, he signed EO-9. Rather than attempting to withdraw Virginia from RGGI directly by executive order--which according to former Attorney General Herring would violate Virginia's Constitution--the Governor asked the board to repeal the underlying regulation. Specifically, EO-9 asked the Director of DEQ to develop two repeal tracks for board approval. The first track (Directive 2) involved a proposal to repeal Virginia's program using emergency regulatory authority, i.e., without the normal public comment period, and the second track (Directive 3) involved initiating a full rulemaking process to make the emergency repeal permanent. EO-9 also requested that DEQ create a "report re-evaluating the costs and benefits of participation in the Regional Greenhouse Gas Initiative Inc. in view of all available data, within 30 days." On March 11, 2022, DEQ provided that report to the Governor, which included a draft proposed emergency regulation and a draft NOIRA for a permanent regulation. Attempts to repeal the underlying law failed in the 2022 General Assembly. Meanwhile, on the regulatory track, the administration took no action for nearly six months, despite the claim that repealing RGGI was so urgent it warranted an unprecedented use of	

	the board's emergency regulatory powers. Finally, at the August 31, 2022 board meeting, Acting Secretary of Natural and Historic Resources Travis Voyles announced that the administration had abandoned the emergency regulatory approach and instead would be moving forward with plans to repeal the regulations through the normal APA process, with the goal of withdrawing Virginia from RGGI by the end of 2023. The administration subsequently published a NOIRA in the Register on September 26, 2022, which proposed the development of a regulation to repeal the program.	
33. SELC	As a policy matter, the current administration does not favor Virginia's participation in RGGI. We disagree; the benefits of Virginia's participation in RGGI are clear and backed by a long track record of success. Regardless, neither we, the administration, nor the board gets to decide this policy. The General Assembly decided Virginia's policy in 2020, when it passed the Act and thereby required Virginia's participation in RGGI. As such, it is the board's responsibility to implement this law, not contradict it, which is what repealing the regulation would do. Multiple provisions of the Act make clear that Virginia must join RGGI and that the regulation cannot simply be repealed. Foremost, the Act specifically requires DEQ to issue and implement the regulation establishing the program. The Act mandates that DEQ incorporate the provisions of the Act into the regulation, without any further action by the board or need to undergo regulatory review under the APA, thus giving DEQ and the board no discretion about whether to adopt the regulation. The law expressly requires it. The Act then grants DEQ the authority it had lacked previously: to sell	The commenter's discussion of former administration activities is appreciated. The legal authority for this regulatory action is discussed in the response to comment 9.

	allowances directly like every other state participating in RGGI. The very next sentence then mandates that the Director of DEQ actually use this new authority, requiring the Director to sell the allowances in the RGGI auctions. The Act goes on to require that DEQ and other agencies "prepare a joint annual written report describing the Commonwealth's participation in RGGI, the annual reduction in greenhouse gas emissions," and the use of revenues collected from RGGI auctions--further indicating the General Assembly's intent that Virginia would join RGGI. The Act is thus unequivocal. The General Assembly required the issuance of regulation and mandated that Virginia participate in RGGI. And in 2020 and 2021, agency officials did exactly what the law required. DEQ revised the program as required by statute, and Virginia began participating in RGGI. Pursuant to the General Assembly's mandate, Virginia is selling 100% of its allowances in the RGGI auctions and using the proceeds to help Virginians as specified in the statute, while power plant owners and operators are acquiring the necessary allowances to account for their carbon pollution. Repealing the regulation would contradict the law. Most evidently, the administration has no authority to repeal a regulatory program that the law specifically required to be issued and implemented. And without the program, numerous other statutory provisions will be violated. Virginia will not generate allowances for the Director to sell at auction. The state treasury will be unable to distribute funds in accordance with the statute. The applicable agencies will be unable to report on the state's participation since Virginia will not be a participant. Not only would the repeal under consideration violate the Act, any decision to do so would also amount to a	

	constitutional violation. The board may not suspend or ignore the execution of laws, nor invade the General Assembly's legislative power, including taking actions contrary to statute, which is what repealing the regulation would do. Even though the text of the Act clearly establishes that Virginia must join RGGI, Governor Youngkin nevertheless takes an opposing view, suggesting in public news reports that the Act merely gave DEQ the discretion to decide whether to participate in RGGI. This argument is based on just one sentence of the Act and ignores the fact that the Act specifically mandates the issuance of this regulation, and every other portion of the Act clearly mandates that Virginia participate in RGGI. The Governor's interpretation is a nonsensical reading of the statute that renders provisions of the law meaningless and adds qualifying language to mandatory requirements where no such qualification exists. Not only is the language of the Act clear, contemporaneous statements from lawmakers and regulators clearly show an intention and expectation that the law itself required DEQ to adopt the program so that Virginia would participate in RGGI. For example, after the Act was put on the Governor's desk, then-Governor Ralph Northam issued a press release stating: "The Act establishes a carbon dioxide cap-and-trade program to reduce emissions from power plants, in compliance with the Regional Greenhouse Gas Initiative (RGGI). The Department of Environmental Quality will establish and operate an auction program to sell allowances into a market-based trading program." David Paylor, then Director of DEQ, made similar statements about how the Act required participation in RGGI, as did Senator Lynwood Lewis, a co-sponsor of the legislation.	

	Moreover, a group of over 60 members of the General Assembly, most of whom were members who voted on the Act, recently sent a letter to the board reiterating that Virginia is required by law to participate in RGGI. The Governor's flawed interpretation is also diametrically opposed to the prior positions of DEQ, the board, and the Attorney General's Office. For example, after DEQ issued the regulations establishing the program, the Virginia Manufacturers Association (VMA) challenged the program, asking the Circuit Court for the City of Richmond to declare the program null and void. VMA argued that DEQ had "the optionality to comply with the Act by joining RGGI, another carbon trading program with an open carbon trading market, or by simply implementing the Original Trading Rule," and that therefore those discretionary decisions were not exempted from administrative process. The trade group also argued that the program was an unconstitutional tax and void due to vagueness. In defending the program, the Attorney General's Office explained repeatedly that the Act did not merely provide DEQ with discretionary authority to run a direct auction program; rather, the Act mandated that DEQ actually use such authority by selling the allowances at auction. The court agreed with the Attorney General's Office and denied the VMA challenge in its entirety. Similarly, the Attorney General's Office has also issued opinions concluding that the Act required DEQ to adopt and implement the Emissions Reduction Program, including selling allowances at RGGI auctions--and that this requirement could be reversed only by an act of the General Assembly, not by the Governor, DEQ or board. As these statements show, lawmakers, regulators, and the Attorney	

	General's Office have all consistently understood that the law requires Virginia's participation in RGGI. There is simply no basis for the current administration to take an opposing view--a view that sharply contradicts the law's plain language and the well-established understanding of the law as set forth by numerous officials and lawmakers, and in official court filings. The administration may not repeal the regulation or withdraw Virginia from RGGI absent legislative consent.	
34. SELC	The administration also asserts that the state must leave RGGI because "the benefits of RGGI have not materialized" and RGGI is placing "a substantial burden" on Virginians in terms of higher electricity costs. Both assertions are disingenuous. Virginia has been part of RGGI for less than two years, so it is far too early to reach definitive conclusions about its success. Nevertheless, Virginia has already experienced substantial benefits from participating in RGGI, including reduced emissions (and corresponding improvements in public health) and hundreds of millions of new dollars in dedicated funding for flood prevention, weatherization of low-income homes, and construction of efficient affordable housing. Other RGGI states have experienced similar drops in emissions while maintaining solid economic growth, which indicates that the net benefits to Virginians will only continue to increase in the years to come. Moreover, while we share the administration's concerns about high electricity bills for Virginians, repealing the regulation in no way fixes that problem. Those increases are due to various non-RGGI factors, most notably increases in fossil fuel costs. And, more importantly, the appropriateness of electricity rates is a question for the General Assembly and the SCC--the body the General Assembly has put in charge of evaluating	As discussed in the response to comment 7, the costs of any carbon reduction program will be borne by the state one way or another. We suggest that these costs be managed in the most transparent way possible.

	utility rates. The board and DEQ should be focusing on its charge, namely, abating air pollution. Given that DEQ has said participation in RGGI is necessary to meet the Commonwealth's emissions goals, there is no reason to repeal the regulation and withdraw from RGGI, even if the board had the authority to do so. Perhaps the most important benefit of participating in RGGI is that it will help drive reductions in power plant emissions in Virginia, which represent roughly 30% of the CO_2 emissions in the state. According to DEQ, "an emission reduction program or combination of programs will be required to meet the Commonwealth's climate goals of the [Virginia Clean Economy Act] and the 2045 net-zero carbon emissions goal. In the absence of any such program, emissions may not reduce sufficiently to achieve these goals." Continued participation in RGGI is thus vital to reducing emissions and ensuring that the state meets its climate goals. Moreover, meeting that net zero goal is critical for helping Virginia avoid the worst impacts of climate change. Left unmitigated, it is estimated that sea level rise will cost the state about $56B in financial damages and lead to a $79B decline in economic output by the end of the century. Sea level rise also could place as many as 400,000 Virginia homes and 900 miles of roads in the Hampton Roads area at risk from storm surges, and it would cost hundreds of billions of dollars to replace those homes and roads. Climate-related shifts in precipitation and weather are also expected to cause water shortages in roughly half of Virginia's counties, potentially imperiling agriculture, which is Virginia's largest industry, supporting almost 311,000 jobs with an annual economic impact of $52B. All of these harms are being mitigated by Virginia's participation	

	in RGGI, both by driving down climate changing emissions and by bringing in critical funding for flood planning and projects. Given those long-term needs and goals, it makes sense that the General Assembly would want to ensure that Virginia participated in RGGI. The entire purpose of RGGI is to reduce emissions in participant states, and it has been effective in achieving that goal. As the current administration has acknowledged, "the RGGI region has a long track record of emission reductions since the beginning of the program" The nine states that have participated in RGGI from the outset saw their power plant emissions collectively drop more than 50% between 2009-2020. That net reduction is approximately 90% more than the rest of the U.S., showing that RGGI participation is a key driver of emissions reductions from power plants. Before joining, Virginia, like the other non-RGGI states, did not see its power plant emissions decline during that period. According to DEQ's EO-9 Report, between 2010-2020 (before Virginia joined RGGI), mass emissions for the power sector remained fairly constant with no discernable trend. But ever since Virginia joined RGGI, there has been a clear shift. Since the beginning of 2021, Virginia's power plant emissions have followed the same downward trajectory as other RGGI participants. Virginia's total CO2 emissions in 2021 were over 4M tons lower than in 2020 (28.6M tons v. 32.8M tons), and emissions during the first half of 2022 have been even lower than the same period in 2021 (12.1M tons v. 13.6M tons). While emissions totals can fluctuate, the pattern is obvious--a long period of stagnating emissions before Virginia joined RGGI, followed by a continual year-over-year decrease in emissions after it did so. Moreover, since RGGI is structured so that the number of available	

	carbon allowances decreases 3% year-over-year, there is every reason to expect that those trends will continue. All of this clearly indicates that RGGI helps drive emissions reductions in participating states and that Virginia's efforts to reduce emissions would be severely hampered if it left RGGI. Participation in RGGI provides substantial benefits to Virginians. It will help Virginia reduce a significant source of CO_2, help protect against the worst effects of climate change, and reduce the costs of responding to extreme weather and sea level rise. Reducing emissions also will result in better health for Virginians by reducing particulate matter and other air pollutants. RGGI auctions are bringing in hundreds of millions of dollars per year to the state, which is required to be used on weatherization, flood prevention, and other measures that directly improve the lives of Virginians. Carbon pollution poses a significant threat to Virginians' health, welfare and safety. According to the CDC, the burning of fossil fuels has resulted in negative impacts to air and water quality and been linked to increased incidence of asthma and cardiovascular disease. Climate change also is leading to improved survival rates for vectors like ticks and mosquitos, resulting in increased incidence of disease. Being part of RGGI will undoubtedly improve those health outcomes. One study estimated that in just the first six years of RGGI's existence, emissions reductions from the program resulted in at least $5.7B in health benefits, including avoidance of 39,000 lost work/school days, 8,200+ asthma attacks, and 300–830 excess deaths. A later study identified an additional $200+ million in children's health benefits from reduced particulate contamination.	

	The sales of allowances at RGGI auctions are also netting significant revenues for the state. To date, Virginia has participated in seven RGGI auctions and has sold all of the 40+ million allowances it has placed into those auctions, receiving approximately $452M from those sales. Virtually all of those revenues are being used to respond to critical needs for Virginians--helping low-income households to reduce energy bills and assisting localities across the state with planning for and preventing recurrent flooding. As required by the Act, 50% of the proceeds from the RGGI allowance sales are credited to an account administered by DHCD to support low-income energy efficiency programs, including programs for eligible housing developments. DHCD developed its HIEE program to distribute the proceeds to WDRP and ASNHP. The WDRP funds repairs that have caused homes or units to be deferred from WAP. It is entirely funded by Virginia's sale of allowances in the RGGI auctions. DHCD uses RGGI proceeds for the ASNHA program, which completes energy efficiency upgrades that would not have been feasible otherwise. Through two rounds of applications, DHCD has used over $29M in proceeds from Virginia's allowance sales to help fund 36 high-efficiency affordable housing projects, representing more than 2,200 affordable housing units. These projects are distributed across the state. The Act requires another 45% of RGGI revenues to be placed in the CFPF, administered by DCR to assist localities and their residents affected by recurrent flooding, sea level rise, and flooding from severe weather events. To date, DCR has awarded a total of $45.9M in grants across three rounds of grants to 76 different projects across Virginia.	

	Repealing the program and withdrawing from RGGI would deprive citizens of hundreds of millions of dollars annually toward addressing these important causes. In most cases, RGGI revenues are the sole funding sources for those programs, so they would cease to exist if Virginia no longer participates in RGGI auctions. Leaving RGGI would thus do a grave disservice to Virginians and cause substantial harm to those vulnerable communities.	
35. SELC	The NOIRA and EO-9 Report both incorrectly claim that RGGI is placing a substantial burden on Virginians because RGGI compliance costs are driving rising electricity costs in Virginia. As an initial matter, the board may not premise a repeal based on the fear that Virginia's participation in RGGI might cause electricity rates to rise. The General Assembly expressly authorized utilities to seek to recover RGGI compliance costs from customers through a rate adjustment clause, subject to SCC approval. The board simply has no authority to second-guess the General Assembly's decision or take oversight authority away from the SCC. But moreover, the entire repeal proposal rests upon a flawed premise. RGGI is not driving increases in electricity bills. As of October 26, 2022, there is no active SCC-approved rate adjustment clause for either Dominion or Appalachian Power RGGI compliance costs. In other words, if the administration's illegal repeal took effect immediately, customers would not save a single penny. Even if there were SCC-approved rate adjustment clauses for either utility to cover RGGI compliance costs, electricity prices began increasing long before Virginia's participation in RGGI. Since Virginia re-regulated its electric utilities in 2007, customers have seen significant increases in electricity rates--increases that far exceed RGGI compliance costs.	See the response to comment 6 for further discussion of the utility structure in Virginia.

	The SCC laid this fact out in a report issued in September 2022. SCC figures clearly show that, for both Dominion and Appalachian Power, almost the entire increase in electricity costs has come from rate adjustment clauses, which are SCC-approved requests by utilities to recover costs for specific projects or compliance costs. The report also clarifies that none of these rate adjustment clause-related cost increases are caused by RGGI. Even more recent rate increases are not due to RGGI. According to the same SCC report, factors contributing to increased utility costs include inflation, pandemic recovery, supply chain limitations, and high natural gas and other commodity prices, as well as geopolitical events. RGGI was not listed as a contributing factor. Fuel factor costs add over $35 a month to the average Dominion residential bill--about one-quarter of the total. That includes an approximately $15 monthly increase that Dominion recently applied for (and the SCC approved). Due specifically to increased fossil fuel costs—primarily natural gas and coal, costs which have nearly doubled year over year--Dominion had under-recovered fuel costs by $1B and sought approval to raise the fuel factor significantly to cover this significant shortfall. Notably, this shortfall is for a single year, but at Dominion's request, customers will pay it off over three years. Had Dominion opted to collect its under-recovery over a one-year period, as is typical, bills would have been raised by $24 per month. Moreover, Dominion may seek additional rate increases next year if fossil fuel costs remain high, which they are expected to do. This means customers may face additional bill increases due to fossil fuel costs, before they have even paid off the 1-year, $1B under-recovery. Numerous other rate adjustments are driving up	

	customer bills, most of which are also fossil fuel-related. Dominion customers pay over $17/month for riders specifically related to coal or gas facilities. At present, the sole RGGI-related rate adjustment has been zeroed out, but even if Dominion were to reinstate it, that amount ($2.39/month) would pale in comparison to the fossil fuel-related charges, which total well over $50/months. The same pattern holds true for customers of Appalachian Power. At present, they pay $23/month for fuel factor costs, though the utility has a pending request to raise that amount to over $40/month to address recent increases in fuel costs. If approved, that would mean that between a quarter and a third of Appalachian Power residential customer bills would be fossil fuel-related costs, not to mention another $5+/month for coal and gas-related operations. By contrast, there are no approved RGGI-related surcharges for Appalachian Power customers currently, and less than $4/month is attributable to clean energy or energy efficiency programs. As Appalachian Power itself acknowledges, the best way to reduce customers' bills is to increase use of renewable energy so there is less need for coal and natural gas to generate power. While an almost never-ending proliferation of rate adjustment clauses has undoubtedly driven customer electricity rates up in Virginia, RGGI is not the cause of that increase. The administration has it exactly backwards when it comes to RGGI. As explained previously, without RGGI, Virginia power plant owners failed to reduce emissions from 2010-2020. Had RGGI been in place in Virginia during this time, customers would have been far better protected from the recent rise in fossil fuel costs. Participating RGGI states, for example, saw their emissions drop	

	by 50% between 2009-2020, meaning existing RGGI states were far less reliant on fossil fuels prior to the recent rise in fossil fuel costs. RGGI is a tool that protects customers from a major driver of rising electricity costs--fossil fuel costs--yet the administration seeks to repeal it. Moreover, though electricity prices have increased, Virginia's average retail electricity prices remain below the national average, even since joining RGGI. The average retail price of electricity across all sectors in Virginia is consistently lower than the national average over the last five years. The NOIRA states that "Virginians pay on average $2,323 per year in non-transportation energy costs, which is higher than the national average of $1,850." The administration simply refers to the U.S. DOE for these numbers but does not examine or explain the reasons for this difference. Are Virginians using more electricity? Are homes less efficient? Do they rely on electric heat more than other states? Are retail gas prices higher in Virginia than other states? Without understanding the cause, the administration has no basis for its misguided solution. In fact, repealing RGGI will exacerbate this problem. Continuing participation in RGGI will help lower non-transportation costs in two ways: forcing utilities to reduce reliance on fossil fuels that are currently (and likely to continue) causing significant increases in customer electricity costs; and providing funding to improve home efficiency and lower electricity bills. Moreover, the NOIRA is simply wrong in stating that RGGI operates as a direct tax in which all RGGI compliance costs are passed through directly to consumers with no incentives for the utility to change. Rather, the law permits monopoly utilities to seek recovery of compliance costs, but the utility may recover only those costs the	

	SCC finds to be necessary to comply with the emissions reduction program, in accordance with the statutory standard Customers thus are charged only when the utility tries to recover the costs and the SCC finds the costs necessary. Notably, although Dominion has sought to recover such costs in the past, it recently withdrew that rate adjustment request and the SCC approved that recission, meaning that customers have not been paying any RGGI-related costs for the past several months, even though Dominion continues to participate in RGGI auctions. The data is clear. The real cause of rising electricity costs is not RGGI--utility bills are high due to fossil fuel costs and myriad anti-customer provisions in Virginia's utility code that predate RGGI. Put another way, leaving RGGI will not reduce electricity rates by a single penny. If the administration wants to work to rein in electricity prices, it should recognize that RGGI is a tool that can help protect customers from fossil fuel prices and instead focus efforts on ongoing bipartisan work to reform the ratemaking system. In the last several years and this year, many bills have been introduced that would advance fair energy utility rates and enhance the availability of customer refunds. If the administration wants to reduce Virginians' energy costs, it should focus on the fundamental problems with Virginia's utility regulation.	
36. International Emissions Trading Association (IETA)	In more than a decade of operation, RGGI has only seen one state (New Jersey) leave the first-ever U.S. GHG cap-and-trade system. This departure occurred in close coordination with RGGI Inc., and at the end of a compliance period. RGGI faced minimal impacts from the state's departure, as New Jersey compliance entities were required to meet their compliance obligations at the end of that final period (prior to exit), and most of their allowances were	The commenter is correct that lowering electric bills without creating major market disruptions is essential, which is why DEQ is proceeding along the full APA regulatory path. The strategic goal is to finalize the regulation and ensure that compliance entities meet their final compliance obligations, all to coincide when the current contract with RGGI Inc., expires, and at the close of the current compliance period, at the end of 2023. This glide path has been designed to provide a smooth transition with minimal disruption to current regulatory and

	retired and removed from the program. We urge DEQ to craft regulations that minimize harm to electricity consumers and limit legal challenges as the state opts to leave RGGI by the end of 2023. This approach would help to achieve Governor Youngkin's goal of lower resident's electricity bills without creating major market disruptions. There are estimated 24.4M allowances in circulation held by Virginia entities for their estimated compliance obligations for 2021 and through June 2022. These holdings represent more than $320M in value to the utilities that hold them. Any move by the state to leave the program should be done to ensure these allowances still retain value until the state exits the scheme. In addition, much of the costs of those allowances has already been recovered or will be recovered from ratepayers by utilities. A path that would unilaterally scrap compliance obligations over the existing three-year period would effectively be a financial windfall for utilities, with Virginia residents bearing the brunt of this approach. Put simply, a DEQ decision to remove RGGI obligations would adversely impact electricity consumers, which would conflict with EO-9. Moreover, a regulatory framework that would remove obligations would also be legally fraught as Virginia would have acquired revenue for carbon allowance auctions without requiring entities to prove compliance with the relevant CO_2 program. As a real-life example, the Ontario Premier took a similar approach by stripping CO_2 obligations as the Canadian province left the Western Climate Initiative in 2018. Ontario did not offer refunds for allowances held, and the collective decision resulted	planning processes, and is similar to the approach taken by New Jersey.

	in numerous legal challenges, many of which are still ongoing. IETA urges Virginia to select a path that assures consumers will experience the least impact while not imposing additional legal burdens on the state. Maintaining the RGGI program CO_2 obligations through 2023 before transitioning away from a regulated market will provide certainty to market participants and consumers in Virginia. This approach would be similar to how New Jersey exited the scheme in 2011.	
37. Dominion Energy	Dominion supports the intended action to repeal Virginia's CO_2 Budget Trading program. In 2018, Dominion submitted comments to DEQ expressing concern that linkage to RGGI would result in a financial burden to customers with no real mitigation of regional GHG emissions. The company's position is unchanged despite the fact that Virginia ultimately became a direct participant in RGGI. Indeed, publicly available data suggest that reductions in CO_2 emissions in Virginia attributable to RGGI participation most likely will be offset by emissions increases within PJM states which are not beholden to the RGGI construct. While the regional emissions benefits of RGGI are uncertain, the additional costs borne by Virginia electric customers are clear. Under applicable regulatory law, the costs of CO_2 allowance purchases are recoverable through utility customers' electric rates. The company filed its first petition for approval of Rider RGGI in November 2020, in anticipation of future compliance costs associated with approximately 19M CO_2 allowance purchases per year. While initial cost estimates relied upon an expected allowance price of $6.84/ton, actual costs have exceeded this projection and	Support for the proposal is appreciated. As discussed in the response to comments 4 and 6, emissions reductions may be occurring regardless of RGGI or not, yet the electric rate structure established by Virginia law does not enable utilities to defer passing RGGI costs onto customers.

	continue to climb. Even at this initial cost projection level, typical Dominion residential customers using 1,000 kWh per month experienced a bill increase of $2.39 beginning on January 1, 2022. The company withdrew Rider RGGI from customer bills effective July 1, 2022. Prior to this withdrawal, the company presented estimates placing CO_2 allowance prices about 65% higher than originally projected and estimating that typical residential customer bills could increase by an additional $1.98, for total of $4.37/month. Bill increases for commercial and industrial customers, as well as residential customers using more than 1,000 kWh/month, would be even higher. It is important to recognize that Dominion will not be relieved of its obligation to procure CO_2 allowances until Virginia officially withdraws from RGGI. RGGI compliance costs will continue to accrue in the interim, and subject to regulatory approval, be passed on to customers. Virginia's RPS program incentivizes utilities to invest in renewable energy to comply with binding targets for the percentage of their retail electricity sales which must be matched with RECs from qualifying resources. Compliance with the RPS entails costs from REC purchases and development of eligible energy resources. And to reiterate, RGGI compliance entails costs from CO_2 allowance purchases. Both the RPS program and RGGI participation thus result in costs borne by Virginia electric customers to achieve what is fundamentally the same objective - ongoing reductions in power sector CO_2 emissions. Judge Jagdmann of the SCC, concurring with the Commission's ruling in Case No. PUR-2020-00169, wrote that the proceeding had "raise[d] the question of the need for two separate and distinct	

	modes for achieving carbon reduction," and noted the "potential costly duplications" that could arise. She wrote that, in light of the RPS, "it remains unclear whether the significant cost required for participation in an additional cap-and-trade program – which is expected to cost customers billions of dollars – are necessary for [utility] ratepayers to bear in order to achieve the General Assembly's carbon reduction objectives." Dominion is keenly aware of the need to maintain affordable electric rates and has a long record of rates below the national average as well as best in the business energy assistance programs, most notably our Energy Share Program. Since Virginia's Reregulation Act took full effect in 2008, Dominion's electric rates have remained consistently below the national average and have been very competitive among states in the DC metro area, the mid-Atlantic, and the southeast. We have also had rates well below the RGGI states' average. That said, amid economy-wide inflation and rising fuel costs, it is important to eliminate duplicative regulatory costs. Elimination of the additional RGGI compliance costs would further increase the competitiveness of the company's rates. Dominion is pursuing many projects that directly support the goal of reducing power sector CO_2 emissions and would be pursued irrespective of Virginia's status as a RGGI participant. These include solar and energy storage deployment, distribution grid transformation, RPS compliance, the Coastal Virginia Offshore Wind commercial project, energy efficiency programs, and license extensions for the company's zero-carbon nuclear units. Virginia has made steady progress toward carbon reductions in recent years, and existing statutory provisions will ensure that	

	emissions from the electric sector continue to decline regardless of whether Virginia continues participating in RGGI. RGGI does not further this goal but instead imparts unnecessary additional costs on Virginia customers with no evidence of incremental benefits.	
38. Environmental Defense Fund (EDF)	§ 10.1-1330 requires the executive branch and agencies to implement the state's RGGI regulation. Indeed, the General Assembly ratified the RGGI regulation, with certain specified changes, when it enacted the Virginia Clean Energy and Community Flood Preparedness Act in 2020, § 10.1-1330(A). The agencies could not at that time seek to rescind a regulation ratified by the legislature, and there is no basis in the statute for revisiting the legislature's decision. On the contrary, other provisions in this section confirm an ongoing obligation to carry out the RGGI regulation. Section 10.1-1330(B) authorizes the DEQ Director to "establish, implement, and manage an auction program to sell allowances into a market-based trading program consistent with the RGGI program and this article" and then requires the Director to "seek to sell 100 percent of all allowances issued each year through the allowance auction." Thus, the statute requires the sale of allowances "each year," which assumes the state's ongoing participation in RGGI. The statute also requires allowance sale revenue to be used to fund specific programs such as flood prevention and low-income energy efficiency programs, § 10.1-1330(C). This allocation of funding further emphasizes that participation in RGGI is required because the legislature intended that auction revenue from participation in RGGI fund specific programs enumerated in the statute. Finally, § 10.1-1330(D) requires an annual report "describing the Commonwealth's participation in RGGI, the annual reduction in GHG emissions, the	The response to comment 9 addresses legal authority issues. See the response to comment 4 for a discussion of emissions reductions, and the response to comment 7 for a discussion of funding challenges and opportunities. Utility rates and structure are covered in the response to comment 6. Environmental justice issues are addressed in the response to comment 39..

	revenues collected and deposited in the interest-bearing account maintained by the Department pursuant to this article, and a description of each way in which money was expended during the fiscal year." If participation in RGGI were optional, this annual reporting requirement would be superfluous. Yet the General Assembly chose to include this reporting requirement, further indicating that Virginia's participation in RGGI is required by statute. Given the many ways the statute makes it clear that participation in RGGI is required by Virginia law, neither the board nor DEQ has the legal authority to end participation in RGGI. The agencies' authority and actions are bound by Virginia's statutory requirements--requirements that only both houses of the General Assembly and the Governor, acting in concert, may alter. RGGI has a long-proven record of emission reductions--a fact that DEQ acknowledged in its own report to the Governor. Continuing in this program would help Virginia achieve its stated goal of achieving a net-zero carbon economy by 2050. With unprecedented droughts, wildfires, floods and heat waves impacting communities nationwide, it's clear to Virginians that climate change is no longer a distant threat. The state has experienced eight different billion-dollar disaster events in 2021 alone. August 2022 was the hottest August recorded in North America and the second warmest August globally. These climate-powered disasters are a national security concern as well as an environmental one. The Hampton Roads area is home to dozens of military installations, including Naval Station Norfolk, the world's largest naval facility which supplies 46% of the regional economy. Funds brought in from RGGI auctions go towards bolstering Virginia's coastal resilience and	

	flood preparedness, ensuring military operations can continue to be run smoothly in the Hampton Roads region. Withdrawing from RGGI means removing the only source of funds for programs that help communities build resilience in the face of flooding and other climate threats. Only the General Assembly has the authority to cut off this vital funding source. Virginia is ranked 10th in the nation for clean energy employment with 88,370 jobs. Clean energy industries are poised for growth as Virginia continues to invest in its clean energy economy through RGGI. Analyses of the RGGI program have shown that growing jobs in the clean energy economy, reducing pollution, and investing in workers and local communities has substantial net benefits. One analysis found that over its first three compliance periods, RGGI created nearly 16,000 job-years in the region and in that same period added $1.4B of value to the economy. According to a new analysis of RGGI through 2017, the program has created over $4B in net economic gains and over 44,000 job-years of employment. Virginia has received approximately $452M in cumulative proceeds since its first auction in March 2021. Virginia Code mandates that 45% of those funds for their statewide Community Flood Preparedness Fund and 50% supports low-income energy efficiency programs. Program-wide, 18% of 2020 RGGI investments and 14% of cumulative RGGI investments went to clean and renewable energy projects across all participating states, which are expected to return over $600M in lifetime energy bill savings while also avoiding the release of over 1.7M short tons of CO_2. Direct bill assistance programs, also a priority investment area for RGGI, received 19% of 2020 RGGI investments and 16% of cumulative RGGI	

	investments, and have returned over $37M in credits or assistance to consumers. Investments from RGGI have saved money for participants on energy bills, while creating jobs and reducing carbon emissions. These investments are projected to save participants an estimated $2B over their lifetime on energy bills, while also avoiding the emission of 6.7M short tons of CO_2. Virginia also stands to receive investments from the passage of the Bipartisan Infrastructure Law, which allocated about $65M for weatherization and $5.5M to help prevent outages and make the power grid more resilient in Virginia. The Inflation Reduction Act helps consumers by making it more affordable for Virginia families to purchase energy efficient appliances, make repairs around their homes, and save money on their utility bills each month through new tax credits and rebates. RGGI's policies work in tandem with federal investment programs. Virginia will miss out on being a leader in the clean energy economy if it goes backward on state policy at the very moment that the federal government and businesses are injecting hundreds of billions into spurring the clean energy economy. Analysis from EDF also shows that federal programs will catalyze hundreds of billions of dollars in clean energy investment from the private sector. As of this summer, about 1 in 6 American households were behind on utility bills, as energy prices rose to the highest level in nearly 15 years. Gas provides about 37% of electricity in the US and the price of gas has tripled since the middle of last year. The U.S. Energy Information Administration also forecast in the September report that average residential electricity prices for this year would be 7.5% higher than in 2021, largely due to high natural gas prices.24	

	Virginians have the 10th highest average monthly residential electricity bills in the country. In 2022, Virginians paid on average $148.15 per month for residential electricity – $11 above the national average. In 2022, Virginia's electricity price was 13.53 cents/kWh compared to 12.02 in 2020. Renewables like solar panels can deliver power to 650 homes for one hour at $31-111 a megawatt-hour. By comparison, natural gas peaking plants deliver power at $122-162 a megawatt-hour. In Virginia in 2020, natural gas accounted for 61% of Virginia's utility-scale electricity net generation, nuclear supplied 29%, renewables, mostly biomass, provided 6%, and coal fueled less than 4%. There are many factors that contribute to the price of wholesale electricity, but the cost of fuel for fossil-fuel generators is an important driver. As noted by the EIA: "Wholesale prices are especially tied to natural gas prices because natural gas-fired units are often the most expensive (marginal) generators dispatched to supply power. The natural gas price at the Henry Hub averaged $8.14/MMBtu in May 2022, 180% higher year on year, according to the EIA, which expects the price of natural gas delivered to electric generators to average $8.81/MMBtu this most recent summer, a jump of 124% from summer 2021." Rising natural gas prices is one reason Dominion and Appalachian Power customers should expect a cost increase. In September 2022, the SCC approved the increase for Dominion, which went into effect provisionally on July 1. According to estimates, the average residential customer, defined as a household using 1,000 kWh of electricity per month, will see their monthly bill increase by $14.93. Dominion says this is due to the increase in its fuel factor. It is clear	

	that RGGI is not the driver of the rising electric prices we have seen in Virginia and elsewhere--rather, it is our current, fossil-fuel dependent system that is one of the major drivers. Cleaning up our grid by deploying generation that does not have volatile fuel prices, like wind and solar, is a critical part of the solution to clear our air, protect our climate, and benefit consumers. If the administration is concerned about customer costs, we recommend that it develop a comprehensive plan that achieves emission reductions to decarbonize the power sector and moves the state to cost-effective, clean energy. RGGI is the sole source of revenue for the statewide CFPF, which is the only state funding source for critical flood resilience planning and project implementation for localities, tribes, and soil and water conservation districts. RGGI has generated $203.5M for the CFPF since Virginia started receiving auction proceeds in 2021. Of this, nearly $46M has been awarded to more than 40 localities. The CFPF funds capacity-building initiatives that most federal grant programs do not, providing critical planning resources that allow localities to pursue larger project implementation requests. The CFPF can also be used as a local match for federal grant programs, making Virginia applicants more competitive for national programs. Without this reliable long-term funding source, localities will be unable to complete flood resilience planning they need to address flood risk. Twenty-five percent of CFPF monies are set aside for low-income geographies and the CFPF prioritizes implementation of nature-based solutions. Pulling Virginia out of RGGI would strip away funding that local governments need, harming under-resourced communities that do not	

	have the capacity to address flood risk on their own. Across the RGGI region, CO_2 emissions have dropped dramatically, thanks to fuel switching, improved energy efficiency, and growing renewable energy output. A report from The Acadia Center says emissions from the plants covered by RGGI are down 47% since 2009, when the program launched--outpacing the rest of the nation by 90%. Even while cutting emissions, the gross domestic product of RGGI states still grew by 47%, faster than the rest of the country, which grew by 31%. In Virginia, the data is clear that RGGI reduces emissions: RGGI cut Virginia power-plant carbon emissions by 13% in its first year. In 2020, carbon emissions in RGGI-covered units reached 32,755,842 short tons of CO_2 and declined to 28,623,530 short tons of CO_2 in 2021 even while demand increased. As carbon pollution from power plants decreases, Virginia is seeing co-benefits from the reduction of co-pollutant emissions like NOx and SO_2: in-state SO_2 emissions fell by 13% and in-state NOx emissions fell by 19% between 2020 and 2021. The Youngkin administration has even admitted the importance of RGGI in a recent report, concluding that RGGI "has a long track record of emission reductions since the beginning of the program." Participation in a carbon market with an overall cap on emissions, like RGGI, provides a high degree of certainty and durability that emissions reductions will be achieved year-over-year. As stated by DEQ, "an emission reduction program or combination of programs will be required to meet the Commonwealth's climate goals of the [VCEA] and the 2045 net-zero carbon emissions goal. In the absence of any such program,	

	emissions may not reduce sufficiently to achieve these goals." Since the beginning of the program through 2020, RGGI has avoided more than 49.5M short tons of carbon emissions in participating states. By remaining in RGGI, Virginia will be able to reduce overall emissions by an additional 30% from 2020-2030. Participating in RGGI means that Virginia can achieve its clean energy economy set forth in the VCEA, which requires that Virginia transition its utilities to renewable energy by 2050. Participation in RGGI gives Virginia the greatest certainty that the state will reach its emission reduction goals. A declining limit on GHG emissions, alongside other essential emission reduction regulations, provide the most reliable pathway for Virginia to meet its goal of net-zero emissions by 2045. Meeting this target is essential for Virginia to avoid the worst impacts of climate change, such as coastal flooding, displacement of up to 400,000 homes due to sea level rise, and billions of dollars to repair and replace homes and roads. Virginia currently has 10 cities and counties not meeting national health-based standards for ground-level ozone, impacting 2.3M Virginians. When carbon pollution is reduced, there are often significant reductions of other health-harming pollution, including ground-level ozone and soot. Power plants, transportation, industrial, and other sources contribute to emissions that impact air quality. According to EPA data, the power plants in Virginia covered by RGGI were responsible for 1,228 short tons of SO_X and 6,125 short tons of NOx pollution in 2021. As RGGI reduces carbon pollution across the region, communities will also benefit from declining levels of soot and smog. DEQ's analysis of the final RGGI	

	rule showed reductions of NOx, SO_2, and $PM_{2.5}$, amounting to tens of millions in monetized benefits over the life of the program. A study found that reduced levels of soot pollution due to RGGI from 2009-2014 benefited children's health, including avoiding cases of asthma, preterm births, cases of autism spectrum disorder and more harmful health impacts. The avoided costs of these health impacts on children are estimated at $191-350M. The Administration should consider the environmental justice impacts of its plan to roll back RGGI and the emission reductions that would be lost as a result. As previously noted by DEQ: "[n]ew laws passed by the General Assembly and signed by the Governor established that it is the policy of the Commonwealth to advance environmental justice. Further, DEQ's statement of policy (§10.1-1183, Code of Virginia) was amended to make environmental justice an explicit part of DEQ's mission." Virginians, like others across the country, are increasingly concerned about climate change and expect their leaders to act. A 2022 poll from Christopher Newport University showed that about 67% of Virginia voters want to stay in the RGGI program. Virginia joined RGGI after a lengthy round of public comment periods and public meetings where hundreds of concerned Virginians showed their support for reducing carbon emissions. Once the public comment period ended, the Virginia General Assembly held a vote that catalyzed RGGI into law. The State Senate voted 22-18 and the House of Delegates voted 51-47 to successfully pass the legislation. Recently, 61 state legislators, more than a third of the General Assembly, signed onto a letter addressed to the Board opposing	

	Gov. Glenn Youngkin's proposed withdrawal of Virginia from RGGI.	
39. New Virginia Majority	In our effort to secure environmental justice for people-of-color, immigrant communities, working-class families, women, and all Virginians alike, we focus our environmental policy efforts on state-level initiatives that shift Virginia toward an equitable 100% clean and renewable energy plan, a just transition, and targeted support for low-income individuals and people of color to obtain credentials, post-secondary education, or workforce training in environmental, renewable energy, or related fields. Therefore, we oppose this regressive proposed action to repeal Virginia's participation in RGGI even though this participation is mandated by state law. We support the continued implementation of RGGI as an important piece of state environmental and climate law. An effective state-level policy response to the climate crises requires rapidly eliminating GHGs from the electricity sector. Alongside recent federal climate mitigation investments in both the Infrastructure Investment and Jobs Act and the Inflation Reduction Act, RGGI enables Virginia to effectively decrease the state's dependence on fossil fuel generation and meet goals set in the state Clean Energy Policy. In addition to supporting mitigation of adverse climate change impacts statewide and regionally, RGGI supports reduction in public health and environmental justice outcomes associated with the pollution from fossil fuel generation facilities, particularly respiratory and cardiovascular diseases. Increasing investments in energy efficiency through RGGI is also fiscally responsible given that investment in energy efficiency is one of the most affordable policy strategies for decreasing GHGs from the electricity sector and	We appreciate the commenter's concerns, and agree that effective state level policy is needed to address carbon pollution in a fiscally responsible and equitable manner. . Indeed, it is people-of-color, immigrant communities, working-class families, women, and all Virginians alike who are disproportionately affected by unnecessary increases in electricity costs. The lack of transparency in the RGGI process, and the limitations on protecting public health and welfare from the effects of climate change forced on Virginia by that process impedes Virginia's ability to best serve all of its citizens.

	generating energy savings for residential customers. Beyond crucial executive orders and budgetary requirements passed to date, the U.S. still lacks codified federal law that outlines explicit clean energy standards or stands up nationally binding clean electricity targets. Virginia's participation in RGGI provides a climate policy that can help zero-out the state's electricity GHGs from public utility service providers fossil fuel powered plants. Household energy bills continue to rise, especially as a result of the increasing costs of non-renewable energy sources, specifically natural gas. This rise is predicted to increase beyond 2022. RGGI supports the growth of increasingly affordable renewable energy resources, which can help decrease the costs of household electricity, most burdensome to households with incomes at or below 50-100% of the Federal Poverty Level. Additionally, advancing legislative utility regulatory reforms that have been introduced to-date as opposed to repealing RGGI is the most effective approach to reducing energy costs concerns outlined in the NOIRA as the premise for repeal. These reforms include retiring cost recovery mechanisms that are uneconomical for customers, removing unnecessary restrictions on the issuance of customer refunds, and restoring the SCC's authority to adjust electricity rates when utilities earn above their authorized profits.	
40. Virginia Manufacturers Association (VMA)	Regulations should maintain an appropriate balance between environmental protection and economic development, be based on exemplary science, consider cost-benefit analysis and comparative risk assessments in the regulatory process, and allow for flexible and performance-based approaches. Energy policies should ensure sustainable economic	Support for the proposal is appreciated. As discussed elsewhere, participation in RGGI is not the most effective means of controlling carbon pollution, nor is it the most consumer-friendly approach.

	growth in manufacturing, with an emphasis on reliable supply at affordable prices. Tax policies should lower the overall effective tax rate on manufacturers. RGGI does not meet any of these public policy tests. VMA ardently supports this rulemaking to repeal RGGI. RGGI levies a direct, unnecessary tax on all Virginians. RGGI membership comes at a high cost and an uncertain benefit. Utilities must purchase an allowance for each ton of carbon emitted. The SCC has approved the pass-through of the allowance costs directly to residential and commercial ratepayers. Customers have no opt-out opportunity. As a result, all Virginians that use electricity must bear the cost of the RGGI program, which is substantial. EO-9 estimates that ratepayers must pay between $1-1.2B over the next four years. Our membership shoulders a substantial proportion of RGGI costs due to the commercial rate structure and electricity requirements to run a manufacturing facility. These facilities are the backbone of Virginia's economy, providing the jobs that fuel the state's economy. Virginia is highly ranked as a competitive southern state for manufacturing. RGGI participation jeopardizes this position. Increased energy costs inflate Virginia manufacturers' cost of operation, a burden not shared by most of the states with which Virginia manufacturers compete. When compared to non-RGGI states, Virginia's competitive advantage is threatened. Cost and regulatory burden is a constant consideration, as we compete for new businesses and existing manufacturers decide whether to stay. RGGI is an unnecessary, duplicative regulatory program in Virginia. Virginia is strongly committed to expanding the role of	

	renewable energy in power generation. Virginia's electric utilities are moving rapidly to expand generation from renewable resources. Virginia is already among the nation's leading states in this effort. Manufacturers have and are expected to continue to explore innovative ways to reduce carbon footprints. In fact, the VCEA establishes the state's climate goals. The VCEA is a comprehensive law to directly address the state's energy policies and to legislate change. The VCEA sets a 2045 net zero carbon emissions goal for the state's economy. To achieve this goal, the VCEA requires fossil fuel electric generating unit shutdowns and adds incentives for renewable generation. The VCEA also establishes an energy efficiency standard to achieve energy efficiency savings annually. The Act requires utility participation in a RPS program with annual goals for sale of renewable energy. DOE projects that Virginia is on schedule to meet the 2045 net-zero goal. RGGI is an ineffective solution to climate goals. In comparison to the VCEA, RGGI does not mandate or even incentivize utilities to make generation changes. RGGI does not cap utility emissions with a state budget. It does have a RGGI cumulative regional cap for all RGGI allowances, which is the only true cap in the program. As a result, the Virginia RGGI budget does not operate as a not-to-exceed cap to curtail emissions. This costly pass-through revenue program is unnecessary to promote the continued growth of renewable energy generation in the state. Virginia does not need RGGI to invest in strategic energy policies, infrastructure, and resilience programs. Virginia has and continues to effectively develop and implement direct, cost-effective programs to address the reported effects of climate change in	

	Virginia. RGGI, Inc. promotes the reinvestment of auction revenue in state programs addressing resiliency, energy efficiency, low-income communities, and other beneficial interests. However, the dollars that Virginia's citizens and businesses spend on RGGI would be much better spent directly on resiliency programs and initiatives with a tangible impact on communities. VMA supports legislative efforts to address these needs outside of the RGGI construct. A direct funding program is greatly preferable to RGGI. The CFPA directs most of the RGGI auction proceeds to assist with flooding from severe weather events and energy efficiency programs. However, using the RGGI platform comes at a cost. Fees are higher with no benefit to Virginians. RGGI, Inc., charges a fee to administer the program, and DEQ collects an additional charge to cover the program expenses and administrative costs. Virginia's utilities also must employ environmental professionals to undertake detailed, comprehensive compliance efforts required for RGGI participation. Aside from costs, Virginia loses control over its own money. RGGI states conduct a RGGI program review every 3-4 years, which results in revisions to the RGGI model rule that sets the program rules. That review can substantially impact the allowance costs of the program, not to mention the fundamental rules of participation. Virginia has only one vote among the RGGI states in this review process. In addition, on an implementation level, outside influences affect the costs of RGGI to Virginians. RGGI allowance costs are often driven higher by private market brokers and entities that purchase allowances to sell, often at a profit, or retire them. For example, in 2021, Virginia received $227M in	

	revenue from RGGI. However, only a little over $129M of that total was attributed to compliance entities, such as Dominion or other utilities, that purchased the allowances for compliance. The 2021 RGGI compliance year illustrates the influence of third-party entities on the RGGI program and how third-party stakeholders increase the amount of the direct tax that Virginians pay for RGGI. In summary, exiting RGGI will restore the state's independence. Virginia will be able to deliberately target resiliency and energy policy goals and address them without administrative fees, outside influences and with certainty. Virginia's carbon emissions are already rapidly dropping, without regard to RGGI. There are many reasons for this trend. First, conversion and retirement of coal-fired generation to natural gas and renewable generation has directly impacted Virginia's carbon footprint. DEQ documented the energy transition that took hold in 2011-2012 with a series of coal-fired plant retirements and fuel conversions. These power sector changes contributed to declining carbon emissions at a CO_2 emissions rate of 43% lower per unit of electricity between 2010-2020. This decline is faster than the nation as a whole and comparable to the RGGI states. These statistics illustrate that carbon emissions can be addressed without a costly regional carbon trading program. Citizens and businesses are becoming more energy efficient. Virginia is already among the nation's leaders in reducing CO_2 emissions. This trend began prior to RGGI membership. These data suggest that RGGI is not needed to achieve Virginia's climate goals. Carbon emissions are not a regional problem, they are a global problem. VMA has consistently articulated that regulating GHG	

	emissions on a regional basis does not make sense. CO_2 does not stop at the borders of RGGI states but coalesces in the atmosphere across states and internationally. Unlike CO_2 emissions, RGGI requirements are confined to state borders. Concepts such as leakage cut against a regional model. For example, a Regional Transmission Organization, such as PJM, may dispatch less expensive electric generating units with higher CO_2 emissions from a power generating plant located in a non-RGGI state in place of an electric generating unit with lower CO_2 emissions on the other side of the state border in a RGGI state. The result is that RGGI states may become net importers of electricity from lower cost non-RGGI assets. Recent data supports this result. Using EPA 2019 emissions data, three out of the five top states importing electricity from out of state were RGGI states (Maryland, Delaware, and Massachusetts). Delaware had the lowest statewide annual CO_2 emissions of any state in 2019, which was likely influenced by importing electricity into the state to satisfy customer demand. A regional approach is not the solution to a global problem, which is best left to a consistent federal approach. RGGI does not incentivize Virginia utilities to shift generation away from carbon-emitting assets, unlike other carbon reduction initiatives. In Virginia, customers bear increased costs associated with RGGI, rather than utilities. For example, the SCC approved that RGGI compliance costs would be passed through to customers in a RGGI Rider. The RGGI Rider appeared on residential and commercial bills as a direct cost. With customers paying the RGGI Rider, the RGGI program does not incentivize Virginia utilities to shift their generation mix away from fossil fuels. RGGI is better suited to other	

	RGGI states with more deregulated markets than in Virginia. In short, Virginia's energy market structure is not a conducive compliment to the RGGI regulatory approach.	

Public Participation

Indicate how the public should contact the agency to submit comments on this regulation, and whether a public hearing will be held, by completing the text below.

The board is providing an opportunity for comments on this regulatory proposal, including but not limited to (i) the costs and benefits of the regulatory proposal, (ii) any alternative approaches, (iii) the potential impacts of the regulation, and (iv) the agency's regulatory flexibility analysis stated in that section of this background document.

Anyone wishing to submit written comments for the public comment file may do so through the Public Comment Forums feature of the Virginia Regulatory Town Hall web site at: https://townhall.virginia.gov. Comments may also be submitted by mail, email or fax to Karen G. Sabasteanski, Department of Environmental Quality, P.O. Box 1105, Richmond VA 23218, phone 804-659-1973, fax 804-659-4178, email karen.sabasteanski@deq.virginia.gov. In order to be considered, comments must be received by 11:59 pm on the last day of the public comment period.

A public hearing will be held following the publication of this stage, and notice of the hearing will be posted on the Virginia Regulatory Town Hall website (https://townhall.virginia.gov) and on the Commonwealth Calendar website (https://commonwealthcalendar.virginia.gov/). Both oral and written comments may be submitted at that time.

Detail of Changes

List all regulatory changes and the consequences of the changes. Explain the new requirements and what they mean rather than merely quoting the text of the regulation. For example, describe the intent of the language and the expected impact. Describe the difference between existing requirement(s) and/or agency practice(s) and what is being proposed in this regulatory change. Use all tables that apply, but delete inapplicable tables.

If an existing VAC Chapter(s) is being amended or repealed, use Table 1 to describe the changes between the existing VAC Chapter(s) and the proposed regulation. If the existing VAC Chapter(s) or sections are being repealed and replaced, ensure Table 1 clearly shows both the current number and the new number for each repealed section and the replacement section.

Table 1: Changes to Existing VAC Chapter(s)

Current chapter-section number	New chapter-section number, if applicable	Current requirements in VAC	Change, intent, rationale, and likely impact of new requirements
9VAC5-140-6010	N/A	Purpose of the regulation is described.	Repealed in accordance with the directives of EO-9.

9VAC5-140-6020	N/A	Terms defined.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6030	N/A	Measurements, abbreviations, and acronyms used in the regulation are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6040	N/A	Entities to which the regulation applies are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6050	N/A	Standard requirements for permitting, monitoring, recordkeeping, liability, etc., are explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6060	N/A	Computation of time is described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6070	N/A	Severability is established.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6080	N/A	Authorization and responsibilities of the CO_2 authorized account representative are explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6090	N/A	The role of the CO_2 authorized alternate account representative is described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6100	N/A	Changing the CO_2 authorized account representatives and the CO_2 authorized alternate account representative; changes in the owners and operators are delineated.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6110	N/A	The elements of an account certificate of representation are provided.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6120	N/A	Objections concerning the CO_2 authorized account representative are addressed.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6130	N/A	Delegation by CO_2 authorized account representatives and CO_2 authorized alternate account representatives is explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6140	N/A	CO_2 budget permit requirements are provided.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6150	N/A	Submission of CO_2 budget permit applications.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6160	N/A	Information requirements for CO_2 budget permit applications are established.	Repealed in accordance with the directives of EO-9.

9VAC5-140-6170	N/A	Compliance certification reports are explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6180	N/A	Actions on compliance certifications are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6190	N/A	The Virginia CO_2 Budget Trading Program base budgets are listed.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6200	N/A	How to handle undistributed and unsold CO_2 allowances is found in this section.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6210	N/A	Allowance allocations are provided.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6220	N/A	CO_2 allowance tracking system accounts are established.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6230	N/A	Establishment of accounts is described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6240	N/A	The CO_2 allowance tracking system responsibilities of CO_2 authorized account representatives are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6250	N/A	How the recordation of allowance allocations is to be accomplished.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6260	N/A	Compliance requirements are established.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6270	N/A	Banking requirements are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6280	N/A	Management of account errors is explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6290	N/A	How to close general accounts.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6300	N/A	How to submit CO_2 allowance transfers.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6310	N/A	The recordation of allowance transfers is explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6320	N/A	Notification of allowance transfers is explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6325	N/A	Life-of-the-unit contractual arrangements are described.	Repealed in accordance with the directives of EO-9.

9VAC5-140-6330	N/A	General requirements for monitoring, reporting, and recordkeeping.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6340	N/A	The initial certification and recertification procedures for a monitoring system are delineated.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6350	N/A	Out-of-control periods are addressed.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6360	N/A	Notifications are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6370	N/A	Recordkeeping and reporting requirements are explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6380	N/A	Petitions for approval to apply an alternative to any acid rain requirement are provided.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6390	N/A	Reserved.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6400	N/A	Reserved.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6410	N/A	The purpose of the requirements for allowance auctions is provided.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6420	N/A	General requirements for the auction notice.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6430	N/A	[repealed section]	[already repealed]
9VAC5-140-6440	N/A	Program monitoring and review requirements.	Repealed in accordance with the directives of EO-9.
	*9VAC5-140-6445	Transition to repeal.	Affected facilities must place the allowances needed to meet their remaining compliance obligation into their compliance account in COATS as soon as practicable but no later than March 1, 2024, in order that they can be deducted from the account to meet the full control period obligation. This section will be repealed once all affected sources have met their full compliance obligation. Needed in order that the transition away from the program is conducted in such a way as to minimize disruption and enable affected facilities to meet their compliance obligations without introducing uncertainty to the market.

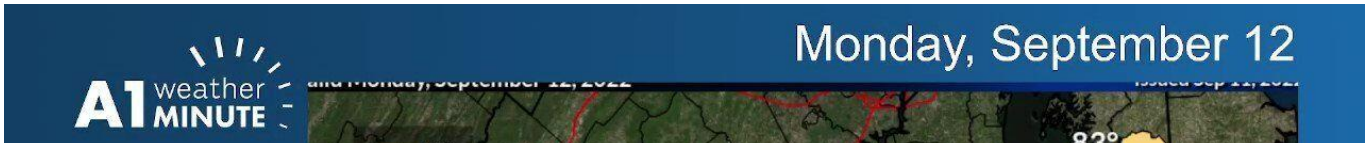
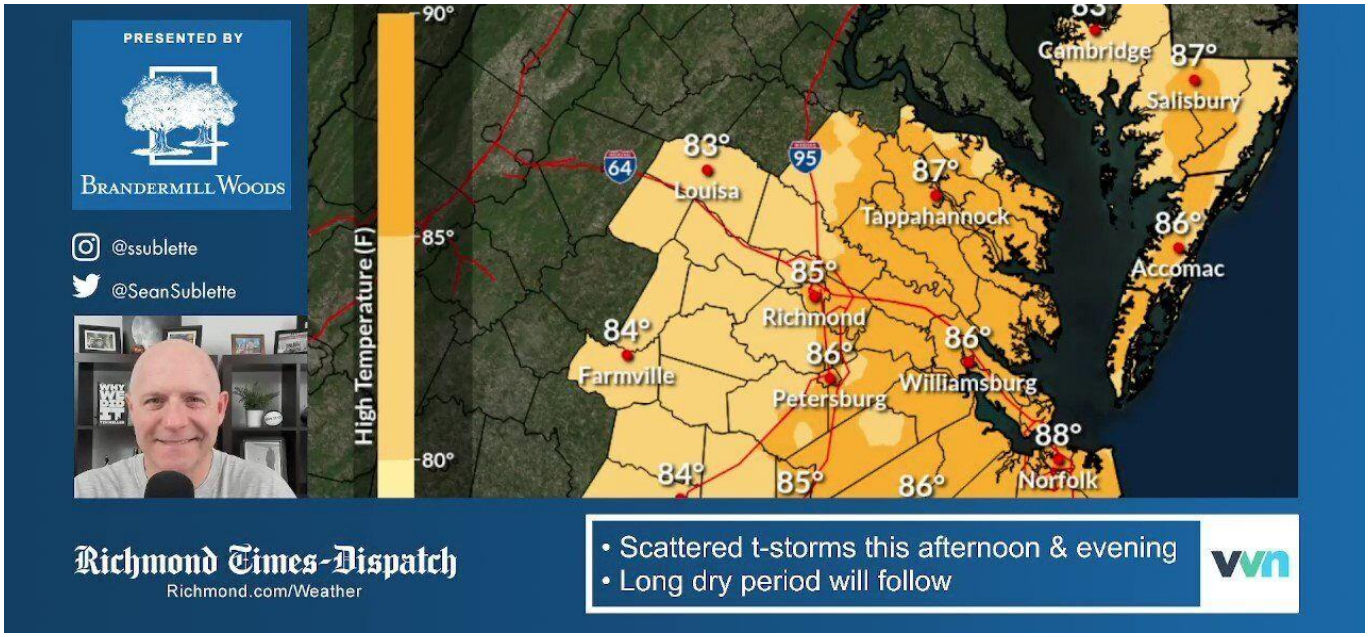
Youngkin: I have the power to pull out of RGGI

David Ress
Sep 12, 2022

In Stafford County, Gov. Glenn Youngkin ceremonially signed legislation to give military retirees a tax break. At right
PETER CIHELKA/THE FREE LANCE-STAR

David Ress





Tuesday through this coming weekend looks like a dry and more seasonable period.

For Gov. Glenn Youngkin, the problem with the **Regional Greenhouse Gas Initiative** is that it's a market that sends the wrong signals to the wrong people.

He wants out.

And so Youngkin and Democratic legislators, along with environmentalists across the state, are **drawing battle lines** over the 11-state carbon market, in which power companies can buy or sell carbon dioxide credits. They can be buyers, if their CO2 emissions exceed a cap, or sellers, if they want to get some extra money for emitting less of the greenhouse gas than their cap.

Many Democratic lawmakers say a state law calls for Virginia's participation in RGGI and that only the legislature can remove Virginia from the compact. Youngkin says that law allowed Virginia to join RGGI, but did not mandate Virginia's participation.

61 Dems say Virginia's participation in RGGI is up to legislature

The idea behind RGGI is that the price of those credits, along with the cost of buying allowances authorizing utilities to emit a limited amount of CO2, will affect decisions about using coal, oil and natural gas to spin the generators that make electricity — and emit CO2.

In the end, RGGI expects its market will move utilities toward generating power with sources that don't emit CO2.

Members of the Virginia Air Pollution Control Board
c/o Office of Regulatory Affairs
Department of Environmental Quality
P.O. Box 1105
Richmond, Virginia 23218

Sent via email: CitizenBoards@DEQ.Virginia.gov

Dear Members of the Air Pollution Control Board:

As current members of the Virginia General Assembly who voted for the Clean Energy and Community Flood Preparedness Act in 2020 or voted against changes to that same law in 2022, we write to express our continued support for Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI). Further, we write to articulate the reality that Virginia's participation in RGGI is mandated by *law*. Therefore, ultimately only a change in the *law* that passes both chambers of the General Assembly and is signed by the Governor can remove Virginia's participation. No proposed regulation, emergency regulation, regulatory act, or any subsequent administrative process can do so.

In addition to the Commonwealth's participation being mandated, RGGI is already delivering benefits to the residents of Virginia. As legislators, we believe it is important that you consider and understand the following benefits to Virginians from our participation in RGGI:

- RGGI has generated $378 million to support low-income energy efficiency programs and flood resilience infrastructure in Virginia.[1]
    - Energy efficiency upgrades are the best way to lower electricity bills, and Virginia's funds are directed to helping those households most in need.[2]
    - Flood resilience infrastructure protects Virginians against increased flooding and extreme weather events.
- RGGI has demonstrated Energy Cost Savings.
    - Electricity prices in RGGI states dropped by almost 6% while they went up by almost 9% throughout the rest of the country.[3] RGGI is a proven tool to reduce utilities'

[3] https://acadiacenter.org/wp-content/uploads/2019/09/Acadia-Center_RGGI_10-Years-in-Review_2019-09-17.pdf

But Youngkin, whose time at the multi-billion-dollar Carlyle Group saw the firm move into carbon-reducing investments in a major way, doesn't buy that argument.

“Let’s not have a hidden tax … that was mis-sold and misrepresented as some sort of market-based incentive, because RGGI is not a market-based incentive,” Youngkin said in an interview with the Richmond Times-Dispatch.

Legislators mull ways to keep power bills down amid Regional Greenhouse Gas Initiative debate

“In this case, the utility can decide but they don’t have to worry about it because they can pass it right on to the consumer and the consumer Has. No. Choice,” he said.

“They have to buy power from the monopoly utility.”

That was shaping up to a fairly big bill.

The State Corporation Commission last year agreed with Dominion’s view that it would spend some $168 million to buy RGGI credits and that in order to cover that cost the bill for a typical residential customer using 1,000 kilowatt hours a month should rise by $2.39.

Youngkin seeks regulatory route to remove Virginia from RGGI

“We must recognize that utilities in this case are monopolies … were told they had to buy these allowances and all they do is 100 percent pass ’em on to the consumer, who has no say in this,” Youngkin said.

But Dominion this year asked, and the SCC agreed, to suspend the surcharge, noting that Virginia was on track to pull out of RGGI. Dominion said it could cover sums it had previously spent through base rates.

Youngkin said he won’t renew Virginia’s contract with RGGI when it expires in December 2023.

Meanwhile, he wants the state Air Pollution Control Board to repeal 2020 amendments to its C02 trading regulations requiring utilities to buy CO2 allowances — that is, RGGI authorization to emit a limited amount of the greenhouse gas.

Environmental group sues to get AG document on withdrawal from RGGI

The board can do that because it is part of the executive branch that the governor leads, he said.

General Assembly Democrats beg to differ. In a letter to the air board last week, 61 of them said the agency's powers are limited because the General Assembly created the air board.

"You only have the powers that the General Assembly grants you," the letter said.

The Democrats' letter also cites the law that enables participation in RGGI — the Clean Energy and Community Flood Preparedness Act — adding, "it is clear our intent for Virginia to participate in RGGI."

RGGI has generated $378 million to support low-income energy efficiency programs and flood protection in Virginia, the Democrats said.

Youngkin sees it differently:

"The bill that was passed … said that you could — it allowed you to go put this in place. It never mandated it," Youngkin said. "It allowed it, it never mandated it."

The bill says the director of the air board "is hereby authorized" to run the program to sell allowances that can be used in RGGI's trading system or something similar. It says the director "shall seek to sell 100 percent of all allowances" unless doing so would mean a net loss of benefit to consumers.

Youngkin said he reads that as allowing the air board to do away with the requirement that utilities buy the allowances, "and then we get to — as a government, the General Assembly — to work and if we want to provide funding for flood resiliency, then let's go provide funding for flood resiliency.

"Let's not have a hidden tax that was, that was mis-sold and misrepresented."

October 14, 2022

The Honorable Todd E. Pillion
Member, Senate of Virginia
851 French Moore Jr. Boulevard, Suite 178
Abingdon, Virginia 24210

Dear Senator Pillion:

I am responding to your request for an official advisory opinion in accordance with § 2.2-505 of the *Code of Virginia.*

Issue Presented

You inquire regarding the potential deployment of license plate recognition (LPR) cameras on Virginia Department of Transportation (VDOT) rights-of-way by third parties.[1] You specifically ask whether the Commonwealth Transportation Board (CTB) has the authority to amend its Land Use Permit Regulations (Regulations) to enable a permit to be issued for the installment of such cameras when requested by a law enforcement agency or local government. In particular, you seek guidance on whether the CTB can amend Part VII, Miscellaneous Provisions, of the Regulations to add the following language:

> **24 VAC 30-151-661. Stationary License Plate Readers.**
>
> Upon request of a locality or the chief law enforcement officer serving a locality, permits may be issued to a third-party provider to install a [LPR] within highway rights-of-way. Maintenance of these facilities is the responsibility of the permittee. Such permits may only be issued upon approval of the proposed operating agreement between the locality/law enforcement and the third-party provider which shall provide any pictures or data captured by such LPRs must be completely deleted within 30 days of capture.

[1] LPR technology is not specifically defined in your inquiry; for purposes of this opinion, an LPR camera is one that takes snapshots of passing vehicles, thereby obtaining and electronically caching information such as the vehicle make, type, and color, and the license plate number and state. This Office has described prior iterations of LPR technology as "a combination of cameras and optical character recognition technology to read license plates. The camera captures an image of a license plate and the optical character recognition technology converts the image into data that can be searched against an existing database or the data may be stored for future use, along with the time, date, and location of the observation." 2013 Op. Va. Att'y Gen. 7, 8-9. Although LPR technology may continue to evolve, salient here is that the LPR cameras collect snapshots of passing vehicles and store the images and related data for some period of time.

Applicable Law and Discussion

The Constitution of Virginia expressly provides that "administrative agencies may be created by the General Assembly with such authority and duties as the General Assembly may prescribe."[2] The General Assembly's delegation of its legislative power to administrative agencies "is essential to carry out the legitimate functions of government[: i]f nothing could be left to the judgment and discretion of administrative officers, government could not be efficient and the legislation itself would become 'either oppressive or inefficient.'"[3] Accordingly, administrative agencies may be empowered to make regulations, and validly adopted regulations carry the force of law.[4]

Unlike the General Assembly, which exercises plenary power limited only by the Virginia or United States Constitutions,[5] the agencies established by the General Assembly are creatures of statute and "derive[] [their] power only from [their] authorizing legislation."[6] An agency's authority to promulgate regulations therefore is not boundless; rather, the agency's power is limited to that which has been delegated by the General Assembly.[7] Absent such a delegation, an agency is precluded from acting in a legislative role.[8]

Central to your inquiry, therefore, is whether the General Assembly has delegated to the CTB the authority to promulgate regulations related to installing, for law enforcement purposes, LPR technologies operated by private parties at the request of a locality or law enforcement.

By statute, the General Assembly has empowered the CTB to "make regulations that are not in conflict with the laws of the Commonwealth for the protection of and covering traffic on and for the use of systems of state highways . . . ."[9] VDOT rights-of-way are part of the state highway system,[10] and pursuant to its statutory authority, the CTB has established a permitting system whereby parties may request certain

[5] Terry v. Mazur, 234 Va. 442, 449 (1987).

[6] Carpenter v. Virginia Real Est. Bd., 20 Va. App. 100, 106 (1995); *accord* Muse v. Virginia Alcohol Beverage Control Bd., 9 Va. App. 74, 78 (1989) ("The [Alcohol Beverage Control] Board, being a creature of statute, derives its powers from statute.").

[7] Sydnor Pump & Well Co. v. Taylor, 201 Va. 311, 316 (1959) ("[A]dministrative agencies, in the exercise of their powers, may validly act only within the authority conferred upon them by statutes vesting power in them.").

[8] The legislative power of the Commonwealth is vested in the General Assembly, VA. CONST. art. IV, § 1; apart from proper delegations of legislative authority to executive branch agencies, "[t]he legislative, executive, and judicial departments shall be separate and distinct, so that none exercise the powers properly belonging to the others, nor any person exercise the power of more than one of them at the same time . . . ." VA. CONST. art. III, § 1. *See generally* Elizabeth River Crossings OpCo, LLC v. Meeks, 286 Va. 287, 310-11 (2013); Cochran v. Fairfax Cnty. Bd. of Zoning Appeals, 267 Va. 756, 765 (2004) ("Under fundamental constitutional principles, . . . agencies are empowered to act only in accordance with standards prescribed by the legislative branch of government.").

[9] VA. CODE ANN. § 33.2-210(A) (2019).

[10] 24 VA. ADMIN. CODE § 30-21-10 (defining "right-of-way" generally to mean the "property within the system of state highways that is open or may be opened for public travel or use"); *accord* 24 VA. ADMIN. CODE § 30-151-10.

uses of the rights-of-way.[11] The current permitting Regulations "apply to all *authorized* use or occupancy of the right-of-way."[12] There is no statute expressly authorizing the general use of the equipment you present on VDOT rights-of-way. Nor is there explicit statutory authority permitting CTB to adopt regulations regarding the installation of data-gathering or surveillance equipment operated by private parties.[13]

Although the language authorizing the CTB to "make regulations . . . for the use of systems of state highways" may appear broad, such language must be considered in relation to the CTB's overall basic law.[14] The scope of an agency's regulatory authority is determined by taking into "account the text as well as the context of the underlying statute," whereby it is viewed it as a "symmetrical and coherent regulatory scheme."[15] The purposes underlying the basic law also are to be considered when examining the validity of agency action.[16]

As the Supreme Court of Virginia has noted, "[t]he General Assembly has delegated to the [CTB] . . . authority over the supervision, management, construction, improvement, and maintenance of public highways and roads."[17] A review of the statutes pertaining to the duties and powers of the CTB reveals that the CTB's basic law generally is limited to issues concerning the passage or conveyance on public roadways in the Commonwealth and enforcing traffic and safety requirements regarding the same.[18] The current Regulations related to rights-of-way generally reflect this understanding of the scope of CTB's

[17] Maddox *ex rel.* Maddox v. Commonwealth, 267 Va. 657, 662 (2004).

[18] *See, e.g.*, VA. CODE ANN. §§ 33.2-208 to -221.1 (2019 & Supp. 2022) (setting forth certain duties and powers of the CTB, to include designation of highway locations; responsibilities regarding certain transportation construction contracts; naming of highways, bridges, and other transportation facilities; prioritization of projects involving the funding of the state transportation system; regulation of roadside memorials; and setting fees for informational signs for motorists); §§ 33.2-300 to -414 (2019 & Supp. 2022) (providing for powers associated with establishing and maintaining highway systems, including road paving; designation of limited access highways, byways, and scenic highways); §§ 33.2-500 to -505 (2019) (relating to the designation and use of high-occupancy vehicle lanes); §§ 33.2-600 to -615 (2019 & Supp. 2022) (relating to ferries and toll facilities); s*ee also* VA. CODE ANN. §§ 46.2-808 (2017), -809 (2017), -809.1 (2017) (relating to the regulation of traffic on certain roadways); 46.2-931 (permitting regulation related to sales, solicitations, and distribution of materials within roadways and medians).

authority.[19] Indeed, in administering its statutory functions, the CTB itself has determined that "[t]he Code of Virginia authorizes the [CTB] . . . to promulgate regulations, establish guidelines, administer programs, or take other actions *related to transportation*."[20]

The camera installation you describe would not relate to the flow of traffic, the transportation network or assets, or uses of the state highways for travel. I find no nexus between the installation of LPR technology to aid law enforcement generally and the CTB's specific authority to issue regulations either "for the protection of," "covering traffic on," or "for the use of systems of state highways."[21] The proposed permitting of LPR cameras by the CTB for the benefit of third-party providers therefore falls outside the scope of authority currently delegated to the CTB.[22]

Not only does a review of the CTB's basic law, standing alone, fail to evince a legislative intent to authorize the CTB to regulate in this area, but an examination of other legislative action by the General Assembly further reveals that the CTB's authority to regulate is not so broad as to encompass the activity you present.[23] Other laws specifically address the use of cameras and similar equipment in connection with transportation assets in the Commonwealth. The General Assembly explicitly has authorized the use of "photo-monitoring systems," which take "photographs, . . . videotape, or other recorded images of [a] vehicle," to capture toll and traffic light violations.[24] The General Assembly also has authorized employing

[19] *See, e.g.*, 24 VA. ADMIN. CODE § 30-151-470 (permits for bicycle and road races, parades and marches); 24 VA. ADMIN. CODE § 30-151-600 (permits for pedestrian and bicycle facilities); 24 VA. ADMIN. CODE § 30-151-630 (permits for school bus shelters, public transit shelters, or ride share stations); 24 VA. ADMIN. CODE § 30-151-610 (permits for the passage of oversized haulers and loaders); 24 VA. ADMIN. CODE § 30-151-460 (permits for moving buildings over 16 feet wide); 24 VA. ADMIN. CODE § 30-151-510 (permits for signals to facilitate the "safe and expeditious entry of emergency vehicles" onto the roadway); 24 VA. ADMIN. CODE § 30-151-530 (permits for flashing school speed limit signs). Other regulations concern land uses with direct or indirect impact to the roadways, including the physical integrity of roadways. *See, e.g.*, 24 VA. ADMIN. CODE §§ 30-151-300 to -430 (permits for utilities, including the placement of utilities under or over the pavement); 24 VA. ADMIN. CODE § 30-151-540 (permits for right-of-way grading).

[20] 24 VA. ADMIN. CODE § 30 (emphasis added). As a regulation interpreting the agency's governing statutes, this determination is entitled to great weight. *Manassas Autocars*, 274 Va. at 87.

[21] VA. CODE ANN. § 33.2-210(A).

[22] The maxim *noscitur a sociis*, which translates as "it is known from its associates," also applies here. It provides that "the meaning of a word takes color and expression from the purport of the entire phrase of which it is a part, and it must be read in harmony with its context." Turner v. Commonwealth, 226 Va. 456, 460 (1983). Accordingly, "[w]hen general words and specific words are grouped together, the general words are limited and qualified by the specific words and will be construed to embrace only objects similar in nature to those objects identified by the specific words." Cuccinelli v. Rector & Visitors of Univ. of Virginia, 283 Va. 420, 432 (2012) (quoting Andrews v. Ring, 266 Va. 311, 319 (2003)). The language of § 33.2-210 authorizing regulations "for the use of systems of state highways" thus must be read in light of the more limited language of the statute permitting regulations "protect[ing] or covering traffic." Such a reading conveys that activity that does not implicate travel and transportation uses is beyond CTB's powers.

[23] As "one body of law," the Virginia Code is to be viewed as a whole, and a statute should be interpreted so that it harmonizes with other statutes. 2004 Op. Va. Att'y Gen. 68, 70 (quoting Branch v. Commonwealth, 14 Va. App. 836, 839 (1992)).

[24] VA. CODE ANN. §§ 15.2-968.1(E) (2018); 46.2-819.1 (Supp. 2022); *see also* §§ 33.2-503(2)(a) (Supp. 2022) (providing for photo enforcement of HOT lanes) and 46.2-819.5 (Supp. 2022) (providing for use of a photo-monitoring system along the Dulles Access Highway).

"video-monitoring system[s]" to enforce traffic laws related to school bus safety[25] and "photo speed monitoring devices" to record speeding violations in highway work zones and school crossing zones.[26] By definition, these monitoring systems and devices are similar in function to LPR cameras. The statutes authorizing the use of this equipment are very detailed. That the General Assembly has set forth these uses with such particularity implies an intent that they not be done otherwise; *i.e.*, through an agency's regulatory action.[27] Accordingly, this express legislation governing, in particularized circumstances, the use of LPR-similar technology within the state highway system supports a finding that general authority to permit their use has not been delegated to the CTB and such authority remains solely vested in the General Assembly.[28]

In sum, I conclude that, although the CTB regulates many uses on VDOT rights-of-way, at present it may not use its regulatory power to permit the installation of LPR systems therein without a clear delegation of authority from the General Assembly. Regulations are designed "to provide for specific applications of the broader policy concerns addressed in legislation passed by the General Assembly."[29] To the extent that the CTB is to regulate such surveillance equipment, it must be with the express authority of the General Assembly.[30]

It is not lost on the Office of the Attorney General that the practical applications of LPR technology may be incredibly useful for law enforcement. It is clear that LPR technology has the potential to allow law enforcement agencies more rapidly to solve crimes; apprehend dangerous fugitives; recover stolen property; or locate missing persons, especially when used in conjunction with AMBER or Silver Alert. Nevertheless, equally evident is that approving and adopting a framework for using LPR technology remains squarely within the purview of the General Assembly, and neither this Office, nor an administrative agency may encroach upon the General Assembly's authority in the present matter.[31]

---

[25] VA. CODE ANN. § 46.2-844 (Supp. 2022).

[26] Section 46.2-882.1 (Supp. 2022). *See* 2022 Op. Va. Att'y Gen. 22-014 (Aug. 15, 2022) (relating to VDOT permitting of such devices in light of express statutory authority providing for their use in particular circumstances), *available at* https://www.oag.state.va.us/files/Opinions/2022/22-014-Foster-issued.pdf.

[27] 2014 Op. Va. Att'y Gen. 34, 37, n.20; 1993 Op. Va. Att'y Gen. 59, 67 (citing Pine v. Commonwealth, 121 Va. 812, 821 (1917); 1991 Op. Va. Att'y Gen. 91, 93). Furthermore, the legislature is presumed to have intended each enactment to have a meaning that is consistent with other provisions of the law and that is not superfluous, but part of a harmonious and symmetrical whole. 2001 Op. Va. Att'y Gen. 192, 193 (citing Sch. Bd. v. Patterson, 111 Va. 482, 487-88 (1910)).

[28] Notably, these enactments themselves are limited to enforcing laws relating to traffic concerns and do not pertain to law enforcement generally. I further note that the General Assembly on many occasions has considered legislation concerning the use of LPR technology. *See, e.g.*, S.B. 1198 (2021 Reg. Sess.); H.B. 1657 (2017 Reg. Sess.); S.B. 236 (2017 Reg. Sess.); H.B. 141 (2016 Reg. Sess.); S.B. 236 (2016 Reg. Sess.); H.B. 1528 (2015 Reg. Sess.); H.B. 1673 (2015 Reg. Sess.); S.B. 965 (2015 Reg. Sess.); S.B. 452 (2014 Reg. Sess.). That the General Assembly often has taken up the issue of LPRs suggests that it believes this is an issue left to the legislature, and outside the purview of an administrative agency.

[29] 2014 Op. Va. Att'y Gen. at 43.

[30] *See* Portsmouth v. Va. Ry. & P. Co., 141 Va. 54, 68 (1925) ("It may be that in the evolution of transportation problems the time has come when the State should, for the public interest, empower the [State Corporation Commission] to relieve some of the street railway companies from some of their paving obligations, but for this relief the appeal must be made to the General Assembly. Neither the Commission nor the court has been vested with this sovereign legislative power, and cannot make but can only declare the law.").

[31] *See* Ours Props., Inc. v. Ley, 198 Va. 848, 851-52 (1957); Thompson v. Smith, 155 Va. 367, 381 (1930).

Conclusion

For the foregoing reasons, it is my opinion that the Commonwealth Transportation Board lacks the authority to amend its land use permit regulations to authorize a land use permit to be issued for license plate readers within the Commonwealth.

With regards, I am,

Very truly yours,

Jason S. Miyares
Attorney General

Attachment 20

COMMONWEALTH of VIRGINIA

Office of the Attorney General
Richmond 23219

900 East Main Street
Richmond, Virginia 23219
804 - 786 - 2071
804 - 371 - 8946 TDD

May 30, 2014

The Honorable L. Scott Lingamfelter
Member, House of Delegates
Post Office Box 7175
Woodbridge, Virginia 22195

The Honorable C. Todd Gilbert
Member, House of Delegates
Post Office Box 309
Woodstock, Virginia 22664

Dear Delegates Lingamfelter and Gilbert:

I am responding to your request for an official advisory Opinion in accordance with § 2.2-505 of the *Code of Virginia*.

Issues Presented

You ask whether the Governor of Virginia has authority to fail to implement or to follow a valid law that has been passed by the General Assembly and signed into law by the Governor in the absence of the General Assembly granting that authority either by statute or by the law's enactment clause. You also ask whether the President of the United States has authority not to implement the Affordable Care Act.

Response

It is my opinion that the Governor must enforce valid, duly enacted laws unless the power to delay or suspend enforcement is granted by statute[1] or by the law's enactment clause.[2] Based on longstanding precedent of this Office, I also conclude that a question related to the scope of power that can be exercised by the President of the United States with regard to enforcing a particular federal law is not an appropriate subject for an official Opinion of this Office.

---

[1] One example of a statute granting modification and suspension authority is VA. CODE ANN. § 2.2-4014 (2011), which allows the relevant standing committees of the General Assembly, or the Joint Commission on Administrative Rules, which is created by VA. CODE ANN. § 30-73.1 (2011), to object to regulations or, with the concurrence of the Governor, to modify or suspend regulations.

[2] Herein, the phrase "duly enacted" means passed by the General Assembly and signed by the Governor, and it also means, in the case of a bill vetoed by the Governor, where the General Assembly has voted to override the veto pursuant to VA. CONST. art. V, § 6(b)(ii). This Opinion assumes that the laws at issue do not have any constitutional infirmity. If a constitutional infirmity in a particular law does exist, a separate legal analysis would be necessary. Such an analysis is beyond the scope of this Opinion.

Applicable Law and Discussion

I. General Duty Of Governor To Enforce Laws

Your first inquiry implicates several provisions of the Constitution of Virginia. First, Article IV, § 1 vests the legislative power of the Commonwealth in the General Assembly.[3] Article V, § 7 provides, in pertinent part, that "[t]he Governor shall take care that the laws be faithfully executed."[4] This provision is commonly known as the "take care" clause.[5] Our Constitution further expressly requires the separation of powers: Article I, § 5 provides that "the legislative, executive, and judicial departments of the Commonwealth should be separate and distinct . . .[,]" and Article III, § 1 provides that "[t]he legislative, executive, and judicial departments shall be separate and distinct, so that none exercise the powers properly belonging to the others, nor any person exercise the power of more than one of them at the same time . . . ."[6] Finally, Article I, § 7 expressly provides "[t]hat all power of suspending laws, or the execution of laws, by any authority, without consent of the representatives of the people, is injurious to their rights, and ought not to be exercised."[7]

A recent Opinion of this Office discusses the history and interplay of these constitutional provisions.[8] Although the Opinion dealt specifically with the application of these provisions to the Governor's power, through formal action, to suspend the enforcement of regulations having the force of law,[9] the reasoning of the Opinion applies equally to the failure of the Governor to enforce, implement, or follow duly enacted statutes. Indeed, as the Opinion explains, "[p]rohibiting the executive from suspending duly enacted laws has long been part of Virginia's constitutional history."[10]

Ignoring or failing to implement a duly adopted regulation or statute has the same practical effect as actively issuing a directive suspending the enforcement of such law. To conclude otherwise, in a fashion analogous to permitting the Governor to issue an order suspending or ignoring a regulation, "would render the 'take care' clause of the Virginia Constitution a mere nullity."[11] Further, in concluding

[6] VA. CONST. art. I, § 5 and art. III, § 1. The separation of powers is a bedrock principle of Virginia government. The concept of separation of powers in Virginia government first appears as § 5 of the Virginia Declaration of Rights of 1776. It has continued in every Virginia Constitution since then. *See* VA. CONST. of 1830 art. I, § 5 & art. II; VA. CONST. of 1851 art. I, § 5 & art. II; VA. CONST. of 1864 art. I, § 5 & art. II; VA. CONST. of 1870 art. I, § 7 & art. II; and VA. CONST. of 1902 §§ 5 & 39.

[7] VA. CONST. art. I, § 7. The explicit prohibition on suspending laws first appeared as § 7 of the Virginia Declaration of Rights of 1776. It has appeared in every subsequent version of the Virginia Constitution. *See* VA. CONST. of 1830 art. I, § 7; VA. CONST. of 1851 art. I, § 7; VA. CONST. of 1864 art. I, § 7; VA. CONST. of 1870 art. I, § 9; and VA. CONST. of 1902 § 7.

[8] *See* 2014 Op. Va. Att'y Gen. No. 13-109, *available via link at* http://www.ag.virginia.gov/Opinions%20and%20Legal%20Resources/Opinions/2014opns/Jan14opndx.html.

[9] The explicit question addressed in the prior Opinion was "whether the Governor has the power to issue a policy directive to suspend a regulation that was properly adopted pursuant to a statutory mandate." *Id.* at 1.

[10] *Id.* at 3.

[11] *Id.* at 4.

that the Governor may not unilaterally suspend a validly promulgated regulation, the previous Opinion noted that such action "is as much a violation of the separation of powers as if the Governor sought to suspend the operation of a Virginia statute,"[12] the action about which you inquire.

II. Duty Of President To Enforce Laws

Your second inquiry is whether the President of the United States may fail to implement or follow a specific law - the Affordable Care Act - that has been passed by Congress and that he has signed into law. Although this Office does from time to time interpret federal law, that is done in order to address the interplay between specific provisions of federal law and the laws of the Commonwealth. Such opinions, when rendered, help to inform state or local decisions. Questions related to the President's inherent, implied, or express authority are governed by a complex interplay of the United States Constitution and various federal laws, including federal legislative history, federal common law, and possibly opinions of the United States Attorney General and the Office of Legal Counsel. Finally, it is important to note a practical consideration: the President is not subject to or guided or governed by Opinions of this Office, and thus any Opinion our office might render on this subject would be merely academic. It would not have any practical impact on either the President's conduct or state or local decisions. In these circumstances, the question of the President's authority not to implement a particular law should be resolved by appropriate federal authorities, not by this Office. For those reasons, I respectfully decline to offer an Opinion of the Office on the matter.

Conclusion

Accordingly, it is my opinion that the Governor must enforce duly enacted valid laws, unless the power to delay or suspend enforcement is granted by statute or by the law's enactment clause. It is further my opinion that a question related to the President of the United States declining to implement a particular federal law is not an appropriate subject for an official Opinion of this Office.

With kindest regards, I am

Very truly yours,

Mark R. Herring

Mark R. Herring
Attorney General

[12] *Id.* at 5. The prior Opinion notes that there may be instances "where a statute . . . allows for [suspension] under certain circumstances, and thus, such suspension would not necessarily violate the separation of powers[,]" *id.* n.28; your request, however, expressly is limited to situations in which there is no statutory allowance.

January 3, 2014

The Honorable Robert G. Marshall
Member, House of Delegates
Post Office Box 406
Richmond, Virginia 23218

Dear Delegate Marshall:

I am responding to your request for an official advisory opinion in accordance with § 2.2-505 of the *Code of Virginia*.

Issue Presented

You inquire whether the Governor has the power to issue a policy directive to suspend a regulation that was properly adopted pursuant to a statutory mandate.

Response

It is my opinion that, while the Governor has a significant role to play in the formulation of regulations promulgated by executive branch agencies, the Virginia Constitution prohibits the Governor from unilaterally suspending the operation of regulations that have the force of law.[1]

Background

The legislative power of the Commonwealth is and has been vested in the General Assembly.[2] Nevertheless, as the scope and reach of government increased, some thought it necessary to create administrative agencies (sometimes referred to as "executive branch agencies") to promulgate regulations to provide for specific applications of the broader policy concerns addressed in legislation passed by the General Assembly. The authority for the existence of such agencies is found in Article III, § 1 of the Virginia Constitution,[3] which provides in pertinent part that "administrative agencies may be created by the General Assembly with such authority and duties as the General Assembly may prescribe."

---

[1] Your inquiry is stated in general terms; however, you then specifically reference a statement made by the Governor-elect, when he was a candidate, about regulations regarding the treatment of abortion facilities as hospitals. The same conclusion results regardless of the particular subject matter.

[2] VA. CONST. art. IV, § 1.

[3] Article III, § 1 also is one of the two provisions of the Virginia Constitution that mandates the separation of powers among the three branches of government. The dispensation for the creation of administrative agencies is the limited "exception to the basic principle" of separation of powers. 1 A.E. DICK HOWARD, COMMENTARIES ON THE CONSTITUTION OF VIRGINIA 433 (1974).

The grant of power to administrative agencies is limited. "[D]elegations of legislative power are valid only if they establish specific policies and fix definite standards to guide the official, agency, or board in the exercise of the power. Delegations of legislative power that lack such policies and standards are unconstitutional and void."[4] Furthermore, administrative agencies are often required to adopt regulations pursuant to the Virginia Administrative Process Act ("APA").[5] Pursuant to the APA, agency regulations are, prior to becoming effective, subject to public notice, and potentially, public hearings,[6] subject to public comment and, potentially, the taking of evidence,[7] subject to review by both the Attorney General and the Governor,[8] and subject to legislative review.[9] If an agency enacts a regulation consistent with its statutory charge[10] and that regulation has gone through the required regulatory processes for promulgation, it has the force of law.[11]

Applicable Law and Discussion

Before addressing the specific issue of whether the Governor has the authority to suspend a validly adopted regulation, it is important to recognize that the Governor has a significant ability to affect the issuance of regulations *prospectively*. As noted above, he has a statutory role in the adoption of regulations under the APA.[12] Additionally, the Governor affects the composition of administrative agencies through his appointments of the heads of administrative agencies[13] and their respective boards.[14] Furthermore, the Virginia Constitution explicitly authorizes the Governor to require certain officers and employees within state agencies to provide him with reports of the agency's activities and to allow him to inspect the agencies financial and other records.[15]

Another method governors have employed to influence the operations of state government is through the issuance of written directions. Whether called executive orders, executive directives, or guidance documents, these directions have been used by governors to have administrative agencies pursue the governor's policy objectives. Before turning to whether the Governor unilaterally may issue such directions to suspend a validly adopted regulation, it is helpful to review the Governor's general authority to issue such orders, directives, or guidance documents.

---

[12] Section 2.2-4013.

[13] VA. CONST. art. V, § 10 ("Except as may be otherwise provided in this Constitution, the Governor shall appoint each officer serving as the head of an administrative department or division of the executive branch of the government, subject to such confirmation as the General Assembly may prescribe. Each officer appointed by the Governor pursuant to this section shall have such professional qualifications as may be prescribed by law and shall serve at the pleasure of the Governor.").

[14] VA. CODE ANN. § 2.2-107 (2011).

[15] VA. CONST. art. V, § 8.

The Supreme Court of Virginia has noted that "[u]nder our system of government, the governor has and can rightly exercise no power except such as may be bestowed upon him by the constitution and the laws."[16] No provisions of the Constitution of Virginia or any statute explicitly grant to the Governor the authority to issue executive orders. Governors historically have issued executive orders based upon the authority inherent in the constitutional duty of the Governor to "take care that the laws be faithfully executed."[17] Prior opinions of the Attorney General recognize that the Constitution grants to the Governor a general reservoir of powers as chief executive of the Commonwealth.[18] Thus, the authority of the Governor to issue executive orders is well established in the law and history of the Commonwealth.

The scope of such authority, however, is limited. The Governor may not use an executive order (or any other means) to exercise legislative power, which is vested solely in the General Assembly.[19] Furthermore, the Governor may not issue executive orders or take other action that is contrary to express provisions of the Virginia Constitution.[20] Thus, if an executive order or other written direction amounts to an exercise of legislative power or violates a provision of the Virginia Constitution, the Governor is without power to issue it and the written direction necessarily is void.

Applying this legal background to your specific inquiry, it becomes clear that the Governor may not unilaterally (whether by executive order, executive directive or guidance opinion[21]) suspend the operation of a validly enacted regulation. As explained below, any attempt to do so would represent a violation of Article V, § 7, Article I, § 7, and the separation of powers provisions of the Virginia Constitution.

Prohibiting the executive from suspending duly enacted laws has long been part of Virginia's constitutional history. The drafters of both the Virginia Constitution and the United States Constitution were very familiar with claims that the executive had the authority to suspend or dispense with duly enacted laws, and both sets of framers sought to borrow from the English experience and prevent the executive from claiming such a power in the New World. As one scholar has noted regarding the drafting of the United States Constitution,

> In 1689, following the forced abdication of James II, Parliament enacted the English Bill of Rights. The first declaration of that momentous statute was "that the pretended Power of Suspending of Laws, or the Execution of Laws, by regal Authority, without Consent of Parliament, is illegal." The royal dispensing prerogative was also declared illegal.
>
> The English Bill of Rights became a template for American constitution drafting. Virtually every secular provision in that statute was incorporated into the U.S. Constitution. The prohibition on the suspending and dispensing powers was encoded in

---

[16] Lewis v. Whittle, 77 Va. 415, 420 (1883).

[17] VA. CONST. art. V, § 7.

[18] *See* 1983-84 Op. Va. Att'y Gen. 180; 1945-46 Op. Va. Att'y Gen. 144.

[19] *See* VA. CONST. art. I, § 5; art. III, § 1; art. IV, § 1.

[20] *Lewis*, 77 Va. at 420.

[21] As they pertain to regulations, "guidance documents" are referenced in § 2.2-4008 of the *Code of Virginia*. Nothing in § 2.2-4008 would allow for a guidance document that was inconsistent with the regulation itself or the relevant authorizing statute. Rather, guidance documents, as properly understood, only may explain or amplify the relevant regulation or statute. Definitionally, suspending the operation of a regulation would neither explain nor amplify the regulation, but rather, only subvert it.

> Article II's requirement that the President must "take Care that the Laws be faithfully executed." Thus, these rejected royal prerogatives were denied to the President.[22]

The drafters of Virginia's Constitution adopted nearly identical language, seeking to effectuate the same prohibition.[23] Article V, § 7 of the Virginia Constitution provides, in pertinent part, that "[t]he Governor shall take care that the laws be faithfully executed."[24]

Validly implemented regulations carry the force of law;[25] thus, it should be self-evident that unilaterally issuing a directive that suspends or ignores such a regulation is inconsistent with the Governor's duty to "take care that the laws be faithfully executed." To conclude otherwise would grant the Governor a suspending power that has been denied to the English King since at least 1689 and would render the "take care" clause of the Virginia Constitution a mere nullity. Simply stated, the Virginia Constitution's "take care" clause prohibits the Governor from issuing instructions (whether by executive order, executive directive or guidance opinion) that a valid regulation be suspended or ignored.

While the framers of the federal constitution apparently believed that the federal "take care" clause was sufficient to make clear that the executive could not suspend validly enacted laws, Virginia went one step further. Article I, § 7 of the Virginia Constitution expressly provides "[t]hat all power of suspending laws, or the execution of laws, by any authority, without consent of the representatives of the people, is injurious to their rights, and ought not to be exercised."[26] Thus, the prohibition that is implicit in Article V, § 7's "take care" clause is made explicit by Article I, § 7: the Governor may not unilaterally direct, by any means, that a validly adopted regulation that has the force of law be suspended or ignored.

Irrespective of the prohibitions found in Article V, § 7 and Article I, § 7, the Virginia Constitution nonetheless would prohibit the Governor from unilaterally suspending a validly adopted regulation carrying the force of law. Specifically, such action would violate the separation of powers provisions found in Article I, § 5 ("That the legislative, executive, and judicial departments of the Commonwealth should be separate and distinct . . . . ") and Article III, § 1 ("The legislative, executive, and judicial

[22] Robert J. Reinstein, *The Limits of Executive Power*, 59 AM. U. L. REV. 259, 280 (2009) (footnotes omitted).

[23] Whether the nation borrowed from Virginia or whether Virginia borrowed from the nation is unclear. Virginia's "take care" clause first appears explicitly in the Virginia Constitution of 1830. VA. CONST. of 1830 art. IV, § 4. At least one scholar has suggested that the federal "take care" clause "descends to us from the English Bill of Rights, via the Virginia Constitution, and was intended to forbid the executive's suspension of statutes." Peter M. Shane, *Restoring Faith in Government: Presidents and the Separation of Powers, Pardons, and Prosecutors: Legal Accountability*, 11 YALE L. & POL'Y REV. 361, 393-94 (1993) (footnote omitted).

[24] As noted in note 23 *supra*, this language first appeared in the Virginia Constitution of 1830. It has appeared in every subsequent version of the Virginia Constitution. *See* VA. CONST. of 1851 art. V, § 5; VA. CONST. of 1864 art. V, § 5; VA. CONST. of 1870 art. IV, § 5; and VA. CONST. of 1902 § 73.

[25] *See Manassas Autocars, Inc.*, 274 Va. at 87, 645 S.E.2d at 445. *See also* VA. CODE ANN. § 2.2-4001 (2011) (defining a "regulation" under the Administrative Process Act as "any statement of general application, having the force of law, affecting the rights or conduct of any person, adopted by an agency in accordance with the authority conferred on it by applicable basic laws.").

[26] The explicit prohibition on suspending laws first appeared as § 7 of the Virginia Declaration of Rights of 1776. It has appeared in every subsequent version of the Virginia Constitution. *See* VA. CONST. of 1830 art. I, § 7; VA. CONST. of 1851 art. I, § 7; VA. CONST. of 1864 art. I, § 7; VA. CONST. of 1870 art. I, § 9; and VA. CONST. of 1902 § 7.

departments shall be separate and distinct, so that none exercise the powers properly belonging to the others, nor any person exercise the power of more than one of them at the same time . . . .").[27]

It must be remembered that, when adopting a regulation, an administrative agency is not engaged in an executive function, but rather, it is exercising legislative authority that has been delegated to it by the General Assembly. As noted above, the authority for the existence of such agencies is found in Article III, § 1 of the Virginia Constitution, which provides in pertinent part that "administrative agencies may be created by the General Assembly with such authority and duties as the General Assembly may prescribe." Because administrative agencies are exercising delegated legislative authority, a unilateral attempt[28] by the Governor to suspend a validly enacted regulation is as much a violation of the separation of powers as if the Governor sought to suspend the operation of a Virginia statute. It is simply beyond a Governor's power to do so, and any such attempt is void.

This conclusion is consistent with the APA's provisions regarding withdrawal of regulations. Section 2.2-4016 provides that

> [n]othing in this chapter shall prevent any agency from withdrawing any regulation at any time prior to the effective date of that regulation. A regulation may be repealed after its effective date only in accordance with the provisions of this chapter that govern the adoption of regulations.

Thus, for regulations promulgated under the APA, it is clear that the executive branch (in this case the relevant agency itself) has the ability to dispense with a regulation at any time prior to its effective date; however, once it becomes effective, the executive no longer may dispense with the regulation unilaterally. Rather, the regulation can be changed or suspended only by going through the full APA process, as a result of a change in the authorizing statute being passed by the General Assembly and becoming law, or by order of a court of competent jurisdiction. Thus, a guidance opinion from the Governor is not legally sufficient to effectuate a change in or suspension of a validly enacted regulation.

Conclusion

Accordingly, it is my opinion that that, while a Governor has a significant role to play in the formulation of regulations promulgated by executive branch agencies, the Virginia Constitution prohibits a Governor from unilaterally suspending the operation of regulations that have the force of law.

---

[27] The separation of powers is a bedrock principle of Virginia government. The concept of separation of powers in Virginia government first appears as § 5 of the Virginia Declaration of Rights of 1776. It has continued in every Virginia Constitution since then. *See* VA. CONST. of 1830 art. I, § 5 & art. II; VA. CONST. of 1851 art. I, § 5 & art. II; VA. CONST. of 1864 art. I, § 5 & art. II; VA. CONST. of 1870 art. I, § 7 & art. II; and VA. CONST. of 1902 §§ 5 & 39.

[28] It is conceivable that there could be circumstances where a statute or regulation allows for the regulation to be suspended under certain circumstances, and thus, such suspension would not necessarily violate the separation of powers. You do not inquire about such a scenario, and a review of all of the specific facts and circumstances would be necessary to determine if such a scenario violated some portion of the Virginia Constitution. Accordingly, such inquiry is beyond the scope of this opinion, and I do not address it in the abstract here.

With kindest regards, I am

Very truly yours,

Kenneth T. Cuccinelli, II
Attorney General

Governor Northam Signs Clean Energy Legislation

RICHMOND—Governor Ralph Northam is accelerating Virginia's transition to clean energy by signing the Virginia Clean Economy Act and by amending the Clean Energy and Community Flood Preparedness Act that requires Virginia to join the Regional Greenhouse Gas Initiative.

"These new clean energy laws propel Virginia to leadership among the states in fighting climate change," **said Governor Northam**. "They advance environmental justice and help create clean energy jobs. In Virginia, we are proving that a clean environment and a strong economy go hand-in-hand."

The **Virginia Clean Economy Act** was passed as House Bill 1526 and Senate Bill 851, which were sponsored by Delegate Richard C. "Rip" Sullivan, Jr. and Senator Jennifer McClellan, respectively. The Act incorporates clean energy directions that the Governor issued in Executive Order Forty-Three in September 2019. It results from extensive stakeholder input and incorporates environmental justice concepts related to the Green New Deal.

The law requires new measures to promote energy efficiency, sets a schedule for closing old fossil fuel power plants, and requires electricity to come from 100 percent renewable sources such as solar or wind. Energy companies must pay penalties for not meeting their targets, and part of that revenue would fund job training and renewable energy programs in historically disadvantaged communities. The Act accomplishes the following broad goals:

- **Establishes renewable portfolio standards**. The Act requires Dominion Energy Virginia to be 100 percent carbon-free by 2045 and Appalachian Power to be 100 percent carbon-

free by 2050. It requires nearly all coal-fired plants to close by the end of 2024.

- **Establishes energy efficiency standards**. The Act declares energy efficiency pilot programs to be "in the public interest." It creates a new program to reduce the energy burden for low-income customers, and it requires the Department of Social Services and the Department of Housing and Community Development to convene stakeholders to develop recommendations to implement this program. The Act sets an energy efficiency resource standard, requiring third party review of whether energy companies meet savings goals.
- **Advances offshore wind**. The Act provides that 5,200 megawatts of offshore wind generation is "in the public interest." It requires Dominion Energy Virginia to prioritize hiring local workers from historically disadvantaged communities, to work with the Commonwealth to advance apprenticeship and job training, and to include an environmental and fisheries mitigation plan.
- **Advances solar and distributed generation**. The Act establishes that 16,100 megawatts of solar and onshore wind is "in the public interest." The law expands "net metering," making it easier for rooftop solar to advance across Virginia. The new law requires Virginia's largest energy companies to construct or acquire more than 3,100 megawatts of energy storage capacity.

"This is a terrific day for Virginia," **said Delegate Richard C. "Rip" Sullivan, Jr**. "While some said Virginia is moving too fast, we said this is the year to get it right. This is an historic step forward on clean energy in Virginia."

"This is the most significant clean energy law in Virginia's history," **said Senator Jennifer McClellan**. "The bill that the Governor signed will make Virginia the first southern state with a 100 percent clean energy standard. The Act will create thousands of clean energy jobs, make major progress on fighting climate change, and break Virginia's reliance on fossil fuels."

The Clean Energy and Community Flood Preparedness Act was passed as House Bill 981 and Senate Bill 1027, sponsored by House Majority Leader Charniele Herring and Senator Lynwood Lewis, respectively.

The Act establishes a carbon dioxide cap-and-trade program to reduce emissions from power plants, in compliance with the Regional Greenhouse Gas Initiative (RGGI). The Department of Environmental Quality will establish and operate an auction program to sell allowances into a market-based trading program.

The Act creates a Virginia Community Flood Preparedness Fund to enhance flood prevention, protection, and coastal resilience. It creates a low-interest loan program to help inland and coastal communities that are subject to recurrent flooding. The sale of emissions allowances would fund it.

The Governor proposed technical amendments to clarify how the fund would operate. The amendments provide for forgiveness of loans used in low-income geographic areas.

“By joining RGGI, Virginia will take part in a proven, market-based program for reducing carbon pollution in a manner that protects consumers,” **said Governor Northam**. “I am proposing important refinements and I look forward to signing it into law soon.”

“Advocates have worked hard for many years to put Virginia on the path to clean energy,” **said House Majority Leader Charniele Herring**. “This will bring cleaner air and water to Virginia, and the Governor’s amendments will make a good law even better.”

“Joining RGGI will secure a sustainable clean energy future for Virginia,” **said Senator Lynwood Lewis**. “Thanks to the Governor’s leadership, we’re almost at the finish line.”

Last year’s budget explicitly prevented Virginia from joining RGGI.

ENERGY + ENVIRONMENT

COMMENTARY

Clean air and clean water are more important now than ever

GUEST COLUMN

APRIL 24, 2020 12:01 AM

The sun sets over the James River in Richmond. (Ned Oliver/Virginia Mercury)

By David K. Paylor

In the face of the greatest public health crisis in decades, we are more aware than ever of the connection between environmental protection, public and individual health and a strong economy. As we enter a new decade of environmentalism, it is worth reflecting on how far we have come so we can move forward with confidence and commitment to address new and urgent challenges.

This week, amid the COVID-19 pandemic, we celebrated the 50th anniversary of Earth Day. This movement started in 1970, when 20 million people gathered in the streets of America to encourage our leaders to rise to the challenge of protecting the environment. From the decimation of our bald eagle population from DDT use to contaminated rivers catching fire, the evidence was painfully clear that we were not adequately aware of our impact on the environment, and its importance to human health. Out of this new awareness, a movement was born.

The 1970s saw the passage of the most comprehensive environmental legislation in U.S. history, including the Clean Air Act, the Clean Water Act, the Endangered Species Act, the Toxic Substances Control Act and the Surface Mining Control and Reclamation Act. In addition, just months after the first Earth Day, a new federal organization tasked with monitoring the nation's natural assets – the Environmental Protection Agency – was created.

The Virginia Department of Environmental Quality is the environmental agency in the commonwealth, safeguarding the places we live and promoting the health and well-being of eight million people. The agency follows laws that provide us with the framework to keep air, water and land clean by preparing and issuing permits to businesses, local governments and state and federal facilities. These permits establish safe limits, reduce pollution and hold violators accountable.

Our efforts are paying off. For example, Virginia is breathing cleaner air than ever before. Water quality improvements have helped bring the Chesapeake Bay back to life. Thousands of acres of contaminated land are being cleaned up and recovered. We have worked with businesses and environmental partners to ensure that strong environmental protections and a strong economy can go hand in hand.

To carry out DEQ's extensive permitting programs and environmental protection and conservation initiatives, we collaborate with a statewide team of partners to help develop clean-up plans for waterbodies, work with dedicated volunteers to monitor recreational waters, oversee the revitalization of contaminated sites to turn distressed property into viable real estate, and respond to pollution complaints and environmental emergencies to assist first responders and mitigate destructive impacts.

This takes a talented team of professionals from six regional locations and the central office. We are engineers, biologists, hydrologists, geologists, meteorologists, inspectors, regulators, modelers, policy makers, permit writers, administrators, communicator and, of course, environmentalists. Most of all, we are mission-driven problem solvers.

The challenges ahead will require innovative approaches to environmental protection that extend into much more complex areas of public policy such as addressing climate change, environmental justice and sustainable economic development. As demonstrated by the COVID-19 pandemic, community health is a vital component of community resilience.

To that end, with direction and support from the governor's office and the secretary of natural resources, DEQ is invested in being part of the solution. We are currently engaged in a wholesale review of our environmental justice procedures, we are committed to transparency, public accessibility of our work and establishing programs to continue to effectively administer our environmental protection programs.

We are also committed to reducing the pollution that causes climate change. The governor has signed the Virginia Clean Economy Act and amended the Clean Energy and Community Flood Preparedness Act to require Virginia to join the Regional Greenhouse Gas Initiative (RGGI).

As the governor has said, by joining RGGI, Virginia will take part in a proven, market-based program for reducing carbon pollution in a manner that protects consumers.

On Earth Day – and every day – our number one priority remains to protect the commonwealth's diverse and abundant natural resources in everything we do. Through this important work, DEQ supports agriculture, industry and commerce, and provides a rich, healthy environment for plants, wildlife and people.

Together, we have made much progress in Virginia over the past few decades. We plan on continuing this legacy as we move forward to address the new challenges in the years ahead.

David K. Paylor is director of the Virginia Department of Environmental Quality.

Greenhouse Gases

Gases that trap heat in the atmosphere are called greenhouse gases (GHGs). These include carbon dioxide, methane, nitrous oxide and fluorinated gases. Solar radiation in the lower atmosphere acts like a “greenhouse” – thus the name – preventing heat from escaping. Emissions of greenhouse gases into the atmosphere is the main cause of climate change.

Virginia is committed to addressing the pollutants that contribute to climate change. The Virginia Clean Economy Act establishes renewable portfolio and energy efficiency standards, and advances offshore wind and solar generation, and the Clean Energy and Community Flood Preparedness Act requires Virginia to join the Regional Greenhouse Gas Initiative (RGGI).

Additionally, DEQ implements several programs to reduce methane DEQ also coordinates Virginia's participation in RGGI and the Transportation Climate Initiative (TCI).

GHG Inventories

DEQ has conducted economy-wide GHG inventories for 2005, 2010 and 2018. The following reports and accompanying Excel files provide more information on these inventories.

ALERT FEATURED

61 Dems say Virginia's participation in RGGI is up to legislature

Charlotte Rene Woods
Sep 8, 2022

Air Pollution Control Board Member Hope Cupit tells Virginia DEQ Director Mike Rolband that the Virginia attorney general's office gave her a document in March saying Virginia's participation in the Regional Greenhouse Gas Initiative is up to the General Assembly, not the Air Board.

On Thursday, 61 Virginia Democrats — more than a third of the General Assembly — signed onto a letter addressed to the state's **Air Pollution Control Board** opposing Gov. Glenn Youngkin's proposed regulatory route to remove Virginia from the Regional Greenhouse Gas Initiative.

On Aug. 31, **Travis Voyles**, the acting secretary of natural and historic resources, outlined the administration's plans to remove Virginia from RGGI through the Administrative Process Act — which entails a period of public comment and eventually a vote by the air board.

Department of Environmental Quality
P.O. Box 1105
Richmond, Virginia 23218

Sent via email: CitizenBoards@DEQ.Virginia.gov

Dear Members of the Air Pollution Control Board:

As current members of the Virginia General Assembly who voted for the Clean Energy and Community Flood Preparedness Act in 2020 or voted against changes to that same law in 2022, we write to express our continued support for Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI). Further, we write to articulate the reality that Virginia's participation in RGGI is mandated by *law*. Therefore, ultimately only a change in the *law* that passes both chambers of the General Assembly and is signed by the Governor can remove Virginia's participation. No proposed regulation, emergency regulation, regulatory act, or any subsequent administrative process can do so.

In addition to the Commonwealth's participation being mandated, RGGI is already delivering benefits to the residents of Virginia. As legislators, we believe it is important that you consider and understand the following benefits to Virginians from our participation in RGGI:

- RGGI has generated $378 million to support low-income energy efficiency programs and flood resilience infrastructure in Virginia.[1]
    - Energy efficiency upgrades are the best way to lower electricity bills, and Virginia's funds are directed to helping those households most in need.[2]
    - Flood resilience infrastructure protects Virginians against increased flooding and extreme weather events.
- RGGI has demonstrated Energy Cost Savings.
    - Electricity prices in RGGI states dropped by almost 6% while they went up by almost 9% throughout the rest of the country.[3] RGGI is a proven tool to reduce utilities'

[1] https://www.rggi.org/sites/default/files/Uploads/Auction-Materials/Cumulative-State-Charts/VA_Proceeds_by_Auction.xlsx

[3] https://acadiacenter.org/wp-content/uploads/2019/09/Acadia-Center_RGGI_10-Years-in-Review_2019-09-17.pdf

But the 61 legislators who have signed onto the letter say that's "improper and illegal" and that it's a decision for the General Assembly.

People are also reading...

3. **Thousands of terrified fish throw themselves onto Outer Banks beach, videos show**
4. **Williams: John V. Moeser, a scholar and a gentleman, pushed for a more inclusive and equitable Richmond region.**

RGGI is a carbon market composed of 11 states where energy producers trade emission reductions for credits or buy credits to emit carbon dioxide past a capped amount. Proponents of the initiative say it can incentivize producers to use fewer fossil fuels over time, and the funding generated through quarterly auctions is used for environmental projects. In 2021, Virginia raked in $228 million in funding for flood protection and energy efficiency programs.

Legislators mull ways to keep power bills down amid Regional Greenhouse Gas Initiative debate

The letter comes amid debates surrounding whose authority it is to pull Virginia out of RGGI. Environmental advocates, legal groups — and now many Democrats in the General Assembly — say that it's the legislative body's purview to remove Virginia from RGGI, that lawmakers put Virginia into the initiative.

"We write to articulate the reality that Virginia's participation in RGGI is mandated by law," the letter reads. "Therefore ultimately only a change in the law that passes both chambers of the General Assembly and is signed into law by the governor can remove Virginia's participation."

It seems that the attorney general's office might share that view. At an air board meeting this spring, member Hope Cupit said she received correspondence from the office reiterating the point.

Environmental advocacy group Appalachian Voices has a **pending lawsuit** in which it seeks to obtain a copy of the correspondence after it unsuccessfully requested the document under the Freedom of Information Act.

Environmental group sues to get AG document on withdrawal from RGGI

The letter, spearheaded by Sen. Lynwood Lewis, D-Accomack, added that the air board is limited in its abilities because it was created by the General Assembly.

"You only have the powers that the General Assembly grants you," the letter said.

The Democrats' letter also notes the law that enables participation in RGGI — the Clean Energy and Community Flood Preparedness Act — adding, "it is clear our intent for Virginia to participate in RGGI."

With Youngkin's proposed regulatory route, his goal is for Virginia to withdraw from the initiative by the end of 2023. The air board is composed of gubernatorial appointees on staggered terms, and with new appointees who could vote in Youngkin's favor, legal groups argue that this may trigger legal challenges.

Youngkin report calls carbon program too expensive; its supporters push back

Some members of the legislature have worked on a withdrawal, but efforts failed in the 2022 session. House Majority Leader Terry Kilgore, R-Scott, and Sen. Richard Stuart, R-Stafford, carried bills that would have repealed the Clean Energy and Community Flood Preparedness Act.

All General Assembly seats are up for election in 2023. Should the legislative body change its mind about RGGI, lawmakers would present such measures during the 2024 session.

ENERGY + ENVIRONMENT

Legislative commission objects to withdrawal from regional carbon market

BY: **CHARLIE PAULLIN** - DECEMBER 20, 2022 5:20 PM

Southern Environmental Law Center Senior Attorney Nate Benforado speaks to the Joint Commission on Administrative Rules Monday morning. (Charlie Paullin/The Mercury)

A legislative oversight commission voted 5-4 Monday to object to actions taken by Gov. Glenn Youngkin's administration earlier this month to repeal regulations governing Virginia's participation in a regional carbon market.

All Democrats on the Joint Commission on Administrative Rules voted in favor of the objection, while all Republicans voted against it.

The commission is charged with reviewing proposed regulations to see if they are consistent with the law. Its objection will be filed with the Virginia registrar and the State Air Pollution Control Board.

The vote followed action by the State Air Pollution Control Board Dec. 7 to start the process of withdrawing Virginia from the Regional Greenhouse Gas Initiative, a multistate carbon market that requires power producers to purchase allowances for every ton of carbon they emit.

Proceeds from the allowance purchases are returned to participating states, which in Virginia's case has resulted in $523 million for flood resilience and energy efficiency programs since January 2021.

Republican Gov. Glenn Youngkin's administration has described RGGI participation as a disguised tax because the costs incurred by the state's regulated electric utilities like Dominion and Appalachian Power are passed on to ratepayers. (Non-utility merchant generators, which are responsible for about a quarter of Virginia carbon emissions tracked by RGGI, bear the remaining costs.)

Acting Secretary of Natural and Historic Resources Travis Voyles defended the administration's withdrawal on the grounds that the 2020 law that led to Virginia's participation says the director of the Department of Environmental Quality is "authorized to establish, implement, and manage an auction program to sell allowances into a market-based trading program consistent with the RGGI program."

The use of the word "authorize," said Voyles, provides discretion to the department to participate or not participate in RGGI.

Commission chair Creigh Deeds, D-Bath, however, said the first line of the code section states that the following provisions of the article "shall be incorporated by the department, without further action by the board."

"I think the mandatory outweighs the discretionary," he said.

Voyles said Deeds' interpretation was "mostly right" in that the law sets up the regulatory system for RGGI participation, but argued DEQ is responsible for any additional steps to implement the program.

No Republican members of the committee questioned the legality of the administration's efforts to leave the program. But Del. William Wampler, R-Washington, noted higher energy costs in other states participating in RGGI, such as Connecticut.

And in response to a question from Del. Roxann Robinson, R-Chesterfield, about whether a reduction in carbon emissions in Virginia can be directly related to RGGI, Voyles said "it's very hard" to attribute one to the other. Instead, he said recent reductions can be attributed to federal energy regulatory systems in place in the state and the Virginia Clean Economy Act, another 2020 Democrat-backed law that aims to decarbonize the electric grid by midcentury.

Southern Environmental Law Center Senior Attorney Nate Benforado, a leading proponent of RGGI participation, disputed that, pointing to data from a report issued by Youngkin's

administration that found carbon emissions fell from 32.8 million tons in 2020 to 28.6 million tons in 2021, a 12.8% difference.

The pool of available emissions allowances shrink every year under RGGI, he argued. Furthermore, he said, RGGI requirements also apply to Virginia's non-utility electricity producers, which are not subject to the Virginia Clean Economy Act.

"I don't think we should jump ship at this point," Benforado said.

All but one of several guest speakers spoke in favor of RGGI and the funding it provides to efforts across the entire state.

Last week, Republican Gov. Glenn Youngkin included in his 2023-24 budget proposal $100 million in each year for the Resilient Virginia Revolving Loan Fund, a pool of money that could serve as an alternative to RGGI funding now being channeled into flood resilience programs.

The administration has not identified an alternative state source of funding for existing low-income energy efficiency programs currently funded by RGGI dollars.

Youngkin spokesperson Macaulay Porter pointed to federal sources for weatherization efforts. Those include annual appropriations of $4.4 million from the U.S. Department of Energy and $14 million for the Low Income Home Energy Assistance Program, or LIHEAP, from the Secretary of Health and Human Service, plus $65 million to Virginia's Department of Housing and Community Development from the Infrastructure Investment and Jobs Act.

This story was updated with funding sources for weatherization efforts.

RECEIVED AND FILED
CIRCUIT COURT
OCT 02 2020
EDWARD F. JEWETT, CLERK
BY _____ D.C.

PETITION FOR APPEAL

1. The Virginia Manufacturers Association (VMA), hereby petitions this court to invalidate, vacate, and declare null and void, Regulation Revision A20 to 9 VAC 5-140, Chapter 140, Regulation for Emissions Trading Programs (Final) (Revised Trading Rule) issued as a final rule by Virginia Department of Environmental Quality (DEQ), effective on July 10, 2020 and published in the Virginia Register on August 3, 2020. In compliance with

Rule 2A:2 of the Rules of the Supreme Court of Virginia, VMA filed a notice of appeal with the DEQ, and counsel on September 2, 2020. A copy of the notice of appeal is attached with this petition as Attachment A (Notice of Appeal).

INTRODUCTION

2. DEQ wrongfully issued the Revised Trading Rule (Revision A20) by determining that the revision is an exempt final regulation. As such, the Revised Trading Rule has had no economic impact analysis, no notice and comment by the public, no Air Pollution Control Board (Air Board) action on the rule, no legislative branch review, and no executive branch review. Revision A20 completely transformed the originally issued trading rule (Original Rule), at significant economic cost to the public, VMA, its member companies, and the Virginia economy. But there has been no analyses of the Revised Trading Rule or an opportunity to comment.

3. In compliance with Rule 2A:4 of the Rules of the Supreme Court of Virginia, VMA submits this petition for appeal within 30 days of filing its notice of appeal on October 2, 2020.

PARTIES

4. Petitioner VMA represents manufacturers across the Commonwealth of Virginia. Virginia's 6,750 manufacturers employ over 230,000 individuals, contribute $43 billion to the gross state product. VMA is the only statewide association in Virginia dedicated exclusively to manufacturers. Since 1922, the VMA has served as Industry's

Advocate.™ VMA develops constructive policies and activities on behalf of industry by serving as an advocate for legislative, regulatory, taxation, and environmental issues. VMA's core mission is to create the best business environment in the United States for world-class advanced technology businesses to manufacture and headquarter their businesses for maximum productivity and profitability. To fulfill this mission, VMA actively participates in the Commonwealth's regulatory processes. Petitioner VMA is a "person" as defined by Virginia Code Ann. §10.1-1300 because it is an association and a legal entity.

5. Respondent DEQ has the authority to draft regulations for action by the Air Board. Va. Code Ann. §§ 10.1-1308 and 10.1-1322.3. DEQ issued the Revised Trading Rule on behalf of the Air Board.

6. Respondent DEQ Director David Paylor may exercise the authority delegated to him by the Air Board and may designate other DEQ officials to exercise certain authorities on his behalf. In his position as Director, Mr. Paylor exercised his authority to issue the Revised Trading Rule.

7. Respondent Air Board is a regulatory board established by Section 10.1-1301 of the State Air Pollution Control Law, Virginia Code Ann. § 10.1-1301. The Air Board has authority to promulgate regulations, such as the Revised Trading Rule. DEQ acted under the Air Board's authority to issue the Revised Trading Rule.

JURISDICTION AND VENUE

8. Under Va. Code Ann. § 2.2-4026, any person has a right to the direct review by an appropriate and timely court action against the agency or its officers or agents if that person is affected by and claiming the unlawfulness of a regulation, whether that regulation is exempted from the procedural requirements of Article 2 of the APA.

9. VMA has standing to seek judicial review the DEQ's promulgation of the Revised Trading Rule as an exempt final regulation because (1) the Rule was unlawfully promulgated by DEQ; (2) the content of the Revised Trading Rule is unlawful; and (3) VMA, as an organization, and its members are adversely affected by the Rule.

10. As required by Virginia Code § 10.1-1318(B), VMA meets the standard for obtaining judicial review of a case or controversy pursuant to Article III of the United States Constitution. VMA, as an organization, and VMA's members have suffered actual, concrete, and particularized invasion of their legally protected interests, which is fairly traceable to the adoption of the Revised Trading Rule as a final rule. This harm is redressable by a favorable decision of the Court. U.S.C.A. Const. Art. 3, Section 1 *et. seq.*; *see also Chesapeake Bay Foundation, Inc. v. Commonwealth, ex rel. Virginia State Water Board*, 52 Va. App. 807 (Nov. 4, 2008).

11. The Revised Trading Rule directly and significantly affects VMA and its members. The Revised Trading Rule creates a Virginia only trading program. Based on the Revised Trading Rule, the Commonwealth joined the Regional Greenhouse Gas Initiative (RGGI) as a full member. Previously, Virginia was only a consignment member of RGGI with only administrative costs.

12. The Revised Trading Rule harms VMA's organizational interests to create the best business environment for businesses to have maximum productivity and profitability. The Rule will place Virginia business at a significant disadvantage due to increased electricity costs resulting from the Revision and causing businesses to expend extensive compliance costs and resource expenditures. VMA's members are adversely affected because they have an additional permitting and compliance burdens and will have significantly higher compliance costs and electricity costs directly traceable to the Revised Trading Rule.

13. Venue is proper in this Court under Va. Code Ann. § 2.2-4003, § 2.2-4026, and § 8.01-261(1). This Court is a preferred forum because VMA "[r]egularly or systematically conducts affairs or business activity" in the City of Richmond, pursuant to Va. Code Ann. § 8.01-261(1).

STATUTORY AND REGULATORY BACKGROUND

A. Virginia Administrative Process Act

14. DEQ's regulatory rulemaking role is to support rules and other actions of the Air Board. DEQ's website describes DEQ's role as:

> DEQ develops regulations for approval by Virginia's citizen regulatory boards that cover a wide variety of air, water and land protection issues. Regulations are intended to implement specific efforts directed by the Commonwealth's environmental laws. The adoption, change or repeal of any regulation usually is conducted in accordance with the Virginia Administrative Process Act and with the agency's public participation guidelines.

15. Agencies in the Commonwealth are subject to the Administrative Process Act (APA) when promulgating regulations. Va. Code § 2.2-4007.03 (Informational proceedings; effect of noncompliance). Unless a regulation is exempt, a regulation when proposed shall be published and go through notice and comment. If the regulation is revised after it is proposed, it shall go through notice and comment again. If APA procedures are not followed, "In no event shall the failure to comply with the requirements of this section be deemed mere harmless error for the purposes of § 2.2-4027." Va. Code Ann. § 2.2-4007.03(C).

16. DEQ also has its own regulations requiring notice and comment when taking any regulatory action including the promulgation or revision of regulations. 9 VAC 15-11-50.

17. Under the APA, DEQ must first provide a Notice of Intended Regulatory Action (NOIRA) and allow 30 days for public comment. Va. Code Ann. § 2.2-4007.01. After the comment period elapses, DEQ will issue a proposed regulation. The public will have an opportunity to comment on the proposed regulation in a public hearing in some cases. *Id.*

18. Before a proposed regulation can be published, DEQ shall submit the regulation to the Department of Planning and Budget (DPB) to prepare an economic impact analysis. Va. Code Ann. § 2.2-4007.04 (Economic Impact Analysis). The economic impact analysis must analyze the number of businesses and entities to which the regulation will apply; the number of persons and employment positions to be affected; costs on the use and

value of private property, and projected costs to affected businesses, localities, and entities of implementing or complying with the regulations. *Id.* The analysis also must analyze the impacts on small businesses in the Commonwealth. *Id.* If the proposed regulation is estimated to have an adverse economic impact on businesses or on a locality, business or entity particularly affected, DEQ must advise the Joint Commission on Administrative Rules, House Committee on Appropriations, and the Senate Committee on Finance. *Id.*

19. DEQ must follow APA guidelines to solicit public input of interested parties in the formation and development of its regulations. There is a general policy for the use of advisory panels and work groups to consult with DEQ on rule development. Va. Code Ann. § 2.2-4007.02. Before or after publication of the NOIRA, DEQ shall provide interested parties with the opportunity to submit data, views and arguments concerning the rulemaking. *Id.*

20. DEQ shall submit proposed regulations to the Virginia Registrar to be published. Va. Code Ann. § 2.2-4007.05. A 60-day notice and comment period shall be provided to the public for written comments, while 30 days is required for a reproposed regulation. 9 VAC 15-11-50(B).

21. Guidance documents are exempt from the APA but are subject to public notice and a 30-day public comment period. Va. Code Ann. § 2.2-4002.1.

22. The Air Board approves air pollution regulations under the APA. 9 VAC 5-5-50.

23. Upon Air Board approval of a final regulation, the regulation must undergo Executive branch review and Legislative branch review. Va. Code Ann. § 2.2-4013; § 2.2-4014.

24. Specific exempted rulemakings, known as exempt final regulations, from the requirements of the APA are outlined in Va. Code Ann. § 2.2-4006. Section 2.2-4006 enumerates sixteen types of rulemakings that are exempt from the APA. Of interest in this case, Section 2.2-4006(4)(a) provides an exemption for regulations that are "necessary to confirm to changes in Virginia statutory law or the appropriation act where no agency discretion is involved."

B. The Regional Greenhouse Gas Initiative

25. The Regional Green House Initiative (RGGI) is a cooperative effort among the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont to create a market-based program to cap and trade power sector CO2 emissions.[1] *See* www.RGGI.org.

26. RGGI is composed of individual CO2 Budget Trading Programs in each participating state. Through independent regulations, based on the RGGI Model Rule, each state's CO2 Budget Trading Program issues CO2 allowances and establishes participation in regional CO2 allowance auctions. RGGI purports to reduce CO2 emissions by returning money from CO2 allowance auctions to

[1] New Jersey participated as a RGGI member from 2009 to 2011.

participating states for reinvestment in programs promoting energy efficiency, clean and renewable energy, greenhouse gas abatement, and direct bill assistance. *See* www.RGGI.org.

27. RGGI is the first mandatory, market-based CO2 emissions trading program in the United States. Within the RGGI states, fossil-fuel-fired electric power generators with a capacity of 25 megawatts (MW) or greater (regulated sources) are required to hold allowances equal to their CO2 emissions over a three-year control period.

28. A CO2 allowance represents a limited authorization to emit one short ton of CO2 from a regulated source, as issued by a participating state. Regulated sources can use a CO2 allowance issued by any participating state to demonstrate compliance in any state. They may acquire allowances by purchasing them at regional auctions, or through secondary markets.

29. The cost of a CO2 allowance in the last RGGI auction was $6.82. *See* www.RGGI.org. It has ranged from $5.27 to $6.82 from 2019-2020 based on auction results, steadily increasing over the years by the design of the program. *Id.*

C. Virginia Regulation for Emissions Trading Programs

30. The Virginia initiative to adopt a CO2 cap and trade program began on May 16, 2017, when then Governor McAuliffe issued Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from the Electric Power Sector and Growing Virginia's Clean Energy Economy." ED 11 directed the DEQ Director, in coordination with the Secretary of Natural Resources, to develop a regulation to control CO2 from electric power facilities that

allows for the use of market-based mechanisms and the trading of CO2 allowances through a multi-state trading program.

31. DEQ published the proposed CO2 cap and trade rule on January 8, 2018 (the Original Trading Rule). The Original Trading Rule called for RGGI consignment membership. The Rule provided "conditional" CO2 allowances to utilities and non-exempt manufacturers that generate electricity, requiring participation in a consignment auction. The conditional allowances were to be contributed into the RGGI auction market with an equal number of allowances (or the number necessary to offset CO2 emissions tons) purchased back from the market. The money that consignment participants paid into the market for allowances would then be returned *directly* to the participant (utility or non-exempt industrial source) from RGGI minus a three percent administration fee. The Original Rule did not require that participants purchase all necessary allowances from the RGGI market. Therefore, the only money to be paid was the three percent administrative fee to RGGI.

32. The Original Trading Rule applied to any fossil fuel-fired unit that services an electricity generator with a nameplate capacity equal to or greater than 25 MWe (typically utility units). There is an exemption for existing manufacturing facilities that supply less than or equal to 10% of their annual net electrical generation to the electric grid or supply less than or equal to 15% of their annual total useful energy to any other entity than the facility itself. Only existing manufacturing facilities prior to January 1, 2020 can avail themselves of this exemption. In summary, the Original Trading Rule applied to sources

that are larger than the applicability threshold and that did not qualify for the exemption. 9 VAC 5-140-6040. The Revised Trading Rule maintains these applicability criteria and the exemption.

33. DEQ went through a full notice and comment process for the Original Trading Rule. As part of the rulemaking process, the rule was re-proposed on February 4, 2019. There was a public comment period for the re-proposal of the Original Trading Rule. VMA submitted extensive written comments in both dockets.

34. The State Corporation Commission (SCC) and the DPB examined the costs of the Original Trading Rule. Even though the Original Trading Rule only required consignment auction RGGI participation with a non-returnable administrative fee of three percent, the cost estimates for the Original Trading Rule to Dominion Energy (Dominion) customers ranged from $3.3 Billion for not linking to RGGI to $5.9 Billion[2] for linking to RGGI. *See* Attachment B (SCC Cost Analysis).

35. The Original Trading Rule was adopted in final form on April 19, 2019 and published May 27, 2019 as a new Chapter 9 VAC 5-140, adding 9 VAC 5-140-6010 through 6440 to the Air Board regulations.

36. Subsequently, the General Assembly passed budget language restricting DEQ's ability to incur any expenses in the implementation of the Original Trading Rule. As a result, Virginia did not join RGGI as a consignment member on January 1, 2020, as

[2] The SCC Report provides an estimate for "linking" to RGGI which is the same as consignment membership.

planned, even though the Original Trading Rule was final. The budget restriction was lifted in the 2020 General Assembly session.

D. The Clean Energy and Community Flood Preparedness Act

37. The 2020 General Assembly passed Chapter 1219 of the 2020 Acts of Assembly, which amended the Air Pollution Control Law to add a new Article 4, Clean Energy and Community Flood Preparedness Act (CECFPA or the Act). Va. Code Ann. § 10.1-1329 *et seq.* *See* Attachment C (2020 Virginia Assembly Session, Chapter 1280, Article 4 "Virginia Clean Energy and Community Flood Preparedness Act").

38. The CECFPA authorizes DEQ to establish, implement, and manage an auction program to sell allowances into a market-based trading program. The Act acknowledges that DEQ has the optionality to comply with the Act by joining RGGI, another carbon trading program with an open carbon trading market, or by simply implementing the Original Trading Rule. Va. Code Ann. § 10.1-1331.

39. The CECFPA provides that, if Virginia receives funds from an allowance auction, the state treasury shall "(i) hold the proceeds recovered from the allowance auction in an interest-bearing account with all interest directed to the account to carry out the purposes of this article and (ii) use the proceeds without further appropriation" as the CECFPA provides "to the extent permitted by Article X, Section 7 of the Constitution of Virginia." The Act directs forty-five percent of the revenue to be credited to the account established pursuant to the Fund for the purpose of assisting localities and their residents

affected by recurrent flooding, sea level rise, and flooding from severe weather events. Fifty percent of the revenue shall be credited to an account administered by Department of Housing and Community Development (DHCD) to support low-income energy efficiency programs, including programs for eligible housing developments. Three percent of the revenue shall be used to cover reasonable administrative expenses of DEQ. Finally, the remaining two percent of the revenue shall be used by the DHCD, in partnership with the Department of Mines, Minerals and Energy (DMME), to administer and implement low-income energy efficiency programs pursuant to subdivision.

40. Under CECFPA Section 10.1-1330(A), the Act directs that: "[T]he provisions of this article shall be incorporated by the Department, without further action by the Board, into the final regulation adopted by the Board on April 19, 2019 [Original Rule], and published in the Virginia Register on May 27, 2019. Such incorporation by the Department shall be exempt from the provisions of the Virginia Administrative Process Act (§ 2.2-4000 *et seq.*)." Thus, the CECFPA authorizes DEQ, on behalf of the Air Board, to incorporate the statutory provisions of the Act into the Trading Rule, but nothing more.

41. The CECFPA dictates that the costs of allowances purchased through the market-based trading program will be deemed to constitute environmental compliance project costs that may be recovered by a Phase I Utility or Phase II Utility. This provision clarifies that if a utility must purchase CO2 allowances for the Act, that utility can recover the allowance costs from electricity customers. In other words, the customer purchasing power from the utility will bear the cost of CO2 allowances.

42. In summary, the CECFPA provides a limited exemption from the APA for DEQ to incorporate the provisions of the Article into the Existing Rule. Va. Code Ann. § 10.1-1330(A). It does not contain an open-ended APA exemption.

E. Revision A20 to the Virginia Regulation for Emissions Trading Programs

43. On July 10, 2020, DEQ issued Revision A20 in final, revising the Original Trading Rule to issue the Revised Trading Rule. The Revised Trading Rule was published in the Virginia Register on August 3, 2020. The Revised Trading Rule was not issued as a proposed rule first, nor were stakeholders consulted for feedback or provided a pre-draft. The Revised Trading Rule did not go through the APA rulemaking process, such as publication of the proposed changes, public comment, action by the Air Board, economic analysis or review by the executive or legislative branches. Rather, DEQ designated Revision A20 as an exempt final regulation from the APA. DEQ, in consultation with the Attorney General's Office, determined that "this regulation is exempted from the Virginia Administrative Process Act, §§ 2.2-4000 *et seq.*, by its enabling legislation," pointing to the CECFPA. *See* Attachment D (Memorandum from G. O'Dwyer regarding Proposed Exempt Regulations – 9 Va. Admin. Code §§ 5-140 *et seq.* (dated July, 09, 2020)).

44. The Revised Trading Rule purports to amend the Original Trading Rule to confirm to the requirements in the CECFPA. The Revised Trading Rule creates a Virginia only rule requiring participants to obtain CO2 allowances and participate in trading and auctioning requirements beginning on January 1, 2021. Sources have begun compliance efforts in preparation for the program start date.

45. The Revised Trading Rule transforms the Original Trading Rule from a consignment auction process to a trading rule that contemplates full participation in the multi-state trading program RGGI, although RGGI is not specifically identified in the Rule.

46. DEQ has announced that Virginia has joined RGGI, Inc. *See* https://www.deq.virginia.gov/Programs/Air/GreenhouseGases/CarbonTrading.aspx Participating states in RGGI, Inc. must sign a contract. *See, e.g.*, https://www.rggi.org/rggi-inc/documents. Presumably, Virginia signed a contract with RGGI, Inc., although it is not publically available.

47. The Revised Trading Rule assumes that Virginia participants will purchase allowances in quarterly auctions held by RGGI, Inc. throughout the calendar year or acquire allowances via private trades with other participants. These allowances will be placed in the compliance account for the source to cover every ton of CO2 it emits. Virginia has a CO2 base budget for 2021 of 27.16 million allowances, which is not an emissions cap but simply the number of allowances that came into the RGGI market for the Commonwealth. 9 VAC 5-140-6190. Cumulatively, Virginia sources may emit more than the Commonwealth's base budget of allowances, if their compliance accounts contain the proper number of allowances for each ton of CO2 emitted. RGGI, Inc. reported orally in the DEQ hosted webinar, "What you need to know about the Virginia Carbon Trading Rule and Participation in RGGI" on August 12, 2020 that no RGGI source has ever had to curtail its operations to reduce CO2 emissions due to allowance scarcity.

48. RGGI, Inc. provides guidance materials on its website that provide clarity on the mechanics of the program, such as how auction funds are handled, auction materials essential to accessing the auctions, and program management details. *See* www.RGGI.org. Sources will be participating in auctions to buy allowances, and Virginia will be participating in the auctions to sell the allowances.

49. DEQ exercised its discretion to determine the type of auction to satisfy the CECFPA. DEQ then knitted together a full auction rule from the existing consignment rule, using RGGI as a guidepost. To achieve this goal, DEQ made substantive decisions to add, delete, and revise the majority of the Original Rule. As examples, the Revised Trading Rule revises and deletes many definitions; modifies the Applicability section (9 VAC 5-140-6040); repeals 9 VAC 5-140-6045, 9 VAC 5-140-6211, 9 VAC 5-140-6215, 9 VAC 5-140-6430 and 9 VAC 5-140-6435; deletes provisions pertaining to the consignment auction; reworks the allocation provision in 9 VAC 5-140-6210, including adjustment of allocation years; and incorporates new auction provisions and deletes consignment auction requirements (*See, e.g.*, 9 VAC 5-140-6210). There are few provisions in the Original Trading Rule that have not been revised to some extent.

50. Absent from the Revised Trading Rule are most of the provisions of the CECFPA that the General Assembly directed DEQ to incorporate without notice and comment. DEQ only incorporates the language from CECFPA Section 10.1-1331(1), which contains language specific to one power producer. It is not of general application. 9 VAC 5-140-6325 (Life-of-unit contractual arrangements).

51. Among the provisions of the CECFPA not incorporated into the Revised Trading Rule as required by Section 10.1-1330(A) are Section 10.1-1329 (Definitions) and Section 10.1-1330(C), which directs how to collect and allocate the proceeds from the auction of CO2 allowances. Presently, the Revised Trading Rule requires utilities to acquire costly allowances, collecting a tax on carbon emissions. But the Rule is silent as to where auction proceeds go when returned to the Commonwealth after the auction. Section 10.1-1330(C) is the most substantive and impactful part of the CECFPA but is not included in the Revised Trading Rule. The Rule also does not direct revenues from RGGI to be paid into the General Treasury. *See* Article X, Section 7 of the Constitution of Virginia.

52. The Director exercised his discretion to add a requirement for exempt industrial sources. Exempt industrial sources shall have "an operating permit containing the applicable restrictions . . . . An application for such operating permit shall be submitted to the department no later than January 1, 2022." 9 VAC 5-140-6040(B). This language appears nowhere in the CECFPA.

53. With respect to cost of the Revised Trading Rule, DEQ did not send the Revised Trading Rule for an economic impact analysis by the DPB. Regardless, the Revised Trading Rule will impose hefty cost on VMA and its members, further impacting businesses that are already experiencing an economic downturn due to the COVID19 pandemic.

54. Utilities and non-exempt manufacturers must purchase CO2 allowances for *each ton of CO2 emitted from sources in Virginia that serve an electricity generator* at an

approximate auction cost of between $6.00 and $13.00 in 2021, which is the fixed price range by RGGI that is incorporated in the Revised Trading Rule. 9 VAC 5-140-6020 at Tables 140-1A and Table 140-1B.

55. Dominion provides electricity to most industrial, commercial and residential customers in Virginia, serving the most populated areas of the state (Richmond, Norfolk/Virginia Beach, and Northern Virginia near Washington, D.C.). *See* Attachment E (EIA Form 861 Virginia Service Provider Data, 2018). VMA is located in the Dominion service area, as do a significant number of its members. To conceive of the magnitude of the RGGI carbon tax, it is important to realize that Dominion emitted at least 30,000,000 CO2 tons in 2019.

56. Utilities will not pay the RGGI carbon tax. Rather, CECFPA allows utilities to recover the cost of purchase of CO2 allowances as an "environmental compliance project" cost subject to rate recovery. This mechanism allows the RGGI tax to be passed to VMA, its members, and all electricity customers.

57. The Dominion Integrated Resource Plan (IRP) dated May 1, 2020 projects that in 2021 alone its sources will emit between 26,000,000-28,000,000 tons of CO2. *See* Attachment F (IRP) at 25-26. Using 27,000,000 tons of CO2 and multiplying by the *minimum* CO2 allowance price in the Revised Trading Rule for 2021 of $6.00, the total electricity cost impact solely for 2021 is $162,000,000. Participation in RGGI will continue until at least 2030. The Dominion IRP includes a Net Present Value cost of Virginia in RGGI under Dominion's preferred operating scenario through 2030 to be $65.7 billion

dollars. IRP at 61. The IRP also analyzes the monthly bills of a typical residential rate payer who pays $122.66 per 1,000kWh per month as of December 31, 2019. The IRP then calculates the average ratepayer cost across the existing RGGI states, which is $184 per kWh, an approximately 50% higher than the $122.66 per kWh rate. IRP at 32-33. The same rate increases will be passed along to industrial and commercial customers. In summary, the Dominion IRP confirms Dominion's intent to pass these staggering RGGI costs to customers.

ASSIGNMENTS OF ERROR

CLAIM I

DEQ violated the Administrative Process Act by issuing the Revised Trading Rule as a final rule without any direct statutory exemption from APA requirements.

58. Allegations 1 through 57 are incorporated and re-alleged herein.

59. Under Section 10.1-1330(A), the Act directs that: "[T]he provisions of this article shall be incorporated by the Department, without further action by the Board, into the final regulation adopted by the Board on April 19, 2019, and published in the Virginia Register on May 27, 2019. Such incorporation by the Department shall be exempt from the provisions of the Virginia Administrative Process Act (§ 2.2-4000 *et seq.*)."

60. The CECFPA only authorizes DEQ to incorporate the statutory provisions of the Act into the Trading Rule.

61. Although the limited exemption language from the APA pertains to adoption of the provisions of the CECFPA, DEQ wrongfully broadened the statutory exemption by taking action on the Act's authorization for the Director of DEQ to "establish, implement, and manage an auction program to sell allowances into a market-based trading consistent with the RGGI program and this article." CECFPA, § 10.1-1330(B).

62. The Revised Trading Rule is a significant revision to the Original Trading Rule. The program outlined by the Revised Trading Rule is dramatically different on its face, in operation, and in expense to all citizens of the Commonwealth. There is no direct statutory authorization for DEQ to use its discretion to revise the Original Trading Rule by adding new cap and trade provisions without adhering to the APA.

63. Respondents erred by failing to comply with the statutory authority of the APA and CECFPA upon issuance of the Rule. *See* Va. Code Ann. § 2.2-4027(ii) (Issues on Review).

64. Respondents erred by failing to observe required procedure under the APA, which cannot be mere harmless error. *See* Va. Code Ann. § 2.2-4027(iii) (Issues on Review).

CLAIM II

DEQ violated the Administrative Process Act by issuing the Final Trading Rule because none of exemptions identified in APA Section § 2.2-4006 apply.

65. Allegations 1 through 64 are incorporated and re-alleged herein.

66. DEQ periodically issues exempt final regulations because they are subject to the exemption from the APA for regulations that are: "Necessary to confirm to changes in Virginia statutory law or the appropriation act *where no agency discretion is involved.*" Va. Code Ann. § 2.2-4006(A)(4)(a) (emphasis added).

67. The Act directed DEQ to "establish, implement, and manage an auction program to sell allowances into a market-based trading consistent with the RGGI program and this article." Section 10.1-1330(B). To carry out this directive, DEQ must exercise its discretion to decide: (1) the type of market-based program to develop and whether full membership in RGGI is an appropriate fit for the Commonwealth; (2) the provisions to add and revise the program design; and (3) the requirements for implementation.

68. DEQ gutted and revamped the Original Trading Rule from a consignment to a full auction program.

69. Due to the considerable amount of discretion DEQ exercised, the Revised Trading Rule is not an exempt final regulation under Va. Code Ann. § 2.2-4006(A)(4)(a). It is not exempt under any other provision in Section 2.2-4006.

70. The Director used his discretion not to incorporate the entire CECPA into the Revised Trading Rule. His exercise of discretion precludes the avoidance of notice and comment rulemaking, particularly when the statute provides him with no such authority.

71. Respondents erred by failing to comply with statutory authority of the APA and CECFPA upon issuance of the Rule. *See* Va. Code Ann. § 2.2-4027(ii) (Issues on Review).

72. Respondents erred by failing to observe required procedure under the APA, which was not mere harmless error. *See* Va. Code Ann. § 2.2-4027(iii) (Issues on Review).

CLAIM III

DEQ violated the Administrative Process Act by issuing the Revised Trading Rule with a provision that creates a permitting burden for certain industrial sources without any APA exemption.

73. Allegations 1 through 72 are incorporated and re-alleged herein.

74. The Revised Trading Rule added language requiring exempt sources to apply for and obtain permits under the new CO2 trading program.

75. The CECFPA does not address exempt industrial sources at all, much less requiring exempt industrial sources to apply for and obtain a permit from DEQ.

76. Since there is no statutory basis for this new permitting requirement, procedurally, it must be vetted through the APA process. It is not exempt and is therefore unlawful.

77. Respondents erred by failing to comply with statutory authority (APA) upon issuance of the Rule. *See* Va. Code Ann. § 2.2-4027(ii) (Issues on Review).

78. Respondents erred by failing to observe required procedure under the APA, which cannot be mere harmless error. *See* Va. Code Ann. § 2.2-4027(iii) (Issues on Review).

CLAIM IV

DEQ is not authorized to levy a carbon tax on electricity customers in Virginia.

79. Allegations 1 through 78 are incorporated and re-alleged herein.

80. The Revised Trading Rule was issued by the DEQ. The Revised Trading Rule requires the purchase of CO2 allowances, at a significant cost to Revised Trading Rule participants. The Revised Trading Rule imposes a hidden tax on program participants.

81. The Virginia Constitution states, "All taxes, licenses, and other revenues of the Commonwealth shall be collected by its proper officers and paid into the State treasury." Va. Constitution, Article X, Section 7.

82. The Power to tax is given only to the General Assembly. No delegation has occurred with respect to the DEQ. DEQ is not a proper officer to collect this tax as defined by the Constitution. Therefore, the tax is illegal. *Wise County Bd. of Supvrs. v. Wilson,* 250 Va. 482, 463 S.E.2d 650 (1995).

83. Respondents erred by acting outside of their constitutional rights, powers, and privileges upon issuance of the Rule. *See* Va. Code Ann. § 2.2-4027(i) (Issues on Review).

CLAIM V

The Revised Trading Rule is fatally flawed because it levies a tax on carbon emissions but does not provide for return of the monies to Virginia's Treasury in accordance with the Virginia Constitution.

84. Allegations 1 through 83 are incorporated and re-alleged herein.

85. The Revised Trading Rule requires the purchase of CO2 allowances, at a significant cost to RGGI participants. Proceeds from these purchases are returned to the Commonwealth by RGGI, Inc.

86. The Virginia Constitution requires that "[a]ll taxes, licenses, and other revenues of the Commonwealth shall be collected by its proper officers and paid into the State treasury. No money shall be paid out of the State treasury except in pursuance of appropriations made by law." Virginia Constitution, Article X, Section 7.

87. The CECFPA acknowledges this Constitutional requirement and concern:

> To the extent permitted by Article X, Section 7 of the Constitution of Virginia, the state treasury shall (i) hold the proceeds recovered from the allowance auction in an interest-bearing account with all interest directed to the account to carry out the purposes of this article and (ii) use the proceeds without further appropriation for the following purposes . . . 10.1-1330(C)

88. The Revised Trading Rule provides for the collection of money and there are implied RGGI contractual obligations to provide for return of that money to the Commonwealth. However, *even though directed by the General Assembly in the CECFPA*, DEQ failed to incorporate provisions to address these revenues. Since the Rule contains no

provisions to ensure compliance with the Virginia Constitution, the trading program in the Revised Trading Rule is unlawful, and Rule must be struck.

89. Respondents erred by acting outside of their constitutional rights, powers, and privileges upon issuance of the Rule. *See* Va. Code Ann. § 2.2-4027(i) (Issues on Review).

CLAIM VI

The Revised Trading Rule is unlawful because it does not provide an authorization for DEQ to join RGGI and does not provide adequate detail to enable participants to implement its provisions without reliance on requirements, procedures, and guidance from RGGI, Inc., which are not incorporated into any Virginia statute or regulation.

90. Allegations 1 through 89 are incorporated and re-alleged herein.

91. The Revised Trading Rule provides a basic framework for a full CO2 trading auction process. But details concerning such key operational aspects are missing, such as how and when auctions will occur?; How will costs from the auction be divided amongst the participating states and returned to the DEQ?; Is DEQ the party that signed the RGGI participation agreement?; How will trades be made?; How will utilities bid into the market?; How will winning bids be determined?; How will the resulting trades be executed?; Will RGGI or a third-party run the auction; and How permitting will work? Therefore, the Revised Trading Rule is substantively flawed.

92. The Rule does not contain the word "RGGI" or "Regional Greenhouse Gas Initiative" in any its provisions or provide a specific contractual authorization for DEQ to join RGGI.

93. Since requirements are missing, DEQ implies that sources look to the documentation on the RGGI, Inc. website, such as the RGGI COATS User's Guide and specific sections of the RGGI, Inc. website (www.rggi.org) to fill-in-the-blanks. None of the RGGI, Inc. requirements or guidance have been incorporated into Virginia regulation or guidance. The lack of specificity in the Revised Trading Rule is illegal because DEQ is forcing sources to comply with private organization requirements that have no legal basis in the Commonwealth without going through the APA rulemaking process.

94. Respondents erred by failing to comply with statutory authority (APA) upon issuance of the Rule. *See* Va. Code Ann. § 2.2-4027(ii) (Issues on Review).

RELIEF REQUESTED

VMA respectfully requests that this Court grant the following relief:

1. That this Court invalidate, vacate, and declare the Revised Trading Rule null and void.
2. That this Court, under the authority of Va. Code Ann. § 2.2-4030, award Petitioner its reasonable costs and attorneys' fees; and
3. That this Court grant such other relief as may appear to be just and proper.

Respectfully Submitted,

Virginia Manufacturers Association

DEQ - OD

COMMONWEALTH OF VIRGINIA

BEFORE THE STATE AIR POLLUTION CONTROL BOARD

IN RE: State Air Pollution Control Board
Final Regulation 9 VAC §§ 5-140 *et seq.*
Regulation for Emissions Trading Programs
Amending 9 VAC § 5-140-6010 through 9 VAC § 5-140-6440

NOTICE OF APPEAL

In accordance with Rule 2A:2 of the Rules of the Supreme Court of Virginia, the Virginia Manufacturers Association ("Appellant" or "VMA") hereby files this notice of appeal with David K. Paylor, Executive Secretary of the Virginia State Air Pollution Control Board, for judicial review of the Virginia Department of Environmental Quality's amendments of the Regulation for Emissions Trading Programs (9 VAC §§ 5-140 *et seq.*) as a final regulation, effective on July 10, 2020.

The appeal of this case decision will be taken to the Circuit Court for the City of Richmond, 13th Judicial Circuit of Virginia, located at 400 North Ninth Street, Richmond, Virginia 23219. Under Rule 2A:3 of the Rules of the Supreme Court of Virginia, the agency record should be forwarded to the Clerk of the Circuit Court for the City of Richmond as soon as possible.

As required by Rule 2A:2(b) of the Rules of the Supreme Court of Virginia, the Appellant provides the following information:

1. The Appellant is:

   Virginia Manufacturers Association
   2108 W. Laburnam Ave, Suite 230
   Richmond, VA 23227

2. Counsel for the Appellant is:

Elizabeth C. Williamson, Esq.
John M. Holloway, Esq.
Williams Mullen
200 South 10th Street
Richmond, VA 23219

3. The Appellee is:

Virginia State Air Pollution Control Board
Virginia Department of Environmental Quality
c/o David K. Paylor, Executive Secretary and Director
1111 East Main Street St., Suite 1400
Richmond, VA 23219

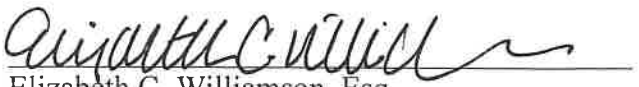
4. Counsel for the Appellee is:

Mark R. Herring, Attorney General of Virginia
Gray O'Dwyer, Assistant Attorney General
Office of the Attorney General of Virginia
202 North Ninth Street
Richmond, VA 23219

Dated: September 2, 2020

Respectfully submitted,

Virginia Manufacturers Association



Elizabeth C. Williamson, Esq.
John M. Holloway, Esq.

COMMONWEALTH OF VIRGINIA

PO Box 1197
Richmond, Virginia 23218-1197

STATE CORPORATION COMMISSION

Division of Public Utility Regulation

February 27, 2019

Delegate Charles D. Poindexter
Virginia House of Delegates
Post Office Box 117
Glade Hill, Virginia 24092

Dear Delegate Poindexter:

I am responding to your letter dated February 15, 2019 requesting SCC Staff responses to questions you raise concerning proposed regulations capping CO2 emissions from the Commonwealth's regulated electric power plants. These proposed regulations concern the Commonwealth linking to the Regional Greenhouse Gas Initiative ("RGGI").

Enclosed for your review is a document that the SCC Staff recently prepared at the request of the Virginia Department of Environmental Quality ("DEQ") to explain the methodology and assumptions used by SCC Staff. The document provides SCC Staff analysis supporting our bill impact estimates that a typical monthly residential bill for Dominion Energy Virginia ("DEV") will increase between $7 and $12 depending on whether Virginia *links* to RGGI or *joins* RGGI.

Answers to your specific questions and requests for information, to the extent that the SCC Staff can provide them, are detailed below:

1. CO2 annual emissions from 2009 through 2018 for:
   a. The Commonwealth's regulated electric power plants.
   b. All other unregulated sources of CO2.

   Inasmuch as the SCC does not regulate or track historic CO2 emissions for either regulated electric power plants or unregulated sources of CO2, we do not maintain any data relative to carbon emissions. The DEQ has regulatory authority relative to environmental issues in the Commonwealth and is the appropriate source of emissions data.

2. The forecast of CO2 emissions beginning in 2019 under the latest integrated resource plans for regulated electric power plants.

   DEV's 2018 Integrated Resource Plan ("IRP") (not approved by the Commission as filed) incorporated the initial proposed CO2 emissions cap for Virginia of 34 million tons rather than the currently proposed 28 million tons. The SCC Staff believes it would be more relevant to provide the CO2 emissions forecast modeled in the SCC Staff's RGGI analysis which used the current proposed cap of 28 million tons. This CO2 forecast is enclosed.

3. The annual CO2 emissions allowed through 2040:
   a. Under the original DEQ proposal (34 million ton 2020 budget base, 3% reductions per year, no reductions beyond 2030).
   b. Under the new re-proposal using a 28 million ton 2020 budget, 3% reductions per year through 2030, and annual reductions of 840,000 tons per year from 2031 to 2040.

   The requested information is enclosed.

4. An estimate of the annual cost of the "allowance fees" purchased through 2040 to be passed through to consumers based on the minimum price and double the minimum price.

   See page 14 of the enclosed document. The SCC Staff's analysis estimated the annual cost of the allowance fees through 2030 based on the RGGI Emission Containment Reserve trigger prices. RGGI has not published any prices beyond 2030.

5. An estimate of the plants that would be shutdown to comply with the emission caps and the change in natural gas deliveries as a result.

   The SCC Staff's analysis concludes that linking to RGGI will result in the premature retirements of DEV'S Chesterfield Units 5 and 6 and Clover Units 1 and 2. Since these are coal units, there are no related impacts to natural gas deliveries.

6. An estimate of the capacity and emissions from the plants required to provide power when solar and wind plants are not able to supply the power demand.

   DEV's units are dispatched by the PJM Interconnection, LLC ("PJM"). PJM dispatches power generation from a mix of nuclear, coal, gas, and renewable generating units owned by PJM member utilities (including DEV) operating in

the PJM Interconnection.[1] When individual solar and wind plants in Virginia or elsewhere in the Interconnection are not available for any reason (forced outages, weather, etc.), the power these units would have furnished will be supplied from the mix of other available generation plants (of all types) located throughout the PJM footprint. Further, if additional generation is needed to meet load during a time of high demand within the Interconnection, PJM simply dispatches from the mix of generation then available to meet load requirements. Consequently, the information requested in this question cannot be provided because of the way in which PJM dispatches the generation of its member utilities.

7. Evaluation of the proposal using the SCC's standard analysis including the Ratepayer Impact Measure. Please provide estimates of the residential, commercial and industrial rates from 2020 through 2040 assuming no return of allowance revenue to consumers as was contemplated in legislation defeated in the General assembly.

   See pages 7-8 of the enclosed document. Staff only provides a high-level bill impact for a typical DEV residential customer. Determining actual rate impacts by year through 2040 for all of DEV's rate classes is beyond the scope of the RGGI analysis that the SCC Staff performed. DEV has very complex non-residential rate structures and many different non-residential rate classes. This fact coupled with the wide diversity of customers within these classes makes such an analysis extraordinarily complex. Additionally, we would have little confidence in the results of such an analysis.

8. Estimates of the amount of power purchased annually from the PJM grid during the 2020-2040 cap regime.

   As a member of PJM, DEV purchases 100% of the power it consumes from PJM and it sells 100% of the power its generating units produce into PJM. Staff's estimate of total sales to PJM, purchases from PJM, and net purchases in excess of sales is enclosed.

9. Experience from other RGGI states between 2007 and 2016 shows an increase in imports of power from other states in the PJM grid as in-state power generation falls because of allowance prices. There was also a significant loss of in-state production of energy intense goods that shifted to other states. What is the SCC estimate of carbon dioxide emission shifting from these two causes? Shouldn't the estimates be included as costs to the RGGI program?

[1] The PJM Interconnection coordinates the movement of electricity through all or parts of Delaware, Illinois, Indiana, Kentucky, Maryland, Michigan, New Jersey, North Carolina, Ohio, Pennsylvania, Tennessee, Virginia, West Virginia and the District of Columbia.

Any changes to imported power from PJM and changes in the dispatch of DEV's fossil fuel units is captured in Staff's RGGI analysis. The SCC Staff has not estimated loss of in-state production of energy intense goods as its analysis was limited to the costs of providing electricity and related customer bill impacts of RGGI compliance.

10. The estimates of the Cost Containment Reserve (CCR) allowance price and the Emission Containment Reserve (ECR) trigger price appear to be based on the discredited Social Cost of Carbon proposed by the Obama Administration. Can you confirm how these two prices were developed?

    The SCC Staff cannot confirm how the Cost Containment Reserve allowance price or the Emission Containment Reserve price were calculated or what formed the basis of those calculations.

If you have any other questions or need additional assistance, please contact me or Greg Abbott at 804-371-9611.

Respectfully,

William Stephens

Enclosures

SCC STAFF ANALYSIS OF CUSTOMER BILL IMPACTS OF VIRGINIA PARTICIPATING IN RGGI
February 21, 2019

EXECUTIVE SUMMARY

During the 2019 Virginia General Assembly session, bills were introduced regarding Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI). Using currently available information and applying certain assumptions, the Staff of the State Corporation Commission ("SCC") made estimates of the potential cost and rate impacts of *joining* or *linking* to RGGI. This document was prepared at the request of the Virginia Department of Environmental Quality ("DEQ") to explain the method and assumptions used by SCC Staff which produced these estimates.

Since DEQ's proposed RGGI rule envisions Virginia linking to RGGI, this document will address the implications of Virginia linking to RGGI. SCC Staff estimates the total cost to Dominion Energy Virginia ("DEV") of linking to RGGI to be about $3.3 billion. SCC Staff estimates the total cost to DEV of joining RGGI to be about $5.9 billion. SCC Staff estimates that linking to RGGI will *increase* the typical DEV ("DEV") residential customer's monthly bill by an average of $6.95 from $120.52 to $127.48 over the 25-year study period.[1]

DEQ estimates that the typical monthly bill for a residential customer served by DEV will *decrease* by an average of $0.54 over the 2020-2030 time period. Given that RGGI is a government imposed cap and trade mechanism designed to impose a carbon tax on the use of fossil fuel generation, and given that DEV owns a significant portfolio of coal and natural gas generation units, the SCC Staff finds DEQ's projection of falling customer bills to be counterintuitive.

DEQ modeled DEV as if it was solely a purchaser of electricity from the grid. In contrast, SCC Staff modeled DEV's actual market structure as a vertically integrated utility that owns fossil fuel generation resources. SCC Staff correctly modeled DEV as both a purchaser of electricity from the grid and as a seller of electricity into the grid.

Chesterfield Units 5 and 6 and Clover Units 1 and 2 are forced into retirement prematurely under SCC Staff's modeling. These units must be paid for by DEV's customers whether the units operate or not. Furthermore, as a member of the PJM Interconnection, LLC ("PJM"), DEV is required to meet PJM's capacity obligation. SCC Staff's analysis shows that approximately 1,500 MWs of capacity will have to be constructed earlier than would otherwise be the case to replace the 4 retired units. DEV's customers essentially pay twice. First, they must pay for the 4 retired units for capacity that they will no longer receive due to RGGI. Secondly, they must pay for the costs of new capacity constructed sooner than otherwise necessary to replace these retired units.

---

[1] Given that SCC Staff used a 25-year study period, this should be viewed as the average increase in the typical residential customer's monthly bill (averaged over the 25-year period in constant dollars). Thus, these bill impacts will likely be lower than $6.95 in the beginning of the study period and higher than that amount at the end of the study period. Measured in future inflated dollars, these average bill impacts will likely be greater than $6.95 over the 25-year period.

SCC STAFF ANALYSIS OF CUSTOMER BILL IMPACTS OF VIRGINIA PARTICIPATING IN RGGI

February 21, 2019

Q. What is the SCC Staff's understanding of the Regional Greenhouse Gas Initiative ("RGGI")?

A. RGGI is a "cap and trade" market mechanism to cap and reduce CO_2 emissions from the electric power sector. It is a cooperative effort among the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont. The number of allowances, or "cap," is ratcheted down each year. Each of the RGGI member states is allocated the number of CO_2 emissions allowances corresponding to its share of the overall RGGI cap. Generally, each member state must submit its CO_2 emissions allowances for sale in the RGGI auction with the revenues received from these sales flowing back to each state. Fossil fuel electric power generators with a capacity of 25 megawatts ("MWs") or greater are required to hold allowances equal to their CO_2 emissions. The required offsetting CO_2 emissions allowances must be purchased by each fossil fuel generator. The Virginia Department of Environmental Quality ("DEQ") proposes to link to RGGI and its allowance auction system by way of a "consignment auction." Essentially, RGGI levies a carbon tax on fossil fuel generation, payable by electric generators in each RGGI state, with the goal of making fossil fuel generation less competitive, thus leading to reductions in fossil fuel generation and corresponding reductions in CO_2 emissions.

Q. What is the SCC Staff's understanding of DEQ's estimate of the bill impact on a typical residential customer under RGGI?

A. DEQ estimates that the typical monthly bill for a residential customer served by Dominion Energy Virginia ("DEV") will decrease by an average of $0.54 over the 2020-2030 time period. Given that RGGI is a government imposed cap and trade mechanism designed to impose additional costs on the use of fossil fuel generation, and given that DEV owns a significant portfolio of coal and natural gas generation units, the SCC Staff finds DEQ's projection of falling customer bills to be counterintuitive.

Q. Has the SCC Staff separately analyzed the cost and rate impacts of Virginia participating in RGGI?

A. Yes. SCC Staff estimates that RGGI will impose costs on DEV's customers. SCC Staff estimates that a typical monthly residential bill will see an average increase between $7 and $12, over the 2019-2043 time period, depending on whether Virginia *links* to RGGI or *joins* RGGI. SCC Staff estimates the total cost of linking to RGGI to be about $3.3 billion. SCC Staff estimates the total cost of joining RGGI to be about $5.9 billion.

Since DEQ's proposed RGGI rule envisions Virginia linking to RGGI, the remainder of this document will address the implications of Virginia linking to RGGI.[2]

Q. Why is the SCC Staff's bill impact of linking to RGGI higher than the bill impact calculated by DEQ?

A. As will be discussed in more detail later in this document, the most important difference between SCC Staff and DEQ is the market structure that was used in the modeling. DEQ modeled DEV as a deregulated utility and Virginia as a deregulated market. As a result, DEQ modeled DEV as if it was solely a purchaser of electricity from the grid. In contrast, SCC Staff modeled DEV's actual market structure as a vertically integrated utility that owns fossil fuel generation resources. SCC Staff correctly modeled DEV as both a purchaser of electricity from the grid and as a seller of electricity into the grid.

The deregulated market approach modeled by DEQ is consistent with the market structure that exists in all other RGGI member states except Vermont. It does not, however, reflect the market reality that exists in Virginia, and it is not appropriate to use this market structure to measure customer bill impacts of RGGI compliance for Virginians. Simply put, DEQ's model assumes that DEV does not own fossil fuel generation units that will be impacted by the new Virginia RGGI CO_2 regulations. However, DEV does own fossil fuel generation units and its customers will pay for the increased operating costs of the fossil fuel units that continue to run. Furthermore, DEV's customers will pay for these units whether the units are run or not.

[2] SCC Staff modeling assumed that if Virginia links to RGGI, 95% of the revenues received through the sale of CO_2 emissions allowances in the RGGI auctions would flow back to customers though the utilities to offset customer bill impacts. There are a variety of ways that emissions allowances revenues could serve to reduce DEV's customer bills. SCC Staff's analysis assumes that these revenues will benefit customers in one way or another.

Q. The 2018 Grid Transformation and Security Act ("2018 GTSA" or "SB966") contained several policy objectives[3] for DEV to potentially achieve by 2028 including: (1) the construction and/or purchase of 5,000 MWs of solar/wind generation capacity; (2) $870 million of proposed spending on energy efficiency programs; and (3) the construction of 30 MWs of battery storage. Will achieving these policy objectives alone result in DEV meeting its CO_2 emissions reductions targets under RGGI?

A. No. Determining the impact of 2018 GTSA policy goals must be done in the context of DEVs' membership and participation in the PJM Interconnection, LLC ("PJM") energy and capacity markets.[4]

PJM dispatches generation based on the economics of each individual unit. The addition of 5,000 MWs of solar/wind resources in Virginia, 30 MWs of battery storage, and $870 million of spending on energy efficiency will displace generation from the least efficient and highest cost generating units in the PJM footprint.[5] These units will most likely be aging coal and/or natural gas generating units. These fossil fuel generating units, while located within PJM, may or may not be in Virginia.[6] As a result, even if DEV achieves all of the 2018 GTSA's policy objectives described above, it may nevertheless be required to (i) prematurely retire currently operational coal generation units to meet RGGI CO_2 emissions reduction goals, and (ii) concurrently construct new natural gas fired generating units in order to meet its generation capacity obligation in PJM.

Q. Please provide the results of the SCC Staff's model simulations of Virginia linking to RGGI.

A. The SCC Staff's analysis[7] used the PLEXOS®[8] model to simulate several different scenarios as follows:

---

[3] SB966 also included the policy goals of grid modernization, the undergrounding of transmission lines, and the undergrounding of tap lines.

[4] PJM coordinates the movement of electricity through all or parts of Delaware, Illinois, Indiana, Kentucky, Maryland, Michigan, New Jersey, North Carolina, Ohio, Pennsylvania, Tennessee, Virginia, West Virginia and the District of Columbia. For purposes of generation unit dispatch, the utilities in these states operate together as one large utility system.

[5] Likewise, the construction of renewable facilities or the implementation of energy efficiency measures in other PJM states may lead to less CO_2 emissions in Virginia.

[6] For example, the construction of additional solar facilities in Virginia may lead to the retirement of a coal unit in West Virginia or Ohio.

[7] DEV owns the PLEXOS® software and performed the model runs contained in this document at the direction of the SCC Staff.

[8] The PLEXOS® Integrated Energy model is a power market simulation software that uses mathematical programming and stochastic optimization techniques and is widely used by electric utilities including both DEV and Appalachian Power Company in Virginia.

1. A base scenario which represents a least cost plan for DEV to meet its customers' electricity requirements and that assumes that Virginia does not participate in RGGI;

2. A GTSA scenario in which the model is required to select the 5,000 MWs of solar/wind, 30 MWs of battery storage, and $870 million of energy efficiency contained in the 2018 GTSA and which also assumes that Virginia does not participate in RGGI; and

3. A GTSA-RGGI scenario in which the model is required to select the 5,000 MWs of solar/wind, 30 MWs of battery storage, and $870 million of energy efficiency contained in the 2018 GTSA and which also assumes that Virginia links to RGGI.

The model results showing the resulting DEV generating unit build plans and the net present value ("NPV") costs under each scenario are presented below:

	Base No RGGI		GTSA No RGGI		GTSA RGGI Link	
	Renewable MWs	Fossil MWs	Renewable MWs	Fossil MWs	Renewable MWs	Fossil MWs

NPV ($B)		$26.75		$27.54		$29.95

Q. What are the differences in the build plans under each scenario?

A. SCC Staff utilized a 25-year study period, which is the standard study period used by the State Corporation Commission ("Commission") to evaluate utility Integrated Resource Plans and utility applications for Certificates of Public Convenience and Necessity for the construction of utility proposed generation projects. In all three scenarios, the model selected the nuclear license extensions for the Surry and North Anna nuclear units on a cost optimization basis. All three scenarios under SCC Staff's modeling also include the retirements of all current cold reserve generating units[9] and Possum Point Unit 5. Under the GTSA-RGGI scenario, the additional retirements of Chesterfield Units 5 and 6 in 2022 and Clover Units 1 and 2 in 2025 are required as the added costs of purchasing the required offsetting CO_2 emissions allowances for these units make them uneconomic. The cost implications of these premature retirements will be discussed later in this document.

Q. Based on the SCC Staff's model results, what is the incremental cost of linking to RGGI?

A. Assuming the generation and energy efficiency related components contained in the 2018 GTSA are implemented, SCC Staff estimates that linking to RGGI will impose an incremental additional NPV cost of $2.41 billion[10] ($29.95 billion minus $27.54 billion) over the 25-year study period.

Q. How did the SCC Staff develop its estimate of a $7 typical residential customer bill impact for linking to RGGI?

A. First, SCC Staff developed a ratio of the NPV cost of the GTSA-No RGGI scenario divided by the NPV cost of the Base–No RGGI scenario. SCC Staff then applied this ratio to the base generation, generation rate adjustment clauses ("RACs"), and fuel factor portion of the current typical residential customer's monthly bill to determine the bill impact of the generation and energy efficiency-related components of the 2018 GTSA. SCC Staff estimates that the generation and energy efficiency-related components of the 2018 GTSA will increase the typical residential customer's monthly bill by $2.28 from $118.24 to $120.52.

SCC Staff then developed a ratio of the NPV cost of the GTSA-RGGI Link scenario divided by the NPV cost of the GTSA-No RGGI scenario. This ratio was applied to the

[9] The following units were placed in cold reserve status during 2018: Bellemeade 1, Bremo 3 & 4, Mecklenberg 1 & 2, Pittsylvania 1, Chesterfield 3 & 4, and Possum Point 3 & 4, representing 1,292 MW of generating capacity.
[10] This is equivalent to approximately $3.3 billion in nominal dollars.

base generation, generation RACs, and fuel factor components of the estimated typical residential customer's monthly bill described above for the generation and energy efficiency-related components 2018 GTSA. SCC Staff estimates that linking to RGGI will increase the typical residential customer's monthly bill by an average of $6.95 from $120.52 to $127.48 over the 25-year study period.[11]

Q. Identify the key assumptions the SCC Staff used in its RGGI bill analysis for DEV customers.

A. Some of the key assumptions are as follows:

- SCC Staff used a RGGI CO_2 emissions cap for Virginia of 28 million tons beginning in 2020 which decreases 3% per year through 2030, as proposed in Virginia State Air Pollution Control Board regulations currently under review.

- SCC Staff modeled DEV as the vertically integrated utility that it is, i.e., a utility that owns generation resources – and whose customers will pay for these units regardless of whether they are run or not;

- SCC Staff used the CO_2 emission containment reserve ("ECR") trigger price floor for CO_2 emission allowances published by RGGI;

- SCC Staff used a discount rate of 6.31%, which represents DEV's after tax weighted average cost of capital used in its most recent Integrated Resource Plan proceeding before the Commission; and

- SCC Staff assumed that 5,000 MWs of solar, 30 MWs of battery storage, and $870 million of spending on energy efficiency programs, consistent with the 2018 GTSA, are built or implemented.

- SCC Staff's analysis reflects the Commission's findings in its December 7, 2018 Order in Case No. PUR-2018-00065 regarding DEV's 2018 Integrated Resource Plan. Namely, Staff's analysis used: (1) the coincident peak PJM load and energy forecast scaled down to the DEV load serving entity level; and (2) a capacity factor of 23% for solar generating resources.

[11] Given that SCC Staff used a 25-year study period, this should be viewed as the average increase in the typical residential customer's monthly bill (averaged over the 25-year period in constant dollars). Thus, these bill impacts will likely be lower than $6.95 in the beginning of the study period and higher than that amount at the end of the study period. Measured in future inflated dollars, these average bill impacts will likely be greater than $6.95 over the 25-year period.

Q. Why is the SCC Staff's bill impact of participating in RGGI higher than the bill impact calculated by DEQ?

A. SCC Staff's customer bill impacts showing an increase to customer bills significantly differs from DEQ's estimates of RGGI compliance resulting in lower customer bills. This is due to differing modeling assumptions. Some of DEQ's key assumptions are as follows:

- DEQ modeled DEV as if it were a deregulated utility that does not own generation resources operating in a deregulated competitive energy market. Thus, DEQ omitted the customer bill impact of increased fuel costs and prematurely retiring generating units and of additional costs to operate DEV's fossil fuel generating units that continue to run;

- DEQ used CO_2 emission allowance prices that are lower than the ECR trigger price for carbon emission allowances published by RGGI;

- DEQ used a discount rate of 2.1%;

- DEQ assumed that the generation and energy efficiency-related policy objectives contained in the 2018 GTSA are implemented.

The impact of these key DEQ assumptions is discussed below.

Q. What is the practical effect of DEQ using a CO_2 emission allowance price that is lower than the RGGI ECR trigger price floor for carbon emission allowances published by RGGI?

A. To the extent that the carbon emission allowance prices are lower, this will result in a lower cost estimate for RGGI compliance and lower typical bill impacts. A comparison of DEQ's CO_2 emission allowance prices, the RGGI ECR trigger price floor, and the RGGI CO_2 cost containment reserve ("CCR") trigger price ceiling is shown below.

	RGGI ECR Trigger Price Floor	RGGI CCR Trigger Price Ceiling	DEQ Price
2020	$6.00	$10.77	N/A
2021	$6.00	$13.00	N/A
2022	$6.42	$13.91	$4.01
2023	$6.87	$14.88	N/A
2024	$7.35	$15.92	N/A
2025	$7.86	$17.03	$4.55
2026	$8.41	$18.22	N/A
2027	$9.00	$19.50	N/A
2028	$9.63	$20.87	$5.18
2029	$10.30	$22.33	N/A
2030	$11.02	$23.89	$5.65

Q. Please explain why SCC Staff views the RGGI ECR trigger price as a floor and the RGGI CCR trigger price as a ceiling.

A. The RGGI ECR and CCR trigger prices establish a range of CO_2 emissions allowance prices which represent the policy goals of RGGI. These trigger prices should be viewed as a "soft" price floor and a "soft" price ceiling. Actual prices for CO_2 emissions allowances can clear at a price below the ECR trigger price or above the CCR trigger price in any given year. However, if the auction price clears below the ECR trigger price, RGGI will remove CO_2 emissions allowances from future auctions to force prices back above the ECR trigger price floor. Similarly, if the auction price clears above the CCR trigger price, then RGGI would inject additional CO_2 emissions allowances into the market to force prices back below the CCR trigger price ceiling.

Q. Does the SCC Staff view DEQ's assumed CO_2 emissions allowance prices to be too low?

A. Not necessarily. Historically, CO_2 emissions allowances have cleared the RGGI auction at relatively low prices. DEQ is assuming that this will continue to be the case in the future. In addition, as mentioned above, the RGGI market can clear at a price below the ECR trigger price. However, when estimating the costs of RGGI compliance going forward for Virginia, SCC Staff believes it is more realistic to use CO_2 emissions allowance prices that

are consistent with RGGI's allowance price trigger mechanisms described above. SCC Staff used the ECR trigger price floor which SCC Staff views as being a conservative assumption.

Q. What is the practical effect of DEQ using a discount rate lower than DEV's weighted average cost of capital?

A. Using a lower discount rate understates the true costs of future capital investments. The Commission has consistently used DEV's weighted average cost of capital in evaluating CPCN applications for proposed generation and transmission projects. This is appropriate because it reflects DEV's actual costs of raising capital for these large capital projects.

Q. What is the practical effect of DEQ modeling DEV as if it were a deregulated utility that does not own generation resources operating in a deregulated competitive energy market?

A. Virginia is unique compared to the RGGI member states which are fully deregulated. Local Distribution Companies ("LDCs") in those deregulated states do not own generation assets. All generation is provided by merchant generators selling into the grid. All power consumed by the LDCs is purchased from the grid or through bilateral power purchase agreements with merchant generators.

In contrast, DEV is a vertically integrated utility that owns generation, transmission, and distribution resources. The LDCs in other RGGI states are purchasers of electricity from the grid. DEV is both a purchaser of electricity from the grid and a producer of electricity sold into the grid. DEV's ownership of generation resources is a key factor that must be considered in any RGGI analysis and it appears that DEQ did not fully consider this factor.

Q. Focusing on the impacts of RGGI on DEV as a purchaser of electricity, explain how DEQ calculated customer bill impacts.

A. DEQ calculates the incremental increase of PJM Interconnection, LLC ("PJM") power prices assuming that Virginia links to RGGI. DEQ then multiplies this incremental increase in cost per kilowatt-hour ("kWh") by the average monthly bill usage to arrive at the bill increase cost of RGGI compliance. DEQ then adjusts this bill impact by subtracting the expected pro-rata share of the RGGI CO_2 emissions allowance revenues that DEV will receive from the sale of CO_2 emissions allowances in the RGGI auction. It appears that DEQ's estimate of RGGI CO_2 emissions allowance revenues is greater than the increase in PJM power prices which results in DEQ's estimate of falling customer bills under RGGI.

Q. Does the SCC Staff agree that Virginia linking to RGGI will put upward pressure on PJM energy prices?

A. Yes. SCC Staff estimates that Virginia linking to RGGI will cause PJM power prices to increase by an average of $0.44 per megawatt hour ("MWh") over the 2020 to 2030 time period. Hourly PJM energy prices are determined by the marginal unit that clears the market each hour. The imposition of additional costs on Virginia fossil fuel units for the required offsetting CO_2 emissions allowances under RGGI will generally lead to higher cost marginal units setting the hourly PJM energy price, thus putting upward pressure on PJM energy prices.

Q. Does the SCC Staff agree that Virginia linking to RGGI will result in DEV receiving revenues from the sale of CO_2 emissions allowances into the RGGI auctions?

A. Yes, the table below shows SCC Staff's estimate of expected revenues from the sale of CO_2 emissions allowances. SCC Staff assumed that DEV would be allocated 70% of the Virginia total. SCC Staff further assumed that 5% of this total would go to the Virginia Department of Mines, Minerals and Energy ("DMME").[12]

[12] 5% of the revenues will go to DMME to defray the costs of oversight and implementation of Virginia's participation in RGGI.

	VA RGGI Carbon Cap (tons) (a)	DEV Carbon Cap 70% of VA (b)	DEV Cap @ 95% (tons) (c)	RGGI ECR Prices (d)	RGGI Allowance Revenues (e) = (c) x (d)
2020	28,000,000	19,600,000	18,620,000	$6.00	$111,720,000
2021	27,160,000	19,012,000	18,061,400	$6.00	$108,368,400
2022	26,320,000	18,424,000	17,502,800	$6.42	$112,367,976
2023	25,480,000	17,836,000	16,944,200	$6.87	$116,406,654
2024	24,640,000	17,248,000	16,385,600	$7.35	$120,434,160
2025	23,800,000	16,660,000	15,827,000	$7.86	$124,400,220
2026	22,960,000	16,072,000	15,268,400	$8.41	$128,407,244
2027	22,120,000	15,484,000	14,709,800	$9.00	$132,388,200
2028	21,280,000	14,896,000	14,151,200	$9.63	$136,276,056
2029	20,440,000	14,308,000	13,592,600	$10.30	$140,003,780
2030	19,600,000	13,720,000	13,034,000	$11.02	$143,634,680

Q. What is missing from DEQ's RGGI cost analysis?

A. As mentioned earlier, SCC Staff modeled DEV as a vertically integrated utility that owns a portfolio of fossil fuel generation resources. DEV is both a purchaser of power from the PJM market and a seller of power into the PJM market. DEQ's RGGI cost analysis does not include the costs of the CO_2 emissions allowances that DEV must purchase for each of its fossil fuel units. These costs will flow back to customers and increase customer bills. The cost of CO_2 emissions allowances will impact customers in two different ways.

First, many of DEV's fossil fuel units will continue to clear the PJM energy and capacity markets and will continue to run. However, given that these units will now have a higher unit dispatch cost, these units will return far less value back to the customer through the fuel factor.[13]

Secondly, Chesterfield Units 5 and 6 and Clover Units 1 and 2 are forced into retirement prematurely under SCC Staff's modeling. These units must be paid for by DEV's customers whether the units run or not.

[13] For a hypothetical example, if the unit dispatch cost for a fossil fuel unit is $30/MWh without RGGI and the PJM energy price is $33/MWh, then this unit will provide $3/MWh of value back to DEV's customers for every MWh sold into PJM. If the unit dispatch cost is increased to $32.50/MWh under RGGI reflecting the costs to the utility of the required offsetting CO_2 emissions allowances, then this unit will still run but it will now only provide $0.50/MWh of value back to the customer. The DEV fuel factor will increase to recover the $2.50/MWh of required RGGI costs under this hypothetical example.

Q. Why must customers pay for these prematurely retired units?

A. As a regulated utility, DEV has a legal obligation to provide service to every customer in its service area. When these units were approved for construction, they formed a necessary part of the generation "fleet" used to supply power to customers; thus, under the regulatory framework, the utility is entitled to recover the entire cost.

Q. What happens to the unrecovered costs of prematurely retired units in DEQ's analysis?

A. DEQ treated all generation units as merchant generators. As such, the shareholders of the entities that own the retiring fossil fuel unit would bear these unrecovered costs. Similarly, even for fossil fuel units that continue to run, DEQ's analysis assumes that the cost of the required offsetting CO_2 emissions allowances will be borne by the shareholders of the entities that own the affected fossil fuel generating units. That is, DEQ assumes that these shareholders will earn a lower profit as a result. In reality, since DEV owns the fossil fuel generating units, the cost of the required offsetting CO_2 emissions allowances will be collected from DEV's customers most likely through a higher fuel factor than would otherwise be the case.

Q. What are the costs that DEV will incur under RGGI for its fossil fuel units that will continue to run under RGGI?

A. SCC Staff estimated these costs to be the product of the expected CO_2 emissions (tons) for the GTSA-RGGI Link scenario and the ECR trigger price. This is presented in the table below.

	RGGI ECR Prices	RGGI/GTSA DEV Carbon Output (tons)	RGGI Allowance Costs
	(a)	(b)	(c) = (a) x (b)
2020	$6.00	26,488,641	158,931,846
2021	$6.00	25,240,860	151,445,160
2022	$6.42	25,715,612	165,094,229
2023	$6.87	25,617,605	175,992,946
2024	$7.35	24,970,901	183,536,122
2025	$7.86	24,767,813	194,675,010
2026	$8.41	24,441,398	205,552,157
2027	$9.00	26,013,263	234,119,367
2028	$9.63	22,956,099	221,067,233
2029	$10.30	24,424,271	251,569,991
2030	$11.02	22,877,523	252,110,303

Q. How would including the costs of CO_2 emissions allowances for DEV's fossil fuel units that will continue to run impact DEQ's RGGI cost analysis?

A. This is displayed in the table below.

	DEV Energy Consumed (MWh)	RGGI PJM Energy Price Increase ($/MWh)	Increased Cost of Purchased Energy	DEV RGGI Allowance Revenues	DEQ RGGI Cost Analysis	DEV RGGI Allowance Costs	SCC Staff RGGI Cost Analysis
	(a)	(b)	(c) = (a) x (b)	(d)	(e) = (c) - (d)	(f)	(g) = (c) - (d) + (f)
2020	88,217,000	$0.44	$38,534,790	$111,720,000	($73,185,210)	$158,931,846	$85,746,636
2021	88,602,520	$0.44	$38,703,192	$108,368,400	($69,665,208)	$151,445,160	$81,779,952
2022	89,374,730	$0.44	$39,040,507	$112,367,976	($73,327,469)	$165,094,229	$91,766,760
2023	89,917,040	$0.44	$39,277,398	$116,406,654	($77,129,256)	$175,992,946	$98,863,690
2024	90,556,640	$0.44	$39,556,787	$120,434,160	($80,877,373)	$183,536,122	$102,658,749
2025	90,793,260	$0.44	$39,660,147	$124,400,220	($84,740,073)	$194,675,010	$109,934,937
2026	91,353,920	$0.44	$39,905,053	$128,407,244	($88,502,191)	$205,552,157	$117,049,966
2027	92,017,840	$0.44	$40,195,066	$132,388,200	($92,193,134)	$234,119,367	$141,926,233
2028	93,082,110	$0.44	$40,659,958	$136,276,056	($95,616,098)	$221,067,233	$125,451,135
2029	94,001,280	$0.44	$41,061,468	$140,003,780	($98,942,312)	$251,569,991	$152,627,680
2030	94,927,940	$0.44	$41,466,250	$143,634,680	($102,168,430)	$252,110,303	$149,941,874

The table above is based on SCC Staff's RGGI model outputs for the GTSA-RGGI Link scenario. Applying DEQ's methodology shows a net cost reduction as the revenues received from the sale of CO_2 emissions allowances is greater than the increased cost of purchased power in all years. However, DEQ's methodology fails to include the required purchases of CO_2 emissions allowances to cover the CO_2 emissions from DEV's fossil fuel units that continue to run. SCC Staff's methodology includes those costs and results in a net cost increase in all years. The costs of the required CO_2 emissions allowances will increase the dispatch costs of DEV's fossil fuel units, which will cause these units to provide less value back to DEV's customers. This will be seen on customers' bills as an increase in the fuel factor. This increase in the fuel factor is captured in the SCC Staff's estimate of a $6.95 increase in the typical residential customer's bill.

It should be noted that DEQ's analysis stops at 2030 (11 years). However, RGGI will continue to impose costs beyond 2030. SCC Staff's analysis includes the costs of RGGI compliance over a 25-year study period, as discussed above.

It is important to note that the table above does not include the costs associated with DEV's fossil fuel units that are forced to retire prematurely nor the increased fuel costs from dispatch changes.

Q. What additional costs are imposed on DEV's customers from Chesterfield Units 5 and 6 and Clover Units 1 and 2 retiring prematurely?

A. SCC Staff's RGGI analysis shows that Chesterfield Units 5 and 6 and Clover Units 1 and 2 are forced into early retirement in 2022 and 2025, respectively. These 4 units have a combined capacity of nearly 1,500 MWs. These units are forced into retirement prematurely because the increase in their dispatch costs from including the costs of CO_2 emissions allowances under RGGI make them no longer competitive in the PJM power market.

Chesterfield Units 5 and 6 would retire in 2034 and 2039, respectively, without RGGI. Likewise, Clover Units 1 and 2 would retire in 2050 and 2051, respectively, without RGGI. Thus, RGGI will result in these units retiring between 12 and 26 years early.

The combined end of year 2018 net book value for DEV of these 4 units is $781 million.[14] The entire $781 million will be collected from DEV's customers.[15]

Furthermore, as a member of PJM, DEV is required to meet PJM's capacity obligation. SCC Staff's analysis shows that approximately 1,500 MWs of capacity will have to be constructed earlier than would otherwise be the case to replace the 4 retired units. Under the SCC Staff's modeling results, most of this will be natural gas-powered combustion turbine units (1,376 MWs), with the remainder being additional solar units (560 MWs nameplate).[16] SCC Staff estimates that this replacement capacity will cost approximately $1.3 billion, excluding financing costs and a profit margin. This investment will also be collected from DEV's customers.

---

[14] Chesterfield Units 5 and 6 have a net book value of $626,986,555. Clover Units 1 and 2 have a net book value of $307,710,398. DEV has a 50% ownership in Clover Units 1 and 2. The remaining 50%, or $153,855,199, is owned by ODEC. SCC Staff has not performed an analysis of the customer bill impacts on Electric Cooperative customers in Virginia due to the premature retirement of Clover Units 1 and 2.

[15] In addition, there are lost property taxes and lost jobs implications associated with these 4 units retiring prematurely. SCC Staff's analysis did not attempt to capture or quantify these impacts.

[16] 560 MWs of nameplate solar capacity translates into about 129 MWs for purposes of meeting the PJM capacity obligation.

DEV's customers essentially pay twice. First, they must pay for the capacity of the retired units for capacity that they will no longer receive due to RGGI. Secondly, they must pay for the costs of new capacity constructed sooner than otherwise necessary to replace these retired units.

The costs of the units required to replace the capacity of the prematurely retired units will most likely be recovered through future RAC's. These bill impacts of these new RACs are captured in the SCC Staff's estimate of a $6.95 increase in the typical residential customer's bill.

VIRGINIA ACTS OF ASSEMBLY -- 2020 RECONVENED SESSION

CHAPTER 1280

An Act to amend and reenact §§ 10.1-603.24 and 10.1-603.25 of the Code of Virginia and to amend the Code of Virginia by adding in Chapter 13 of Title 10.1 an article numbered 4, consisting of sections numbered 10.1-1329, 10.1-1330, and 10.1-1331, relating to Clean Energy and Community Flood Preparedness Act; fund.

[S 1027]

Approved April 22, 2020

Be it enacted by the General Assembly of Virginia:

1. That §§ 10.1-603.24 and 10.1-603.25 of the Code of Virginia are amended and reenacted and that the Code of Virginia is amended by adding in Chapter 13 of Title 10.1 an article numbered 4, consisting of sections numbered 10.1-1329, 10.1-1330, and 10.1-1331, as follows:

Article 1.3.

Virginia ~~Shoreline Resiliency~~ *Community Flood Preparedness* Fund.

§ 10.1-603.24. Definitions.

As used in this article, unless the context requires a different meaning:

"Authority" means the Virginia Resources Authority.

"Cost," as applied to any project financed under the provisions of this article, means the total of all costs incurred by the local government as reasonable and necessary for carrying out all works and undertakings necessary or incident to the accomplishment of any project.

"Department" means the Virginia Department of ~~Emergency Management~~ *Conservation and Recreation.*

"Flood prevention or protection" means the construction of hazard mitigation projects, acquisition of land, or implementation of land use controls that reduce or mitigate damage from coastal or riverine flooding.

"Flood prevention or protection study" means the conduct of a hydraulic or hydrologic study of a flood plain with historic and predicted floods, the assessment of flood risk, and the development of strategies to prevent or mitigate damage from coastal or riverine flooding.

"Fund" means the Virginia ~~Shoreline Resiliency~~ *Community Flood Preparedness* Fund *created pursuant to § 10.1-603.25.*

"Local government" means any county, city, town, municipal corporation, authority, district, commission, or political subdivision created by the General Assembly or pursuant to the Constitution of Virginia or laws of the Commonwealth.

"Low-income geographic area" means any locality, or community within a locality, that has a median household income that is not greater than 80 percent of the local median household income, or any area in the Commonwealth designated as a qualified opportunity zone by the U.S. Secretary of the Treasury via his delegation of authority to the Internal Revenue Service.

"Nature-based solution" means an approach that reduces the impacts of flood and storm events through the use of environmental processes and natural systems. A nature-based solution may provide additional benefits beyond flood control, including recreational opportunities and improved water quality.

§ 10.1-603.25. Virginia Community Flood Preparedness Fund; loan and grant program.

~~There shall be set apart a permanent and perpetual fund, to be known as the~~ *A. The* Virginia Shoreline Resiliency Fund~~, consisting of such~~ *is hereby continued as a permanent and perpetual fund to be known as the Virginia Community Flood Preparedness Fund. All sums that are designated for deposit in the Fund from revenue generated by the sale of emissions allowances pursuant to subdivision C 1 of § 10.1-1330, all* sums that may be appropriated to the Fund by the General Assembly, all receipts by the Fund from *the repayment of* loans made by it to local governments, all income from the investment of moneys held in the Fund, and any other sums designated for deposit to the Fund from any source, public or private, *including any federal grants and awards or other forms of assistance received by the Commonwealth that are eligible for deposit in the Fund under federal law, shall be designated for deposit to the Fund. Interest earned on moneys in the Fund shall remain in the Fund and be credited to it. Any moneys remaining in the Fund, including any appropriated funds and all principal, interest accrued, and payments, at the end of each fiscal year shall not revert to the general fund but shall remain in the Fund. All loans and grants provided under this article shall be deemed to promote the public purposes of enhancing flood prevention or protection and coastal resilience.* ~~The Fund shall be administered by the Department as prescribed in this article. The Department shall establish guidelines regarding the distribution of loans from the Fund and prioritization of such loans.~~

B. Moneys in the Fund shall be used solely for the purposes of enhancing flood prevention or

protection and coastal resilience as required by this article. The Authority shall manage the Fund and shall establish interest rates and repayment terms of such loans as provided in this article *in accordance with a memorandum of agreement with the Department.* The Authority may disburse from the Fund its reasonable costs and expenses incurred in the management of the Fund. *The Department shall direct distribution of loans and grants from the Fund in accordance with the provisions of subsection D.*

C. The Authority is authorized at any time and from time to time to pledge, assign, or transfer from the Fund or any bank or trust company designated by the Authority any or all of the assets of the Fund to be held in trust as security for the payment of principal of, premium, if any, and interest on any and all bonds, as defined in § 62.1-199, issued to finance any flood prevention or protection project undertaken pursuant to the provisions of this article. In addition, the Authority is authorized at any time and from time to time to sell upon such terms and conditions as the Authority deems appropriate any loan or interest thereon made pursuant to this article. The net proceeds of the sale remaining after payment of costs and expenses shall be designated for deposit to, and become part of, the Fund.

D. The Fund shall be administered by the Department as prescribed in this article. The Department, in consultation with the Secretary of Natural Resources and the Special Assistant to the Governor for Coastal Adaptation and Protection, shall establish guidelines regarding the distribution and prioritization of loans and grants, including loans and grants that support flood prevention or protection studies of statewide or regional significance.

E. Localities shall use moneys from the Fund primarily for the purpose of ~~creating a low-interest loan program to help residents and businesses~~ *implementing flood prevention and protection projects and studies in areas* that are subject to recurrent flooding as confirmed by a locality-certified floodplain manager. Moneys in the Fund may be used to mitigate future flood damage *and to assist inland and coastal communities across the Commonwealth that are subject to recurrent or repetitive flooding. No less than 25 percent of the moneys disbursed from the Fund each year shall be used for projects in low-income geographic areas. Priority shall be given to projects that implement community-scale hazard mitigation activities that use nature-based solutions to reduce flood risk.*

F. Any locality is authorized to secure a loan made ~~through such a low-interest loan program~~ *pursuant to this section* by placing a lien up to the value of the loan against any property that benefits from the loan. Such a lien shall be subordinate to each prior lien on such property, except prior liens for which the prior lienholder executes a written subordination agreement, in a form and substance acceptable to the prior lienholder in its sole and exclusive discretion, that is recorded in the land records where the property is located.

G. Any locality using moneys in the Fund to provide a loan for a project in a low-income geographic area is authorized to forgive the principal of such loan. If a locality forgives the principal of any such loan, any obligation of the locality to repay that principal to the Commonwealth shall not be forgiven and such obligation shall remain in full force and effect. The total amount of loans forgiven by all localities in a fiscal year shall not exceed 30 percent of the amount appropriated in such fiscal year to the Fund by the General Assembly.

Article 4.

Clean Energy and Community Flood Preparedness Act.

§ 10.1-1329. Definitions.

As used in this article, unless the context requires a different meaning:

"Allowance" means an authorization to emit a fixed amount of carbon dioxide.

"Allowance auction" means an auction in which the Department or its agent offers allowances for sale.

"DHCD" means the Department of Housing and Community Development.

"DMME" means the Department of Mines, Minerals and Energy.

"Energy efficiency program" has the same meaning as provided in § 56-576.

"Fund" means the Virginia Community Flood Preparedness Fund created pursuant to § 10.1-603.25.

"Housing development" means the same as that term is defined in § 36-141.

"Regional Greenhouse Gas Initiative" or "RGGI" means the program to implement the memorandum of understanding between signatory states dated December 20, 2005, and as may be amended, and the corresponding model rule that established a regional carbon dioxide electric power sector cap and trade program.

"Secretary" means the Secretary of Natural Resources.

§ 10.1-1330. Clean Energy and Community Flood Preparedness.

A. The provisions of this article shall be incorporated by the Department, without further action by the Board, into the final regulation adopted by the Board on April 19, 2019, and published in the Virginia Register on May 27, 2019. Such incorporation by the Department shall be exempt from the provisions of the Virginia Administrative Process Act (§ 2.2-4000 et seq.).

B. The Director is hereby authorized to establish, implement, and manage an auction program to sell allowances into a market-based trading program consistent with the RGGI program and this article. The Director shall seek to sell 100 percent of all allowances issued each year through the allowance auction, unless the Department finds that doing so will have a negative impact on the value of

allowances and result in a net loss of consumer benefit or is otherwise inconsistent with the RGGI program.

C. To the extent permitted by Article X, Section 7 of the Constitution of Virginia, the state treasury shall (i) hold the proceeds recovered from the allowance auction in an interest-bearing account with all interest directed to the account to carry out the purposes of this article and (ii) use the proceeds without further appropriation for the following purposes:

1. Forty-five percent of the revenue shall be credited to the account established pursuant to the Fund for the purpose of assisting localities and their residents affected by recurrent flooding, sea level rise, and flooding from severe weather events.

2. Fifty percent of the revenue shall be credited to an account administered by DHCD to support low-income energy efficiency programs, including programs for eligible housing developments. DHCD shall review and approve funding proposals for such energy efficiency programs, and DMME shall provide technical assistance upon request. Any sums remaining within the account administered by DHCD, including interest thereon, at the end of each fiscal year shall not revert to the general fund but shall remain in such account to support low-income energy efficiency programs.

3. Three percent of the revenue shall be used to (i) cover reasonable administrative expenses of the Department in the administration of the revenue allocation, carbon dioxide emissions cap and trade program, and auction and (ii) carry out statewide climate change planning and mitigation activities.

4. Two percent of the revenue shall be used by DHCD, in partnership with DMME, to administer and implement low-income energy efficiency programs pursuant to subdivision 2.

D. The Department, the Department of Conservation and Recreation, DHCD, and DMME shall prepare a joint annual written report describing the Commonwealth's participation in RGGI, the annual reduction in greenhouse gas emissions, the revenues collected and deposited in the interest-bearing account maintained by the Department pursuant to this article, and a description of each way in which money was expended during the fiscal year. The report shall be submitted to the Governor and General Assembly by January 1, 2022, and annually thereafter.

§ 10.1-1331. Energy conversion or energy tolling agreements.

If the Governor seeks to include the Commonwealth as a full participant in RGGI or another carbon trading program with an open auction of allowances, or if the Department implements the final carbon trading regulation as approved by the Board on April 19, 2019, (the Final Regulation) in order to establish a carbon dioxide cap and trade program that limits and reduces the total carbon dioxide emissions released by certain electric generation facilities and that complies with the RGGI model rule, then (i) the definition of the term "life-of-the-unit contractual arrangement" under the Final Regulation shall include any energy conversion or energy tolling agreement that has a primary term of 20 years or more and pursuant to which the purchaser is required to deliver fuel to the CO2 budget source or CO2 budget unit and is entitled to receive all of the nameplate capacity and associated energy generated by such source or unit for the entire contractual period and (ii) any purchaser under an energy conversion or energy tolling agreement shall be responsible for acquiring any CO2 allowances required under the Final Regulation in relation to a CO2 budget source or CO2 budget unit that is subject to such agreement.

2. That the costs of allowances purchased through a market-based trading program consistent with the provisions of Article 4 (§ 10.1-1329 et seq.) of Chapter 13 of Title 10.1 of the Code of Virginia as added by this act are deemed to constitute environmental compliance project costs that may be recovered by a Phase I Utility or Phase II Utility, as defined in subdivision A 1 of § 56-585.1 of the Code of Virginia, pursuant to subdivision A 5 e of § 56-585.1 of the Code of Virginia.

3. That any moneys in the Virginia Shoreline Resiliency Fund as created by Chapter 762 of the Acts of Assembly of 2016 shall remain in the Virginia Community Flood Preparedness Fund pursuant to § 10.1-603.25 of the Code of Virginia, as amended and reenacted by this act.

ATTACHMENT D

MEMO FROM GRAY O'DWYER

MEMORANDUM

FROM: Gray O'Dwyer
Assistant Attorney General

DATE: July 09, 2020

RE: Proposed Exempt Regulations - 9 Va. Admin. Code §§ 5-140 *et seq.*

Please note that this memorandum does not constitute an opinion, formal or informal, of the Attorney General. Rather, this memorandum contains the legal analysis of the individual staff member providing it.

It is my view that the Department of Environmental Quality ("Department") on behalf of the Virginia Air Pollution Control Board ("Board") has the authority to promulgate these proposed amendments to its regulations in 9 Va. Admin. Code §§ 5-140 *et seq.*

It is also my view that this regulation is exempted from the Virginia Administrative Process Act, §§ 2.2-4000 *et seq.*, by its enabling legislation. Chapter 1219 of the 2020 Acts of Assembly amended the Air Pollution Control Law to add a new Article 4, the Clean Energy and Community Flood Preparedness Act. Under § 10.1-1330 A, Clean Energy and Community Flood Preparedness, "[T]he provisions of this article shall be incorporated by the Department, without further action by the Board, into the final regulation adopted by the Board on April 19, 2019, and published in the Virginia Register on May 27, 2019. Such incorporation by the Department shall be exempt from the provisions of the Virginia Administrative Process Act (§ 2.2-4000 et seq.)."

The foregoing conclusion is my own. It does not constitute an opinion, formal or informal, of the Attorney General.

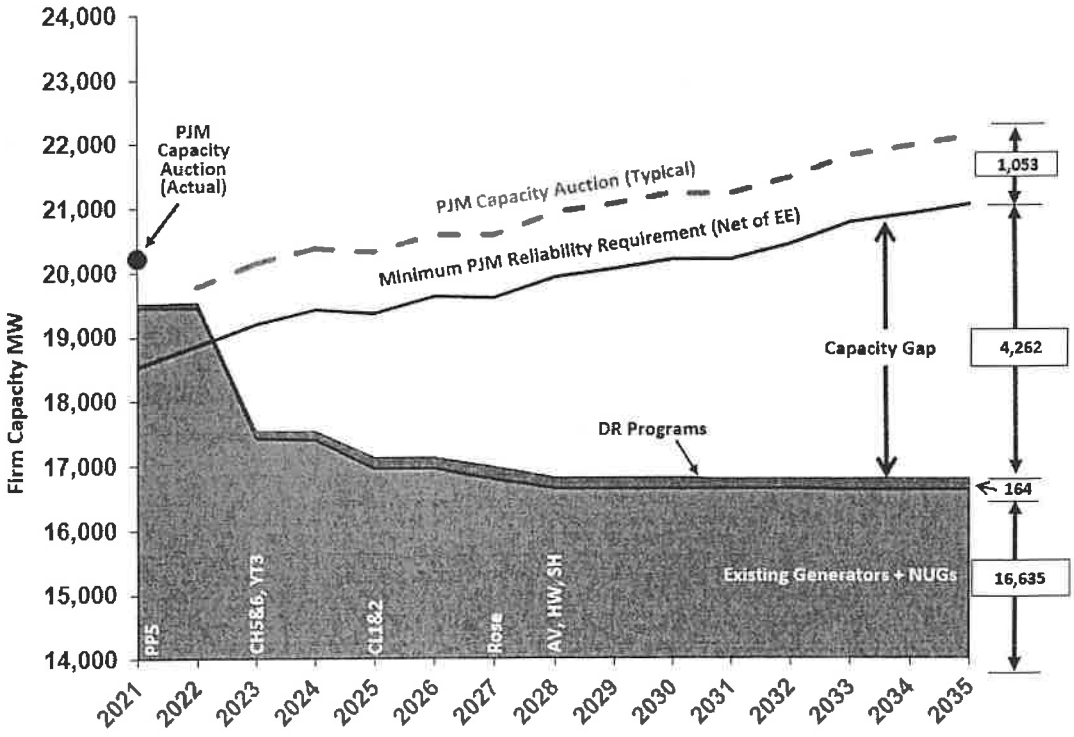
Chapter 2: Results of Integrated Planning Process

This chapter presents the results of the integrated planning process, including the Company's current capacity and energy positions, the Alternative Plans presented to meet the future capacity and energy needs of the Company's customers, and the net present value ("NPV") of each Alternative Plan. This section also includes the results of the initial transmission system reliability analysis related to the retirement of all Company-owned carbon-emitting generation in 2045, and the results of a Virginia residential bill analysis.

2.1 Capacity and Energy Positions

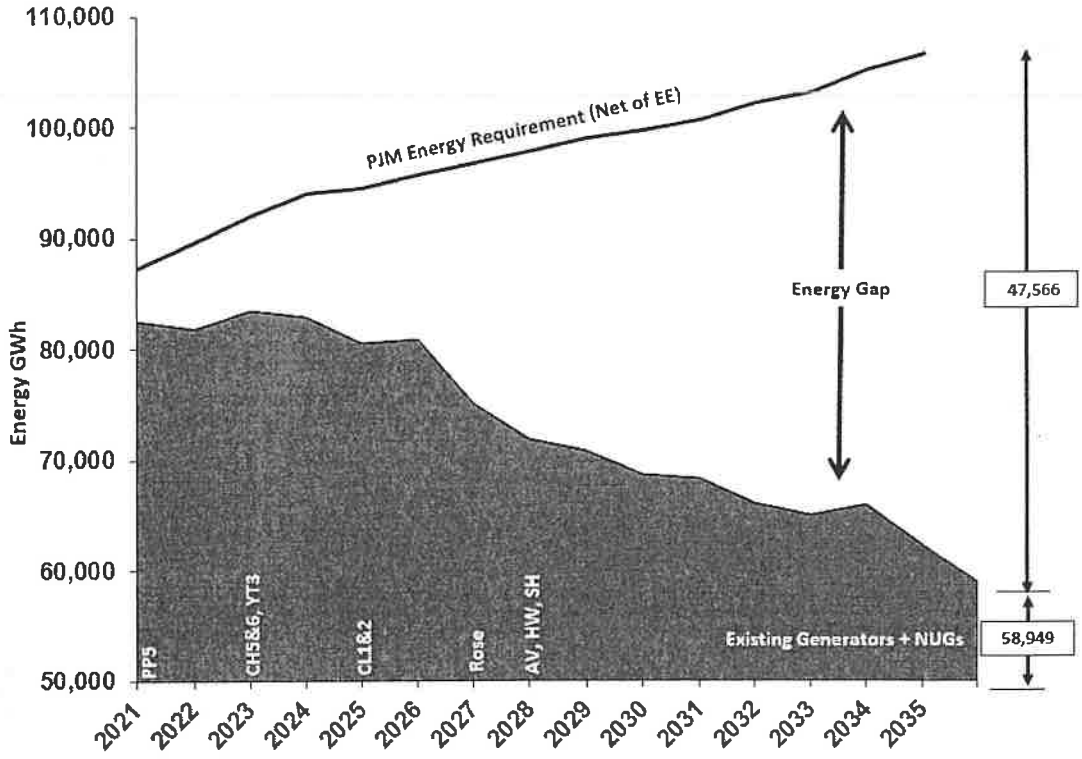
Figures 2.1.1 and 2.1.2 illustrate the Company's current capacity and energy positions using unit retirement assumptions for Alternative Plan B. After adjusting for energy efficiency, voltage optimization, and retail choice as discussed in Sections 4.1.3, 4.1.4, and 4.1.5, respectively, DOM LSE is expected to experience a compound annual growth rate ("CAGR") of 1.0% in future summer peak demand and 1.3% in energy requirements over the Planning Period.

Figure 2.1.1 - Current Company Capacity Position (2021 to 2035)



Notes: "Existing Generators + NUGS" also include generation under construction; "DR" = demand response; "EE" = energy efficiency; "PP5" = Possum Point Unit 5 (oil); "CH5&6" = Chesterfield Units 5 & 6 (coal); "YT3" = Yorktown Unit 3 (oil); "CL1&2" = Clover Units 1 & 2 (coal); "Rose" = Rosemary (oil); "AV" = Altavista (biomass); "HW" = Hopewell (biomass); "SH" = Southampton (biomass).

Figure 2.1.2 - Current Company Energy Position (2021 to 2035)



Notes: "Existing Generators + NUGS" include generation under construction; "EE" = energy efficiency; "PP5" = Possum Point Unit 5 (oil); "CH5&6" = Chesterfield Units 5 & 6 (coal); "YT3" = Yorktown Unit 3 (oil); "CL1&2" = Clover Units 1 & 2 (coal); "Rose" = Rosemary (oil); "AV" = Altavista (biomass); "HW" = Hopewell (biomass); "SH" = Southampton (biomass).

2.2 Alternative Plans

The 2020 Plan presents a range of alternatives representing paths forward for the Company to meet the future capacity and energy needs of its customers. Notably, however, the build plans shown in Alternative Plans B through D do not fully account for possible system reliability and security issues. More planning work is necessary to test the grid under different conditions to ensure system reliability and security in the long term.

The Company's options for meeting customers' future capacity and energy needs are: (i) supply-side resources, (ii) demand-side resources, and (iii) market purchases. A balanced approach—which includes the consideration of options for maintaining and enhancing rate stability, increasing energy independence, promoting economic development, incorporating input from stakeholders, and minimizing adverse environmental impact—will help the Company meet growing demand and achieve its clean energy goals while protecting customers from a variety of potential challenges.

Specifically, the Company presents four different Alternative Plans designed to meet customers' needs in the future under different scenarios, which were designed using constraint-based least-cost planning techniques:

- Plan A – This Alternative Plan presents a least-cost plan that estimates future generation expansion where there are no new constraints, including no new regulations or restrictions on CO_2 emissions. Plan A is presented for cost comparison purposes only in compliance with SCC orders. Given the legislation that will take effect in Virginia on July 1, 2020, this Alternative Plan does not represent a realistic state of relevant law and regulation.

- Plan B – This Alternative Plan sets the Company on a trajectory toward dramatically reducing greenhouse gas emissions, taking into consideration future challenges and uncertainties. Plan B includes the significant development of solar, wind, and energy storage resources envisioned by the VCEA. Plan B preserves approximately 9,700 MW of natural gas-fired generation to address future system reliability, stability, and energy independence issues.

- Plan C – This Alternative Plan uses similar assumptions as Plan B, but retires all Company-owned carbon-emitting generation in 2045, resulting in close to zero CO_2 emissions from the Company's fleet in 2045. To reach zero CO_2 emissions in 2045, Plan C significantly increases the amount of energy storage resources and the level of imported power.

- Plan D – This Alternative Plan uses similar assumptions as Plan C, but changes the capacity factor assumption for future solar resources from 25% to 19%. As a result, Plan D significantly increases the amount of solar resources needed to reach zero CO_2 emissions in 2045.

Figures 2.2.1 through 2.2.4 show the build plans for each Alternative Plan. See Appendix 2A for the capacity and energy associated with all Alternative Plans.

Figure 2.2.1 - Alternative Plan A (nameplate MW)

Year	Solar COS	Solar PPA	Solar DER	OSW	Battery Storage	Pumped Storage	Natural Gas-Fired	Nuclear	Retirements

2032	960	600			500			Surry 1	
2033	960	600						Surry 2	
2034	720	360		2,556	500				
2035	720	360							
TOTAL	11,460	6,240	1,100	5,112	2,414	300	970	1,676	3,183

Notes: (1) Natural-gas fired facilities are placeholders to address probable system reliability issues resulting from the addition of significant renewable energy resources and the retirement of coal-fired facilities.

"COS" = cost of service; "PPA" = power purchase agreement; "Solar DER" = solar distributed energy resources (less than 3 MW), whether Company-owned or PPA; "OSW" = offshore wind; "PP5" = Possum Point Unit 5 (oil); "CH5&6" = Chesterfield Units 5 & 6 (coal); "YT3" = Yorktown Unit 3 (oil); "CL1&2" = Clover Units 1 & 2 (coal); "AV" = Altavista (biomass); "HW" = Hopewell (biomass); "SH" = Southampton (biomass).

Alternative Plans B, C, and D include 970 MW of natural gas-fired CTs as a placeholder to address probable system reliability issues resulting from the addition of significant renewable energy resources and the retirement of coal-fired facilities.

Figure 2.2.5 shows the CO_2 emissions from the Company's fleet for each Alternative Plan, while Figure 2.2.6 shows the regional CO_2 emissions for each Alternative Plan. Because the regional CO_2 emissions capture the effects of both energy imports and exports required to meet customer needs, the regional emissions are a better indicator of customers' impact on the environment.

Figure 2.2.5 – Virginia CO_2 Output from Company Fleet for Alternative Plans

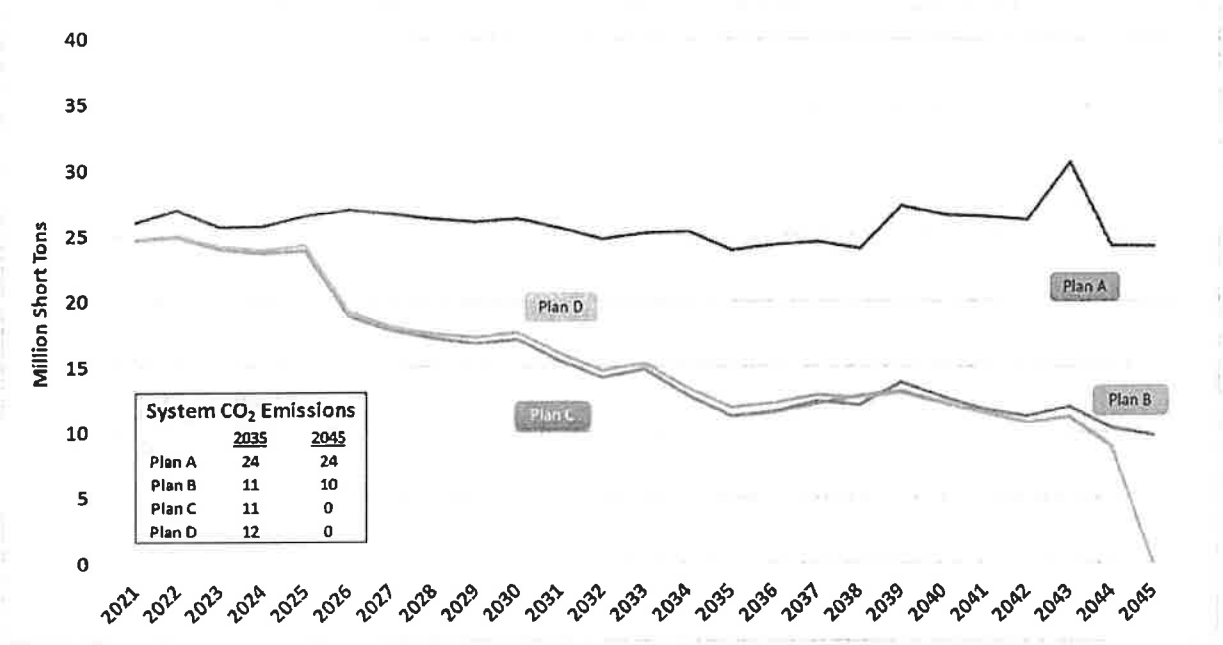

Figure 2.2.6 – Regional CO_2 Output for Alternative Plans

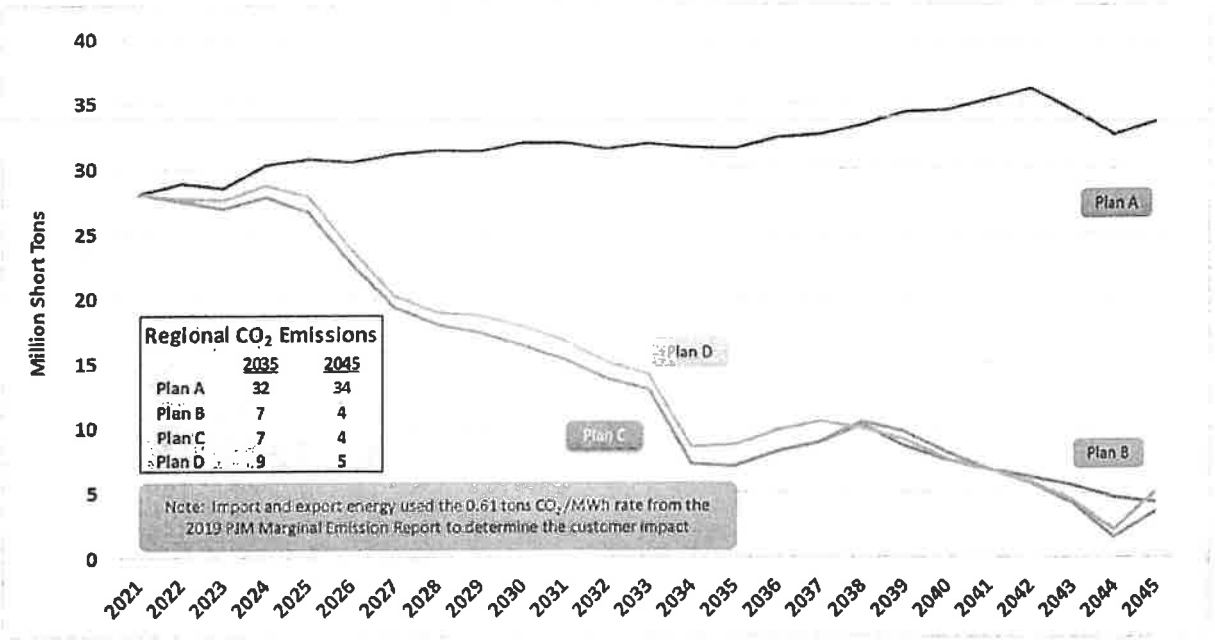


As seen in Figures 2.2.2 through 2.2.4, Plans B through D are all very similar over the first 15 years of each Alternative Plan. This alignment between Alternative Plans B through D over the 15-year Planning Period creates a common pathway for the Company to pursue now while allowing new technologies to emerge and mature, and allowing analysis and study to continue. Accordingly, for this 2020 Plan, the Company recommends a path forward that substantially aligns with the first 15 years of Alternative Plans B through D. Over the longer-term, however, based on current technology and this "snapshot in time," the Company recommends Alternative Plan B.

2.3 Transmission System Reliability Analysis

In order to understand the possible transmission system reliability implications of retiring all Company-owned carbon-emitting generation in 2045, as contemplated by Alternative Plans C and D, the Company performed a transmission system power flow analysis by developing a base power flow case and three different scenarios, and utilizing simplifying assumptions. The initial results of this analysis identified North America Electric Reliability Corporation ("NERC") reliability deficiencies on twenty-six 115 kV lines, thirty-two 230 kV lines, six 500 kV lines, and eleven transmission transformers that would need to be resolved to avoid NERC violations. In addition, the results indicated that Alternative Plans C and D would require construction of four interstate transmission lines at an estimated cost of $8.4 billion. A discussion of this analysis and the full results are provided in Section 7.5.

2.4 NPV Results

The Company evaluated the Alternative Plans to compare and contrast the NPV utility costs for each build plan over the Study Period. Figure 2.4.1 presents these NPV results on the "Total

System Costs" line, as well as the estimated NPV of proposed investments in the Company's transmission and distribution systems, broken down by specific line item.

Figure 2.4.1 – NPV Results

2020 $B	Plan A	Plan B	Plan C	Plan D
Total System Costs[1]	$ 34.7	$ 56.8	$ 60.7	$ 63.0
GT Plan	$ 0.2	$ 3.2	$ 3.2	$ 3.2
SUP	$ 2.2	$ 2.2	$ 2.2	$ 2.2
Broadband	$ -	$ 0.2	$ 0.2	$ 0.2
Transmission Underground Pilot	$ -	$ 0.2	$ 0.2	$ 0.2
Transmission	$ 5.1	$ 5.1	$ 5.1	$ 5.1
Transmission Level Import Increase	$ -	$ -	$ 8.4	$ 8.4
Customer Growth	$ 2.0	$ 2.0	$ 2.0	$ 2.0
Subtotal Plan NPV[2]	**$ 44.3**	**$ 69.7**	**$ 82.1**	**$ 84.3**
Less Benefits of GT Plan	$ -	$ (3.5)	$ (3.5)	$ (3.5)
Total Plan NPV	**$ 44.3**	**$ 66.2**	**$ 78.6**	**$ 80.8**
Plan Delta vs. Plan A	$ -	$ 21.9	$ 34.3	$ 36.6

Notes: (1) Total system costs include the results from Figures 2.2.1 through 2.2.4 plus approved, proposed, and generic DSM; solar interconnection costs; and solar integration costs. (2) Numbers may not add due to rounding.

2.5 Virginia Residential Bill Analysis

The bill of a typical residential customer in Virginia using 1,000 kWh per month as of December 31, 2019, was $122.66. As of May 1, 2020, this typical bill is $116.18, largely attributable to a significant decrease in the fuel factor. The Company calculated the projected residential bill for Alternative Plans A and B over each of the next ten years. Figure 2.5.1 presents the summary results of these projections in 2030, as well as the CAGR. Importantly, these bill projections are not final—all Company rates are subject to regulatory approval. Additionally, the bill projection associated with Alternative Plan A is presented for comparison purposes only in compliance with SCC orders. Given the legislation that will take effect in Virginia on July 1, 2020, Plan A does not represent a realistic state of relevant law and regulation.

As can be seen in Figure 2.5.1, about 40% of the projected bill increase from 2020 to 2030 is associated with investments incentivized or mandated by the VCEA and other legislation from the 2020 Regular Session of the Virginia General Assembly. Roughly one-third is attributable to compliance with directives that pre-date 2020, including the GTSA. Overall, the projected bill increase is approximately 2.9% on a compound annual basis using year-end 2019 customer bill as a baseline. The Company used year-end 2019 for this calculation to compare full-year data points. For comparison, in 2008, the year following passage of the Virginia Electric Utility Regulation Act, the bill of a typical residential customer in Virginia using 1,000 kWh per month was $107.20. Using 2008 as a baseline, the projected compound annual growth rate in the typical residential customer bill through 2030 is approximately 2.1%.

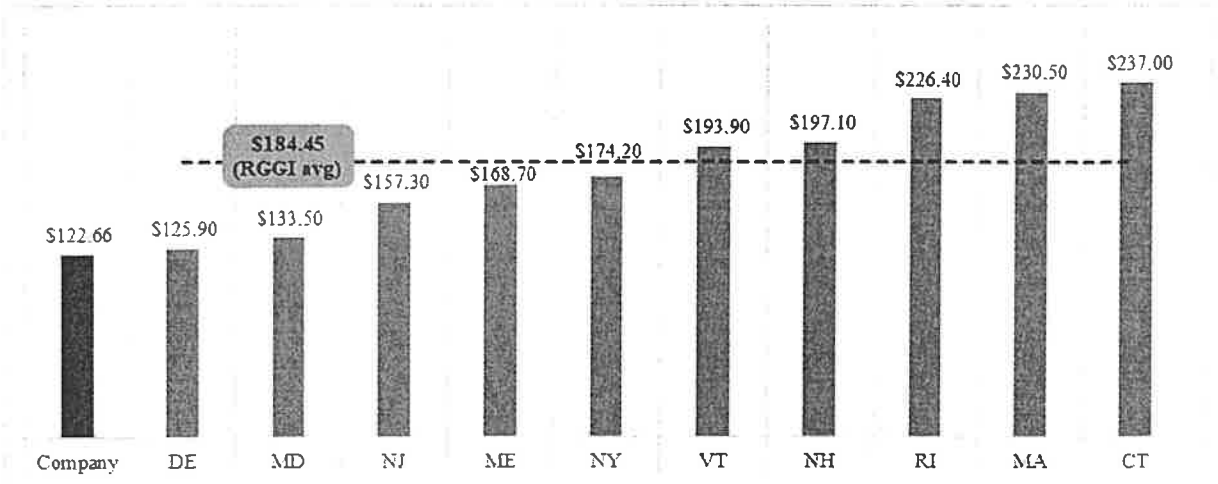
Figure 2.5.1 – Residential Bill Projection (1,000 kWh per Month)

	2030	CAGR
2019 Year End	$122.66	
Plan A[1]	$11.70	0.8%
Pre-2020 Legislation[2]	$15.28	1.0%
2020 Legislation[3]	$18.94	1.1%
Total 2030 Year End	**$168.58**	**2.9%**
Total Bill Increase	$45.92	

Notes: (1) Represents bill projections associated with future generation in Alternative Plan A; approved and proposed investments in DSM; approved investments in the Grid Transformation Plan (*i.e.* Phase IA and IB); investments in the Strategic Underground Program; and compliance with environmental laws and regulations, including CCR investments. (2) Represents bill projections associated with future generation in Alternative Plan B and other investments incentivized or mandated by legislation prior to 2020, including legislation related to pumped storage (2017), the GTSA (2018), and rural broadband (2019). (3) Represents bill projections associated with future generation in Alternative Plan B and other investments incentivized or mandated by the VCEA and other 2020 legislation.

For perspective, the average residential rate for RGGI states normalized for 1,000 kWh monthly usage—approximately $184.45—is approximately 50% higher than the Company's typical residential bill as of year-end 2019 (*i.e.*, $122.66). See Figure 2.5.2.

Figure 2.5.2 – Residential Bill Comparison for RGGI States[1]



Note: (1) Based on residential rate data for RGGI states from U.S. Energy Information Administration as of February 2020, normalized for 1,000 kilowatt-hour monthly usage. Typical 1,000 kilowatt-hour residential bill for Company as of year-end 2019.

Chapter 3: Short-Term Action Plan

The short-term action plan provides the Company's strategic plan for the next five years (2020 to 2025). Generally, the Company plans to proactively position itself in the short-term to meet its commitment to clean energy for the benefit of all stakeholders over the long term. The Company also plans to continue its analyses on how to meet both its clean energy goals and the requirements of the VCEA while continuing to provide safe and reliable service to its customers. As shown in Figures 2.2.2 through 2.2.4, Alternative Plans B through D present the same path forward in the next five years, and substantially similar paths over the next 15 years.

3.1 Generation

Over the next five years, the Company expects to take the following actions related to existing and proposed generation resources:

- File annual plans for the development of solar, onshore wind, and energy storage resources consistent with the RPS requirements established by the VCEA, including related requests for approval of certificates of public convenience and necessity and for prudence determinations related to PPAs;
- Continue the construction of the CVOW demonstration project;
- Continue development and begin construction of a larger build-out of offshore wind off the coast of Virginia;
- Meet its targets under the Virginia RPS at a reasonable cost and in a prudent manner by: (i) applying renewable energy from existing generating facilities, including NUGs; (ii) constructing and operating new renewable energy facilities and energy storage facilities; (iii) purchasing cost-effective RECs, including optimizing RECs produced by Company-owned generation (*i.e.*, when higher priced RECs are sold into the market and less expensive RECs are purchased and applied to the Company's RPS requirements);
- Meet its target under North Carolina Renewable Energy Portfolio Standard at a reasonable cost and in a prudent manner, and submit its annual compliance report and compliance plan;
- Support ongoing Nuclear Regulatory Commission ("NRC") review of the subsequent license renewal application submitted for Surry Units 1 and 2 in October 2018;
- Submit an application to the NRC for the subsequent license renewal for North Anna Units 1 and 2 by the end of 2020;
- Continue developmental work for 300 MW of new pumped hydroelectric storage in southwestern Virginia;
- Achieve a minimum of 10% electricity production at VCHEC through the use of renewable waste wood by the end of 2021;
- Continue to make investments at existing generation units needed to comply with environmental regulations;
- In order to preserve the option to address probable system reliability issues resulting from the addition of significant renewable energy resources and the retirement of coal-fired facilities in the near term, evaluate sites and equipment for the construction of gas-fired CT units;

Figure 4.4.1.1 –Fuel, Power, and REC Price Commodity Forecast Comparison

Fuel Price	Planning Period Comparison Average Value (Nominal $)		
	2018 Plan Federal CO_2 [3]	2019 Update Virginia in RGGI [3]	2020 Plan Mid-Case Federal CO_2 with Virginia in RGGI [3]
Henry Hub Natural Gas[1] ($/MMbtu)	4.29	3.81	4.05
Zone 5 Delivered Natural Gas[1] ($/MMbtu)	3.71	3.54	3.68
CAPP CSX: 12,500 1%S FOB ($/MMbtu)	2.66	2.42	2.97
No. 2 Oil ($/MMbtu)	18.52	17.78	17.89
1% No. 6 Oil ($/MMbtu)	11.93	11.56	11.52
Electric and REC Prices			
PJM-DOM On-Peak ($/MWh)	41.29	38.94	44.58
PJM-DOM Off-Peak ($/MWh)	34.36	32.79	34.78
PJM Tier 1 REC Prices[4] ($/MWh)	5.73	6.72	9.13
RTO Capacity Prices[2] ($/KW-yr)	59.33	62.50	57.34

Notes: 1) Zone 5 natural gas price used in Plan analyses. Henry Hub prices shown to provide market reference.
2) Capacity price represents actual clearing price from the PJM RPM base residual auction through delivery year 2020/2021 for 2018 Plan, and through delivery year 2021/2022 for the 2020 Plan and 2019 Update.
3) 2018 Planning Period 2019-2033, 2019 Planning Period 2020-2034, 2020 Planning Period 2021-2035.
4) The 2018 Plan column reflects the PJM Tier 1 REC prices as filed in the 2018 Compliance Filing.

4.4.2 No CO_2 Tax Commodity Forecast

The No CO_2 Tax commodity forecast anticipates a future without any new regulations or restrictions on CO_2 emissions beyond those already in place or previously approved. DOM Zone peak energy prices are slightly lower than the Mid-Case Federal CO_2 with Virginia in RGGI commodity forecast across the Planning Period because there is no incremental requirement to comply with CO_2 regulation targets to pass through to power prices. Given forthcoming law in Virginia imposing CO_2 regulation, this assumption is, in the Company's view, no longer reasonable. The No CO_2 Tax forecast is utilized only in analysis of Alternative Plan A, which is presented solely to measure additional costs of various planning scenarios.

4.4.3 Virginia in RGGI Commodity Forecast

The Virginia in RGGI commodity forecast includes New Jersey and Virginia as new participants in RGGI (Virginia in 2021), along with the nine existing RGGI states. The key assumptions regarding market structure and the use of an integrated, internally-consistent fundamental based modeling methodology remain consistent with those utilized in the other commodity forecast except that the carbon program modeled is RGGI and that there is no federal program addressing CO_2 reduction targets.

RGGI utilizes an emissions containment reserve ("ECR") as a trigger to limit downward pressure on the CO_2 allowance price. The ECR price trigger starts at $6 in 2021 and increases at 7% annually. If triggered, the ECR withholds up to 10% of the auction budget of states opting to implement the ECR (the ECR is modeled for all states but Maine and New Hampshire). In the

Virginia in RGGI commodity forecast, the RGGI prices are forecasted to be below the ECR trigger price and, therefore, in ICF's model the emission budget (cap) is reduced by 10% in the years it is triggered. Even with the 10% reduction in allowances, the market clearing prices remain below the ECR trigger prices. The reason for the lower clearing prices is that the CO_2 allowance supply in this case is driven not by coal generation displacement, but by the state policies (in member states) that continue to drive non-fossil generation growth. Carbon reductions are being driven by the high RPS targets in many of the RGGI states, with several states targeting 50% renewable or clean energy standards by the 2030 to 2035 timeframe, and further increasing beyond those years. Additionally, offshore wind procurements are modeled in 7 of the 11 RGGI states (*i.e.*, RI, VA, CT, MA, MD, NJ, NY), providing added clean energy in the RGGI region and displacing fossil resources. As noted earlier, the Virginia in RGGI commodity forecast does not include the regional effects of VCEA on RGGI allowance prices; therefore, the forecast does not account for the additional carbon reductions associated with the revised RPS requirements in Virginia.

4.4.4 High-Case Federal CO_2 Commodity Forecast

The High-Case Federal CO_2 commodity forecast addresses a scenario with a more stringent CO_2 regulatory environment implemented nationwide. In this commodity forecast, CO_2 regulation is addressed as a legislative approach to a national mass cap-and-trade program that begins in 2028 and targets an approximately 80% reduction from 2005 sector emissions by 2050. This target is similar to CO_2 reduction levels being discussed by several states, and it is consistent with what was proposed under the Waxman-Markey Bill in 2009. Load under this scenario increases relative to the other cases because of state electrification efforts. The tightening carbon cap and higher load compared to the No CO_2 Tax commodity forecast leads to higher renewable buildout and lower nuclear retirements. The "high" case includes existing and new sources under a national cap and trade program. This representation assumes that all states participate in the program except for California, which maintains its state-specific program. In this commodity forecast, ICF assumed that Virginia does not join RGGI. Compared to the Mid Case Federal CO_2 with RGGI in Virginia commodity forecast, the power prices are lower in the near term, while post-2025 all hours prices are roughly 36% higher on average. The higher power price is driven by CO_2 allowance price in excess of $100/ton by 2050.

4.4.5 Capacity Price Forecasting Methodology

In most wholesale electricity markets, electric power generators are paid for providing:

- Energy: the actual electricity consumed by customers;
- Capacity: standing ready to provide a specified amount of electric energy; and
- Ancillary Services: a variety of operations needed to maintain grid stability and security, including frequency control, spinning reserves, and operating reserves.

The purpose of a mandatory capacity market is to encourage new investments where they are most needed on the grid. PJM's capacity market (*i.e.*, the RPM), ensures long-term grid reliability by procuring the appropriate amount of supply- and demand-side resources needed to meet predicted peak demand in the future. In a capacity market, utilities or other electricity

suppliers are required to purchase adequate resources to meet their customers' demand plus a reserve amount. Suppliers offer supply- or demand-side resources into the capacity market at a price. To the extent the supply offer clears the market, then those capacity resources are obligated to supply energy (or reduce energy in the case of demand-side resources) when dispatched, or pay penalty fees.

The RPM is designed to provide financial incentives to attract and maintain sufficient capacity to meet the load demands anticipated by PJM; in concept, revenues from energy and ancillary services plus capacity payments should equal the amount necessary to attract new entry. Parallel to the actual market construct, forecasting of long-term capacity prices is based on estimating the amount of capacity revenue a generation resource requires, in addition to revenue from energy and ancillary services. The capacity revenue forecast represents the amount by which a resource's cost exceeds its forecasted wholesale electricity market revenues. The basic concept utilized in forecasting is that in order to maintain appropriate reserve levels to assure reliable electric service, generating resources will require sufficient revenue to cover expenses and, when necessary, support the required new investment. When wholesale market energy and ancillary services revenue is not sufficient, then capacity revenues are required to fill this gap.

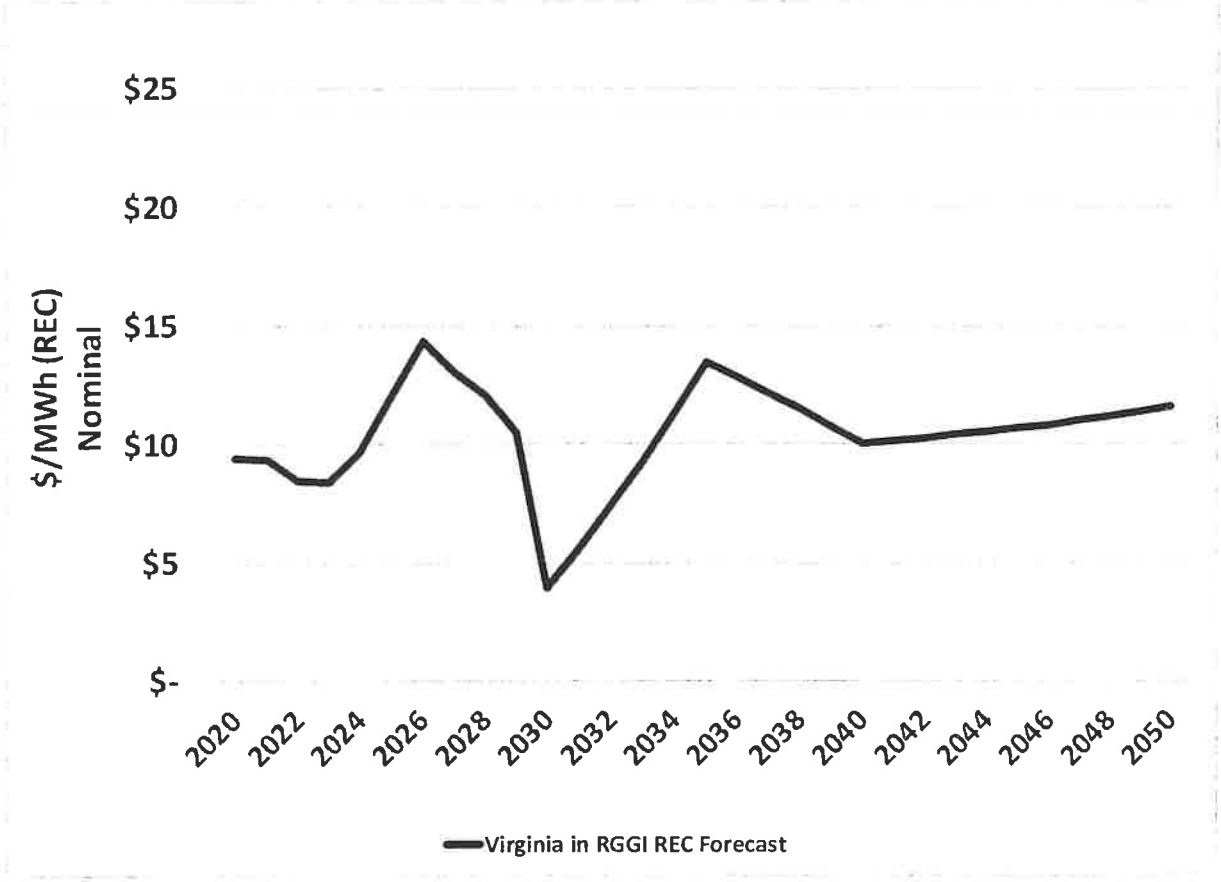
When forecasting capacity prices over long periods, it is reasonable to assume markets will move toward equilibrium and will provide sufficient revenue to support existing resources and incent investment in new resources that require equity returns on the capital expended for development and construction of the new resource. In markets with excess capacity, existing resources generally set the capacity price. These resources require revenue to cover only operating expenses and do not include equity returns or significant going forward capital expenditures. Because of this, the capacity price tends to be lower in markets with excess capacity. However, over the long term, the market is expected to move to an equilibrium status where sufficient revenues are provided, which assures adequate resource capacity and encourages market efficiency. Note that while long-term forecasts tend toward an equilibrium pricing, it is expected that actual markets will continue to follow an up-and-down cycle that moves around equilibrium levels. Long-term forecasts for capacity focus on the equilibrium level pricing rather than attempting to estimate the cyclical movement.

For these reasons, the issues surrounding the FERC MOPR Order described is Section 1.6.1 do not change the methods used to develop long-term capacity price forecasts.

4.4.6 REC Price Forecasting Methodology

Together with ICF, the Company developed a revised methodology for forecasting REC Tier 1 prices from what was presented in the 2018 Plan. A white paper describing the forecasting methodology and providing details related to the revised methodology for forecasting REC prices is provided in Appendix 4Q. The white paper also includes a section that illustrates the impact on REC prices if the federal tax credits for production tax credits and investment tax credits are extended indefinitely. Figure 4.4.6.1 provides a graph of the REC price forecast for the Virginia in RGGI commodity forecast.

Figure 4.4.6.1 – Tier 1 REC Forecast Comparison



The shape of the REC price forecast illustrated in Figure 4.4.6.1 reflects the fundamental changes occurring in the PJM states' RPS programs and the advancement of state-sponsored offshore wind development. The early price rise forecasted for Tier 1 RECs reflect recently enacted increases in RPS programs in several PJM states. These same states have implemented offshore wind procurement programs designed to supply large amounts of RECs to meet the expanding RPS requirements. The curve through 2030 reflect these fundamental developments, with prices rising as demand for RECs increase with the expanding RPS requirements, but then declining sharply as the large amounts of offshore wind procured by the states provide ample amounts of RECs to meet demand. As noted earlier, these results do not include the regional impacts of the VCEA.

4.5 Virginia Renewable Portfolio Standard Assumptions

In Virginia, the VCEA established a mandatory RPS as discussed in Section 1.2. In this 2020 Plan, the Company optimized the model for each Alternative Plan according to its typical process. The Company then determined whether additional renewable resources were needed to meet the annual RPS requirements, and added additional renewable resources (either Company-build or PPA) as needed. The Company assumed that it could construct or purchase renewable resources at less than the $45/MWh deficiency payment in the VCEA.

Attachment 28

Virginia:

In the Circuit Court of the City of Richmond, John Marshall Courts Building

VIRGINIA MANUFACTURERS ASSOCIATION	)	
Petitioner,	)	
v.	)	**Case No.: CL20-4918**
VIRGINIA DEPARTMENT OF ENVIRONMENTAL QUALITY, DAVID PAYLOR DIRECTOR, VIRGINIA DEPARTMENT OF ENVIRONMENTAL QUALITY, AND THE VIRGINIA STATE AIR POLLUTION CONTROL BOARD;	)	
Respondents.	)	

OPINION ORDER

Virginia Manufacturers Association (hereinafter, "VMA") came before the Court on June 30, 2021, to be heard on its Petition for Appeal which named the Virginia Department of Environmental Quality, David Paylor, and the Virginia State Air Pollution Control Board (hereinafter, "Respondents" or "DEQ") as Respondents. The Court took the matter under advisement and denies VMA's petition for the reasons set forth below.

I. Procedural History

VMA filed a Petition for Appeal on October 2, 2020 asserting six Assignments of Error, four of which outline how DEQ allegedly violated the Virginia Administrative Process Act ("VAPA") when it amended the regulation governing Virginia's CO_2 Budget Trading Program. The remaining Assignments of Error allege that the amended regulation is constitutionally infirm because it is both void for vagueness and levies a tax in violation of Article X, Section 7 of the Virginia Constitution. To remedy the alleged violations, VMA asks the Court to invalidate, vacate, and declare the amended regulation null and void.

On October 20, 2020, Virginia Interfaith Power & Light, Wetlands Watch, and Appalachian Voices (collectively, the "Conservation Organizations") filed a Motion to Intervene as Respondents. The Court denied the Motion to Intervene on February 9, 2021 for the reasons stated in the Court's Letter Opinion.

On October 28, 2020, DEQ filed a Motion to Dismiss the Petition for Appeal. The Court denied the Motion to Dismiss on January 29, 2021.

The Court entered a briefing schedule Order on April 1, 2021, and the parties' briefs were submitted in compliance with the deadlines established therein. On May 7, 2021, the Conservation Organizations filed a Motion for Leave to File an *Amicus Curiae* Brief in Support of Respondents. The *amicus* brief was filed contemporaneously with the motion.[1] The *amicus* brief assists the Court in deciding the issues presented in this appeal and therefore, the Court will take it into consideration. 4 Am. Jur. 2d *Amicus Curiae* §§ 1, 5 (2021); *Jones v. Caldwell*, 61 Va. Cir. 408 (2003).

II. Factual Background

As a preliminary matter, the issue on appeal is whether the amendment of the CO_2 Budget Trading Program was lawful. VMA devoted a considerable amount of time arguing that the amended trading program imposes significant financial burdens on the entities required to participate and that similar programs have failed to effectively reduce carbon emissions. On the other hand, DEQ argues that the trading program reduces CO_2 emissions, improves public health, and helps keep electricity costs down. The parties' dispute whether the CO_2 Budget Trading Program is "good" for the Commonwealth or "successful" in accomplishing the goal of reducing CO_2 emissions is irrelevant to the questions presented. However, the history of the CO_2 Budget Trading Program and the events preceding this appeal must be discussed to better understand the legal issues presented.

a. The Original Regulation

In June of 2016, former Governor McAuliffe issued Executive Order 57 which directed the Secretary of Natural Resources to convene a study and recommend ways in which the Commonwealth could attempt to reduce the amount of carbon dioxide emitted by utilities that produce electricity. The study group recommended, among other things, the need to promulgate a regulation "limiting the total amount of carbon dioxide emitted from electric power facilities." Va. Exec. Directive No. 11 (May 16, 2017). Governor McAuliffe agreed, directed DEQ to promulgate a regulation, and specified that it should:

a. Include[] provisions to ensure that Virginia's regulation is 'trading-ready' to allow for the use of market-based mechanisms and the trading of carbon dioxide allowances through a multi-state trading program; and

b. Establish[] abatement mechanisms providing for a corresponding level of stringency to limits on carbon dioxide emissions imposed in other states with such limits.

Id. DEQ published the proposed regulation in January of 2018 and presented it to the State Air Pollution Control Board for consideration for approval for public comment. *Id.* The regulation was re-proposed in February of 2019 to address feedback received from the VAPA notice and comment

[1] Although the Conservation Organizations were not subject to the filing deadlines set forth in the Court's briefing schedule Order, the *amicus* brief was filed in accordance with the deadlines applicable to DEQ.

process, and more public comment was received. Pet. for Appeal ¶ 33. The Air Board adopted the regulation (hereinafter, the "Original Regulation") on April 19, 2019, and it was published as a new chapter of the Air Board's regulations on May 27, 2019. *Id.* ¶ 35. Neither party disputes that the Original Regulation was fully vetted through the VAPA. *Id.* ¶ 33.

The Original Regulation established the Virginia component of the CO_2 Budget Trading Program. Designed to operate as a consignment-based, conditional allowance program, it proscribed that CO_2 allowances would be allocated to electricity manufacturers, sold by the manufacturers into an auction market, and thereafter repurchased by the manufacturers at auction. Pet. for Appeal ¶ 30-31. The auction market into which the CO_2 allowances were to be sold and purchased was that created by the Regional Greenhouse Gas Initiative ("RGGI"). *Id.* ¶ 31. At oral argument, the parties conceded that RGGI is the only currently existing auction house for trading CO_2 allowances.

Although properly adopted and intended to go into effect in 2020, the General Assembly passed a budget provision preventing DEQ from implementing the program and joining RGGI as a consignment member. H.B. 1700, CH. 854, Item 4-5.11, Reg. Sess. (Va. 2019).

b. The Clean Energy and Flood Preparedness Act

In 2020, the General Assembly struck the budgetary restriction. H.B. 29, Ch. 1283, Item 4-5.11, Reg. Sess. (Va. 2020). With the Original Regulation still intact, Virginia was permitted to join or participate in RGGI as a consignment member. Instead, the General Assembly enacted the Clean Energy and Flood Preparedness Act (the "Act"), Virginia Code § 10.1-1329 *et seq.*, which authorized DEQ to move away from the consignment-based model and establish a direct auction trading system.

The Act authorized the Director of DEQ "to establish, implement, and manage an auction program to sell allowances into a market-based trading program consistent with the RGGI program and this article." Va. Code § 10.1-1330(B). The Act also directed DEQ to incorporate "[t]he provisions of this article" into the Original Regulation "without further action by the [Air Pollution Control] Board," and provided that "[s]uch incorporation . . . shall be exempt from the" VAPA. Va. Code § 10.1-1330(A).

On July 10, 2020, DEQ issued Revision A20 (hereinafter, the "Amended Regulation") which amended the Original Regulation by converting the CO_2 Budget Trading Program from the prior consignment-based model to a direct auction trading system. VMA argues that DEQ acted beyond the scope of the Act's exemption in doing so and that no other VAPA exemptions save its actions. VMA additionally argues that the Amended Regulation is both unlawfully vague and imposes a tax which DEQ is not authorized to levy.

III. Standard of Review

As VMA is the "the party complaining of agency action," it carries the burden "to designate and demonstrate an error of law subject to review." Va. Code § 2.2-4027.

> Such issues of law include: (i) accordance with constitutional right, power, privilege, or immunity, (ii) compliance with statutory authority, jurisdiction

> limitations, or right as provided in the basic laws as to subject matter, the stated objectives for which regulations may be made, and the factual showing respecting violations or entitlement in connection with case decisions, (iii) observance of required procedure where any failure therein is not mere harmless error, and (iv) the substantiality of the evidentiary support for findings of fact.

Id. The issues in this appeal concern matters of statutory interpretation. "A question of statutory interpretation is subject to review *de novo* on appeal." *Karr v. Va. Dep't of Envtl. Quality*, 66 Va. App 507, 513 (2016) (internal quotation and citations omitted). The parties do not dispute that the issues raised in VMA's Petition for Appeal present questions of statutory and constitutional interpretation. Accordingly, the Court must analyze the Act and DEQ's actions in accordance with well-settled principles of statutory interpretation to determine whether DEQ had "statutory authorization" to issue the Amended Regulation and whether "it did so within the statutory limits of its discretion and with the intent of the statute in mind[.]" *Va. Jockey Club, Inc. v. Va. Racing Comm'n*, 22 Va. App. 275, 286 (1996) (internal quotations and citation omitted). In doing so, the Court does not construe the statue "by singling out a particular phrase." *Va. Electric & Power Co. v. Citizens for Safe Power*, 222 Va. 866, 869 (1981).

IV. Discussion

a. Whether Amending the Regulation Was Exempt from the VAPA

VMA asserts the Act did not grant the Director of DEQ an unbridled VAPA exemption to substantively amend the Original Regulation. According to VMA, the General Assembly permitted the Director to incorporate or, in essence, lift the language from the Act and place it into the Original Regulation. It argues that any further action was subject to the requirements of the VAPA. Because DEQ allegedly acted outside the scope of the Act's VAPA exemption, VMA requests the Court to declare the Amended Regulation null and void.

As an initial matter, VMA claims that DEQ cannot invoke the VAPA exemption contained in Virginia Code § 2.2-4006(A)(4)(a). DEQ has conceded that it does not attempt to claim that exemption. Pursuant to Virginia Code § 2.2-4006(A)(4)(a), DEQ is permitted to bypass the VAPA when issuing regulations "[n]ecessary to conform to changes in Virginia statutory law or the appropriation act where no agency discretion is involved." The Court agrees with DEQ that it never intended to, nor needed to, invoke this exemption. The Act contains a specific VAPA exemption rendering it unnecessary for DEQ to seek to comply with one which is broader and more generalized. Va. Code § 10.1-1330(A).

VMA concedes that "DEQ was permitted to avoid [V]APA procedural requirements for a revision" but argues that the exemption only permitted DEQ to copy the language of the Act and paste into the Original Regulation verbatim. Pet'r Br. in Supp. 19. Converting the CO_2 Budget Trading Program to a direct auction trading system, it argues, fell outside the scope of the Act's VAPA exemption and therefore, the Amended Regulation must be nullified because it was not vetted through the VAPA.

When the language of a statute is "clear and unambiguous," the Court is to "assign the statute its plain meaning." *Browning-Ferris Indus. v. Residents Involved in Saving the Env't, Inc.*, 254 Va. 278, 284 (1997). "The plain, obvious, and rational meaning of [the] statute is preferred

over any curious, narrow, or strained construction." *Karr*, 66 Va. App. at 527 (quoting *Commonwealth v. Zamani*, 256 Va. 391, 395 (1998)).

The Act directs DEQ to incorporate its provisions into the Original Regulation. "Incorporate," as that word is commonly used, means "to unite or work into something already existent so as to form an indistinguishable whole." *Incorporate*, Merriam-Webster.com, https://www.merriam-webster.com/dictionary/incorporate (last visited July 12, 2021). In context, DEQ was directed to take the provisions of the Act and unite them into the Original Regulation to create an indistinguishable regulation applicable to electricity manufacturers that emit CO_2. The incorporation language specifically identifies the already existent regulation into which the Act is to be incorporated – the Original Regulation – and expressly provides that the Air Board need not approve, and the VAPA shall not apply to, such incorporation. Va. Code § 10.1-1330(A).

It is well-settled "that every part of a statute is presumed to have some effect and no part will be considered meaningless unless absolutely necessary." *Hubbard v. Henrico Ltd. P'ship*, 255 Va. 335, 340 (1998). VMA argues that the General Assembly directed DEQ to take the language of the Act and add it to the Original Regulation verbatim. In other words, the General Assembly directed DEQ to recite what the General Assembly had already stated. Doing so, however, would have produced no change. The Original Regulation would proscribe the particulars of a consignment-based trading program but state that DEQ is authorized to "establish, implement, and manage" one that operates differently. If VMA were correct in arguing that DEQ had to comply with the VAPA before converting the Original Regulation to a direct auction program, the trading program would remain unchanged, and the Amended Regulation would have provided nothing more than what was stated in the Act itself. The amendment contemplated by VMA would have been wholly ineffectual.

When interpreting the plain language of a statute, the Court is to construe it "so as to avoid an absurd result." *Eastlack v. Commonwealth*, 282 Va. 120, 126 (2011) (citing *Commonwealth v. Doe*, 278 Va. 223, 230 (2009)). Here, however, VMA singles out the language of incorporation without reading the Act in context. If its cut and paste argument were correct, DEQ would have produced a convoluted and confusing regulatory scheme. The Original Regulation would specify how the consignment-based trading program shall operate and define terms such as "conditional allowances" and "consignment auctions." It would simultaneously state that the Director of DEQ is "authorized to establish, implement, and manage" a direct auction trading program under which CO_2 allowances are not consigned and consignment auctions are not held.

Further confusion would result from a verbatim transfer of language because certain language in the Act has no application to manufacturers required to participate in the CO_2 Budget Trading Program. For instance, VMA claims that DEQ failed to include a provision of the Act stating that the revenues generated by DEQ's sale of CO_2 allowances will be held by the state treasury and spent for enumerated purposes. Va. Code § 10.1-1330(C). It would be nonsensical to include such language in a regulation governing electricity manufacturers. The enacted language was not a directive to DEQ. Instead, its inclusion was necessitated by the fact the General Assembly authorized DEQ to sell CO_2 allowances directly into the auction market rather than

consign them to participants.[2] Determining what to do with the revenue generated from those sales was a question for the General Assembly which it answered in the Act.

Furthermore, VMA believes the General Assembly directed DEQ to add to the Original Regulation an entirely new set of definitions – those set forth in Virginia Code § 10.1-1329 – effectively creating two sets of definitions in a single regulation. Not only would doing so have been duplicative of certain definitions included in the Original Regulation, the newly defined terms would be meaningless. The newly added set of definitions would clarify that "'DHCD' means the Department of Housing and Community Development" and define what an "energy efficiency program" is, yet neither the abbreviation nor the phrase are used in the regulation itself. Va. Code § 10.1-1329. The newly added definitions would also be prefaced with the phrase, "[a]s used in this article, unless the context requires a different meaning[,]" yet appear in a regulation. *Id.*

The General Assembly did not direct DEQ to amend the Original Regulation in a manner which would only confuse those required to participate and substantively amend nothing. Rather, it authorized DEQ to convert the trading program to a direct auction trading system and directed DEQ to sell, not consign, CO_2 allowances. The General Assembly not only authorized this change, but it also exempted DEQ from requirements which would otherwise apply in the absence of language to the contrary.

It is worth noting that when DEQ issued the Original Regulation in response to the Governor's directive, it had to both comply with the VAPA and receive Air Board approval. If the General Assembly had not included the exemption in this new Act, the Amended Regulation would have been subject to the same requirements and the amendment process would have been prolonged.

VMA attempts to distinguish the VAPA exemption language from other instances in which the General Assembly granted exemptions, yet the examples they provided either applied to the enactment of wholly new regulations or contained differing exemption language for different mandates. The exemption language here applies to the amendment of a preexisting regulation and does not differentiate between exempt and non-exempt actions. "Courts assume that the General Assembly chose, with care, the words it used in enacting the statute." *Kalergis v. Comm'r of Highways*, 294 Va. 260, 266 (1017). If the General Assembly intended for the VAPA to apply, it would have stated so. In fact, in the same session in which the Act was enacted, the General Assembly did so expressly when it added a new subsection E to Virginia Code § 10.1-1308 which states: "Regulations adopted by the [Air Pollution Control] Board under this subsection shall be subject to the requirements set out in" specific provisions of the VAPA.[3]

The Court recognizes that bypassing the VAPA may have prevented interested parties from providing important input into the rulemaking process, but DEQ did what the General Assembly

---

[2] Under the Original Regulation, DEQ was to consign the allocated number of CO_2 allowances to manufacturers. However, the Act stated that DEQ "shall seek to *sell* 100 percent of all allowances issued each year through the allowance auction[.]" Va. Code § 10.1-1330(B) (emphasis added). The revenue generated from the sale of allowances is to be held by the state treasury and used for environmental mitigation purposes. Va. Code § 10.1-1330(C).

[3] Other state statutes that authorize the issuance of regulations establishing the state's CO_2 Budget Trading Program expressly require compliance with that state's version of the APA, yet the General Assembly in this case provided the exact opposite. *See* Conn. Gen. Stat. § 22a-200c (requiring that adoption of such regulations be "in accordance with" Connecticut's Uniform Administrative Procedure Act).

required it to do. Therefore, the Court **FINDS** that DEQ did not violate the VAPA in issuing the Amended Regulation.

b. Whether DEQ Impermissibly Added a Permitting Requirement

VMA argues that the Amended Regulation impermissibly added a permitting requirement which was neither found in the Original Regulation nor authorized by the Act. DEQ argues that the Original Regulation contained the same permitting requirement and therefore, this provision of the Amended Regulation remains unchanged.

Subsection A of the "Applicability" provision specifies which manufacturers are required to participate in the CO_2 Budget Trading Program. 9 VAC 5-140-6040(A). Subsection B of the "Applicability" provision previously stated:

> *Exempt* from the requirements of this part is *any* fossil fuel *CO_2 budget source* located at or adjacent to and physically interconnected with a manufacturing facility that, prior to January 1, 2019, and in every subsequent calendar year, *met either of the following requirements*:
>
> . . .
>
> "Such CO_2 *budget source* shall have an operating permit containing the applicable restrictions *under this subsection*."

9 VAC 5-140-6040(B) (2019) (emphasis added) (amended 2020). The Amended Regulation merely added the word "exempt" to say: "Such exempt CO_2 budget source shall have an operating permit containing the applicable restrictions under this subsection." 9 VAC 5-140-6040(B). The permit requirement in the Original Regulation clearly applied to exempt budget sources. The word "exempt" only clarified, but did not change, what was previously required.

The other change VMA takes issue with is a provision clarifying that exempt budget sources must file an application permit by January 1, 2022. 9 VAC 5-140-6040(B). The Original Regulation required all CO_2 budget sources to file an application permit by January 1, 2020; however, that deadline was rendered obsolete as the Amended Regulation was issued on July 10, 2020. If DEQ had not changed the permitting deadline, the Amended Regulation would require budget sources to submit permit applications after the deadline for doing so had expired. DEQ simply extended the generally applicable permitting deadline to January 1, 2021 and provided exempt budget sources with a further extended deadline of January 1, 2022. *Compare* 9 VAC 5-140-6040(B), *with* 9 VAC 5-140-6150.

Exempt and non-exempt manufacturers are subject to the same permitting requirements that were set forth in the Original Regulation. The other change only extends the deadline by which exempt budget sources must submit permitting applications. For these reasons, the Court **FINDS** that the Amended Regulation did not add a new permitting requirement and that DEQ did not otherwise act outside the scope of the VAPA exemption.

c. Whether the Amended Regulation is Void for Vagueness

VMA argues that the Amended Regulation is so vague that no participant of ordinary intelligence can discern what is necessary for compliance. Specifically, VMA alleges that the Amended Regulation fails to define key operational aspects of the CO_2 Budget Trading Program such as how CO_2 allowances are to be obtained. It also asserts that the Amended Regulation does not mention "Regional Greenhouse Gas Initiative" or "RGGI" but participants must comply with RGGI's internal rules, which are "de facto" rules subject to the VAPA.

First, VMA has not pointed to any case in which the void for vagueness doctrine has been applied in the regulatory context. It cites to *Tanner v. City of Va. Beach*, 227 Va. 431 (2009) (analyzing whether a city noise ordinance was facially vague or vague as applied to plaintiffs) and *Volkswagen of Am., Inc. v. Smit*, 279 Va. 327 (2010) (analyzing whether a statute was impermissibly vague as applied), but neither case contains a claim similar to the one asserted here. Furthermore, *Tanner* and *Volkswagen* establish that VMA carries a high burden to prevail on this assertion.

Second, VMA has not pointed to any vague or incomprehensible provision within the Amended Regulation. To comply with the CO_2 Budget Trading Program, electricity manufacturers must hold CO_2 allowances in an amount equal to or greater than the amount of CO_2 they emit. 9 VAC 5-140-6050(C). VMA participated in the development of the Original Regulation, and all material aspects of this provision remain identical. A statute, and perhaps also a regulation, is not vague if it can be "construed reasonably in a manner that will render its terms definite and sufficient[.]" *Tanner*, 227 Va. at 438-39. The Amended Regulation sets forth what the manufacturers need to do for compliance purposes – hold a certain amount of CO_2 allowances relative to the amount of CO_2 they emit – using explicit and definite terms. It specifies which entities must participate, the requirements for permitting and monitoring, where the allowances are to be held, how compliance is measured, penalties for non-compliance, recordkeeping requirements, and how Virginia's budget for allowances will change over time. The Amended Regulation sufficiently details what manufacturers are required to do for compliance purposes, and Virginia has since held two successful auctions with no reported confusion.

VMA next asserts that the rules governing the actual trading market are "de facto" rules created by RGGI which may change in the future and potentially deprive participants of their due process rights. However, the Original Regulation also required participants to use the RGGI auction house for trading allowances. *See* Pet. for Appeal ¶¶ 34, 36. VMA's concern that RGGI rules may change in the future are merely hypothetical and not ripe for review. Furthermore, the cases VMA cites for this proposition are inapposite because they involve an agency's interpretation of a regulation. *See Va. Bd. of Med. v. Va. Physical Therapy Ass'n*, 13 Va. App. 458 (1991); *Jerri's Ceramic Arts, Inc. v. Consumer Prod. Safety Comm'n*, 874 F.2d 205 (4th Cir. 1989). Lastly, manufacturers are only required to comply with RGGI rules if they choose to acquire allowances through the RGGI auction market. They are free to acquire the required amount of allowances on a secondary market.

For the foregoing reasons, the Court **FINDS** that VMA's vagueness claims fail.

d. Whether the Amended Regulation Imposes an Unconstitutional Tax

VMA alleges that the Amended Regulation imposes an illegal tax DEQ is not authorized to levy. It claims that participants will incur costs in complying with the Amended Regulation which will then be passed down to consumers under the guise of an "environmental compliance cost" which is a tax. Because the General Assembly possesses the authority to impose taxes and has not delegated such authority to DEQ, the Amended Regulation must be declared null and void.

This taxation argument focuses on the revenues the CO_2 Budget Trading Program will generate. DEQ argues that it only sells the CO_2 allowances into the market and enforces the Amended Regulation. While the revenue is generated from the sale by DEQ, it argues that it does nothing with respect to such revenues after the sale has been made. The Court agrees. The General Assembly directed DEQ to establish, implement, and manage the CO_2 Budget Trading Program. Va. Code § 10.1-1330(B). It also authorized DEQ to sell rather than consign CO_2 allowances. *Id.* As VMA notes, DEQ did not copy and paste Virginia Code § 10.1-1330(C) into the Amended Regulation, but it did not need to do so as discussed above. Aside from the requirements set forth in Amended Regulation, DEQ has no role.

VMA conceded at oral argument that the Amended Regulation does not cloak DEQ with authority to decide where the revenue is to be held or how it is to be spent. The operational aspects concerning revenues generated is controlled by the statute itself. Va. Code § 10.1-1330(C). As part of the Act, the General Assembly directed the state treasury to hold and allocate the auction proceeds. *Id.* The General Assembly also declared that the state treasury shall distribute the proceeds "without further appropriation." *Id.*

Because VMA's constitutional challenge is directed at the Act itself, the Court **FINDS** that the Amended Regulation is not violative of the Virginia Constitution.

V. Conclusion

Upon consideration of the pleadings, briefs, argument of counsel, and for the reasons discussed above, the Court **FINDS** that DEQ did not violate the VAPA or the Virginia Constitution when it issued the Revised Regulation. Therefore, VMA's Petition for Appeal is hereby **DISMISSED**.

Pursuant to Rule 1:13 of the Supreme Court of Virginia, the Court dispenses with the Parties' endorsement of this Order.

The Clerk is directed to forward a copy of this Order to all parties.

It is so **ORDERED**.

FEATURED

The mystery of the secret Virginia air board document

Patrick Wilson
May 13, 2022

DEQ Director Mike Rolband addressed the Virginia State Air Pollution Control Board during its meeting at the Parha on April 20.

SHABAN ATHUMAN/TIMES-DISPATCH

Patrick Wilson

Air Pollution Control Board Member Hope Cupit tells Virginia DEQ Director Mike Rolband that the Virginia attorney general's office gave her a document in March saying Virginia's participation in the Regional Greenhouse Gas Initiative is up to the General Assembly, not the Air Board.

State officials are refusing to release a document that purportedly undercuts Gov. Glenn Youngkin's desire to remove Virginia from a greenhouse gas reduction program.

Youngkin wants the Virginia State Air Pollution Control Board to consider an emergency regulation that would remove Virginia from the **Regional Greenhouse Gas Initiative**, a multistate program in which energy producers charge their customers to cover the costs of reducing pollution.

But a member of the air board said at the panel's April 20 meeting that the attorney general's office believes only the General Assembly can remove Virginia from the program.

Hope Cupit said she received an "opinion" in March from the attorney general's office. But she and the attorney general's office declined to release it. A staffer with the Virginia Department of Environmental Quality said someone there had the document "at one point."

People are also reading...

3. **As catalytic converter thefts rise in the Richmond area, local police promote new deterrence measure**
4. **Parent sues Hanover schools over new transgender policy**

DEQ's Natalie Womack declined to explain how someone at DEQ had the document "at one point" but supposedly no longer has it.

In any event, the mysterious document — which would undercut Youngkin's goal — remains secret.

After he was elected, Youngkin **gave a speech in December** saying he would remove Virginia from the greenhouse program, known as RGGI, by executive action. But the General Assembly passed a law in 2020 requiring Virginia to join the program, and a governor doesn't have the power to overturn a law.

Under RGGI, energy producers in a number of states trade emission reductions for credits, or buy credits to emit carbon dioxide past a cap. The states in the program are Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont and Virginia.

Youngkin **backed off his plan**, and instead issued an **executive order** calling on the air board to consider a regulation removing Virginia from RGGI. Environmental groups say even that would be illegal because a regulatory board can't overturn a state law.

Cupit, the air board member, asked DEQ Director Mike Rolband at the April 20 board meeting about the administration's plan for an emergency regulation for the air board to consider. (Air board members are appointed by the governor, and DEQ

acts as staff to the air board.)

DEQ staff in March **issued a report** — as requested by Youngkin's executive order — about how the agency believes Virginia could remove itself from the program.

Rolband told her the process was "complicated" and is being "vetted by a lot of different people."

He said the emergency regulation would need review and approval by the air board, and that would begin the process of removing the state from RGGI, which DEQ's report said was an "emergency" because of the costs. Rolband said the attorney general's office would review everything first.

That's when Cupit introduced an issue that seemed to surprise Rolband.

"I did reach out to the attorney general's office and was told that this is not an action of the board, it actually is an action of the General Assembly," Cupit said at the meeting.

She added: "I got an opinion from the attorney general's office back in March saying that it's not the responsibility of the board, that it's the responsibility of the General Assembly."

Rolband asked Cupit to provide him with a copy of it, and she said she would.

The Richmond Times-Dispatch asked Cupit after the meeting for a copy of what the attorney general sent her; she said she'd check to see if she could release it, but never responded.

Victoria LaCivita, a spokeswoman for the attorney general, said by email for this story that there had been "no official or unofficial AG's opinion on RGGI issued by this administration."

But pressed as to whether the attorney general's office provided Cupit with anything in writing, a special counsel in the office, Stephanie Hamlett, said there was a document. She said the attorney general declined to release it, and she cited a discretionary FOIA exemption for written advice of legal counsel.

Womack, the DEQ staffer, declined to explain the circumstances under which someone at DEQ had the document "at one point" but no longer did.

Womack also responded last week on behalf of Cupit, the air board member, saying Cupit was opting not to release the document. Womack cited the discretionary FOIA exemption for legal advice.

Nothing in the Freedom of Information Act stops the attorney general's office or Cupit from releasing the document, but FOIA allows them to withhold it, at their discretion.

So for now, the mystery of the secret air board document remains unsolved.

Under RGGI, the revenue Virginia gets is directed to programs that help low-income people reduce energy usage — thereby lowering their cost of electricity — and for programs combating sea level rise in coastal areas and inland flooding across the state.

Under the initial RGGI cost recovery request from Dominion Energy, the state's largest electric utility, a typical customer's bill increased $2.39 a month because of the program.

Flooding in the Hague area of Norfolk in May 2022.

Unchecked sea level rise would cost Virginia $79 billion this century, ODU says

PLAY

The impacts of large natural disasters — think fires and hurricanes — are pretty easy to demonstrate.

But the injury from sea level rise can be harder to illustrate, said Bob McNab, director of Old Dominion University's Dragas Center for Economic Analysis and Policy.

Changes happen over months and years rather than all at once.

"You just kind of adjust slowly as the climate changes," McNab said. "And that's why it's harder to combat."

So how to grab people's attention on the issue? Follow the money.

That's what a new ODU analysis tries to do. Researchers estimated exactly how much coastal Virginia could lose if nothing changes to confront sea level rise and flooding.

They came up with some massive figures, expressed in 2021 dollars.

Unmitigated flooding from 2020 to 2099 would result in about $56 billion in financial damages — about 85% of which is in Hampton Roads, according to the new report.

That would lead to a roughly $79 billion decline in economic output across the Commonwealth's coast.

"Imagine a hurricane hitting Virginia last year and wiping out more than 13% of economic activity in Virginia," McNab said. "That's the cost we project in sea level rise and recurrent flooding over the remainder of the century."

To reach those numbers, the researchers looked at eight planning districts that comprise coastal Virginia, including Hampton Roads.

George McLeod, director of the Center for Geospatial Science, Education and Analytics said his team used modeling that builds upon their existing work.

They have spent years projecting (https://www.pilotonline.com/news/environment/vp-nw-odu-flood-map-20211221-ll2ikzcwfzfrvdi2cgm6bq3c2y-

story.html) how much flooding the region will see by 2040, 2060 and 2080 – down to the street level (https://odu-geosea.maps.arcgis.com/home/webmap/viewer.html?webmap=36e758f7e2b544a980962faef1faaeb4#).

According to data from the National Oceanic and Atmospheric Administration, average sea levels in Virginia could rise by almost 5 feet by the end of the century – even more in certain spots around the region.

One difference for this project is it includes projections for storm surge in addition to regular nuisance flooding, McLeod said.

His team used the models combined with basic economic numbers from various categories including agriculture, government and education.

“The way I look at it is, because of the complexity and magnitude and inevitability of this issue of sea level rise, it’s really our job to look at the problem at all scales,” McLeod said.

“It’s really incumbent upon us to look at every one of those scales and to try to provide as much information to decision-makers as possible.”

McNab then did further economic analysis, which does not take into account future mitigation efforts like a planned floodwall in Norfolk.

The Hampton Roads region would suffer the most economic consequences: $47 billion in direct losses leading to $67 billion in lost output.

That’s a conservative estimate, McNab said.

McNab and McLeod said they hope people will use the report to jumpstart both policy and grassroots efforts.

“This should be another part of the wake-up call for not only Virginia but coastal areas in the United States, because sea level rise is occurring,” McNab said. “These

are all the conversations that will become part and parcel of local, state and national politics over the coming decades."

As flooding risks increase, this small town in Appalachia is working on a flood mitigation plan

RADIO IQ | By Roxy Todd

Photo Courtesy WDBJ7 / Https://Www.Wdbj7.Com/Content/Misc/Flooding-In-Pulaski-569590501.Html

Flooding in April 2020 from Peak Creek pushed water onto East Main Street in Pulaski.

Scientists predict that flooding events will become more common, due to climate change, and communities in Appalachia are particularly vulnerable. The small town of Pulaski, in the New River Valley, is responding, by creating a plan to withstand the worst impacts of flooding.

On a clear, fall morning, Cathy Hanks is standing on a walking trail beside Peak Creek.

Radio IQ
PRI's The World

In 2020 for example, the creek flooded several times.

“We had several 100 year floods in one month. You can see where this is being eaten away,” said Hanks, the President of a local activist group, Friends of Peak Creek.

The bank along the creek is eroding, including at the edge of a former EPA Superfund site, a factory that used to make sulfuric acid. The site was contained by the EPA in the early 2000s, but Hanks and others wonder if repeated floods are bringing contaminants into the creek.

“Our concern is, it’s right beside the creek and there’s still erosion over there.”

Testing in 2019 by a student researcher at Virginia Tech revealed that heavy metals are present in the water and sediment near the site.

The Virginia Department of Environmental Quality has added portions of the creek to its list of impaired waters for high levels of several metals and chemicals, as well as e-coli.

To address these issues, as well as the flooding along the creek, in 2013 Hanks and other residents formed a local group called Friends of Peak Creek (FOPC). They also do beautification projects along the creek and organize clean up events to collect trash from the water.

Council in February, 2021.

Part of the plan outlines steps that could clean up the contamination in the creek. It was submitted to the EPA, and the agency may provide funding for cleanup if the plan is approved.

Another part of the plan was sent to the Army Corps of Engineers (USACE) to help widen the creek and prevent erosion. According to Darlene Burcham, Pulaski town manager, the USACE has said that it will provide funds to do some of the flood mitigation work.

Applying for aid from the federal government to implement these types of plans isn't easy, and it's expensive. First, a community has to establish proof from engineers that it's necessary.

A team of faculty and students from Virginia Tech's Department of Biological Systems Engineering provided some assistance for free. They collected water and sediment quality data before and after rainfall events to see what the impacts of flooding were.

"They're just kind of stuck because they built this town right next to the creek. And it floods, and there's almost no way to stop that," said Cully Hession, an engineering professor at Virginia Tech.

He says relocating homes closest to the flood zone is one solution. Another is rebuilding the banks that erosion has eaten away.

Radio IQ
PRI's The World

Peak Creek in downtown Pulaski

“Pulaski is one of our favorite places to work. Because they have a really great citizen’s group, and the town engineer reached out,” said Leigh Anne Krometis, another engineering professor who was on the team that assisted with the flood mitigation plan. She said sometimes communities get into disputes when it comes to addressing environmental and public health issues, but Pulaski worked together on the project in a collaborative way.

Back at the pedestrian path, Hanks points to one place they’ve recently done some restoration work themselves. Near a playground along the banks of one of the tributaries that flows into Peak Creek, the town partnered with FOPC and the New River Conservancy to plant bushes and native plants, like willow, elderberry and silky dogwood.

The vegetation can’t prevent flooding, but it can reduce erosion. And in a bad flood, the plants can help slow the water. “People don’t understand that this is healthy. Pretty is not necessarily healthy,” Hanks said.

The playgrounds and parks near the creek will continue to flood, a situation that's inevitable,. And it's one that many communities are grappling with.

Pulaski is working to stay ahead of the risk by developing a plan and taking steps to act on it. But it will take time, and a lot of money, to prevent the worst damage from flooding.

“This is gonna take years,” Hanks said. “Years and years to do, to implement plans to protect the creek.”

As floods worsen in Appalachia, disaster prep gets more complex — and necessary

by **Molly Born**
September 16, 2021

Drone footage of Powell County, Ky., on March 1, 2021, following historic flooding. Courtesy of Jason Rose.

As climate change leads to more intense flooding, communities will need to make crucial — and creative — investments to protect themselves.

On the evening of Feb. 28, Kevin Babcock watched as rain fell across the Eastern Appalachian Mountains, threatening to send the Red River in Powell County, Ken., over its banks. The water came fast, and without much warning, causing record flooding in parts of eastern and central Kentucky. The state's network of environmental monitoring stations, Kentucky Mesonet, helps local emergency managers like Babcock prepare by tracking temperature, precipitation, and historical weather data in 76 locations across the state.

However, Powell is one of several eastern counties without this technology. So, Babcock and other officials must rely on reports from other parts of the state to make predictions that inform critical decisions such as whether to issue an evacuation order.

During the floods in late February, estimates coming from the National Weather Service's Jackson County location — more than 50 miles away — offered the best determination of how high the river might get. "We're basically in a little valley by ourselves," said Babcock, "I didn't want to go to sleep if the river was rising rapidly."

Around 3:30 a.m. on March 1, Babcock received notice that the predictions in Powell were underestimated by up to four feet: The river, normally between 8 and 12 feet deep, topped out at more than 25. More than 300 families left their homes after the flood warning was issued on Feb. 28, but "the speed and uncertainty of the flooding" led to nearly 100 water rescues, Babcock said.

Babcock said this marked the second-highest crest in modern history. Drone **footage** showed washed out roads; homes and businesses were partially underwater. Floodwaters inundated a fifth of the county, led to dozens of rescues, and cut off the county's second most populous town for days.

"Since 1978 we've had five 40-year floods," Babcock said of Powell County. "That's not right, that's not normal."

A monitoring station closer to Powell could save lives, Babcock insisted, and he applied for a hazard mitigation grant from the Federal Emergency Management Agency (FEMA) that would fund the purchase of one for around $50,000.

"In the old days I used to rely on animals [that] moved to high ground," Babcock said of the way he used to predict flooding. "We don't need to do that. We have actual technology that could help us," he said.

But other experts suggest the money could be better spent elsewhere.

Nicolas Zegre, associate professor of forest hydrology and director of West Virginia University's Mountain Hydrology Laboratory, noted that while forecasts can be useful, they can also be wrong. He suggested that the $50,000 could go toward paying a team to work with residents to map evacuation routes, develop in-home emergency preparedness plans, and gather examples of community resilience in past disasters.

"The most important thing we can do about this is talk about this," Zegre said. "Nothing is going to happen until there's public discourse around this. And after we have public discourse, that's what then influences our elected decision makers to act."

While experts may disagree about the best response, the last few years, in particular, demonstrate the peril of flooding in Appalachia.

Kentucky's interim climatologist, Megan Schargorodski, called what happened in the state earlier this year a "combination event" because the ground was still saturated from the winter, making drainage even more difficult. In eastern Kentucky especially, "it's a huge problem because there's nowhere for the water to go," she said.

In mountainous states like the ones that make up Appalachia, heavy rain will run off hillsides, soaking the valleys beneath, and unlike the sandy soils of coastal states, clay-heavy soil found in **parts** of the Southern Appalachians drains water slowly. As West Virginia state climatologist Kevin Law told *Southerly*, five inches of rain in West Virginia might be more devastating than it would be in Florida. Flooding can be exacerbated, too, by the dangerous conditions in **parts of the region damaged by coal mining**: Strip mine sites can increase erosion and stream flow, leading to landslides.

The flooding in Kentucky is part of a pattern that other parts of the South are also seeing as climate change leads to more intense precipitation. That will likely continue, according to the latest **Intergovernmental Panel on Climate Change assessment**. In August, four people died about 45 minutes west of Asheville, N.C. after flooding caused by Tropical Storm Fred. Days later, 17 inches of water fell in a single day in middle Tennessee, causing flash flooding that killed at least 22 people. Hurricane Ida hit the Gulf Coast as a Category 4 storm, which caused **minor flooding** in West Virginia, but caused deadly floods a few states north.

Law, who is also a professor at Marshall University, has been studying how hurricanes making landfall are causing heavier rain inland, "possibly stalling out and dumping more rainfall in the Appalachian Mountains." Law said it'd "definitely be advantageous" to have a more robust weather monitoring network in West Virginia, "especially in flood prone areas like the southwestern coalfields. We just don't really have a whole lot of stations down there," he added.

Parts of central Appalachia, including southwest Virginia, eastern Kentucky, and West Virginia, have been drenched in recent years by floods, some deadly. According to West Virginia University, more than 700 floods have occurred across the state since 2016, costing the state billions. In **February 2020,** heavy rains caused flooding and mudslides in southeastern Kentucky, sending trailers downstream and resulting in one death when a man was found dead in his car after he drove into flood waters. In West Virginia, flooding is "the most frequent and devastating disaster threatening" the state, according to its hazard mitigation plan, which was last updated in 2018. In June 2016, **23 people died** and thousands of homes and businesses were damaged when up to 10 inches of rain fell in less than 12 hours—one of the deadliest floods in the state's history.

People get caught off guard because they're not prepared, said Zegre, noting that "historically, the likelihood of something big happening to any given person at any given time was less." With more frequent, intense

weather events, that is changing. And while flooding is relevant while it's happening, he continues, the more time passes "the less important it becomes to our day-to-day."

"That memory is only going to become relevant if we talk about it and we keep the memory fresh," through activities like community forums and storytelling. "But that has to be intentional. And that really doesn't happen the way it needs to," Zegre said.

With a group of colleagues, Zegre explored this idea in a recent analysis for the journal **Frontiers in Water**, asserting that scientific experts should be "on equal footing" with residents in communities vulnerable to flooding. For her part, Jamie Shinn, WVU assistant professor of geography, brings a camera and recorder during interviews with survivors of the 2016 floods in Rainelle, West Virginia, to document their stories.

Among the authors most "critical" findings in the recent analysis: Drainage infrastructure, especially culverts, should be upgraded; communities should be better prepared through education; and the institutions overseeing flood preparation and response should be better run.

"They themselves are experts in their lived experience and they know what they need," Zegre said. "Simply throwing money from the federal government down is a good start, but it's not the end and it's barely beginning."

Then there's the familiar sense that for one person "it's hella overwhelming and complex" to consider how to affect change, Zegre said.

"At the individual level, it's really overwhelming. It's scary. It seems like there isn't a solution. And I think it's kind of the human brain to not focus on it, especially when it's not happening all the time," he said.

Last year First Street Foundation, a nonprofit group of hydrologists, researchers and data scientists, found that several Appalachia counties may be much more at risk of major flooding than FEMA predictions show. A 2021 analysis found that West Virginia, Kentucky, and Ohio share "a significant amount of risk" of economic damage "driven by heavy precipitation and small waterway flooding."

FEMA has warned property owners about these risks as far back as 2010. In an advisory from that year, the agency stated: "The next time you hear hurricane — think inland flooding!" According to the National Oceanic and Atmospheric Administration, roughly a quarter of U.S. hurricane deaths between 1963 and 2012 occurred in inland counties, and half were related to freshwater flooding.

A federal disaster declaration following the Kentucky floods in late February unlocked millions in FEMA aid as hundreds of residents grappled with damage to homes and businesses — and the reality that yet another devastating flood had left its mark on the region.

This summer FEMA announced three ambitious "pre-disaster funding opportunities" including nearly $3.5 billion in hazard mitigation grants that states can use to protect against future catastrophes. That money covers three-quarters of total project costs and states or communities; Kentucky, for instance, will get $22 million for plans the state has reviewed and submitted to FEMA for funding in 2022.

"The real goal of mitigation is to reduce future damages," said David Vandewater, a FEMA program manager for hazard mitigation assistance grants, covering Florida, Tennessee, and Kentucky.

The influx of cash supports FEMA's existing hazard mitigation grant program, which began in the late 1980s to fund projects like retrofitting a building to improve its wind resistance, upgrading drainage systems, or purchasing a weather monitoring station like the one Babcock is seeking, among other plans. One major hazard mitigation grant project in recent years in Kentucky included the construction of a drainage basin with new culverts in Lexington. (The city had to cover just $273,000 of the $2.1 million project.)

Communities are responsible for developing a project plan that must be approved by the state and FEMA before the agency will release funding. Even applying can be a delicate process. In a 2010 **video**, the University of Kentucky's hazard mitigation planning manager, who assists communities applying for grants, said project requests typically need reworking to include "FEMA language" that "maybe people out in the communities don't know."

By their design, hazard mitigation grants give states wide latitude to green-light projects. But the recent Frontiers in Water study of the aftermath of the 2016 flood in West Virginia suggests why that could be problematic. West Virginia's institutions responsible for minimizing flood risks, for example, might be considered "weak" because of "policies that prioritize resource extraction-based political agenda," the report reads. Notably, officials have taken "little-to-no action" on the plan developed by the state's Flood Protection Task Force, according to the 2016 report.

"Strong institutions necessary to coordinate and develop community information through local floods and hazard maps, evacuation routes, and safe zones are absent. Hence, disaster preparedness stymied by weak institutional governance results in high hazards leading to greater vulnerability," the report reads.

In Kentucky, Babcock is still waiting for final approval from FEMA for the Mesonet weather monitoring station in Powell County, which the county applied for in response to flooding in early 2019.

"It is good to know that they make sure of the needs with the limited funds available," he said, "but it would help to be faster."

Molly Born is Southerly's Appalachia correspondent. If you have ideas about what she should be covering in Appalachia, or you want to tell your flood story, ***fill out this form.***

Subpart XX-1 CO_2 Budget Trading Program General Provisions

XX-1.1 Purpose.

This Part establishes the NAME OF RELEVANT RGGI STATE component of the CO_2 Budget Trading Program, which is designed to reduce anthropogenic emissions of CO_2, a greenhouse gas, from CO_2 budget sources in an economically efficient manner.

XX-1.2 Definitions.

Account Number. The identification number given by the REGULATORY AGENCY or its agent to each CO_2 Allowance Tracking System account.

Acid rain emissions limitation. As defined in 40 CFR 72.2, a limitation on emissions of sulfur dioxide or nitrogen oxides under the Acid Rain Program under title IV of the Clean Air Act.

Acid Rain Program. Acid Rain Program means a multi-state sulfur dioxide and nitrogen oxides air pollution control and emission reduction program established by the Administrator under title IV of the CAA and 40 CFR Parts 72 through 78.

Administrator. Administrator means the Administrator of the United States Environmental Protection Agency or the administrator's authorized representative.

Allocate or allocation. The determination by the REGULATORY AGENCY of the number of CO_2 allowances to be recorded in the compliance account of a CO_2 budget unit, an allocation set-aside account, the consumer benefit or strategic energy purpose account, or the general account of the sponsor of an approved CO_2 emissions offset project.

[The reference to the consumer benefit or strategic energy purpose account illustrates how this account could be labeled and does not necessarily represent what an individual RGGI State will propose.]

Allocation year. A calendar year for which the REGULATORY AGENCY allocates or awards CO_2 allowances pursuant to Subparts XX-5 and XX-10. The allocation year of each CO_2 allowance is reflected in the unique identification number given to the allowance pursuant to subdivision XX-6.4(c).

Allowance auction or auction. An auction in which the REGULATORY AGENCY or its agent offers CO_2 allowances for sale.

Attribute. A characteristic associated with electricity generated using a particular renewable fuel, such as its generation date, facility geographic location, unit vintage, emissions output, fuel, state program eligibility, or other characteristic that can be identified, accounted for, and tracked.

Attribute credit. An attribute credit represents the attributes related to one megawatt-hour of electricity generation.

Automated Data Acquisition and Handling System (DAHS). That component of the continuous emissions monitoring system, or other emissions monitoring system approved for use under Subpart XX-8, designed to interpret and convert individual output signals from pollutant concentration monitors, flow monitors, diluent gas monitors, and other component parts of the monitoring system to produce a continuous record of the measured parameters in the measurement units required by Subpart XX-8.

Award. The determination by the REGULATORY AGENCY of the number of CO_2 offset allowances to be recorded in the general account of a project sponsor pursuant to XX-10.7. Award is a type of allocation.

Billing Meter. To qualify as a billing meter, the measurement device must be used to measure electric or thermal output for commercial billing under a contract. The facility selling the electric or thermal output must have different owners from the owners of the party purchasing the electric or thermal output.

Boiler. An enclosed fossil or other fuel-fired combustion device used to produce heat and to transfer heat to recirculating water, steam, or other medium.

CO_2 allowance. A limited authorization by the REGULATORY AGENCY or a participating state under the CO_2 Budget Trading Program to emit up to one ton of CO_2, subject to all applicable limitations contained in this Part.

CO_2 allowance deduction or deduct CO_2 allowances. The permanent withdrawal of CO_2 allowances by the REGULATORY AGENCY or its agent from a CO_2 Allowance Tracking System compliance account to account for the number of tons of CO_2 emitted from a CO_2 budget source for a control period or an interim control period, determined in accordance with Subpart XX-8, or for the forfeit or retirement of CO_2 allowances as provided by this Part.

CO_2 allowances held or hold CO_2 allowances. The CO_2 allowances recorded by the REGULATORY AGENCY or its agent, or submitted to the REGULATORY AGENCY or its agent for recordation, in accordance with Subparts XX-6 and XX-7, in a CO_2 Allowance Tracking System account.

CO_2 Allowance Tracking System (COATS). A system by which the REGULATORY AGENCY or its agent records allocations, deductions, and transfers of CO_2 allowances under the CO_2 Budget Trading Program. The tracking system may also be used to track CO_2 emissions offset projects, CO_2 allowance prices and emissions from affected sources.

CO_2 Allowance Tracking System account. An account in the CO_2 Allowance Tracking System established by the REGULATORY AGENCY or its agent for purposes of recording the allocation, holding, transferring, or deducting of CO_2 allowances.

CO_2 allowance transfer deadline. Midnight of the March 1 occurring after the end of the relevant control period and each relevant interim control period or, if that March 1 is not

a business day, midnight of the first business day thereafter and is the deadline by which CO_2 allowances must be submitted for recordation in a CO_2 budget source's compliance account in order for the source to meet the CO_2 requirements of XX-1.5(c) for the control period and each interim control period immediately preceding such deadline.

CO_2 authorized account representative. For a CO_2 budget source and each CO_2 budget unit at the source, the natural person who is authorized by the owners and operators of the source and all CO_2 budget units at the source, in accordance with Subpart XX-2, to represent and legally bind each owner and operator in matters pertaining to the CO_2 Budget Trading Program or, for a general account, the natural person who is authorized, under Subpart XX-6, to transfer or otherwise dispose of CO_2 allowances held in the general account. If the CO_2 budget source is also subject to the Acid Rain Program, CSAPR NO_x Annual Trading Program, CSAPR NO_x Ozone Season Trading Program, CSAPR SO_2 Group 1 Trading Program or CSAPR SO_2 Group 2 Trading Program then, for a CO_2 Budget Trading Program compliance account, this natural person shall be the same person as the designated representative as defined in the respective program.

CO_2 authorized alternate account representative. For a CO_2 budget source and each CO_2 budget unit at the source, the alternate natural person who is authorized by the owners and operators of the source and all CO_2 budget units at the source, in accordance with Subpart XX-2, to represent and legally bind each owner and operator in matters pertaining to the CO_2 Budget Trading Program or, for a general account, the alternate natural person who is authorized, under Subpart XX-6, to transfer or otherwise dispose of CO_2 allowances held in the general account. If the CO_2 budget source is also subject to the Acid Rain Program, CSAPR NO_x Annual Trading Program, CSAPR NO_x Ozone Season Trading Program, CSAPR SO_2 Group 1 Trading Program or CSAPR SO_2 Group 2 Trading Program then, for a CO_2 Budget Trading Program

compliance account, this alternate natural person shall be the same person as the alternate designated representative as defined in the respective program.

CO_2 budget emissions limitation. For a CO_2 budget source, the tonnage equivalent, in CO_2 emissions in a control period or an interim control period, of the CO_2 allowances available for compliance deduction for the source for a control period or an interim control period.

CO_2 budget permit. The portion of the legally binding permit issued by the REGULATORY AGENCY pursuant to **[Insert Reference to State's Permitting Regulation(s)]** to a CO_2 budget source or CO_2 budget unit which specifies the CO_2 Budget Trading Program requirements applicable to the CO_2 budget source, to each CO_2 budget unit at the CO_2 budget source, and to the owners and operators and the CO_2 authorized account representative of the CO_2 budget source and each CO_2 budget unit.

CO_2 budget source. A source that includes one or more CO_2 budget units.

CO_2 Budget Trading Program. A multi-state CO_2 air pollution control and emissions reduction program established pursuant to this Part and corresponding regulations in other states as a means of reducing emissions of CO_2 from CO_2 budget sources.

CO_2 budget unit. A unit that is subject to the CO_2 Budget Trading Program requirements under section XX-1.4.

CO_2 cost containment reserve allowance or CO_2 CCR allowance. A CO_2 allowance that is offered for sale at an auction by the REGULATORY AGENCY for the purpose of containing the cost of CO_2 Allowances. CO_2 CCR allowances offered for sale at an auction are separate from and additional to CO_2 allowances allocated from the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base and adjusted

budgets. CO_2 CCR allowances are subject to all applicable limitations contained in this Part.

CO_2 cost containment reserve trigger price, or CCR trigger price. The CCR trigger price is the minimum price at which CO_2 CCR allowances are offered for sale by the REGULATORY AGENCY or its agent at an auction. The CCR trigger price shall be $10.00 per CO_2 allowance in calendar year 2017. Each calendar year thereafter through 2020, the CCR trigger price shall be 1.025 multiplied by the CCR trigger price from the previous calendar year, rounded to the nearest whole cent. The CCR trigger price in calendar year 2021 shall be $13.00. Each calendar year thereafter, the CCR trigger price shall be 1.07 multiplied by the CCR trigger price from the previous calendar year, rounded to the nearest whole cent, as shown in Table 1.

Table 1. CO_2 CCR Trigger Price

2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030
$10.25	$10.51	$10.77	$13.00	$13.91	$14.88	$15.92	$17.03	$18.22	$19.50	$20.87	$22.33	$23.89

CO_2 emissions containment reserve allowance or CO_2 ECR allowance. A CO_2 allowance that is withheld from sale at an auction by the REGULATORY AGENCY for the purpose of additional emission reduction in the event of lower than anticipated emission reduction costs.

CO_2 emissions containment reserve trigger price, or ECR trigger price. The ECR trigger price is the price below which CO_2 allowances will be withheld from sale by the REGULATORY AGENCY or its agent at an auction. The ECR trigger price in calendar year 2021 shall be $6.00. Each calendar year thereafter, the ECR trigger price shall be 1.07 multiplied by the ECR trigger price from the previous calendar year, rounded to the nearest whole cent, as shown in Table 2.

Table 2. CO_2 ECR Trigger Price

2021	2022	2023	2024	2025	2026	2027	2028	2029	2030
$ 6.00	$ 6.42	$ 6.87	$ 7.35	$ 7.86	$ 8.41	$ 9.00	$ 9.63	$10.30	$11.02

CO_2 equivalent. The quantity of a given greenhouse gas multiplied by its global warming potential (GWP).

CO_2 offset allowance. A CO_2 allowance that is awarded to the sponsor of a CO_2 emissions offset project pursuant to section XX-10.7 and is subject to the relevant compliance deduction limitations of section XX-6.5(a)(3).

Combined cycle system. A system comprised of one or more combustion turbines, heat recovery steam generators, and steam turbines configured to improve overall efficiency of electricity generation or steam production.

[This definition of CHP unit illustrates how this could be defined and does not necessarily represent what an individual RGGI State will propose]

Combined heat and power unit or CHP unit, (also known as "cogeneration"). An electric generating unit that uses a steam-generating unit or stationary combustion turbine to simultaneously produce both electric (or mechanical) and useful thermal output from the same primary energy facility.

Combustion turbine. An enclosed fossil or other fuel-fired device that is comprised of a compressor (if applicable), a combustor, and a turbine, and in which the flue gas resulting from the combustion of fuel in the combustor passes through the turbine, rotating the turbine.

Commence commercial operation. With regard to a unit that serves a generator, to have begun to produce steam, gas, or other heated medium used to generate electricity for sale or use, including test generation. For a unit that is a CO_2 budget unit under

section XX-1.4 on the date the unit commences commercial operation, such date shall remain the unit's date of commencement of commercial operation even if the unit is subsequently modified, reconstructed, or repowered. For a unit that is not a CO_2 budget unit under section XX-1.4 on the date the unit commences commercial operation, the date the unit becomes a CO_2 budget unit under section XX-1.4 shall be the unit's date of commencement of commercial operation.

Commence operation. To begin any mechanical, chemical, or electronic process, including, with regard to a unit, start-up of a unit's combustion chamber. For a unit that is a CO_2 budget unit under section XX-1.4 on the date of commencement of operation, such date shall remain the unit's date of commencement of operation even if the unit is subsequently modified, reconstructed, or repowered. For a unit that is not a CO_2 budget unit under section XX-1.4 on the date of commencement of operation, the date the unit becomes a CO_2 budget unit under section XX-1.4 shall be the unit's date of commencement of operation.

Compliance account. A CO_2 Allowance Tracking System account, established by the REGULATORY AGENCY or its agent for a CO_2 budget source under Subpart XX-6, in which are held CO_2 allowances available for use by the source for a control period and each interim control period for the purpose of meeting the CO_2 requirements of XX-1.5(c).

[This definition for the consumer benefit or strategic energy purpose account illustrates how this account could be defined and does not necessarily represent what an individual RGGI State will propose.]

Consumer benefit or strategic energy purpose account. A general account established by the Regulatory Agency or its agent from which allowances will be sold or distributed in order to provide funds to encourage and foster the following: promotion of energy efficiency measures, direct mitigation of electricity ratepayer impacts attributable to the

implementation of the CO_2 Budget Trading Program, promotion of renewable or non-carbon-emitting energy technologies, stimulation or reward of investment in the development of innovative carbon emissions abatement technologies with significant carbon reduction potential, and/or the administration of NAME OF RELEVANT RGGI STATE component of the CO_2 Budget Trading Program.

Continuous Emissions Monitoring System (CEMS). The equipment required under Subpart XX-8 to sample, analyze, measure, and provide, by means of readings recorded at least once every 15 minutes (using an automated DAHS), a permanent record of stack gas volumetric flow rate, stack gas moisture content, and oxygen or carbon dioxide concentration (as applicable), in a manner consistent with 40 CFR Part 75 and Subpart XX-8. The following systems are types of continuous emissions monitoring systems required under Subpart XX-8.

(1) A flow monitoring system, consisting of a stack flow rate monitor and an automated data acquisition and handling system and providing a permanent, continuous record of stack gas volumetric flow rate, in standard cubic feet per hour (scfh);

(2) A nitrogen oxides emissions rate (or NO_X-diluent) monitoring system, consisting of a NO_X pollutant concentration monitor, a diluent gas (CO_2 or O_2) monitor, and an automated data acquisition and handling system and providing a permanent, continuous record of NO_X concentration, in parts per million (ppm), diluent gas concentration, in percent CO_2 or O_2; and NO_X emissions rate, in pounds per million British thermal units (lb/MMBtu);

(3) A moisture monitoring system, as defined in 40 CFR 75.11(b)(2) and providing a permanent, continuous record of the stack gas moisture content, in percent H_2O;

(4) A carbon dioxide monitoring system, consisting of a CO_2 pollutant concentration monitor (or an oxygen monitor plus suitable mathematical equations from which the CO_2 concentration is derived) and an automated

data acquisition and handling system and providing a permanent, continuous record of CO_2 emissions, in percent CO_2; and

(5) An oxygen monitoring system, consisting of an O_2 concentration monitor and an automated data acquisition and handling system and providing a permanent, continuous record of O_2, in percent O_2.

Control period. The control period is a three-calendar-year time period. The first control period is from January 1, 2009 to December 31, 2011, inclusive. Each subsequent sequential three-calendar-year period is a separate control period. The first two calendar years of each control period are each defined as an interim control period, beginning on January 1, 2015.

Cross State Air Pollution Rule (CSAPR) NO_X Annual Trading Program. A multi-state NO_X air pollution control and emission reduction program established in accordance with subpart AAAAA of 40 CFR Part 97 and 40 CFR 52.38(a) (including such a program that is revised in a SIP revision approved by the Administrator under 40 CFR 52.38(a)(3) or (4) or that is established in a SIP revision approved by the Administrator under 40 CFR 52.38(a)(5)), as a means of mitigating interstate transport of fine particulates and NO_X.

Cross State Air Pollution Rule (CSAPR) NO_X Ozone Season Trading Program. A multi-state NO_X air pollution control and emission reduction program established in accordance with subpart BBBBB of 40 CFR Part 97 and 40 CFR 52.38(b) (including such a program that is revised in a SIP revision approved by the Administrator under 40 CFR 52.38(b)(3) or (4) or that is established in a SIP revision approved by the Administrator under 40 CFR 52.38(b)(5)), as a means of mitigating interstate transport of ozone and NO_X.

Cross State Air Pollution Rule (CSAPR) SO_2 Group 1 Trading Program. A multi-state SO_2 air pollution control and emission reduction program established in accordance with subpart CCCCC of 40 CFR Part 97 and 40 CFR 52.39(a), (b), (d) through (f), (j), and (k)

(including such a program that is revised in a SIP revision approved by the Administrator under 40 CFR 52.39(d) or (e) or that is established in a SIP revision approved by the Administrator under 40 CFR 52.39(f)), as a means of mitigating interstate transport of fine particulates and SO_2.

Cross State Air Pollution Rule (CSAPR) SO_2 Group 2 Trading Program. A multi-state SO_2 air pollution control and emission reduction program established in accordance with subpart DDDDD of 40 CFR Part 97 and 40 CFR 52.39(a), (c), and (g) through (k) of this chapter (including such a program that is revised in a SIP revision approved by the Administrator under 40 CFR 52.39(g) or (h) of this chapter or that is established in a SIP revision approved by the Administrator under 40 CFR 52.39(i) of this chapter), as a means of mitigating interstate transport of fine particulates and SO_2.

Eligible biomass. Eligible biomass includes sustainably harvested woody and herbaceous fuel sources that are available on a renewable or recurring basis (excluding old-growth timber), including dedicated energy crops and trees, agricultural food and feed crop residues, aquatic plants, unadulterated wood and wood residues, animal wastes, other clean organic wastes not mixed with other solid wastes, biogas, and other neat liquid biofuels derived from such fuel sources. Sustainably harvested will be determined by the REGULATORY AGENCY.

Excess emissions. Any tonnage of CO_2 emitted by a CO_2 budget source during a control period that exceeds the CO_2 budget emissions limitation for the source.

Excess interim emissions. Any tonnage of CO_2 emitted by a CO_2 budget source during an interim control period multiplied by 0.50 that exceeds the CO_2 budget emissions limitation for the source.

First control period adjustment for banked allowances. An adjustment applied to the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget for allocation years 2014 through 2020 to address the surplus allocation year 2009, 2010,

and 2011 allowances held in general and compliance accounts, including compliance accounts established pursuant to the CO_2 Budget Trading Program, but not including accounts opened by participating states.

Fossil fuel. Natural gas, petroleum, coal, or any form of solid, liquid, or gaseous fuel derived from such material.

Fossil fuel-fired.

(1) With regard to a unit that commenced operation prior to January 1, 2005, the combustion of fossil fuel, alone or in combination with any other fuel, where the fossil fuel combusted comprises, or is projected to comprise, more than 50 percent of the annual heat input on a Btu basis during any year.

(2) With regard to a unit that commenced or commences operation on or after January 1, 2005, the combustion of fossil fuel, alone or in combination with any other fuel, where the fossil fuel combusted comprises, or is projected to comprise, more than 5 percent of the annual heat input on a Btu basis during any year.

General account. A CO_2 Allowance Tracking System account, established under Subpart XX-6, that is not a compliance account.

Global Warming Potential (GWP). A measure of the radiative efficiency (heat-absorbing ability) of a particular gas relative to that of carbon dioxide (CO_2) after taking into account the decay rate of each gas (the amount removed from the atmosphere over a given number of years) relative to that of CO_2. Global warming potentials used in this Part are consistent with the values used in the Intergovernmental Panel on Climate Change, Fifth Assessment Report.

Gross generation. The electrical output (in MWe) at the terminals of the generator.

Interim control period. An interim control period is a one-calendar-year time period, during each of the first and second calendar years of each three year control period. The first interim control period starts on January 1, 2015 and ends on December 31, 2015, inclusive. The second interim control period starts on January 1, 2016 and ends on December 31, 2016, inclusive. Each successive three year control period will have two interim control periods, comprised of each of the first two calendar years of that control period.

Life-of-the-unit contractual arrangement. A unit participation power sales agreement under which a customer reserves, or is entitled to receive, a specified amount or percentage of nameplate capacity and/or associated energy from any specified unit pursuant to a contract:

(1) For the life of the unit;

(2) For a cumulative term of no less than 30 years, including contracts that permit an election for early termination; or

(3) For a period equal to or greater than 25 years or 70 percent of the economic useful life of the unit determined as of the time the unit is built, with option rights to purchase or release some portion of the nameplate capacity and associated energy generated by the unit at the end of the period.

Maximum potential hourly heat input. An hourly heat input used for reporting purposes when a unit lacks certified monitors to report heat input. If the unit intends to use appendix D of 40 CFR Part 75 to report heat input, this value should be calculated, in accordance with 40 CFR Part 75, using the maximum fuel flow rate and the maximum gross calorific value. If the unit intends to use a flow monitor and a diluent gas monitor, this value should be reported, in accordance with 40 CFR Part 75, using the maximum potential flow rate and either the maximum carbon dioxide concentration (in percent CO_2) or the minimum oxygen concentration (in percent O_2).

Minimum reserve price. The minimum reserve price in calendar year 2014 shall be $2.00. Each calendar year thereafter, the minimum reserve price shall be 1.025 multiplied by the minimum reserve price from the previous calendar year, rounded to the nearest whole cent.

Monitoring system. Any monitoring system that meets the requirements of Subpart XX-8, including a continuous emissions monitoring system, an excepted monitoring system, or an alternative monitoring system.

NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program adjusted budget. The NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program adjusted budget is determined in accordance with section XX-5.3 and is the annual amount of CO_2 tons available in NAME OF RELEVANT RGGI STATE for allocation in a given allocation year, in accordance with the CO_2 Budget Trading Program. CO_2 offset allowances allocated to project sponsors and CO_2 CCR allowances offered for sale at an auction are separate from and additional to CO_2 allowances allocated from the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program adjusted budget.

NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program Base Budget. The NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is specified in section XX-5.1. CO_2 offset allowances allocated to project sponsors and CO_2 CCR allowances offered for sale at an auction are separate from and additional to CO_2 allowances allocated from the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program Base Budget.

Nameplate capacity. The maximum electrical output (in MWe) that a generator can sustain over a specified period of time when not restricted by seasonal or other de-ratings as measured in accordance with the United States Department of Energy standards.

[This definition for Net-Electric Output illustrates how this could be defined and does not necessarily represent what an individual RGGI State will propose.]

Net-electric output. The amount of gross generation the generator(s) produce (including, but not limited to, output from steam turbine(s), combustion turbine(s), and gas expander(s)), as measured at the generator terminals, less the electricity used to operate the plant (i.e., auxiliary loads); such uses include fuel handling equipment, pumps, fans, pollution control equipment, other electricity needs, and transformer losses as measured at the transmission side of the step up transformer (e.g., the point of sale).

Non-CO_2 budget unit. A unit that does not meet the applicability criteria of Section XX-1.4 of this Part.

Operator. Any person who operates, controls, or supervises a CO_2 budget unit or a CO_2 budget source and shall include, but not be limited to, any holding company, utility system, or plant manager of such a unit or source.

Owner. Any of the following persons:

(1) Any holder of any portion of the legal or equitable title in a CO_2 budget unit; or

(2) Any holder of a leasehold interest in a CO_2 budget unit, other than a passive lessor, or a person who has an equitable interest through such lessor, whose rental payments are not based, either directly or indirectly, upon the revenues or income from the CO_2 budget unit; or

(3) Any purchaser of power from a CO_2 budget unit under a life-of-the-unit contractual arrangement in which the purchaser controls the dispatch of the unit; or

(4) With respect to any general account, any person who has an ownership interest with respect to the CO_2 allowances held in the general account and who is subject to the binding agreement for the CO_2 authorized

account representative to represent that person's ownership interest with respect to the CO_2 allowances.

Participating state. A state that has established a corresponding regulation as part of the CO_2 Budget Trading Program.

Receive or *receipt of*. When referring to the REGULATORY AGENCY or its agent, to come into possession of a document, information, or correspondence (whether sent in writing or by authorized electronic transmission), as indicated in an official correspondence log, or by a notation made on the document, information, or correspondence, by the REGULATORY AGENCY or its agent in the regular course of business.

Recordation, record, or *recorded*. With regard to CO_2 allowances, the movement of CO_2 allowances by the REGULATORY AGENCY or its agent from one CO_2 Allowance Tracking System account to another, for purposes of allocation, transfer, or deduction.

Reserve price. The minimum acceptable price for each CO_2 allowance in a specific auction. The reserve price at an auction is either the minimum reserve price or the CCR trigger price, as specified in Subpart XX-9.

Second control period adjustment for banked allowances. An adjustment applied to the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget for allocation years 2015 through 2020 to address the allocation year 2012 and 2013 allowances held in general and compliance accounts, including compliance accounts established pursuant to the CO_2 Budget Trading Program, but not including accounts opened by participating states, that are in addition to the aggregate quantity of 2012 and 2013 emissions from all CO_2 budget sources in all of the participating states.

Serial number. When referring to CO_2 allowances, the unique identification number assigned to each CO_2 allowance by the REGULATORY AGENCY or its agent under

section XX-6.4(c).

Source. Any governmental, institutional, commercial, or industrial structure, installation, plant, building, or facility that emits or has the potential to emit any air pollutant. A source, including a source with multiple units, shall be considered a single facility.

State. A State, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, and American Samoa and includes the Commonwealth of the Northern Mariana Islands.

Submit or *serve*. To send or transmit a document, information, or correspondence to the person specified in accordance with the applicable regulation:

(1) In person;

(2) By United States Postal Service;

(3) By other means of dispatch or transmission and delivery.

Compliance with any "submission," "service," or "mailing" deadline shall be determined by the date of dispatch, transmission, or mailing and not the date of receipt.

Third adjustment for banked allowances. An adjustment applied to the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget for allocation years 2021 through 2025 to address allowances held in general and compliance accounts, including compliance accounts established pursuant to the CO_2 Budget Trading Program, but not including accounts opened by participating states, that are in addition to the aggregate quantity of emissions from all CO_2 budget sources in all of the participating states at the end of the fourth control period in 2020 and as reflected in the CO_2 Allowance Tracking System on March 15, 2021.

Ton or *tonnage.* Any "short ton", or 2,000 pounds. For the purpose of determining compliance with the CO_2 requirements of XX-1.5(c), total tons for a control period and each interim control period shall be calculated as the sum of all recorded hourly emissions (or the tonnage equivalent of the recorded hourly emissions rates) in

accordance with Subpart XX-8, with any remaining fraction of a ton equal to or greater than 0.50 ton deemed to equal one ton and any fraction of a ton less than 0.50 ton deemed to equal zero tons. A short ton is equal to 0.9072 metric tons.

Undistributed CO_2 allowances. CO_2 allowances originally allocated to a set aside account as pursuant to XX-5.3 that were not distributed.

Unit. A fossil fuel-fired stationary boiler, combustion turbine, or combined cycle system.

Unit operating day. A calendar day in which a unit combusts any fuel.

Unsold CO_2 allowances. CO_2 allowances that have been made available for sale in an auction conducted by the REGULATORY AGENCY or its agent, but not sold.

Voluntary renewable energy purchase. A purchase of electricity from renewable energy generation or renewable energy attribute credits by a retail electricity customer on a voluntary basis. Renewable energy includes electricity generated from biomass, wind, solar thermal, photovoltaic, geothermal, hydroelectric facilities certified by the Low Impact Hydropower Institute, wave and tidal action, and fuel cells powered by renewable fuels. The renewable energy generation or renewable energy attribute credits related to such purchases may not be used by the generator or purchaser to meet any regulatory mandate, such as a renewable portfolio standard.

[The above subdivision is an optional definition that complements the optional voluntary renewable energy market set-aside provision at XX-5.3(d).]

XX-1.3 Measurements, abbreviations and acronyms.

Measurements, abbreviations, and acronyms used in this Part are defined as follows:

(1) CO_2: carbon dioxide.

(2) hr: hour.

(3) lb: pounds.

(4) MMBtu: one million British thermal units

(5) MW: megawatt

(6) MWe: megawatt electrical.

(7) MWh: megawatt hours

XX-1.4 Applicability.

(a) *Units.* Any unit that, at any time on or after January 1, 2005, serves an electricity generator with a nameplate capacity equal to or greater than 25 MWe shall be a CO_2 budget unit, and any source that includes one or more such units shall be a CO_2 budget source, subject to the requirements of this Part.

[The following subdivision is optional. The text of this subdivision illustrates how a participating state might provide for an exemption for units with electrical output to the electric grid restricted by permit conditions. Upon exemption, the tons attributable to sources in a state's initial inventory shall be removed the state's budget under Section XX-5.3.]

(b) *Limited exemption for units with electrical output to the electric grid restricted by permit conditions*.

(1) *Applicability*. Notwithstanding subdivision (a) of this section, a unit under subdivision (a) of this section that has a permit containing a condition restricting the supply of the unit's annual electrical output to the electric grid to less than or equal to 10 percent of the annual gross generation of the unit, and which complies with the provisions in paragraph (b)(3) of this section, shall be exempt from the requirements of this Part, except for the provisions of this section, section XX-1.2, section XX-1.3, section XX-1.6 and, if applicable because of the allocation of CO_2 allowances during the pre-exemption time period, Subparts XX-5, XX-6 and XX-7.

(2) *Effective date*. The exemption under paragraph (b)(1) of this section shall

become effective as of the January 1 that is on or after the date on which the restriction on the percentage of annual gross generation that may be supplied to the electric grid and the provisions in the permit required under paragraph (b)(1) of this section become final.

(3) *Compliance.*

(i) A unit exempt under paragraph (b)(1) of this section shall comply with the restriction on percentage of annual gross generation that may be supplied to the electric grid described in paragraph (b)(1) of this section.

(ii) A unit exempt under paragraph (b)(1) shall report to the REGULATORY AGENCY the amount of annual gross generation and the amount of annual gross generation supplied to the electric grid during the year by the following February 1.

(iii) For a period of 10 years from the date the records are created, the owners and operators of a unit exempt under paragraph (b)(1) of this section shall retain, at the source that includes the unit, records demonstrating that the conditions of the permit under paragraph (b)(1) of this section were met. The 10-year period for keeping records may be extended for cause, at any time prior to the end of the period, in writing by the REGULATORY AGENCY. The owners and operators bear the burden of proof that the unit met the restriction on the percentage of annual gross generation that may be supplied to the electric grid.

(iv) The owners and operators and, to the extent applicable, the CO_2 authorized account representative of a unit exempt under paragraph (b)(1) of this section shall comply with all the requirements of this Part concerning all time periods for which the exemption is not in effect, even if such requirements arise, or must be complied with, after the exemption takes effect.

(v) On the earlier of the following dates, a unit exempt under paragraph (b)(1) of this section shall lose its exemption:

(a) The date on which the restriction on the percentage of annual gross generation that may be supplied to the electric grid described in paragraph (b)(1) of this section is removed from the unit's permit or otherwise becomes no longer applicable in any year that commences on or after January 1, 2009; or

(b) The first date on which the unit fails to comply, or on which the owners and operators fail to meet their burden of proving that the unit is complying, with the restriction on the percentage of annual gross generation that may be supplied to the electric grid described in paragraph (b)(1) of this section during any year that commences on or after January 1, 2009.

(vi) A unit that loses its exemption in accordance with subparagraph (b)(3)(v) of this section shall be subject to the requirements of this Part. For the purpose of applying permitting requirements under Subpart XX-3, allocating allowances under Subpart XX-5, and applying monitoring requirements under Subpart XX-8, the unit shall be treated as commencing operation on the date the unit loses its exemption.

(4) *Deduction of tons from NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program limited industrial exemption set-aside account*. In the event that the REGULATORY AGENCY grants an exemption under this subdivision to a CO_2 source, with one or more units that on January 1, 2005, serves an electricity generator with a nameplate capacity equal to or greater than 25 MWe, the REGULATORY AGENCY shall retire for each subsequent allocation year the number of CO_2 tons equal to the exempt

source's average annual emissions over the most recent three calendar years for which data are available. The retired tons shall be taken from the set-aside established for such purpose under section XX-5.3.

XX-1.5 Standard requirements.

(a) *Permit requirements*. **[Each state's text for this subdivision will likely be different because the states have unique permitting requirements. The text below illustrates how this subdivision could be drafted and does not necessarily represent what an individual RGGI state will propose.]**

(1) The CO_2 authorized account representative of each CO_2 budget source required to have an operating permit pursuant to **[Insert Reference to state's Permitting Regulation(s)]** of this Title and each CO_2 budget unit required to have an operating permit pursuant to **[Insert Reference to state's Permitting Regulation(s)]** of this Title shall:

(i) Submit to the REGULATORY AGENCY a complete CO_2 budget permit application under section XX-3.3 in accordance with the deadlines specified in section XX-3.2; and

(ii) Submit in a timely manner any supplemental information that the REGULATORY AGENCY determines is necessary in order to review the CO_2 budget permit application and issue or deny a CO_2 budget permit.

(2) The owners and operators of each CO_2 budget source required to have an operating permit pursuant to **[Insert Reference to state's Permitting Regulation(s)]** of this Title and each CO_2 budget unit required to have an operating permit pursuant to **[Insert Reference to state's Permitting Regulation(s)]** of this Title for the source shall have a CO_2 budget permit and operate the CO_2 budget source and the CO_2 budget unit at the source in compliance with such CO_2 budget permit.

(b) *Monitoring requirements*.

(1) The owners and operators and, to the extent applicable, the CO_2 authorized account representative of each CO_2 budget source and each CO_2 budget unit at the source shall comply with the monitoring requirements of Subpart XX-8.

(2) The emissions measurements recorded and reported in accordance with Subpart XX-8 shall be used to determine compliance by the unit with the CO_2 requirements under subdivision (c) of this section.

(c) *CO_2 requirements*.

(1) The owners and operators of each CO_2 budget source and each CO_2 budget unit at the source shall hold CO_2 allowances available for compliance deductions under section XX-6.5, as of the CO_2 allowance transfer deadline, in the source's compliance account in an amount not less than the total CO_2 emissions for the control period from all CO_2 budget units at the source, less the CO_2 allowances deducted to meet the requirements of paragraph XX-1.5(c)(2), with respect to the previous two interim control periods, as determined in accordance with Subparts XX-6 and XX-8.

(2) The owners and operators of each CO_2 budget source and each CO_2 budget unit at the source shall hold CO_2 allowances available for compliance deductions under section XX-6.5, as of the CO_2 allowance transfer deadline, in the source's compliance account in an amount not less than the total CO_2 emissions for the interim control period from all CO_2 budget units at the source multiplied by 0.50, as determined in accordance with Subparts XX-6 and XX-8.

(3) Each ton of CO_2 emitted in excess of the CO_2 budget emissions limitation for a control period shall constitute a separate violation of this Part and applicable federal and state law.

(4) Each ton of excess interim emissions shall constitute a separate violation of this Part and applicable state law.

(5) A CO_2 budget unit shall be subject to the requirements under paragraph (c)(1) of this section starting on the later, of January 1, 2009 or the date on which the unit commences operation.

(6) CO_2 allowances shall be held in, deducted from, or transferred among CO_2 Allowance Tracking System accounts in accordance with Subparts XX-5, XX-6, and XX-7, and section XX-10.7.

(7) A CO_2 allowance shall not be deducted, in order to comply with the requirements under paragraph (c)(1) or (2) of this section, for a control period or interim control period that ends prior to the year for which the CO_2 allowance was allocated. A CO_2 offset allowance shall not be deducted, in order to comply with the requirements under paragraph (c)(1) or (2) of this section, beyond the applicable percent limitations set out in paragraph XX-6.5(a)(3).

(8) A CO_2 allowance under the CO_2 Budget Trading Program is a limited authorization by the REGULATORY AGENCY or a participating state to emit one ton of CO_2 in accordance with the CO_2 Budget Trading Program. No provision of the CO_2 Budget Trading Program, the CO_2 budget permit application, or the CO_2 budget permit or any provision of law shall be construed to limit the authority of the REGULATORY AGENCY or a participating state to terminate or limit such authorization.

(9) A CO_2 allowance under the CO_2 Budget Trading Program does not constitute a property right.

(d) *Excess emissions requirements*. The owners and operators of a CO_2 budget source that has excess emissions in any control period, or excess interim emissions for any interim control period, shall:

(1) Forfeit the CO_2 allowances required for deduction under paragraph XX-

6.5(d)(1), provided CO_2 offset allowances may not be used to cover any part of such excess emissions; and

(2) Pay any fine, penalty, or assessment or comply with any other remedy imposed under paragraph XX-6.5(d)(2).

(e) *Recordkeeping and reporting requirements.*

(1) Unless otherwise provided, the owners and operators of the CO_2 budget source and each CO_2 budget unit at the source shall keep on site at the source each of the following documents for a period of 10 years from the date the document is created. This period may be extended for cause, at any time prior to the end of 10 years, in writing by the REGULATORY AGENCY.

(i) The account certificate of representation for the CO_2 authorized account representative for the source and each CO_2 budget unit at the source and all documents that demonstrate the truth of the statements in the account certificate of representation, in accordance with section XX-2.4, provided that the certificate and documents shall be retained on site at the source beyond such 10-year period until such documents are superseded because of the submission of a new account certificate of representation changing the CO_2 authorized account representative.

(ii) All emissions monitoring information, in accordance with Subpart XX-8 and 40 CFR 75.57.

(iii) Copies of all reports, compliance certifications, and other submissions and all records made or required under the CO_2 Budget Trading Program.

(iv) Copies of all documents used to complete a CO_2 budget permit application and any other submission under the CO_2 Budget Trading Program or to demonstrate compliance with the

requirements of the CO_2 Budget Trading Program.

(2) The CO_2 authorized account representative of a CO_2 budget source and each CO_2 budget unit at the source shall submit the reports and compliance certifications required under the CO_2 Budget Trading Program, including those under Subpart XX-4.

(f) *Liability*.

(1) No permit revision shall excuse any violation of the requirements of the CO_2 Budget Trading Program that occurs prior to the date that the revision takes effect.

(2) Any provision of the CO_2 Budget Trading Program that applies to a CO_2 budget source (including a provision applicable to the CO_2 authorized account representative of a CO_2 budget source) shall also apply to the owners and operators of such source and of the CO_2 budget units at the source.

(3) Any provision of the CO_2 Budget Trading Program that applies to a CO_2 budget unit (including a provision applicable to the CO_2 authorized account representative of a CO_2 budget unit) shall also apply to the owners and operators of such unit.

(g) *Effect on other authorities*. No provision of the CO_2 Budget Trading Program, a CO_2 budget permit application, or a CO_2 budget permit, shall be construed as exempting or excluding the owners and operators and, to the extent applicable, the CO_2 authorized account representative of the CO_2 budget source or CO_2 budget unit from compliance with any other provisions of applicable State and federal law regulations.

XX-1.6 Computation of time.

(a) Unless otherwise stated, any time period scheduled, under the CO_2 Budget Trading Program, to begin on the occurrence of an act or event shall begin on the day

the act or event occurs.

(b) Unless otherwise stated, any time period scheduled, under the CO_2 Budget Trading Program, to begin before the occurrence of an act or event shall be computed so that the period ends the day before the act or event occurs.

(c) Unless otherwise stated, if the final day of any time period, under the CO_2 Budget Trading Program, falls on a weekend or a State or Federal holiday, the time period shall be extended to the next business day.

XX-1.7 Severability.

If any provision of this Part, or its application to any particular person or circumstances, is held invalid, the remainder of this Part, and the application thereof to other persons or circumstances, shall not be affected thereby.

Subpart XX-2 CO_2 Authorized Account Representative for CO_2 Budget Sources

XX-2.1 Authorization and responsibilities of the CO_2 authorized account representative.

(a) Except as provided under section XX-2.2, each CO_2 budget source, including all CO_2 budget units at the source, shall have one and only one CO_2 authorized account representative, with regard to all matters under the CO_2 Budget Trading Program concerning the source or any CO_2 budget unit at the source.

(b) The CO_2 authorized account representative of the CO_2 budget source shall be selected by an agreement binding on the owners and operators of the source and all CO_2 budget units at the source and must act in accordance with the certificate of representation under section XX-2.4.

(c) Upon receipt by the REGULATORY AGENCY or its agent of a complete account certificate of representation under section XX-2.4, the CO_2 authorized account representative of the source shall represent and, by his or her representations, actions, inactions, or submissions, legally bind each owner and operator of the CO_2 budget source represented and each CO_2 budget unit at the source in all matters pertaining to the CO_2 Budget Trading Program, notwithstanding any agreement between the CO_2 authorized account representative and such owners and operators. The owners and operators shall be bound by any decision or order issued to the CO_2 authorized account representative by the REGULATORY AGENCY or a court regarding the source or unit.

(d) No CO_2 budget permit shall be issued, and no CO_2 Allowance Tracking System account shall be established for a CO_2 budget source, until the REGULATORY AGENCY or its agent has received a complete account certificate of representation under section XX-2.4 for a CO_2 authorized account representative of the source and the CO_2 budget units at the source. Each submission under the CO_2 Budget Trading Program shall be submitted, signed, and certified by the CO_2 authorized account representative for each CO_2 budget source on behalf of which the submission is made.

(e) Each such submission shall include the following certification statement by the CO_2 authorized account representative:
"I am authorized to make this submission on behalf of the owners and Operators of the CO_2 budget sources or CO_2 budget units for which the submission is made. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

(f) The REGULATORY AGENCY or its agent will accept or act on a submission made on behalf of owners or operators of a CO_2 budget source or a CO_2 budget unit only if the submission has been made, signed, and certified in accordance with subdivision (e) of this section.

XX-2.2 CO_2 authorized alternate account representative.

(a) An account certificate of representation may designate one and only one CO_2 authorized alternate account representative who may act on behalf of the CO_2 authorized account representative. The agreement by which the CO_2 authorized alternate account representative is selected shall include a procedure for authorizing the CO_2 authorized alternate account representative to act in lieu of the CO_2 authorized account representative.

(b) Upon receipt by the REGULATORY AGENCY or its agent of a complete account certificate of representation under section XX-2.4, any representation, action, inaction, or submission by the CO_2 authorized alternate account representative shall be deemed to be a representation, action, inaction, or submission by the CO_2 authorized account representative.

(c) Except in this section and subdivision XX-2.1(a), section XX-2.3, section XX-2.4, and section XX-6.2, whenever the term "CO_2 authorized account representative" is used in this Part, the term shall be construed to include the CO_2 authorized alternate account representative.

XX-2.3 Changing the CO_2 authorized account representatives and the CO_2 authorized alternate account representative; changes in the owner and operators.

(a) *Changing the CO_2 authorized account representative*. The CO_2 authorized account representative may be changed at any time upon receipt by the REGULATORY AGENCY or its agent of a superseding complete account certificate of representation

under section XX-2.4. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CO_2 authorized account representative or CO_2 authorized alternate account representative prior to the time and date when the REGULATORY AGENCY or its agent receives the superseding account certificate of representation shall be binding on the new CO_2 authorized account representative and the owners and operators of the CO_2 budget source and the CO_2 budget units at the source.

(b) *Changing the CO_2 authorized alternate account representative*. The CO_2 authorized alternate account representative may be changed at any time upon receipt by the REGULATORY AGENCY or its agent of a superseding complete account certificate of representation under section XX-2.4. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous or CO_2 authorized alternate account representative or CO_2 authorized alternate account representative prior to the time and date when the REGULATORY AGENCY or its agent receives the superseding account certificate of representation shall be binding on the new CO_2 authorized alternate account representative and the owners and operators of the CO_2 budget source and the CO_2 budget units at the source.

(c) *Changes in the owners and operators*.

(1) In the event a new owner or operator of a CO_2 budget source or a CO_2 budget unit is not included in the list of owners and operators submitted in the account certificate of representation, such new owner or operator shall be deemed to be subject to and bound by the account certificate of representation, the representations, actions, inactions, and submissions of the CO_2 authorized account representative and any CO_2 authorized alternate account representative of the source or unit, and the decisions, orders, actions, and inactions of the REGULATORY AGENCY, as if the new owner or operator were included in such list.

(2) Within 30 days following any change in the owners and operators of a CO_2 budget source or a CO_2 budget unit, including the addition of a new owner or operator, the CO_2 authorized account representative or CO_2 authorized alternate account representative shall submit a revision to the account certificate of representation amending the list of owners and operators to include the change.

XX-2.4 Account certificate of representation.

(a) A complete account certificate of representation for a CO_2 authorized account representative or a CO_2 authorized alternate account representative shall include the following elements in a format prescribed by the REGULATORY AGENCY or its agent:

(1) Identification of the CO_2 budget source and each CO_2 budget unit at the source for which the account certificate of representation is submitted;

(2) The name, address, e-mail address, and telephone number of the CO_2 authorized account representative and any CO_2 authorized alternate account representative;

(3) A list of the owners and operators of the CO_2 budget source and of each CO_2 budget unit at the source;

(4) The following certification statement by the CO_2 authorized account representative and any CO_2 authorized alternate account representative: *"I certify that I was selected as the CO_2 authorized account representative or CO_2 authorized alternate account representative, as applicable, by an agreement binding on the owners and operators of the CO_2 budget source and each CO_2 budget unit at the source. I certify that I have all the necessary authority to carry out my duties and responsibilities under the CO_2 Budget Trading Program on behalf of the owners and operators of the CO_2 budget source and of each CO_2 budget unit at the source and that each such owner and operator shall be fully bound by my representations,*

actions, inactions, or submissions and by any decision or order issued to me by the REGULATORY AGENCY or a court regarding the source or unit."; and

(5) The signature of the CO_2 authorized account representative and any CO_2 authorized alternate account representative and the dates signed.

(b) Unless otherwise required by the REGULATORY AGENCY or its agent, documents of agreement referred to in the account certificate of representation shall not be submitted to the REGULATORY AGENCY or its agent. Neither the REGULATORY AGENCY nor its agent shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

XX-2.5 Objections concerning the CO_2 authorized account representative.

(a) Once a complete account certificate of representation under section XX-2.4 has been submitted and received, the REGULATORY AGENCY and its agent will rely on the account certificate of representation unless and until the REGULATORY AGENCY or its agent receives a superseding complete account certificate of representation under section XX-2.4.

(b) Except as provided in subdivision XX-2.3(a) or (b), no objection or other communication submitted to the REGULATORY AGENCY or its agent concerning the authorization, or any representation, action, inaction, or submission of the CO_2 authorized account representative shall affect any representation, action, inaction, or submission of the CO_2 authorized account representative or the finality of any decision or order by the REGULATORY AGENCY or its agent under the CO_2 Budget Trading Program.

(c) Neither the REGULATORY AGENCY nor its agent will adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of any CO_2 authorized account representative, including private legal

disputes concerning the proceeds of CO_2 allowance transfers.

XX-2.6 Delegation by CO_2 authorized account representative and CO_2 authorized alternate account representative.

(a) A CO_2 authorized account representative may delegate, to one or more natural persons, his or her authority to make an electronic submission to the REGULATORY AGENCY or its agent under this Part.

(b) A CO_2 authorized alternate account representative may delegate, to one or more natural persons, his or her authority to make an electronic submission to the REGULATORY AGENCY or its agent under this part.

(c) In order to delegate authority to make an electronic submission to the REGULATORY AGENCY or its agent in accordance with subdivision (a) and (b) of this section, the CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, must submit to the REGULATORY AGENCY or its agent a notice of delegation, in a format prescribed by the REGULATORY AGENCY that includes the following elements:

(1) The name, address, e-mail address, and telephone number of such CO_2 authorized account representative or CO_2 authorized alternate account representative;

(2) The name, address, e-mail address, and telephone number of each such natural person, herein referred to as the “electronic submission agent”;

(3) For each such natural person, a list of the type of electronic submissions under subdivision (a) or (b) of this section for which authority is delegated to him or her; and

(4) The following certification statements by such CO_2 authorized account representative or CO_2 authorized alternate account representative:

(i) *“I agree that any electronic submission to the REGULATORY AGENCY or its agent that is by a natural person identified in this*

notice of delegation and of a type listed for such electronic submission agent in this notice of delegation and that is made when I am a CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, and before this notice of delegation is superseded by another notice of delegation under subdivision XX-2.6(d) shall be deemed to be an electronic submission by me."

(ii) "*Until this notice of delegation is superseded by another notice of delegation under subdivision XX-2.6(d), I agree to maintain an e-mail account and to notify the REGULATORY AGENCY or its agent immediately of any change in my e-mail address unless all delegation authority by me under section XX-2.6 is terminated."*

(d) A notice of delegation submitted under subdivision (c) of this section shall be effective, with regard to the CO_2 authorized account representative or CO_2 authorized alternate account representative identified in such notice, upon receipt of such notice by the REGULATORY AGENCY or its agent and until receipt by the REGULATORY AGENCY or its agent of a superseding notice of delegation by such CO_2 authorized account representative or CO_2 authorized alternate account representative as appropriate. The superseding notice of delegation may replace any previously identified electronic submission agent, add a new electronic submission agent, or eliminate entirely any delegation of authority.

(e) Any electronic submission covered by the certification in subparagraph (c)(4)(i) of this section and made in accordance with a notice of delegation effective under subdivision (d) of this section shall be deemed to be an electronic submission by the CO_2 authorized account representative or CO_2 authorized alternate account representative submitting such notice of delegation.

(f) A CO_2 authorized account representative may delegate, to one or more natural

persons, his or her authority to review information in the CO_2 allowance tracking system under this part.

(g) A CO_2 authorized alternate account representative may delegate, to one or more natural persons, his or her authority to review information in the CO_2 allowance tracking system under this part.

(h) In order to delegate authority to review information in the CO_2 allowance tracking system in accordance with subdivision (f) and (g) of this section, the CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, must submit to the REGULATORY AGENCY or its agent a notice of delegation, in a format prescribed by the REGULATORY AGENCY that includes the following elements:

(1) The name, address, e-mail address, and telephone number of such CO_2 authorized account representative or CO_2 authorized alternate account representative;

(2) The name, address, e-mail address, and telephone number of each such natural person, herein referred to as the "reviewer";

(3) For each such natural person, a list of the type of information under subdivision (f) or (g) of this section for which authority is delegated to him or her; and

(4) The following certification statements by such CO_2 authorized account representative or CO_2 authorized alternate account representative:

(i) *"I agree that any information that is reviewed by a natural person identified in this notice of delegation and of a type listed for such information accessible by the reviewer in this notice of delegation and that is made when I am a CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, and before this notice of delegation is superseded by another notice of delegation under subdivision XX-2.6(i) shall be*

deemed to be a reviewer by me."

(ii) "*Until this notice of delegation is superseded by another notice of delegation under subdivision XX-2.6(i), I agree to maintain an e-mail account and to notify the REGULATORY AGENCY or its agent immediately of any change in my e-mail address unless all delegation authority by me under section XX-2.6 is terminated."*

(i) A notice of delegation submitted under subdivision (h) of this section shall be effective, with regard to the CO_2 authorized account representative or CO_2 authorized alternate account representative identified in such notice, upon receipt of such notice by the REGULATORY AGENCY or its agent and until receipt by the REGULATORY AGENCY or its agent of a superseding notice of delegation by such CO_2 authorized account representative or CO_2 authorized alternate account representative as appropriate. The superseding notice of delegation may replace any previously identified reviewer, add a new reviewer, or eliminate entirely any delegation of authority.

Subpart XX-3 Permits

[Each state's text for this Subpart will likely be different because states have unique permitting requirements. The text below illustrates how this Subpart could be drafted and does not necessarily represent what an individual RGGI state will propose.]

XX-3.1 CO_2 budget permit requirements.

(a) Each CO_2 budget source must have a permit issued by the REGULATORY AGENCY pursuant to **[Insert Reference to State's Permitting Regulation(s)]** of this Title.

(b) Each CO_2 budget permit shall contain all applicable CO_2 Budget Trading Program requirements and shall be a complete and distinguishable portion of the permit

under subdivision (a) of this section.

XX-3.2 Submission of CO_2 budget permit applications.

For any CO_2 budget source, the CO_2 authorized account representative shall submit a complete CO_2 budget permit application under section XX-3.3 covering such CO_2 budget source to the REGULATORY AGENCY by the later of January 1, 2009 or 12 months before the date on which the CO_2 budget source, or a new unit at the source, commences operation.

XX-3.3 Information requirements for CO_2 budget permit applications.

(a) A complete CO_2 budget permit application shall include the following elements concerning the CO_2 budget source for which the application is submitted, in a format prescribed by the REGULATORY AGENCY:

(1) Identification of the CO_2 budget source, including plant name and the ORIS (Office of Regulatory Information Systems) or facility code assigned to the source by the Energy Information Administration of the United States Department of Energy, if applicable;

(2) Identification of each CO_2 budget unit at the CO_2 budget source; and

(3) The standard requirements under section XX-1.5.

Subpart XX-4 Compliance Certification

XX-4.1 Compliance certification report.

(a) *Applicability and deadline*. For each control period in which a CO_2 budget source is subject to the CO_2 requirements of XX-1.5(c), the CO_2 authorized account representative of the source shall submit to the REGULATORY AGENCY by the March 1 following the relevant control period, a compliance certification report. A compliance certification report is not required as part of the compliance obligation during an interim

control period.

(b) *Contents of report*. The CO_2 authorized account representative shall include in the compliance certification report under subdivision (a) of this section the following elements, in a format prescribed by the REGULATORY AGENCY:

(1) Identification of the source and each CO_2 budget unit at the source;

(2) At the CO_2 authorized account representative's option, the serial numbers of the CO_2 allowances that are to be deducted from the source's compliance account under section XX-6.5 for the control period, including the serial numbers of any CO_2 offset allowances that are to be deducted subject to the limitations of paragraph XX-6.5(a)(3); and

(3) The compliance certification under subdivision (c) of this section.

(c) *Compliance certification*. In the compliance certification report under subdivision (a) of this section, the CO_2 authorized account representative shall certify, based on reasonable inquiry of those persons with primary responsibility for operating the source and the CO_2 budget units at the source in compliance with the CO_2 Budget Trading Program, whether the source and each CO_2 budget unit at the source for which the compliance certification is submitted was operated during the calendar years covered by the report in compliance with the requirements of the CO_2 Budget Trading Program , including:

(1) Whether the source was operated in compliance with the CO_2 requirements of XX-1.5(c);

(2) Whether the monitoring plan applicable to each unit at the source has been maintained to reflect the actual operation and monitoring of the unit, and contains all information necessary to attribute CO_2 emissions to the unit, in accordance with Subpart XX-8;

(3) Whether all the CO_2 emissions from the units at the source were monitored or accounted for through the missing data procedures and

reported in the quarterly monitoring reports, including whether conditional data were reported in the quarterly reports in accordance with Subpart XX-8. If conditional data were reported, the owner or operator shall indicate whether the status of all conditional data has been resolved and all necessary quarterly report resubmissions have been made;

(4) Whether the facts that form the basis for certification under Subpart XX-8 of each monitor at each unit at the source, or for using an excepted monitoring method or alternative monitoring method approved under Subpart XX-8, if any, have changed; and

(5) If a change is required to be reported under paragraph (c)(4) of this section, specify the nature of the change, the reason for the change, when the change occurred, and how the unit's compliance status was determined subsequent to the change, including what method was used to determine emissions when a change mandated the need for monitor recertification.

XX-4.2 REGULATORY AGENCY's action on compliance certifications.

(a) The REGULATORY AGENCY or its agent may review and conduct independent audits concerning any compliance certification or any other submission under the CO_2 Budget Trading Program and make appropriate adjustments of the information in the compliance certifications or other submissions.

(b) The REGULATORY AGENCY or its agent may deduct CO_2 allowances from or transfer CO_2 allowances to a source's compliance account based on the information in the compliance certifications or other submissions, as adjusted under subdivision (a) of this section.

Subpart XX-5 CO_2 Allowance Allocations

XX-5.1 NAME OF RELEVANT RGGI STATE CO_2 trading program base budget.

(a) For 2018, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(b) For 2019, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(c) For 2020, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(d) For 2021, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(e) For 2022, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(f) For 2023, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(g) For 2024, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(h) For 2025, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(i) For 2026, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(j) For 2027, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading

Program base budget is___tons.

(k) For 2028, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(l) For 2029, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

(m) For 2030 and each succeeding calendar year, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget is___tons.

[…or as established in a future program adjustment.]

XX-5.2 Undistributed and unsold CO_2 allowances

(a) REGULATORY AGENCY may retire undistributed CO_2 allowances at the end of each control period.

(b) REGULATORY AGENCY may retire unsold CO_2 allowances at the end of each control period.

XX-5.3 CO_2 allowance allocations.

(a) *General allocations*. **[Allocation provisions will vary from state to state, provided at least 25% of the allocations will go to a consumer benefit or strategic energy purpose.]**

(b) *Consumer benefit or strategic energy purpose allocation.* The REGULATORY AGENCY will allocate a minimum of twenty-five percent of the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget to the consumer benefit or strategic energy purpose set-aside account.

[The reference to the consumer benefit or strategic energy purpose account

illustrates how this account could be labeled and does not necessarily represent what an individual RGGI state will propose.]

(c) *CO_2 Allowances available for allocation*. For the allocation year 2018 and each succeeding calendar year, the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program adjusted budget shall be the maximum number of allowances available for allocation in a given allocation year, except for CO_2 offset allowances and CO_2 CCR allowances. In any year in which there is no adjusted budget, the adjusted budget shall equal the base budget.

(d) *Cost Containment Reserve (CCR) allocation*. The REGULATORY AGENCY shall allocate CO_2 CCR allowances, separate from and additional to the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget set forth in section XX-5.1, to the RELEVANT STATE AUCTION ACCOUNT. The CCR allocation is for the purpose of containing the cost of CO_2 allowances. The REGULATORY AGENCY shall allocate CO_2 CCR allowances in the following manner:

(1) The REGULATORY AGENCY shall initially allocate___CO_2 CCR allowances for calendar year 2014.

(2) On or before January 1, 2015 and each calendar year thereafter through 2020, the REGULATORY AGENCY shall allocate CO_2 CCR allowances in an amount equal to _____, minus the number of CO_2 CCR allowances that remain in the RELEVANT STATE AUCTION ACCOUNT at the end of the prior calendar year.

(3) On or before January 1, 2021 and each year thereafter, the REGULATORY AGENCY shall allocate current vintage year CCR allowances equal to the quantity in Table 3, and withdraw the number of CO_2 CCR allowances that remain in the RELEVANT STATE AUCTION ACCOUNT at the end of the prior calendar year:

Table 3. CCR allowances from 2021 forward

2021	2022	2023	2024	2024	2025	2026	2027	2028	2029	2030 and each year thereafter
TBD	TBD	TBD	TBD	TBD	TBD	TBD	TBD	TBD	TBD	TBD

(e) *Emissions Containment Reserve (ECR) Withholding*. The REGULATORY AGENCY shall convert and transfer any CO_2 allowances that have been withheld from any auction(s) into the RELEVANT STATE ECR ACCOUNT. The ECR withholding is for the purpose of additional emissions reductions in the event of lower than anticipated emissions reduction costs. The REGULATORY AGENCY shall withhold CO_2 ECR allowances in the following manner.

(1) If the condition in paragraph 9.2 (d)(1) is met at an auction, then the maximum number of CO_2 ECR allowances that will be withheld from that auction will be equal to the quantity shown in Table 4 minus the total quantity of CO_2 ECR allowances that have been withheld from any prior auction(s) in that calendar year. Any CO_2 ECR allowances withheld from an auction will be transferred into the RELEVANT STATE ECR ACCOUNT.

Table 4. ECR allowances from 2021 forward

2021	2022	2023	2024	2024	2025	2026	2027	2028	2029	2030 and each year thereafter
TBD	TBD	TBD	TBD	TBD	TBD	TBD	TBD	TBD	TBD	TBD

(2) Allowances that have been transferred into the RELEVANT STATE ECR ACCOUNT shall not be withdrawn.

(f) *First control period adjustment for banked allowances.* By January 15, 2014, the REGULATORY AGENCY shall establish the first control period adjustment for banked allowances quantity for allocation years 2014 through 2020:

Table 5. First control period adjustment for banked allowances

2014	2015	2016	2017	2018	2019	2020
Insert amount						

(g) *Second control period adjustment for banked allowances.* On March 17, 2014, the REGULATORY AGENCY shall establish the second control period adjustment for banked allowances quantity the allocation years 2015 through 2020:

Table 6. Second control period adjustment for banked allowances

2015	2016	2017	2018	2019	2020
Insert amount					

(h) *Third adjustment for banked allowances.* On March 15, 2021, the REGULATORY AGENCY shall determine the third adjustment for banked allowances quantity for allocation years 2021 through 2025 through the application of the following formula:

$$TABA = \frac{TA - TAE}{5} \times RS\%$$

Where:

TABA is the third adjustment for banked allowances quantity in tons.

TA, third adjustment, is the total quantity of allowances of vintage years prior to 2021 held in general and compliance accounts, including compliance accounts established pursuant to the CO_2 Budget Trading Program, but not including accounts opened by participating states, as reflected in the CO_2 Allowance

Tracking System on March 15, 2021.

TAE, third adjustment emissions, is the total quantity of 2018, 2019 and 2020 emissions from all CO_2 budget sources in all participating states, reported pursuant to CO_2 Budget Trading Program as reflected in the CO_2 Allowance Tracking System on March 15, 2021.

RS% is RELEVANT RGGI STATE'S 2021 budget divided by the 2021 regional budget.

(i) *CO_2 Budget Trading Program adjusted budgets for 2018 through 2020.* On April 15, 2014 the REGULATORY AGENCY shall establish the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program adjusted budgets for the 2018 through 2020 allocation years in the following table:

Table 7. CO_2 Budget Trading Program adjusted budgets

2018	2019	2020
Insert amount		

(j) *CO_2 Budget Trading Program adjusted budgets for 2021 through 2025.* On or before April 15, 2021, the REGULATORY AGENCY shall establish the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program adjusted budgets for the 2021 through 2025 allocation years by the following formula:

AB = BB – TABA

Where:

AB is the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program adjusted budget.

BB is the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program

base budget.

TABA is the third adjustment for banked allowances quantity in tons.

(k) After making the determinations in XX-5.3 (j), the REGULATORY AGENCY or its Agent will publish the CO_2 trading program adjusted budgets for the 2021 through 2025 allocation years.

[The following subdivision is an optional voluntary renewable energy market set-aside provision. It represents one way a state could implement such a set-aside.]

(l) *Voluntary renewable energy market set-aside allocation*. For each control period, the REGULATORY AGENCY shall allocate to the voluntary renewable energy market set-aside account a certain number of tons, calculated as set forth in this subdivision, from the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget set forth in section XX-5.1, as applicable. The REGULATORY AGENCY shall administer the voluntary renewable energy set-aside in accordance with this subdivision.

(1) The REGULATORY AGENCY will open and manage a general account for the voluntary renewable energy market set-aside for each control period.

(2) The number of tons that will be allocated to the voluntary renewable energy market set-aside account in a specific control period will be determined as set out in this paragraph.

(i) Any person may submit data to the REGULATORY AGENCY documenting purchases of voluntary renewable energy that meet the requirements of this subdivision by no later than the July 30 prior to the beginning of a control period. Such data must be from reputable sources, which may include retail electricity providers, organizations that certify renewable energy products, and other parties as determined by the REGULATORY AGENCY. To be considered, data must be verifiable and document the following for voluntary renewable energy purchases.

(a) Documentation of voluntary renewable energy or renewable energy attribute credit purchases by retail customers, by customer class, in the State during the most recent three-year period for which data are available.

(b) Documentation that the renewable energy or renewable energy attributes related to voluntary renewable energy or renewable energy attribute credit sales was procured by the retail provider.

(c) Time period when the retail purchase(s) was made.

(d) State where the electricity was generated or the renewable energy attribute credit was created, including documentation of facility name, unique generator identification number, and fuel type.

(e) Time period when the electricity was generated or the renewable energy attribute credit was created.

(ii) Subject to the timely receipt of adequate data pursuant to subparagraph (i) of this paragraph, and based on such data, the REGULATORY AGENCY shall project the voluntary renewable energy purchases in the State during a control period that represents renewable energy generation in one or more participating states. The megawatt-hours (MWh) of projected voluntary renewable energy purchases in a control period shall be multiplied by the marginal CO_2 emissions rate (lbs. CO_2/MWh) in the control area where the generation occurred, as determined by the REGULATORY AGENCY. If data to determine the marginal emissions rate is unavailable, the average emissions rate shall be used, as determined by the REGULATORY AGENCY.

(iii) The CO_2 tons to be allocated to the voluntary renewable energy set-aside account shall be calculated as follows:

CO_2 tons = MP x EF

Where:

CO_2 tons, rounded down to the nearest whole ton, is the number of allowances to be placed in the reserve account;

MP is the projected MWh of voluntary renewable energy purchases in the State during the future control period that meets the requirements of this subdivision; and

EF is the CO_2 emissions factor for the control area where the electricity represented by the sale was generated.

(iv) If following the end of a control period, the number of CO_2 allowances allocated to the voluntary renewable energy set-aside account is less than the number of CO_2 tons represented by the actual MWh of voluntary renewable energy purchases during the control period, the REGULATORY AGENCY will add the difference between CO_2 tons represented by actual purchases, as calculated in accordance with subparagraph (iii) of this paragraph, and CO_2 allowances held in the set-aside account to the projection for the following control period, pursuant to paragraph (2) of this subdivision. If following the end of a control period, the number of CO_2 allowances allocated to the voluntary renewable energy set-aside account is greater than the number of CO_2 tons represented by the actual MWh of voluntary renewable energy purchases during the control period, the REGULATORY AGENCY will subtract the difference between CO_2 tons represented by actual purchases, as calculated in accordance with subparagraph (iii) of this paragraph, and CO_2 allowances held in the set-aside account from the

projection for the following control period, pursuant to paragraph (2) of this subdivision. In no event shall the size of the voluntary renewable set-aside exceed_____tons.

(3) As of the December 31 that is after the end of a control period for which an allocation has been made to the voluntary renewable energy set-aside account, the REGULATORY AGENCY shall determine the actual MWh of voluntary renewable energy purchases that occurred during the control period. The REGULATORY AGENCY shall retire CO_2 allowances in the voluntary renewable energy set-aside account in an amount up to the number of tons of CO_2 represented by actual voluntary renewable energy purchases, based on actual MWh purchases and the emissions factor determined pursuant to paragraph (2) of this subdivision.

[The following subdivision is an optional limited industrial exemptions set-aside allocation provision. It represents one way a state could implement such a set-aside.]

(m) *Limited industrial exemption set-aside allocation.* The limited industrial exemption set-aside allocation will consist of_tons from the NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program base budget set forth in section XX-5.1, as applicable. For each control period, the AGENCY will determine CO_2 allowance allocations in accordance with the following procedures.

(1) The REGULATORY AGENCY will open and manage a general account for the limited exemption set-aside for each control period.

(2) As of the January 1 that is after the date that an exemption under subdivision XX-1.4(b) has been granted, for each allocation year the REGULATORY AGENCY will retire CO_2 allowances in the limited industrial exemption set-aside general account as determined pursuant to paragraph XX-1.4(b)(4).

(3) After retirement of allowances pursuant to paragraph (2) of this subdivision,

the REGULATORY AGENCY will determine whether any CO_2 allowances remain in the limited industrial exemption set-aside general account for the control period. The REGULATORY AGENCY will transfer any such remaining CO_2 allowances from the limited industrial exemption set-aside allocation general account to the compliance account of each CO_2 budget source that was allocated allowances pursuant to subdivision (a) of this section using the following methodology:

Existing CO_2 budget unit's share of the CO_2 allowances remaining in the limited industrial exemption set-aside general account = Total CO_2 allowances remaining in the limited industrial exemption set-aside general account x (The individual CO_2 budget unit's CO_2 allowance allocation determined in accordance with subdivision (a) of this section ÷ The NAME OF RELEVANT RGGI STATE CO_2 Budget Trading Program annual base budget, as applicable)

Where:

"Total CO_2 allowances remaining in the limited industrial exemption set-aside allocation general account" is the total number of CO_2 allowances remaining in the limited industrial exemption set-aside allocation general account (established under paragraph (e)(1) of this section) for the particular control period to which the limited industrial exemption set-aside allocation applies; and

"The individual CO_2 budget unit's CO_2 allowance allocation" is the number of CO_2 allowances allocated under subdivision (a) of this section to the individual CO_2 budget unit for the control period to which the limited industrial exemption set- aside allocation applies.

The REGULATORY AGENCY will only transfer CO_2 allowances in whole

ton increments. The REGULATORY AGENCY will continue to hold any fractional shares of CO_2 allowances in the name of the CO_2 budget unit as banked CO_2 allowances until they may be combined with other fractional shares of CO_2 allowances in future years and then transferred as whole ton increments.

Subpart XX-6 CO_2 Allowance Tracking System

XX-6.1 CO_2 Allowance Tracking System accounts.

(a) *Nature and function of compliance accounts*. Consistent with subdivision XX-6.2(a), the REGULATORY AGENCY or its agent will establish one compliance account for each CO_2 budget source. Allocations of CO_2 allowances pursuant to Subpart XX-5 and deductions or transfers of CO_2 allowances pursuant to sections XX-4.2, XX-6.5, XX-6.7, or Subpart XX-7 will be recorded in the compliance accounts in accordance with this Subpart.

(b) *Nature and function of general accounts*. Consistent with subdivision XX- 6.2(b), the REGULATORY AGENCY or its agent will establish, upon request, a general account for any person. Transfers of CO_2 allowances pursuant to Subpart XX-7 will be recorded in the general account in accordance with this Subpart.

XX-6.2 Establishment of accounts.

(a) *Compliance accounts*. Upon receipt of a complete account certificate of representation under section XX-2.4, the REGULATORY AGENCY or its agent will establish a compliance account for each CO_2 budget source for which the account certificate of representation was submitted.

(b) *General accounts*.

(1) *Application for general account.* Any person may apply to open a general

account for the purpose of holding and transferring CO_2 allowances. An application for a general account may designate one and only one CO_2 authorized account representative and one and only one CO_2 authorized alternate account representative who may act on behalf of the CO_2 authorized account representative. The agreement by which the CO_2 authorized alternate account representative is selected shall include a procedure for authorizing the CO_2 authorized alternate account representative to act in lieu of the CO_2 authorized account representative. A complete application for a general account shall be submitted to the REGULATORY AGENCY or its agent and shall include the following elements in a format prescribed by the REGULATORY AGENCY or its agent:

(i) Name, address, e-mail address, and telephone number of the CO_2 authorized account representative and any CO_2 authorized alternate account representative;

(ii) At the option of the CO_2 authorized account representative, organization name and type of organization;

(iii) A list of all persons subject to a binding agreement for the CO_2 authorized account representative or any CO_2 authorized alternate account representative to represent their ownership interest with respect to the CO_2 allowances held in the general account;

(iv) The following certification statement by the CO_2 authorized account representative and any CO_2 authorized alternate account representative: “I certify that I was selected as the CO_2 authorized account representative or the CO_2 authorized alternate account representative, as applicable, by an agreement that is binding on all persons who have an ownership interest with respect to CO_2 allowances held in the general account. I certify that I have all the necessary authority to carry out my duties and responsibilities under

the CO_2 Budget Trading Program on behalf of such persons and that each such person shall be fully bound by my representations, actions, inactions, or submissions and by any order or decision issued to me by the REGULATORY AGENCY or its agent or a court regarding the general account.";

(v) The signature of the CO_2 authorized account representative and any CO_2 authorized alternate account representative and the dates signed; and

(vi) Unless otherwise required by the REGULATORY AGENCY or its agent, documents of agreement referred to in the application for a general account shall not be submitted to the REGULATORY AGENCY or its agent. Neither the REGULATORY AGENCY nor its agent shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

(2) *Authorization of CO_2 authorized account representative*.

(i) Upon receipt by the REGULATORY AGENCY or its agent of a complete application for a general account under paragraph (b)(1) of this section:

(a) The REGULATORY AGENCY or its agent will establish a general account for the person or persons for whom the application is submitted.

(b) The CO_2 authorized account representative and any CO_2 authorized alternate account representative for the general account shall represent and, by his or her representations, actions, inactions, or submissions, legally bind each person who has an ownership interest with respect to CO_2 allowances held in the general account in all matters pertaining to the CO_2 Budget Trading Program, notwithstanding any agreement between the CO_2 authorized

account representative or any CO_2 authorized alternate account representative and such person. Any such person shall be bound by any order or decision issued to the CO_2 authorized account representative or any CO_2 authorized alternate account representative by the REGULATORY AGENCY or its agent or a court regarding the general account.

(c) Any representation, action, inaction, or submission by any CO_2 authorized alternate account representative shall be deemed to be a representation, action, inaction, or submission by the CO_2 authorized account representative.

(ii) Each submission concerning the general account shall be submitted, signed, and certified by the CO_2 authorized account representative or any CO_2 authorized alternate account representative for the persons having an ownership interest with respect to CO_2 allowances held in the general account. Each such submission shall include the following certification statement by the CO_2 authorized account representative or any CO_2 authorized alternate account representative:

"I am authorized to make this submission on behalf of the persons having an ownership interest with respect to the CO_2 allowances held in the general account. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting

required statements and information, including the possibility of fine or imprisonment."

(iii) The REGULATORY AGENCY or its agent will accept or act on a submission concerning the general account only if the submission has been made, signed, and certified in accordance with subparagraph (b)(2)(ii) of this section.

(3) *Changing CO_2 authorized account representative and CO_2 authorized alternate account representative; changes in persons with ownership interest*.

(i) The CO_2 authorized account representative for a general account may be changed at any time upon receipt by the REGULATORY AGENCY or its agent of a superseding complete application for a general account under paragraph (b)(1) of this section. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CO_2 authorized account representative, or the previous CO_2 authorized alternate account representative, prior to the time and date when the REGULATORY AGENCY or its agent receives the superseding application for a general account shall be binding on the new CO_2 authorized account representative and the persons with an ownership interest with respect to the CO_2 allowances in the general account.

(ii) The CO_2 authorized alternate account representative for a general account may be changed at any time upon receipt by the REGULATORY AGENCY or its agent of a superseding complete application for a general account under paragraph (b)(1) of this section. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CO_2 authorized account representative, or the previous CO_2 authorized alternate account representative, prior to the time and date when the

REGULATORY AGENCY or its agent receives the superseding application for a general account shall be binding on the new CO_2 authorized alternate account representative and the persons with an ownership interest with respect to the CO_2 allowances in the general account.

(iii) In the event a new person having an ownership interest with respect to CO_2 allowances in the general account is not included in the list of such persons in the application for a general account, such new person shall be deemed to be subject to and bound by the application for a general account, the representations, actions, inactions, and submissions of the CO_2 authorized account representative and any CO_2 authorized alternate account representative, and the decisions, orders, actions, and inactions of the REGULATORY AGENCY or its agent, as if the new person were included in such list.

(iv) Within 30 days following any change in the persons having an ownership interest with respect to CO_2 allowances in the general account, including the addition or deletion of persons, the CO_2 authorized account representative or any CO_2 authorized alternate account representative shall submit a revision to the application for a general account amending the list of persons having an ownership interest with respect to the CO_2 allowances in the general account to include the change.

(4) *Objections concerning CO_2 authorized account representative*.

(i) Once a complete application for a general account under paragraph (b)(1) of this section has been submitted and received, the REGULATORY AGENCY or its agent will rely on the application unless and until a superseding complete application for a general account under paragraph (b)(1) of this section is received by the

REGULATORY AGENCY or its agent.

(ii) Except as provided in subparagraphs (b)(3)(i) and (ii) of this section, no objection or other communication submitted to the REGULATORY AGENCY or its agent concerning the authorization, or any representation, action, inaction, or submission of the CO_2 authorized account representative or any CO_2 authorized alternate account representative for a general account shall affect any representation, action, inaction, or submission of the CO_2 authorized account representative or any CO_2 authorized alternate account representative or the finality of any decision or order by the REGULATORY AGENCY or its agent under the CO_2 Budget Trading Program.

(iii) Neither the REGULATORY AGENCY nor its agent will adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of the CO_2 authorized account representative or any CO_2 authorized alternate account representative for a general account, including private legal disputes concerning the proceeds of CO_2 allowance transfers.

(5) *Delegation by CO_2 authorized account representative and CO_2 authorized alternate account representative.*

(i) A CO_2 authorized account representative may delegate, to one or more natural persons, his or her authority to make an electronic submission to the REGULATORY AGENCY or its agent provided for under Subparts XX-6 and XX-7.

(ii) A CO_2 authorized alternate account representative may delegate, to one or more natural persons, his or her authority to make an electronic submission to the REGULATORY AGENCY or its agent provided for under Subparts XX-6 and XX-7.

(iii) In order to delegate authority to make an electronic submission to

the REGULATORY AGENCY or its agent in accordance with subparagraphs (i) and (ii) of this paragraph, the CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, must submit to the REGULATORY AGENCY or its agent a notice of delegation, in a format prescribed by the REGULATORY AGENCY that includes the following elements:

(a) The name, address, e-mail address, and telephone number of such CO_2 authorized account representative or CO_2 authorized alternate account representative;

(b) The name, address, e-mail address, and telephone number of each such natural person, herein referred to as "electronic submission agent";

(c) For each such natural person, a list of the type of electronic submissions under subdivision (a) or (b) of this section for which authority is delegated to him or her; and

(d) The following certification statements by such CO_2 authorized account representative or CO_2 authorized alternate account representative:

(1) "I agree that any electronic submission to the REGULATORY AGENCY or its agent that is by a natural person identified in this notice of delegation and of a type listed for such electronic submission agent in this notice of delegation and that is made when I am a CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, and before this notice of delegation is superseded by another notice of delegation under subparagraph XX- 6.2(b)(5)(iv) shall be deemed to be

an electronic submission by me."

(2) "Until this notice of delegation is superseded by another notice of delegation under subparagraph XX-6.2(b)(5)(iv), I agree to maintain an e-mail account and to notify the REGULATORY AGENCY or its agent immediately of any change in my e-mail address unless all delegation authority by me under paragraph XX-6.2(b)(5) is terminated."

(iv) A notice of delegation submitted under subparagraph (iii) of this paragraph shall be effective, with regard to the CO_2 authorized account representative or CO_2 authorized alternate account representative identified in such notice, upon receipt of such notice by the REGULATORY AGENCY or its agent and until receipt by the REGULATORY AGENCY or its agent of a superseding notice of delegation by such CO_2 authorized account representative or CO_2 authorized alternate account representative as appropriate. The superseding notice of delegation may replace any previously identified electronic submission agent, add a new electronic submission agent, or eliminate entirely any delegation of authority.

(v) Any electronic submission covered by the certification in sub-clause (iii)*(d)(1)* of this paragraph and made in accordance with a notice of delegation effective under subparagraph (iv) of this paragraph shall be deemed to be an electronic submission by the CO_2 authorized account representative or CO_2 authorized alternate account representative submitting such notice of delegation.

(c) *Account identification*. The REGULATORY AGENCY or its agent will assign a unique identifying number to each account established under subdivisions (a) or (b) of this section.

XX-6.3 CO_2 Allowance Tracking System responsibilities of CO_2 authorized account representative.

Following the establishment of a CO_2 Allowance Tracking System account, all submissions to the REGULATORY AGENCY or its agent pertaining to the account, including, but not limited to, submissions concerning the deduction or transfer of CO_2 allowances in the account, shall be made only by the CO_2 authorized account representative for the account.

XX-6.4 Recordation of CO_2 allowance allocations.

(a) By January 1 of each calendar year, the REGULATORY AGENCY or its agent will record in the following accounts:

(1) In each CO_2 budget source's compliance account, the CO_2 allowances allocated for CO_2 budget units at the source (if any) under subdivision XX-5.3(a); and

(2) The CO_2 allowances allocated for the consumer benefit or strategic energy purpose account under subdivision XX-5.3(b).

[Should states wish to establish other set-aside allocations (for new sources, for example), they would be referred to (at least generically) in the above subdivision.]

(b) Each year the REGULATORY AGENCY or its agent will record CO_2 allowances, as allocated to the unit under Subpart XX-5, in the compliance account for the year after the last year for which CO_2 allowances were previously allocated to the compliance account. Each year, the REGULATORY AGENCY or its agent will also record CO_2 allowances, as allocated under Subpart XX-5, in an allocation set-aside for the year after the last year for which CO_2 allowances were previously allocated to an allocation set-aside.

(c) *Serial numbers for allocated CO_2 allowances*. When allocating CO_2 allowances

to and recording them in an account, the REGULATORY AGENCY or its agent will assign each CO_2 allowance a unique identification number that will include digits identifying the year for which the CO_2 allowance is allocated.

XX-6.5 Compliance.

(a) *Allowances available for compliance deduction.* CO_2 allowances that meet the following criteria are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of XX-1.5(c) for a control period or an interim control period.

(1) The CO_2 allowances, other than CO_2 offset allowances, are of allocation years that fall within a prior control period, the same control period, or the same interim control period for which the allowances will be deducted.

(2) The CO_2 allowances are held in the CO_2 budget source's compliance account as of the CO_2 allowance transfer deadline for that control period or interim control period or are transferred into the compliance account by a CO_2 allowance transfer correctly submitted for recordation under section XX-7.1 by the CO_2 allowance transfer deadline for that control period or interim control period.

(3) For CO_2 offset allowances, the number of CO_2 offset allowances that are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of XX-1.5(c) for a control period or an interim control period may not exceed 3.3 percent of the CO_2 budget source's CO_2 emissions for that control period, or 3.3 percent of 0.50 times the CO_2 budget source's CO_2 emissions for an interim control period, as determined in accordance with Subparts XX-6 and XX-8.

(4) The CO_2 allowances are not necessary for deductions for excess emissions for a prior control period under subdivision (d) of this section.

(b) *Deductions for compliance*. Following the recordation, in accordance with section

XX-7.2, of CO_2 allowance transfers submitted for recordation in the CO_2 budget source's compliance account by the CO_2 allowance transfer deadline for a control period or interim control period, the REGULATORY AGENCY or its agent will deduct CO_2 allowances available under subdivision (a) of this section to cover the source's CO_2 emissions (as determined in accordance with Subpart XX-8) for the control period or interim control period, as follows:

(1) Until the amount of CO_2 allowances deducted equals the number of tons of total CO_2 emissions (or 0.50 times the number of tons of total CO_2 emissions for an interim control period), less any CO_2 emissions attributable to the burning of eligible biomass, determined in accordance with Subpart XX-8, from all CO_2 budget units at the CO_2 budget source for the control period or interim control period; or

(2) If there are insufficient CO_2 allowances to complete the deductions in paragraph (b)(1) of this section, until no more CO_2 allowances available under subdivision (a) of this section remain in the compliance account.

(c) *Identification of available CO_2 allowances by serial number; default compliance deductions.*

(1) The CO_2 authorized account representative for a source's compliance account may request that specific CO_2 allowances, identified by serial number, in the compliance account be deducted for emissions or excess emissions for a control period or interim control period in accordance with subdivision (b), or (d) of this section. Such identification shall be made in the compliance certification report submitted in accordance with section XX-4.1.

(2) The REGULATORY AGENCY or its agent will deduct CO_2 allowances for a control period or interim control period from the CO_2 budget source's compliance account, in the absence of an identification or in the case of a partial identification of available CO_2 allowances by serial number under

paragraph (c)(1) of this section, in the following order:

(i) First, subject to the relevant compliance deduction limitations under XX-6.5(a)(3) and (d)(1), CO_2 offset allowances. CO_2 offset allowances shall be deducted in chronological order (i.e., CO_2 offset allowances from earlier allocation years shall be deducted before CO_2 offset allowances from later allocation years). In the event that some, but not all, CO_2 offset allowances from a particular allocation year are to be deducted, CO_2 offset allowances shall be deducted by serial number, with lower serial number allowances deducted before higher serial number allowances.

(ii) Second, any CO_2 allowances, other than CO_2 offset allowances, that are available for deduction under subdivision (a) of this section. CO_2 allowances shall be deducted in chronological order (i.e., CO_2 allowances from earlier allocation years shall be deducted before CO_2 allowances from later allocation years). In the event that some, but not all, CO_2 allowances from a particular allocation year are to be deducted, CO_2 allowances shall be deducted by serial number, with lower serial number allowances deducted before higher serial number allowances.

(d) *Deductions for excess emissions.*

(1) After making the deductions for compliance under subdivision (b) of this section, the REGULATORY AGENCY or its agent will deduct from the CO_2 budget source's compliance account a number of CO_2 allowances, equal to three times the number of the source's excess emissions. In the event that a source has insufficient CO_2 allowances to cover three times the number of the source's excess emissions, the source shall be required to immediately transfer sufficient allowances into its compliance account. No CO_2 offset allowances may be deducted to account for the source's

excess emissions.

(2) Any CO_2 allowance deduction required under paragraph (d)(1) of this section shall not affect the liability of the owners and operators of the CO_2 budget source or the CO_2 units at the source for any fine, penalty, or assessment, or their obligation to comply with any other remedy, for the same violation, as ordered under applicable State law. The following guidelines will be followed in assessing fines, penalties or other obligations.

(i) For purposes of determining the number of days of violation, if a CO_2 budget source has excess emissions for a control period, each day in the control period constitutes a day in violation unless the owners and operators of the unit demonstrate that a lesser number of days should be considered.

(ii) Each ton of excess emissions is a separate violation.

(iii) For purposes of determining the number of days of violation, if a CO_2 budget source has excess interim emissions for an interim control period, each day in the interim control period constitutes a day in violation unless the owners and operators of the unit demonstrate that a lesser number of days should be considered.

(iv) Each ton of excess interim emissions is a separate violation.

(3) The propriety of the REGULATORY AGENCY's determination that a CO_2 budget source had excess emissions and the concomitant deduction of CO_2 allowances from that CO_2 budget source's account may be later challenged in the context of the initial administrative enforcement, or any civil or criminal judicial action arising from or encompassing that excess emissions violation. The commencement or pendency of any administrative enforcement, or civil or criminal judicial action arising from or encompassing that excess emissions violation will not act to prevent the REGULATORY AGENCY or its agent from initially deducting the CO_2

allowances resulting from the REGULATORY AGENCY's original determination that the relevant CO_2 budget source has had excess emissions. Should the REGULATORY AGENCY's determination of the existence or extent of the CO_2 budget source's excess emissions be revised either by a settlement or final conclusion of any administrative or judicial action, the REGULATORY AGENCY will act as follows.

(i) In any instance where the REGULATORY AGENCY's determination of the extent of excess emissions was too low, the REGULATORY AGENCY will take further action under paragraphs (d)(1) and (2) of this section to address the expanded violation.

(ii) In any instance where the REGULATORY AGENCY's determination of the extent of excess emissions was too high, the REGULATORY AGENCY will distribute to the relevant CO_2 budget source a number of CO_2 allowances equaling the number of CO_2 allowances deducted which are attributable to the difference between the original and final quantity of excess emissions. Should such CO_2 budget source's compliance account no longer exist, the CO_2 allowances will be provided to a general account selected by the owner or operator of the CO_2 budget source from which they were originally deducted.

(e) The REGULATORY AGENCY or its agent will record in the appropriate compliance account all deductions from such an account pursuant to subdivisions (b) and (d) of this section.

(f) *Action by the REGULATORY AGENCY on submissions*.

(1) The REGULATORY AGENCY may review and conduct independent audits concerning any submission under the CO_2 Budget Trading Program and make appropriate adjustments of the information in the submissions.

(2) The REGULATORY AGENCY may deduct CO_2 allowances from or

transfer CO_2 allowances to a source's compliance account based on information in the submissions, as adjusted under paragraph (f)(1) of this section.

XX-6.6 Banking.

Each CO_2 allowance that is held in a compliance account or a general account will remain in such account unless and until the CO_2 allowance is deducted or transferred under section XX-4.2, section XX-6.5, section XX-6.7, or Subpart XX-7.

XX-6.7 Account error.

The REGULATORY AGENCY or its agent may, at its sole discretion and on his or her own motion, correct any error in any CO_2 Allowance Tracking System account. Within 10 business days of making such correction, the REGULATORY AGENCY or its agent will notify the CO_2 authorized account representative for the account.

XX-6.8 Closing of general accounts.

(a) A CO_2 authorized account representative of a general account may instruct the REGULATORY AGENCY or its agent to close the account by submitting a statement requesting deletion of the account from the CO_2 Allowance Tracking System and by correctly submitting for recordation under section XX-7.1 a CO_2 allowance transfer of all CO_2 allowances in the account to one or more other CO_2 Allowance Tracking System account.

(b) If a general account shows no activity for a period of one year or more and does not contain any CO_2 allowances, the REGULATORY AGENCY or its agent may notify the CO_2 authorized account representative for the account that the account will be closed in the CO_2 Allowance Tracking System 30 business days after the notice is sent. The account will be closed after the 30-day period unless before the end of the 30-day period the REGULATORY AGENCY or its agent receives a correctly submitted transfer

of CO_2 allowances into the account under section XX-7.1 or a statement submitted by the CO_2 authorized account representative demonstrating to the satisfaction of the REGULATORY AGENCY or its agent good cause as to why the account should not be closed. The REGULATORY AGENCY or its agent will have sole discretion to determine if the owner or operator of the unit demonstrated that the account should not be closed.

Subpart XX-7 CO_2 Allowance Transfers

XX-7.1 Submission of CO_2 allowance transfers.

The CO_2 authorized account representatives seeking recordation of a CO_2 allowance transfer shall submit the transfer to the REGULATORY AGENCY or its agent. To be considered correctly submitted, the CO_2 allowance transfer shall include the following elements in a format specified by the REGULATORY AGENCY or its agent:

(a) The numbers identifying both the transferor and transferee accounts;

(b) A specification by serial number of each CO_2 allowance to be transferred;

(c) The printed name and signature of the CO_2 authorized account representative of the transferor account and the date signed;

(d) The date of the completion of the last sale or purchase transaction for the allowance, if any; and

(e) The purchase or sale price of the allowance that is the subject of a sale or purchase transaction under subdivision (d) of this section.

XX-7.2 Recordation.

(a) Within 5 business days of receiving a CO_2 allowance transfer, except as provided in subdivision (b) of this section, the REGULATORY AGENCY or its agent will record a

CO_2 allowance transfer by moving each CO_2 allowance from the transferor account to the transferee account as specified by the request, provided that the transfer is correctly submitted under section XX-7.1; and

(1) The transferor account includes each CO_2 allowance identified by serial number in the transfer.

(2) A CO_2 allowance transfer into or out of a compliance account that is submitted for recordation following the CO_2 allowance transfer deadline and that includes any CO_2 allowances that are of allocation years that fall within a control period or interim control period prior to or the same as the control period or interim control period to which the CO_2 allowance transfer deadline applies will not be recorded until after completion of the process pursuant to XX-6.5(b).

(b) Where a CO_2 allowance transfer submitted for recordation fails to meet the requirements of subdivision (a) of this section, the REGULATORY AGENCY or its agent will not record such transfer.

XX-7.3 Notification.

(a) *Notification of recordation*. Within 5 business days of recordation of a CO_2 allowance transfer under section XX-7.2, the REGULATORY AGENCY or its agent will notify each party to the transfer. Notice will be given to the CO_2 authorized account representatives of both the transferor and transferee accounts.

(b) *Notification of non-recordation*. Within 10 business days of receipt of a CO_2 allowance transfer that fails to meet the requirements of subdivision XX-7.2(a), the REGULATORY AGENCY or its agent will notify the CO_2 authorized account representatives of both accounts subject to the transfer of:

(1) A decision not to record the transfer, and

(2) The reasons for such non-recordation.

(c) Nothing in this section shall preclude the submission of a CO_2 allowance transfer for recordation following notification of non-recordation.

Subpart XX-8 Monitoring, Reporting & Recordkeeping

XX-8.1 General requirements.

The owners and operators, and to the extent applicable, the CO_2 authorized account representative of a CO_2 budget unit, shall comply with the monitoring, recordkeeping and reporting requirements as provided in this Subpart and all applicable sections of 40 CFR part 75. Where referenced in XX-8, the monitoring requirements of 40 CFR Part 75 shall be adhered to in a manner consistent with the purpose of monitoring and reporting CO_2 mass emissions pursuant to **[these regulations]**. For purposes of complying with such requirements, the definitions in section XX-1.2 and in 40 CFR 72.2 shall apply, and the terms ‘‘affected unit,’’ ‘‘designated representative,’’ and ‘‘continuous emissions monitoring system’’ (or ‘‘CEMS’’) in 40 CFR part 75 shall be replaced by the terms ‘‘CO_2 budget unit,’’ ‘‘CO_2 authorized account representative,’’ and ‘‘continuous emissions monitoring system’’ (or ‘‘CEMS’’), respectively, as defined in section XX-1.2.

For units not subject to an Acid Rain emissions limitation, the term “Administrator” in 40 CFR Part 75 shall be replaced with “the Administrator, REGULATORY AGENCY or its agent.” Owners or operators of a CO_2 budget unit who monitor a non-CO_2 budget unit pursuant to the common, multiple, or bypass stack procedures in 40 CFR 75.72(b)(2)(ii), or 40 CFR 75.16 (b)(2)(ii)(B) as pursuant to 40 CFR 75.13, for purposes of complying with **[these regulations]**, shall monitor and report CO_2 mass emissions from such non-CO_2 budget units according to the procedures for CO_2 budget units established in XX-8.1 through XX-8.7.

(a) *Requirements for installation, certification, and data accounting*. The owner or

operator of each CO_2 budget unit must meet the following requirements.

(1) Install all monitoring systems necessary to monitor CO_2 mass emissions in accordance with 40 CFR Part 75, except for equation G-1. Equation G-1 in Appendix G shall not be used to determine CO_2 emissions under this Part. This may require systems to monitor CO_2 concentration, stack gas flow rate, O_2 concentration, heat input, and fuel flow rate.

(2) Successfully complete all certification tests required under section XX-8.2 and meet all other requirements of this Subpart and 40 CFR part 75 applicable to the monitoring systems under paragraph (a)(1) of this section.

(3) Record, report and quality-assure the data from the monitoring systems under paragraph (a)(1) of this section.

(b) *Compliance dates*. The owner or operator shall meet the monitoring system certification and other requirements of paragraphs (a)(1) through (a)(3) of this section on or before the following dates. The owner or operator shall record, report and quality-assure the data from the monitoring systems under paragraph (a)(1) of this section on and after the following dates.

(1) The owner or operator of a CO_2 budget unit, except for a CO_2 budget unit under paragraph (b)(2) of this section, that commences commercial operation before July 1, 2008, must comply with the requirements of this Subpart by January 1, 2009.

(2) The owner or operator of a CO_2 budget unit that commences commercial operation on or after July 1, 2008 must comply with the requirements of this Subpart by the later of the following dates:

(i) January 1, 2009; or

(ii) The earlier of:

(a) 90 unit operating days after the date on which the unit commences commercial operation; or

(b) 180 calendar days after the date on which the unit commences commercial operation.

(3) For the owner or operator of a CO_2 budget unit for which construction of a new stack or flue installation is completed after the applicable deadline under paragraph (b)(1) or (b)(2) of this section by the earlier of:

(i) 90 unit operating days after the date on which emissions first exit to the atmosphere through the new stack or flue; or

(ii) 180 calendar days after the date on which emissions first exit to the atmosphere through the new stack or flue.

(c) *Reporting data.*

(1) Except as provided in paragraph (c)(2) of this section, the owner or operator of a CO_2 budget unit that does not meet the applicable compliance date set forth in paragraphs (b)(1), (b)(2) and (b)(3) of this section for any monitoring system under paragraph (a)(1) of this section shall, for each such monitoring system, determine, record, and report maximum potential (or as appropriate minimum potential) values for CO_2 concentration, CO_2 emissions rate, stack gas moisture content, fuel flow rate, heat input, and any other parameter required to determine CO_2 mass emissions in accordance with 40 CFR 75.31(b)(2) or (c)(3), or section 2.4 of appendix D of 40 CFR part 75 as applicable.

(2) The owner or operator of a CO_2 budget unit that does not meet the applicable compliance date set forth in paragraph (b)(3) of this section for any monitoring system under paragraph (a)(1) of this section shall, for each such monitoring system, determine, record, and report substitute data using the applicable missing data procedures in Subpart D, or appendix D of 40 CFR part 75, in lieu of the maximum potential (or as appropriate minimum potential) values for a parameter if the owner or operator demonstrates that there is continuity between the data streams for that parameter before and after the construction or installation under paragraph (b)(3) of this section.

(i) CO_2 budget units subject to an acid rain emissions limitation or

[state-specific annual or CSAPR NOx Ozone Season Trading Program] that qualify for the optional SO_2, NO_X, and CO_2 (for acid rain) or NOx (for **[state-specific annual or CSAPR NOx Ozone Season Trading Program]**) emissions calculations for low mass emissions (LME) units under 40 CFR 75.19 and report emissions for such programs using the calculations under 40 CFR 75.19 , shall also use the CO_2 emissions calculations for LME units under 40 CFR 75.19 for purposes of compliance with these regulations.

(ii) CO_2 budget units subject to an acid rain emissions limitation or **[state-specific annual or ozone season CAIR citation]** that do not qualify for the optional SO_2, NO_X, and CO_2 (for acid rain) or NOx (for **[state-specific annual or CSAPR NOx Ozone Season Trading Program]**) emissions calculations for LME units under 40 CFR 75.19, shall not use the CO_2 emissions calculations for LME units under 40 CFR 75.19 for purposes of compliance with these regulations.

(iii) CO_2 budget units not subject to an acid rain emissions limitation or **[state-specific annual or CSAPR NOx Ozone Season Trading Program]** shall qualify for the optional CO_2 emissions calculation for LME units under 40 CFR 75.19, provided that they emit less than 100 tons of NO_X annually and no more than 25 tons of SO_2 annually.

(d) *Prohibitions.*

(1) No owner or operator of a CO_2 budget unit shall use any alternative monitoring system, alternative reference method, or any other alternative for the required continuous emissions monitoring system without having obtained prior written approval in accordance with section XX-8.6.

(2) No owner or operator of a CO_2 budget unit shall operate the unit so as to discharge, or allow to be discharged, CO_2 emissions to the atmosphere

without accounting for all such emissions in accordance with the applicable provisions of this Subpart and 40 CFR part 75.

(3) No owner or operator of a CO_2 budget unit shall disrupt the continuous emissions monitoring system, any portion thereof, or any other approved emissions monitoring method, and thereby avoid monitoring and recording CO_2 mass emissions discharged into the atmosphere, except for periods of recertification or periods when calibration, quality assurance testing, or maintenance is performed in accordance with the applicable provisions of this Subpart and 40 CFR part 75.

No owner or operator of a CO_2 budget unit shall retire or permanently discontinue use of the continuous emissions monitoring system, any component thereof, or any other approved emissions monitoring system under this Subpart, except under any one of the following circumstances:

(i) The owner or operator is monitoring emissions from the unit with another certified monitoring system approved, in accordance with the applicable provisions of this Subpart and 40 CFR part 75, by the Administrator, REGULATORY AGENCY for use at that unit that provides emissions data for the same pollutant or parameter as the retired or discontinued monitoring system; or

(ii) The CO_2 authorized account representative submits notification of the date of certification testing of a replacement monitoring system in accordance with subparagraph XX-8.2(d)(3)(i).

XX-8.2 Initial certification and recertification procedures.

(a) The owner or operator of a CO_2 budget unit shall be exempt from the initial certification requirements of this section for a monitoring system under paragraph XX-8.1(a)(1) if the following conditions are met:

(1) The monitoring system has been previously certified in accordance with 40 CFR part 75; and

(2) The applicable quality-assurance and quality-control requirements of 40 CFR 75.21 and appendix B and appendix D of 40 CFR part 75 are fully met for the certified monitoring system described in paragraph (a)(1) of this section.

(b) The recertification provisions of this section shall apply to a monitoring system under paragraph XX-8.1(a)(1) exempt from initial certification requirements under subdivision (a) of this section.

(c) Not withstanding XX-8.2(a), if the Administrator has previously approved a petition under 40 CFR 75.72(b)(2)(ii), or 40 CFR 75.16(b)(2)(ii)(B) as pursuant to 40 CFR 75.13 for apportioning the CO_2 emissions rate measured in a common stack or a petition under 40 CFR 75.66 of this chapter for an alternative requirement in 40 CFR part 75, the CO_2 authorized account representative shall submit the petition to the Administrator, REGULATORY AGENCY under subdivision XX-8.6(a) to determine whether the approval applies under this program.

(d) Except as provided in subdivision (a) of this section, the owner or operator of a CO_2 budget unit shall comply with the following initial certification and recertification procedures for a continuous emissions monitoring system and an excepted monitoring system under appendix D of 40 CFR part 75 and under paragraph XX-8.1(a)(1). The owner or operator of a unit that qualifies to use the low mass emissions excepted monitoring methodology in 40 CFR 75.19 or that qualifies to use an alternative monitoring system under Subpart E of 40 CFR part 75 shall comply with the procedures in subdivision (e) or (f) of this section, respectively.

(1) *Requirements for initial certification.* The owner or operator shall ensure that each continuous emissions monitoring system required under paragraph XX-8.1(a)(1) (which includes the automated data acquisition

and handling system) successfully completes all of the initial certification testing required under 40 CFR 75.20 by the applicable deadlines specified in subdivision XX-8.1(b). In addition, whenever the owner or operator installs a monitoring system in order to meet the requirements of this Subpart in a location where no such monitoring system was previously installed, initial certification in accordance with 40 CFR 75.20 is required.

(2) *Requirements for recertification.*

(i) Whenever the owner or operator makes a replacement, modification, or change in a certified continuous emissions monitoring system under paragraph XX-8.1(a)(1) that the Administrator or the Administrator, REGULATORY AGENCY determines significantly affects the ability of the system to accurately measure or record CO_2 mass emissions or to meet the quality-assurance and quality-control requirements of 40 CFR 75.21 or appendix B to 40 CFR part 75, the owner or operator shall recertify the monitoring system according to 40 CFR 75.20(b).

(ii) For systems using stack measurements such as stack flow, stack moisture content, CO_2 or O_2 monitors, whenever the owner or operator makes a replacement, modification, or change to the flue gas handling system or the unit's operation that the Administrator or the Administrator, REGULATORY AGENCY determines to significantly change the flow or concentration profile, the owner or operator shall recertify the continuous emissions monitoring system according to 40 CFR 75.20(b). Examples of changes which require recertification include: replacement of the analyzer, change in location or orientation of the sampling probe or site, or changing of flow rate monitor polynomial coefficients.

(3) *Approval process for initial certifications and recertification*. Subparagraphs (d)(3)(i) through (iv) of this section apply to both initial certification and recertification of a monitoring system under paragraph XX-8.1(a)(1). For re-certifications, replace the words "certification" and "initial certification" with the word "recertification," replace the word "certified" with "recertified," and proceed in the manner prescribed in 40 CFR 75.20(b)(5) and (g)(7) in lieu of XX-8.2(d)(3)(v).

(i) *Notification of certification.* The CO_2 authorized account representative shall submit to the Administrator, REGULATORY AGENCY or its agent, the appropriate EPA Regional Office and the Administrator a written notice of the dates of certification in accordance with section XX-8.4.

(ii) *Certification application.* The CO_2 authorized account representative shall submit to the Administrator, REGULATORY AGENCY or its agent a certification application for each monitoring system. A complete certification application shall include the information specified in 40 CFR 75.63.

(iii) *Provisional certification data.* The provisional certification date for a monitor shall be determined in accordance with 40 CFR 75.20(a)(3). A provisionally certified monitor may be used under the CO_2 budget Trading Program for a period not to exceed 120 days after receipt by the Administrator, REGULATORY AGENCY of the complete certification application for the monitoring system or component thereof under subparagraph (d)(3)(ii) of this section. Data measured and recorded by the provisionally certified monitoring system or component thereof, in accordance with the requirements of 40 CFR part 75, will be considered valid quality-assured data (retroactive to the date and time of provisional certification), provided that the Administrator, REGULATORY AGENCY does not invalidate the

provisional certification by issuing a notice of disapproval within 120 days of receipt of the complete certification application by the Administrator, REGULATORY AGENCY.

(iv) *Certification application approval process.* The Administrator, REGULATORY AGENCY will issue a written notice of approval or disapproval of the certification application to the owner or operator within 120 days of receipt of the complete certification application under subparagraph (d)(3)(ii) of this section. In the event the Administrator, REGULATORY AGENCY does not issue such a notice within such 120-day period, each monitoring system which meets the applicable performance requirements of 40 CFR part 75 and is included in the certification application will be deemed certified for use under the CO_2 Budget Trading Program.

(a) *Approval notice.* If the certification application is complete and shows that each monitoring system meets the applicable performance requirements of 40 CFR part 75, then the Administrator, REGULATORY AGENCY will issue a written notice of approval of the certification application within 120 days of receipt.

(b) *Incomplete application notice.* If the certification application is not complete, then the Administrator, REGULATORY AGENCY will issue a written notice of incompleteness that sets a reasonable date by which the CO_2 authorized account representative must submit the additional information required to complete the certification application. If the CO_2 authorized account representative does not comply with the notice of incompleteness by the specified date, then the Administrator, REGULATORY AGENCY may issue a notice of disapproval under clause

(d)(3)(iv)*(c)* of this section. The 120 day review period shall not begin before receipt of a complete certification application.

(c) *Disapproval notice.* If the certification application shows that any monitoring system or component thereof does not meet the performance requirements of 40 CFR part 75, or if the certification application is incomplete and the requirement for disapproval under clause (d)(3)(iv)*(b)* of this section is met, then the REGULATORY AGENCY will issue a written notice of disapproval of the certification application. Upon issuance of such notice of disapproval, the provisional certification is invalidated by the Administrator, REGULATORY AGENCY and the data measured and recorded by each uncertified monitoring system or component thereof shall not be considered valid quality assured data beginning with the date and hour of provisional certification. The owner or operator shall follow the procedures for loss of certification in subparagraph (d)(3)(v) of this section for each monitoring system or component thereof, which is disapproved for initial certification.

(d) *Audit decertification.* The REGULATORY AGENCY may issue a notice of disapproval of the certification status of a monitor in accordance with subdivision XX-8.3(b).

(v) *Procedures for loss of certification.* If the REGULATORY AGENCY issues a notice of disapproval of a certification application under clause (d)(3)(iv)*(c)* of this section or a notice of disapproval of certification status under clause (d)(3)(iv)*(d)* of this section, then:

(a) The owner or operator shall substitute the following values for each disapproved monitoring system, for each hour of

unit operation during the period of invalid data beginning with the date and hour of provisional certification and continuing until the time, date, and hour specified under 40 CFR 75.20(a)(5)(i) or 40 CFR 75.20(g)(7):

(1) For units using or intending to monitor for CO_2 mass emissions using heat input or for units using the low mass emissions excepted methodology under 40 CFR 75.19, the maximum potential hourly heat input of the unit; or

(2) For units intending to monitor for CO_2 mass emissions using a CO_2 pollutant concentration monitor and a flow monitor, the maximum potential concentration of CO_2 and the maximum potential flow rate of the unit under section 2.1 of appendix A of 40 CFR part 75.

(b) The CO_2 authorized account representative shall submit a notification of certification retest dates and a new certification application in accordance with subparagraphs (d)(3)(i) and (ii) of this section; and

(c) The owner or operator shall repeat all certification tests or other requirements that were failed by the monitoring system, as indicated in the REGULATORY AGENCY's notice of disapproval, no later than 30 unit operating days after the date of issuance of the notice of disapproval.

(e) *Initial certification and recertification procedures for low mass emissions units using the excepted methodologies under XX-8.1(c)(2)*. The owner or operator of a unit qualified to use the low mass emissions excepted methodology under XX-8.1(c)(2) shall meet the applicable certification and recertification requirements of 40 CFR 75.19(a)(2), 40 CFR 75.20(h) and section XX-8.2. If the owner or operator of such a unit elects to certify a fuel flow meter system for heat input determinations, the owner

or operator shall also meet the certification and recertification requirements in 40 CFR 75.20(g).

(f) *Certification/recertification procedures for alternative monitoring systems*. The CO_2 authorized account of each unit for which the owner or operator intends to use an alternative monitoring system approved by the Administrator and, if applicable, the Administrator, REGULATORY AGENCY under Subpart E of 40 CFR part 75 shall comply with the applicable notification and application procedures of 40 CFR 75.20(f).

XX-8.3 Out-of-control periods.

(a) Whenever any monitoring system fails to meet the quality assurance and quality control requirements or data validation requirements of 40 CFR part 75, data shall be substituted using the applicable procedures in Subpart D or appendix D of 40 CFR part 75.

(b) *Audit decertification.* Whenever both an audit of a monitoring system and a review of the initial certification or recertification application reveal that any monitoring system should not have been certified or recertified because it did not meet a particular performance specification or other requirement under section XX-8.2 or the applicable provisions of 40 CFR part 75 , both at the time of the initial certification or recertification application submission and at the time of the audit, the REGULATORY AGENCY or Administrator will issue a notice of disapproval of the certification status of such monitoring system. For the purposes of this paragraph, an audit shall be either a field audit or an audit of any information submitted to the REGULATORY AGENCY or the Administrator. By issuing the notice of disapproval, the REGULATORY AGENCY or Administrator revokes prospectively the certification status of the monitoring system. The data measured and recorded by the monitoring system shall not be considered valid quality-assured data from the date of issuance of the notification of the revoked certification status until the date and time that the owner or operator completes subsequently approved initial certification or recertification tests

for the monitoring system. The owner or operator shall follow the initial certification or recertification procedures in section XX-8.2 for each disapproved monitoring system.

XX-8.4 Notifications.

The CO_2 authorized account representative for a CO_2 budget unit shall submit written notice to the REGULATORY AGENCY and the Administrator in accordance with 40 CFR 75.61.

XX-8.5 Recordkeeping and reporting.

(a) *General provisions.* The CO_2 authorized account representative shall comply with all recordkeeping and reporting requirements in this section, the applicable record keeping and reporting requirements under 40 CFR 75.73 and with the requirements of subdivision XX-2.1(e).

(b) *Monitoring plans.* The owner or operator of a CO_2 budget unit shall submit a monitoring plan in the manner prescribed in 40 CFR 75.62.

(c) *Certification applications.* The CO_2 authorized account representative shall submit an application to the Administrator, REGULATORY AGENCY within 45 days after completing all CO_2 monitoring system initial certification or recertification tests required under section XX-8.2 including the information required under 40 CFR 75.63 and 40 CFR 75.53(g) and (h).

(d) *Quarterly reports.* The CO_2 authorized account representative shall submit quarterly reports, as follows:

(1) The CO_2 authorized account representative shall report the CO_2 mass emissions data for the CO_2 budget unit, in an electronic format prescribed by the Administrator unless otherwise prescribed by the Administrator, REGULATORY AGENCY for each calendar quarter beginning with:

(i) For a unit that commences commercial operation before July 1, 2008, the calendar quarter covering January 1, 2009 through March 31, 2009; or

(ii) For a unit commencing commercial operation on or after July 1, 2008, the calendar quarter corresponding to, the earlier of the date of provisional certification or the applicable deadline for initial certification under subdivision XX-8.1(b) or, unless that quarter is the third or fourth quarter of 2008, in which case reporting shall commence in the quarter covering January 1, 2009 through March 31, 2009.

(2) The CO_2 authorized account representative shall submit each quarterly report to the Administrator, REGULATORY AGENCY or its agent within 30 days following the end of the calendar quarter covered by the report. Quarterly reports shall be submitted in the manner specified in Subpart H of 40 CFR part 75 and 40 CFR 75.64. Quarterly reports shall be submitted for each CO_2 budget unit (or group of units using a common stack), and shall include all of the data and information required in Subpart G of 40 CFR part 75, except for opacity, heat input, NOx, and SO_2 provisions.

(3) *Compliance certification.* The CO_2 authorized account representative shall submit to the Administrator, REGULATORY AGENCY or its agent a compliance certification in support of each quarterly report based on reasonable inquiry of those persons with primary responsibility for ensuring that all of the unit's emissions are correctly and fully monitored. The certification shall state that:

(i) The monitoring data submitted were recorded in accordance with the applicable requirements of this Subpart and 40 CFR part 75, including the quality assurance procedures and specifications;

(ii) For a unit with add-on CO_2 emissions controls and for all hours

where data are substituted in accordance with 40 CFR 75.34(a)(1) , the add-on emissions controls were operating within the range of parameters listed in the quality assurance/quality control program under appendix B of 40 CFR part 75 and the substitute values do not systematically underestimate CO_2 emissions; and

(iii) The CO_2 concentration values substituted for missing data under Subpart D of 40 CFR part 75 do not systematically underestimate CO_2 emissions.

XX-8.6 Petitions.

(a) Except as provided in subdivision (c) of this section, the CO_2 authorized account representative of a CO_2 budget unit that is subject to an Acid Rain emissions limitation may submit a petition to the Administrator under 40 CFR 75.66 and to the REGULATORY AGENCY requesting approval to apply an alternative to any requirement of 40 CFR Part 75. Application of an alternative to any requirement of 40 CFR Part 75 is in accordance with this Subpart only to the extent that the petition is approved in writing by the Administrator, and subsequently approved in writing by the REGULATORY AGENCY.

(b) Petitions for a CO_2 budget unit that is not subject to an Acid Rain emissions limitation.

(1) The CO_2 authorized account representative of a CO_2 budget unit that is not subject to an Acid Rain emissions limitation may submit a petition to the Administrator under 40 CFR 75.66 and to the REGULATORY AGENCY requesting approval to apply an alternative to any requirement of 40 CFR PART 75. Application of an alternative to any requirement of 40 CFR PART 75 is in accordance with this Subpart only to the extent that the petition is approved in writing by the Administrator and subsequently approved in writing by the REGULATORY AGENCY.

(2) In the event that the Administrator declines to review a petition under XX-8.6(b)(1), the CO_2 authorized account representative of a CO_2 budget unit that is not subject to an Acid Rain emissions limitation may submit a petition to the REGULATORY AGENCY requesting approval to apply an alternative to any requirement of XX-8. That petition shall contain all of the relevant information specified in 40 CFR 75.66. Application of an alternative to any requirement of XX-8 is in accordance with XX-8 only to the extent that the petition is approved in writing by the REGULATORY AGENCY.

(c) The CO_2 authorized account representative of a CO_2 budget unit that is subject to an Acid Rain emissions limitation may submit a petition to the Administrator under 40 CFR 75.66 and to the REGULATORY AGENCY requesting approval to apply an alternative to a requirement concerning any additional CEMS required under the common stack provisions of 40 CFR 75.72 or a CO_2 concentration CEMS used under 40 CFR 75.71(a)(2). Application of an alternative to any such requirement is in accordance with this Subpart only to the extent the petition is approved in writing by the Administrator and subsequently approved in writing by the REGULATORY AGENCY.

XX-8.7 CO_2 budget units that co-fire eligible biomass.

(a) The CO_2 authorized account representative of a CO_2 budget unit that co-fires eligible biomass as a compliance mechanism under XX shall report the following information to the REGULATORY AGENCY or its agent for each calendar quarter:

(1) For each shipment of solid eligible biomass fuel fired at the CO_2 budget unit, the total eligible biomass fuel input, on an as-fired basis, in pounds;

(2) For each shipment of solid eligible biomass fuel fired at the CO_2 budget unit, the moisture content, on an as-fired basis, as a fraction by weight;

(3) For each distinct type of gaseous eligible biomass fuel fired at the CO_2 budget unit, the density of the biogas, on an as-fired basis, in pounds per standard cubic foot;

(4) For each distinct type of gaseous eligible biomass fuel fired at the CO_2 budget unit, the moisture content of the biogas, as a fraction by total weight;

(5) For each distinct type of gaseous eligible biomass fuel fired at the CO_2 budget unit, the total eligible biomass fuel input, in standard cubic feet;

(6) For each distinct type of eligible biomass fuel fired at the CO_2 budget unit, the dry basis carbon content of the fuel type, as a fraction by dry weight;

(7) For each distinct type of eligible biomass fuel fired at the CO_2 budget unit, the dry basis higher heating value, in MMBtu per dry pound;

(8) For each distinct type of eligible biomass fuel fired at the CO_2 budget unit, the total dry basis eligible biomass fuel input, in pounds, calculated in accordance with XX-8.7(b);

(9) The total amount of CO_2 emitted from the $CO2$ budget unit due to firing eligible biomass fuel, in tons, calculated in accordance with XX-8.7(c);

(10) For each distinct type of eligible biomass fuel fired at the CO_2 budget unit, the total eligible biomass fuel heat input, in MMBtu, calculated in accordance with XX-8.7(d)(1).

(11) The total amount of heat input to the CO_2 budget unit due to firing eligible biomass fuel, in MMBtu, calculated in accordance with XX-8.7(d)(2);

(12) Description and documentation of monitoring technology employed, and description and documentation of fuel sampling methodology employed, including sampling frequency; and

(13) For each distinct type of eligible biomass fuel fired at the CO_2 budget unit, chemical analysis, including heating value and carbon content.

(b) An owner or operator of a CO_2 budget unit shall calculate and submit to the REGULATORY AGENCY or its agent on a quarterly basis the total dry weight for each distinct type of eligible biomass fired by the CO_2 budget unit during the reporting quarter. The total dry weight shall be determined for each fuel type as follows:

(1) For solid fuel types:

$$F_j = \sum_{i=1}^{m} (1 - M_i) \times F_i$$

Where:

F_j = Total eligible biomass dry basis fuel input (lbs) for fuel type j;

F_i = Eligible biomass as fired fuel input (lbs) for fired shipment i;

M_i = Moisture content (fraction) for fired shipment i;

i = Fired fuel shipment;

j = Fuel type; and

m = Number of shipments.

(2) For gaseous fuel types:

$$F_j = D_j \times V_j \times (1 - M_j)$$

Where:

F_j = Total eligible biomass dry basis fuel input (lbs) for fuel type j;

D_j = Density of biogas (lbs/scf) for fuel type j;

V_j = Total volume (scf) for fuel type j;

M_j = Moisture content (fraction) for fuel type j;

j = Fuel type.

(c) CO_2 emissions due to firing of eligible biomass shall be determined as follows:

(1) For any full calendar quarter during which no fuel other than eligible biomass is combusted at the CO_2 budget unit, as measured and recorded in accordance with XX-8.1 through XX-8.6 ; or

For any full calendar quarter during which fuels other than eligible biomass are combusted at the CO_2 budget unit, as determined using the following equation:

$$CO_2\ tons = \sum_{j=1}^{n} F_j \times C_j \times O_j \times \frac{44}{12} \times 0.0005$$

Where:

CO_2 tons = CO_2 emissions due to firing of eligible biomass for the reporting quarter;

F_j = Total eligible biomass dry basis fuel input (lbs) for fuel type j, as calculated in XX-8.7(b);

C_j = Carbon fraction (dry basis) for fuel type j;

O_j = Oxidation factor for eligible biomass fuel type j, derived for solid fuels based on the ash content of the eligible biomass fired and the carbon content of this ash, as determined pursuant to XX-8.7(a)(12); for gaseous eligible biomass fuels, a default oxidation factor of 0.995 may be used;

44/12 = The number of tons of carbon dioxide that are created when one ton of carbon is combusted (44/12);

0.0005 = The number of short tons which is equal to one pound;

j = Fuel type; and

n = Number of distinct fuel types.

(d) Heat input due to firing of eligible biomass for each quarter shall be determined as follows:

(1) For each distinct fuel type:

$$H_j = F_j \times HHV_j$$

Where:

H_j = Heat input (MMBtu) for fuel type j;

F_j = Total eligible biomass dry basis fuel input (lbs) for fuel type j, as calculated in XX-8.7(b);

HHV_j = Higher heating value (MMBtu/lb), dry basis, for fuel type j, as determined through chemical analysis; and

j = fuel type.

(2) For all fuel types:

$$Heat\ input\ MMBtu = \sum_{i=1}^{n} H_j$$

Where:

H_j = Heat input (MMBtu) for fuel type j;

j = fuel type; and

n = number of distinct fuel types.

(e) Fuel sampling methods and fuel sampling technology shall be consistent with the New York State Renewable Portfolio Standard Biomass Guidebook, September 2011.

XX-8.8 Additional requirements to provide output data.

(a) A CO_2 budget unit in a state that requires the use of information submitted to the Independent System Operator (ISO) to document megawatt-hours (MWh) the CO_2 budget unit produces shall submit to the REGULATORY AGENCY or its agent the same MWh value submitted to the ISO and a statement certifying that the MWh of electrical output reported reflects the total actual electrical output for all CO_2 budget units at the facility used by the ISO to determine settlement resources of energy market participants.

(b) A CO_2 budget unit in a state that requires gross output to be used that also reports gross hourly MW to the Administrator, shall use the same electronic data report (EDR) gross output (in MW), as submitted to the Administrator, for the hour times operating time in the hour, added for all hours in a year. A CO_2 budget unit that does not report gross hourly MW to the Administrator shall submit to the REGULATORY AGENCY or its agent information in accordance with paragraph XX-8.8(e)(1).

(c) A CO_2 budget unit in a state that requires net electrical output, shall submit to the REGULATORY AGENCY or its agent information in accordance with paragraph XX-8.8(e)(1). A CO_2 budget source whose electrical output is not used in ISO energy market settlement determinations shall propose to the REGULATORY AGENCY a method for quantification of net electrical output.

(d) CO_2 budget sources selling steam should use billing meters to determine net steam output. A CO_2 budget source whose steam output is not measured by billing meters or whose steam output is combined with output from a non-CO_2 budget unit prior to measurement by the billing meter shall propose to the REGULATORY AGENCY an alternative method for quantification of net steam output. If data for steam output is not

available, the CO_2 budget source may report heat input providing useful steam output as a surrogate for steam output.

(e) *Monitoring.* The owner or operator of each CO_2 budget unit, in a state that requires the CO_2 budget unit's net output, must meet the following requirements. Each CO_2 budget source must submit an output monitoring plan. The output monitoring plan must include a description and diagram as stated below.

(1) Submit a diagram of the electrical and/or steam system for which output is being monitored, specifically including the following.

If the CO_2 budget unit monitors net electric output, the diagram should contain all CO_2 budget units and all generators served by each CO_2 budget unit and the relationship between CO_2 budget units and generators. If a generator served by a CO_2 budget unit is also served by a non-affected unit, the non-affected unit and its relationship to each generator should be indicated on the diagram as well. The diagram should indicate where the net electric output is measured and should include all electrical inputs and outputs to and from the plant. If net electric output is determined using a billing meter, the diagram should show each billing meter used to determine net sales of electricity and should show that all electricity measured at the point of sale is generated by the CO_2 budget units.

(i) If the CO_2 budget unit monitors net thermal output, the diagram should include all steam or hot water coming into the net steam system, including steam from CO_2 budget units and non-affected units, and all exit points of steam or hot water from the net steam system. In addition, each input and output stream will have an estimated temperature, pressure and phase indicator, and an enthalpy in Btu/lb. The diagram of the net steam system should identify all useful loads, house loads, parasitic loads, any other steam loads and all boiler feedwater returns. The diagram will represent all energy losses in the system as either usable or

unusable losses. The diagram will also indicate all flow meters, temperature or pressure sensors or other equipment used to calculate gross thermal output. If a sales agreement is used to determine net thermal output, the diagram should show the monitoring equipment used to determine the sales of steam.

(2) Submit a description of each output monitoring system. The description of the output monitoring system should include a written description of the output system and the equations used to calculate output. For net thermal output systems descriptions and justifications of each useful load should be included.

(3) Submit a detailed description of all quality assurance/quality control activities that will be performed to maintain the output system in accordance with subdivision XX-8.8(g).

(4) Submit documentation supporting any output value(s) to be used as a missing data value should there be periods of invalid output data. The missing data output value must be either zero or an output value that is likely to be lower than a measured value and that is approved as part of the monitoring plan required under this subdivision.

(f) *Initial certification*. A certification statement must be submitted by the CO_2 authorized account representative stating that either the output monitoring system consists entirely of billing meters or that the output monitoring system meets one of the accuracy requirements for non-billing meters at paragraph (2) of this subdivision. This statement may be submitted with the certification application required under subdivision XX-8.5(c).

(1) *Billing meters*. The billing meter must record the electric or thermal output. Any electric or thermal output values that the facility reports must be the same as the values used in billing for the output. Any output measurement equipment used as a billing meter in commercial transactions requires no additional certification or testing.

(2) *Non-billing meters*. For non-billing meters, the output monitoring system must either meet an accuracy of within 10% of the reference value, or each component monitor for the output system must meet an accuracy of within 3% of the full scale value, whichever is less stringent.

(i) *System approach to accuracy*. The system approach to accuracy must include a determination of how the system accuracy of 10% is achieved using the individual components in the system and should include data loggers and any watt meters used to calculate the final net electric output data and/or any flow meters for steam or condensate, temperature measurement devices, absolute pressure measurement devices, and differential pressure devices used for measuring thermal energy.

(ii) *Component approach to accuracy*. If testing a piece of output measurement equipment shows that the output readings are not accurate to within 3.0 percent of the full scale value, then the equipment should be repaired or replaced to meet that requirement. Data shall remain invalid until the output measurement equipment passes an accuracy test or is replaced with another piece of equipment that passes the accuracy test.

(g) *Ongoing QA/QC*. Ongoing quality assurance/quality control activities must be performed in order to maintain the output system.

(1) *Billing meters*. In the case where billing meters are used to determine output, no QA/QC activities beyond what are already performed are required.

(2) *Non-billing meters*. Certain types of equipment such as potential transformers, current transformers, nozzle and venturi type meters, and the primary element of an orifice plate only require an initial certification of calibration and do not require periodic recalibration unless the equipment is physically changed. However, the pressure and temperature

transmitters accompanying an orifice plate will require periodic retesting. For other types of equipment, either recalibrate or re-verify the meter accuracy at least once every two years (i.e., every eight calendar quarters), unless a consensus standard allows for less frequent calibrations or accuracy tests. For non- billing meters, the output monitoring system must either meet an accuracy of within 10% of the reference value, or each component monitor for the output system must meet an accuracy of within 3% of the full scale value, whichever is less stringent. If testing a piece of output measurement equipment shows that the output readings are not accurate to within 3.0 percent of the full scale value, then the equipment should be repaired or replaced to meet that requirement.

(3) *Out-of-control periods*. If testing a piece of output measurement equipment shows that the output readings are not accurate to the certification value, data remain invalid until the output measurement equipment passes an accuracy test or is replaced with another piece of equipment that passes the accuracy test. All invalid data shall be replaced by either zero or an output value that is likely to be lower than a measured value and that is approved as part of the monitoring plan required under subdivision XX-8.8(e).

(h) *Recordkeeping and reporting.*

(1) *General provisions.* The CO_2 authorized account representative shall comply with all recordkeeping and reporting requirements in this section and with the requirements of subdivisions XX-1.5(e) and XX-2.1(e).

(2) *Recordkeeping.* Facilities shall retain data used to monitor, determine, or calculate net generation for ten years.

(3) *Annual reports.* The CO_2 authorized account representative shall submit annual output reports, as follows. The data must be sent both electronically and in hardcopy by March 1 for the immediately preceding

calendar year to the REGULATORY AGENCY or its agent. The annual report shall include unit level MWh, all useful steam output and a certification statement from the CO_2 authorized account representative stating the following,

"I am authorized to make this submission on behalf of the owners and operators of the CO_2 budget sources or CO_2 budget units for which the submission is made. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

Subpart XX-9 Auction of CO_2 CCR and ECR allowances

XX-9.1 Purpose

The following rules shall apply to each allowance auction. The REGULATORY AGENCY or its agent may specify additional information in the auction notice for each auction. Such additional information may include the time and location of the auction, auction rules, registration deadlines, and any additional information deemed necessary or useful.

XX-9.2 General Requirements

(a) The REGULATORY AGENCY or its agent shall include the following information in the auction notice for each auction:

(1) The number of CO_2 allowances offered for sale at the auction, not including any CO_2 CCR allowances;

(2) The number of CO_2 CCR allowances that will be offered for sale at the auction if the condition of paragraph (b)(1) of this section is met;

(3) The minimum reserve price for the auction; and

(4) The CCR trigger price for the auction.

(5) The maximum number of CO_2 allowances that may be withheld from sale at the auction if the condition of paragraph (d) (1) of this section is met;

(6) The ECR trigger price for the auction.

(b) The REGULATORY AGENCY or its agent shall follow these rules for the sale of CO_2 CCR allowances:

(1) CO_2 CCR allowances shall only be sold at an auction in which total demand for allowances, above the CCR trigger price, exceeds the number of CO_2 allowances available for purchase at the auction, not including any CO_2 CCR allowances.

(2) If the condition of paragraph (1) of this subdivision is met at an auction, then the number of CO_2 CCR allowances offered for sale by the REGULATORY AGENCY or its agent at the auction shall be equal to the number of CO_2 CCR allowances in the RELEVANT STATE AUCTION ACCOUNT at the time of the auction.

(3) After all of the CO_2 CCR allowances in the RELEVANT STATE AUCTION ACCOUNT have been sold in a given calendar year, no additional CO_2 CCR allowances will be sold at any auction for the remainder of that calendar year, even if the condition of paragraph (1) of this subdivision is met at an auction; and

(4) At an auction in which CO_2 CCR allowances are sold, the reserve price at for the auction shall be the CCR trigger price.

(5) If the condition of paragraph (1) of this subdivision is not satisfied, no CO_2

CCR allowances shall be offered for sale at the auction, and the reserve price for the auction shall be equal to the minimum reserve prices.

(c) The REGULATORY AGENCY or its agent shall implement the reserve price in the following manner:

(1) No allowances shall be sold at any auction for a price below the reserve price for that auction; and

(2) If the total demand for allowances at an auction is less than or equal to the total number of allowances made available for sale in that auction, then the auction clearing price for the auction shall be the reserve price.

(d) The REGULATORY AGENCY or its agent shall follow these rules for the withholding of CO_2 ECR allowances from an auction:

(1) CO_2 ECR allowances shall only be withheld from an auction if the demand for allowances would result in an auction clearing price that is less than the ECR trigger price prior to the withholding from the auction of any ECR allowances.

(2) If the condition in paragraph (1) of this subdivision is met at an auction, then the maximum number of CO_2 ECR allowances that may be withheld from that auction will be equal to the quantity shown in section 5.3(e)(1) Table 4 minus the total quantity of CO_2 ECR allowances that have been withheld from any prior auction in that calendar year. Any CO_2 ECR allowances withheld from an auction will be transferred into the RELEVANT STATE ECR ACCOUNT.

Subpart XX-10 CO_2 Emissions Offset Projects

XX-10.1 Purpose.

The REGULATORY AGENCY will provide for the award of CO_2 offset allowances to sponsors of CO_2 emissions offset projects that have reduced or avoided atmospheric

loading of CO_2, CO_2 equivalent or sequestered carbon as demonstrated in accordance with the applicable provisions of this Subpart. The requirements of this Subpart seek to ensure that CO_2 offset allowances awarded represent CO_2 equivalent emission reductions or carbon sequestration that are real, additional, verifiable, enforceable, and permanent within the framework of a standards-based approach. Subject to the relevant compliance deduction limitations of paragraph XX-6.5(a)(3), CO_2 offset allowances may be used by any CO_2 budget source for compliance purposes.

XX-10.2 Definitions.

(a) *Anaerobic digester*. A device that promotes the decomposition of organic material to simple organics and gaseous biogas products, in the absence of elemental oxygen, usually accomplished by means of controlling temperature and volume, and including a methane recovery system.

(b) *Anaerobic digestion*. The decomposition of organic material including manure brought about through the action of microorganisms in the absence of elemental oxygen.

(c) *Anaerobic storage*. Storage of organic material in an oxygen-free environment, or under oxygen-free conditions, including but not limited to, holding tanks, ponds, and lagoons.

(d) *ANSI*. American National Standards Institute.

(e) *Biogas*. Gas resulting from the decomposition of organic matter under anaerobic conditions. The principle constituents are methane and carbon dioxide.

(f) *CO_2e*. CO_2e means carbon dioxide equivalent.

(g) *Conflict of interest*. A situation that may arise with respect to an individual in relation to any specific project sponsor, CO_2 emissions offset project or category of

offset projects, such that the individual's other activities or relationships with other persons or organizations render or may render the individual incapable of providing an impartial certification opinion, or otherwise compromise the individual's objectivity in performing certification functions.

(h) *Cooperating regulatory agency*. A regulatory agency in a state or United States jurisdiction that is not a participating state that has entered into a memorandum of understanding with the appropriate regulatory agencies of all participating states to carry out certain obligations relative to CO_2 emissions offset projects in that state or United States jurisdiction, including but not limited to the obligation to perform audits of offset project sites, and report violations of this Subpart.

(i) *Forest offset project*. An offset project involving reforestation, improved forest management, or avoided conversion.

(j) *Forest offset project data report*. The report prepared by a project sponsor each year that provides the information and documentation required by this Subpart or the forest offset protocol.

(k) *Forest offset protocol*. The protocol titled "Regional Greenhouse Gas Initiative Offset Protocol U.S. Forest Projects", published by the participating states on June 12, 2013.

(l) *Independent verifier*. An individual that has been approved by the REGULATORY AGENCY or its agent to conduct verification activities.

(m) *Intentional Reversal*. Any reversal caused by a forest owner's negligence, gross negligence, or willful intent, including harvesting, development, and harm to the area within the offset project boundary

(n) *Market penetration rate*. A measure of the diffusion of a technology, product, or practice in a defined market, as represented by the percentage of annual sales for a

product or practice, or as a percentage of the existing installed stock for a product or category of products, or as the percentage of existing installed stock that utilizes a practice. The REGULATORY AGENCY may determine an appropriate market definition and market penetration metric for a category of technology, product or practice, and may issue guidance specifying the technologies, products or practices that meet a specified market penetration rate.

(o) *Offset project*. An offset project includes all equipment, materials, items, or actions directly related to the reduction of CO_2 equivalent emissions or the sequestration of carbon specified in a consistency application submitted pursuant to section XX-10.4. Equipment, materials, items, or actions unrelated to an offset project reduction of CO_2 equivalent emissions or the sequestration of carbon, but occurring at a location where an offset project occurs, shall not be considered part of an offset project, unless specified at section XX-10.5.

(p) *Permanently retired*. A greenhouse gas allowance or credit has been "permanently retired" if it has been placed in a retirement account controlled by the jurisdiction that generated the allowance or credit, or has been placed in an allowance retirement account controlled by the REGULATORY AGENCY, or is otherwise determined by the REGULATORY AGENCY to have been rendered unusable.

(q) *Project commencement*. For an offset project involving physical construction, other work at an offset project site, or installation of equipment or materials, the date of the beginning of such activity. For an offset project that involves the implementation of a management activity or protocol, the date on which such activity is first implemented or such protocol first utilized. For an offset project involving reforestation, improved forest management, or avoided conversion, the date specified in section 3.2 of the forest offset protocol.

(r) *Regional-type anaerobic digester*. An anaerobic digester using feedstock from more than one agricultural operation, or importing feedstock from more than one

agricultural operation. Also commonly referred to as a "community digester" or "centralized digester."

(s) *Renewable portfolio standard*. A statutory or regulatory requirement that a load-serving entity provide a certain portion of the electricity it supplies to its customers from renewable energy sources, or any other statutory or regulatory requirement that a certain portion of electricity supplied to the electricity grid be generated from renewable energy sources.

(t) *Reporting Period*. The period of time covered by a forest offset project data report. The first reporting period for an offset project in an initial crediting period may consist of 6 to 24 consecutive months; all subsequent reporting periods in an initial crediting and all reporting periods in any renewed crediting period must consist of 12 consecutive months.

(u) *Reversal*. A GHG emission reduction or GHG removal enhancement for which CO_2 offset allowances have been issued that is subsequently released or emitted back into the atmosphere due to any intentional or unintentional circumstance.

(v) *System benefit fund*. Any fund collected directly from retail electricity or natural gas ratepayers.

(w) *Total solids*. Total solids are the total of all solids in a sample. They include the total suspended solids, total dissolved solids, and volatile suspended solids.

(x) *Transmission and/or distribution entity*. The assets and equipment used to transmit and distribute electricity from an electric generator to the electrical load of a customer. Includes all related assets and equipment located within the service territory of the entity, defined as the service territory of a load-serving entity specified by the applicable state regulatory agency.

(y) *Unintentional Reversal*. Any reversal, including, but not limited to, wildfires, insects, or disease that is not the result of the forest owner's negligence, gross negligence, or willful intent.

(z) *Verification*. The verification by an independent verifier that certain parts of a CO_2 emissions offset project consistency application and/or measurement, monitoring or verification report conforms to the requirements of this Subpart.

(aa) *Volatile solids*. The fraction of total solids that is comprised primarily of organic matter as defined in U.S.EPA Method Number 160.4, Methods for the Chemical Analysis of Water and Wastes (MCAWW) (EPA/600/4-79/020).

XX-10.3 General requirements.

(a) *Eligible CO_2 emissions offset projects*. To qualify for the award of CO_2 offset allowances, offset projects shall satisfy all the applicable requirements of XX-10.

(1) *Offset project types*. The following types of offset projects are eligible for the award of CO_2 offset allowances.

(i) Landfill methane capture and destruction;

(ii) Sequestration of carbon due to reforestation, improved forest management, or avoided conversion;

(iii) Avoided methane emissions from agricultural manure management operations.

(2) *Offset project locations*.

(i) To qualify for the award of CO_2 allowances under XX-10, eligible offset projects may be located in any of the following locations:

(a) In **[STATE]**; and

(b) In any state or United States jurisdiction in which a cooperating regulatory agency has entered into a memorandum of understanding with the appropriate regulatory agencies of all participating states to carry out

certain obligations relative to CO_2 emissions offset projects in that state or U.S. jurisdiction, including but not limited to the obligation to perform audits of offset project sites, and report violations of XX-10.

(ii) Projects located (in whole or in part) in one or more participating states are not eligible for CO_2 offset allowances under XX-10 unless more of the CO_2 equivalent emissions reduction or carbon sequestration due to the offset project is projected to occur in **[STATE]** than in any other participating state.

(b) *Project sponsor*. Any person may act as the sponsor of an eligible CO_2 emissions offset project, provided that person meets the requirements at section XX-10.4.

(c) *General additionality requirements.* Except as provided with respect to specific offset project standards in section XX-10.5, the following general requirements shall apply.

(1) CO_2 offset allowances shall not be awarded to an offset project that is required pursuant to any local, state or federal law, regulation, or administrative or judicial order. If an offset project receives a consistency determination under section XX-10.4 and is later required by local, state or federal law, regulation, or administrative or judicial order, then the offset project shall remain eligible for the award of CO_2 offset allowances until the end of its current allocation period but its eligibility shall not be extended for an additional allocation period.

(2) CO_2 offset allowances shall not be awarded to an offset project that includes an electric generation component, unless the project sponsor transfers legal rights to any and all attribute credits (other than the CO_2 offset allowances awarded under section XX-10.7) generated from the operation of the offset project that may be used for compliance with a

renewable portfolio standard or other regulatory requirement, to the REGULATORY AGENCY or its agent.

(3) CO_2 offset allowances shall not be awarded to an offset project that receives funding or other incentives from any system benefit fund, or funds or other incentives provided through the consumer benefit or strategic energy purpose allocation required pursuant to subdivision XX-5.3(b).

(4) CO_2 offset allowances shall not be awarded to an offset project that is awarded credits or allowances under any other mandatory or voluntary greenhouse gas program, except ~~for~~ as described in Section XX-10.5(b)(10).

(d) *Maximum allocation periods for CO_2 emissions offset projects*.

(1) *Maximum allocation periods*. Except as provided in paragraph (d)(2) of this section, the REGULATORY AGENCY may award CO_2 offset allowances under section XX-10.7 for an initial 10-year allocation period. At the end of the initial 10-year allocation period, the REGULATORY AGENCY may award CO_2 offset allowances for a second 10-year allocation period, provided the offset sponsor has submitted a consistency application pursuant to section XX-10.4 prior to the expiration of the initial allocation period, and the REGULATORY AGENCY has issued a consistency determination pursuant to paragraph XX-10.4(e)(2).

(2) *Maximum allocation period for involving reforestation, improved forest management, or avoided conversion*. The REGULATORY AGENCY may award CO_2 offset allowances under section XX-10.7 for any project involving reforestation, improved forest management, or avoided conversion offset project for an initial 25-year allocation period. At the end of the initial 25-year allocation period, or any subsequent crediting period, the REGULATORY AGENCY may award CO_2 offset allowances for a subsequent 25-year allocation period, provided the offset sponsor has

submitted a consistency application for the offset project pursuant to section XX-10.4 prior to the expiration of the initial allocation period, and the REGULATORY AGENCY has issued a consistency determination pursuant to paragraph XX-10.4(e)(2).

(e) *Offset project audit*. Project sponsors shall provide, in writing, an access agreement to the REGULATORY AGENCY granting the REGULATORY AGENCY or its agent access to the physical location of the offset project to inspect for compliance with this Subpart. For offset projects located in any state or other U.S. jurisdiction that is not a participating state, project sponsors shall also provide, in writing, an access agreement to the REGULATORY AGENCY granting the cooperating regulatory agency with access to the physical location of the offset project to inspect for compliance with this Subpart.

(f) *Ineligibility due to noncompliance*.

(1) If at any time the REGULATORY AGENCY determines that a project sponsor has not complied with the requirements of this Subpart, then the REGULATORY AGENCY may revoke and retire any and all CO_2 offset allowances in the project sponsor's account.

(2) If at any time the REGULATORY AGENCY determines that an offset project does not comply with the requirements of this Subpart, then the REGULATORY AGENCY may revoke any approvals it has issued relative to an offset project.

XX-10.4 Application process.

(a) *Establishment of general account.* The sponsor of an offset project must establish a general account under subdivision XX-6.2(b). All submissions to the REGULATORY AGENCY required for the award of CO_2 offset allowances under this Subpart must be from the CO_2 authorized account representative for the general

account of the sponsor of the relevant offset project, herein referred to as "project sponsor."

(b) *Consistency application deadlines.*

(1) For offset projects not involving reforestation, improved forest management, or avoided conversion the consistency application must be submitted by the date that is 6 months after the offset project is commenced.

(2) For offset projects involving reforestation, improved forest management, or avoided conversion the consistency application must be submitted by the date that is one year after the offset project is commenced, except for as described in Section XX 10.5(c)(9).

(3) Any consistency application that fails to meet the deadlines of this subdivision will result in the denial of the consistency application and the continued ineligibility of the subject offset project.

(c) *Consistency application contents*.

(1) For an offset project, the consistency application must include the following information.

(i) The project's sponsor's name, address, e-mail address, telephone number, facsimile transmission number, and account number.

(ii) The offset project description as required by the relevant provisions of section XX-10.5.

(iii) A demonstration that the offset project meets all applicable requirements set forth in this Subpart.

(iv) The emissions baseline determination as required by the relevant provisions of section XX-10.5.

(v) An explanation of how the projected reduction or avoidance of atmospheric loading of CO_2 or CO_2 equivalent or the sequestration

of carbon is to be quantified, monitored, and verified as required by the relevant provisions of section XX-10.5.

(vi) A completed consistency application agreement that reads as follows:

"The undersigned project sponsor recognizes and accepts that the application for, and the receipt of, CO_2 offset allowances under the CO_2 Budget Trading Program is predicated on the project sponsor following all the requirements of Subpart XX-10. The undersigned project sponsor holds the legal rights to the offset project, or has been granted the right to act on behalf of a party that holds the legal rights to the offset project. I understand that eligibility for the award of CO_2 offset allowances under Subpart XX-10 is contingent on meeting the requirements of Subpart XX-10. I authorize the REGULATORY AGENCY or its agent to audit this offset project for purposes of verifying that the offset project, including the monitoring and verification plan, has been implemented as described in this application. I understand that this right to audit shall include the right to enter the physical location of the offset project. I submit to the legal jurisdiction of **[RGGI PARTICIPATING STATE]**."

(vii) A statement and certification report signed by the offset project sponsor certifying that all offset projects for which the sponsor has received CO_2 offset allowances under this Subpart (or similar provisions in the rules of other participating states), under the sponsor's ownership or control (or under the ownership or control of any entity which controls, is controlled by, or has common control with the sponsor) are in compliance with all applicable requirements of the CO_2 Budget Trading Program in all participating states.

(vii) A verification report and certification statement signed by an independent verifier accredited pursuant to section XX-10.6 that

expresses that the independent verifier has reviewed the entire application and evaluated the following in relation to the applicable requirements at sections XX-10.3 and XX-10.5, and any applicable guidance issued by the REGULATORY AGENCY.

(a) The adequacy and validity of information supplied by the project sponsor to demonstrate that the offset project meets the applicable eligibility requirements of sections XX-10.3 and XX-10.5.

(b) The adequacy and validity of information supplied by the project sponsor to demonstrate baseline emissions pursuant to the applicable requirements at section XX-10.5.

(c) The adequacy of the monitoring and verification plan submitted pursuant to the applicable requirements at section XX-10.5.

(d) Such other evaluations and statements as may be required by the REGULATORY AGENCY.

(ix) Disclosure of any voluntary or mandatory programs, other than the CO_2 Budget Trading Program, to which greenhouse gas emissions data related to the offset project has been, or will be reported.

(x) For offset projects located in a state or United States jurisdiction that is not a participating state, a demonstration that the project sponsor has complied with all requirements of the cooperating regulatory agency in the state or United States jurisdiction where the offset project is located.

(2) Consistency applications shall be submitted in a format approved by the REGULATORY AGENCY.

(d) Consistency applications may not be submitted to **[REGULATORY AGENCY]** if a consistency application has already been submitted for the same project, or any portion of the same project, in another participating state, unless the consistency

application was rejected by another participating state solely because more of the CO_2 equivalent emissions reduction or carbon sequestration due to the offset project is projected to occur in **[STATE]** than in any other participating state.

(e) *REGULATORY AGENCY action on consistency applications.*

(1) *Completeness determination*. Within 30 days following receipt of the consistency application filed pursuant to subdivision (b) of this section, the REGULATORY AGENCY will notify the project sponsor whether the consistency application is complete. A complete consistency application is one that is in an approved form and is determined by the REGULATORY AGENCY to be complete for the purpose of commencing review of the consistency application. In no event shall a completeness determination prevent the REGULATORY AGENCY from requesting additional information in order to enable the REGULATORY AGENCY to make a consistency determination under paragraph (2) of this subdivision.

(2) *Consistency determination*. Within 90 days of making the completeness determination under paragraph (1) of this subdivision, the REGULATORY AGENCY will issue a determination as to whether the offset project is consistent with the requirements of sections XX-10.3 and XX-10.4 and the requirements of the applicable offset project standard of section XX-10.5. For any offset project found to lack consistency with these requirements, the REGULATORY AGENCY will inform the project sponsor of the offset project's deficiencies.

XX-10.5 CO_2 emissions offset project standards.

(a) *Landfill methane capture and destruction.* To qualify for the award of CO_2 offset allowances under XX-10, offset projects that capture and destroy methane from landfills shall meet the requirements of XX-10.5(a) and all other applicable requirements of XX-10.

(1) *Eligibility.* Eligible offset projects shall occur at landfills that are not subject to the New Source Performance Standards (NSPS) for municipal solid waste landfills, 40 CFR Part 60, Subpart Cc and Subpart WWW.

(2) *Offset project description*. The offset project sponsor shall provide a detailed narrative of the offset project actions to be taken, including documentation that the offset project meets the eligibility requirements of paragraph (1) of this subdivision.

The project narrative shall include the following information.

(i) Owner and operator of the offset project;

(ii) Location and specifications of the landfill where the offset project will occur, including waste in place;

(iii) Owner and operator of the landfill where the offset project will occur; and

(iv) Specifications of the equipment to be installed and a technical schematic of the offset project.

(3) *Emissions baseline determination*. The emissions baseline shall represent the potential fugitive landfill emissions of CH_4 (in tons of CO_2e), as represented by the CH_4 collected and metered for thermal destruction as part of the offset project, and calculated in accordance with this paragraph.

$$\text{Emissions (tons } CO_2e) = \frac{V \times M \times (1-OX) \times GWP}{2000}$$

Where:

V = volume of CH_4 collected (ft^3);

M = Mass of CH_4 per cubic foot (0.04246 lbs/ft^3 default value at 1 atmosphere, 20^o C);

OX= Oxidation factor (0.10), representing estimated portion of collected CH_4 that would have eventually oxidized to CO_2 if not collected; and

GWP = CO_2e global warming potential of CH_4 (28).

(4) *Calculating emissions reductions*. Emissions reductions shall be determined based on potential fugitive CH_4 emissions that would have occurred at the landfill if metered CH_4 collected from the landfill for thermal destruction as part of the offset project was not collected and destroyed. CO_2e emissions reductions shall be calculated as follows:

$$\text{Emissions Reductions (tons } CO_2e) = \frac{V \times M \times (1-OX) \times C_{ef} \times GWP}{2000}$$

Where:

V = Volume of CH_4 collected (ft_3);

M = Mass of CH_4 per cubic foot (0.04246 lbs/ft^3 default value at 1 atmosphere and 20^o C);

OX= Oxidation factor (0.10), representing estimated portion of collected CH_4 that would have eventually oxidized to CO_2 if not collected;

C_{ef} = Combustion efficiency of methane control technology (0.98); and

GWP = CO_2e global warming potential of CH_4 (28).

(5) *Monitoring and verification requirements*. Offset projects shall employ a landfill gas collection system that provides continuous metering and data computation of landfill gas volumetric flow rate and CH_4 concentration. Annual monitoring and verification reports shall include monthly volumetric flow rate and CH_4 concentration data, including documentation that the

CH_4 was actually supplied to the combustion source. Monitoring and verification is also subject to the following requirements.

(i) The project sponsor shall submit a monitoring and verification plan as part of the consistency application that includes a quality assurance and quality control program associated with equipment used to determine landfill gas volumetric flow rate and CH_4 composition. The monitoring and verification plan shall also include provisions for ensuring that measuring and monitoring equipment is maintained, operated, and calibrated based on manufacturer recommendations, as well as provisions for the retention of maintenance records for audit purposes. The monitoring and verification plan shall be certified by an independent verifier accredited pursuant to section XX-10.6.

(ii) The project sponsor shall annually verify landfill gas CH_4 composition through landfill gas sampling and independent laboratory analysis using applicable U.S. Environmental Protection Agency laboratory test methods.

(b) *Sequestration of carbon due to reforestation, improved forest management, or avoided conversion.* To qualify for the award of CO_2 offset allowances under XX-10, offset projects that involve reforestation, improved forest management, or avoided conversion shall meet all requirements of XX-10.5(b) and the forest offset protocol, and all other applicable requirements of XX-10.

(1) *Eligibility*. Eligible forest offset projects shall satisfy all eligibility requirements of the forest offset protocol and this Subpart.

(2) *Offset project descriptio*n. The offset project sponsor shall provide a detailed narrative of the offset project actions to be taken, including documentation that the offset project meets the eligibility requirements of paragraph (1) of this subdivision. The offset project description must include all information identified in sections 8.1 and 9.1 of the forest offset

protocol, and any other information deemed necessary by the REGULATORY AGENCY.

(3) *Carbon sequestration baseline determination*. Baseline onsite carbon stocks shall be determined as required by sections 6.1.1, 6.1.2, 6.2.1, 6.2.2, 6.2.3, 6.3.1, and 6.3.2 of the forest offset protocol, as applicable.

(4) *Calculating carbon sequestered*. Net GHG reductions and GHG removal enhancements shall be calculated as required by section 6 of the forest offset protocol. The project's risk reversal rating shall be calculated using the forest offset protocol Determination of a Forest Project's Reversal Risk Rating assessment worksheet.

(5) *Monitoring and verification requirements*. Monitoring and verification is subject to the following requirements.

(i) Monitoring and verification reports shall include all forest offset project data reports submitted to the REGULATORY AGENCY, including any additional data required by section 9.2.2 of the forest offset protocol.

(ii) The consistency application shall include a monitoring and verification plan certified by an independent verifier accredited pursuant to section XX-10.6. The monitoring and verification plan shall consist of a forest carbon inventory program, as required by section 8.1 of the forest offset protocol.

(iii) Monitoring and verification reports shall be submitted not less than every six years, except that the first monitoring and verification report for reforestation projects must be submitted within twelve years of project commencement

(6) *Forest Offset Project Data Reports*. A project sponsor shall submit a forest offset Project data report to the REGULATORY AGENCY for each reporting period. Each forest offset project data report must cover a single reporting period. Reporting periods must be contiguous; there must be no gaps in reporting once the first reporting period has commenced.

(7) Prior to the award of CO_2 offset allowances pursuant to XX-10.7, or to any surrender of allowances pursuant to XX-10.5(b)(8)(ii)(c), any quantity expressed in metric tons, or metric tons of CO_2 equivalent, shall be converted to tons using the conversion factor specified in XX-1.2.

(8) *Carbon sequestration permanence*. The offset project shall meet the following requirements to address reversals of sequestered carbon.

(i) *Unintentional reversals.* Requirements for unintentional reversals are as follows:

(a) The project sponsor must notify the REGULATORY AGENCY of the reversal and provide an explanation for the nature of the unintentional reversal within 30 calendar days of its discovery; and

(b) The project sponsor must submit to the REGULATORY AGENCY a verified estimate of current carbon stocks within the offset project boundary within one year of the discovery of the unintentional reversal.

(ii) *Intentional Reversals.* Requirements for intentional reversals are as follows:

(a) If an intentional reversal occurs, the project sponsor shall, within 30 calendar days of the intentional reversal:

(1) Provide notice, in writing, to the REGULATORY AGENCY of the intentional reversal; and

(2) Provide a written description and explanation of the intentional reversal to the REGULATORY AGENCY.

(b) Within one year of the occurrence of an intentional reversal, the project sponsor shall submit to the REGULATORY AGENCY a verified estimate of current carbon stocks within the offset project boundary.

(c) If an intentional reversal occurs, and CO_2 offset allowances have been awarded to the offset project, the forest owner

must surrender to the REGULATORY AGENCY or its agent for retirement a quantity of CO_2 allowances corresponding to the quantity of CO_2 equivalent tons reversed within six months of notification by the REGULATORY AGENCY.

(1) Notification by the REGULATORY AGENCY will occur after the verified estimate of carbon stocks has been submitted to the REGULATORY AGENCY, or after one year has elapsed since the occurrence of the reversal if the project sponsor fails to submit the verified estimate of carbon stocks.

(2) If the forest owner does not surrender valid CO_2 allowances to the REGULATORY AGENCY within six months of notification by the REGULATORY AGENCY, the forest owner will be subject to enforcement action and each CO_2 equivalent ton of carbon sequestration reversed will constitute a separate violation of this Part and applicable state law.

(d) *Project Termination.* Requirements for project termination are as follows:

(1) The project sponsor must surrender to the REGULATORY AGENCY or its agent for retirement a quantity of CO_2 Allowances in the amount calculated pursuant to project termination provisions in the forest offset protocol within six months of project termination.

(2) If the project sponsor does not surrender to the REGULATORY AGENCY or its agent a quantity of CO_2 Allowances in the amount calculated pursuant to project termination provisions in the forest offset

protocol within six months of project termination, they will be subject to enforcement action and each CO_2 offset allowance not surrendered will constitute a separate violation of this Part and applicable state law

(iii) *Disposition of Forest Sequestration Projects After a Reversal.* If a reversal lowers the forest offset project's actual standing live carbon stocks below its project baseline standing live carbon stocks, the forest offset project will be terminated by the REGULATORY AGENCY.

(9) *Timing of forest offset projects.* The REGULATORY AGENCY may award CO_2 offset allowances under section XX-10.7 only for forest offset projects that are initially commenced on or after January 1, 2014.

(10) *Projects that Have Been Awarded Credits by a Voluntary Greenhouse Gas Reduction Program*. The provisions of paragraphs XX-10.3(c)(4) and XX-10.4(b)(2) shall not apply to forest projects that have been awarded credits under a voluntary greenhouse gas reduction program provided that the following conditions are satisfied. For such projects, the number of CO_2 Offset Allowances will be calculated pursuant to the requirements of XX-10.5(b), without regard to quantity of credits that were awarded to the project under the voluntary program.

(i) The project satisfies all other general requirements of XX-10, including all specific requirements of XX-10.5(b), for all reporting periods for which the project has been awarded credits under a voluntary greenhouse gas program and also intends to be awarded CO_2 offset allowances pursuant to XX-10.7.

(ii) At the time of submittal of the consistency application for the project, the project submits forest offset data reports and a monitoring and verification report covering all reporting periods for which the project has been awarded credits under a voluntary greenhouse gas program and also intends to be awarded CO_2

offset allowances pursuant to XX-10.7. Forest offset data reports and monitoring and verification reports must meet all requirements of XX-10.5(b)(5) and (6).

(iii) The consistency application includes information sufficient to allow the Department to make the following determinations, and the voluntary greenhouse gas program has published information on its website to allow the Department to verify the information included in the consistency application.

(a) The offset project has met all legal and contractual requirements to allow it to terminate its relationship with the voluntary greenhouse gas program, and such termination has been completed.

(b) The project sponsor or voluntary greenhouse gas program has cancelled or retired all credits that were awarded for carbon sequestration that occurred during the time periods for which the project intends to be awarded CO_2 offset allowances pursuant to XX-10.7, and such credits were cancelled or required for the sole purpose of allowing the project to be awarded CO_2 offset allowances pursuant to XX-10.7.

(c) *Avoided methane emissions from agricultural manure management operations*. To qualify for the award of CO_2 offset allowances under XX-10, offset projects that capture and destroy methane from animal manure and organic food waste using anaerobic digesters shall meet the requirements of XX-10.5(c) and all other applicable requirements of XX-10.

(1) *Eligibility*.

(i) Eligible offset projects shall consist of the destruction of that portion of methane generated by an anaerobic digester that would have

been generated in the absence of the offset project through the uncontrolled anaerobic storage of manure or organic food waste.

(ii) Eligible offset projects shall employ only manure-based anaerobic digester systems using livestock manure as the majority of digester feedstock, defined as more than 50% of the mass input into the digester on an annual basis. Organic food waste used by an anaerobic digester shall only be that which would have been stored in anaerobic conditions in the absence of the offset project.

(iii) The provisions of paragraphs XX-10.3(c)(2) and (3) shall not apply to agricultural manure management offset projects provided either of the following requirements are met.

(a) The offset project is located in a state that has a market penetration rate for anaerobic digester projects of 5% or less. The market penetration determination shall utilize the most recent market data available at the time of submission of the consistency application pursuant to section XX-10.4 and shall be determined as follows:

$$MP\ (\%) = MG_{AD} / MG_{STATE}$$

Where:

MG_{AD} = Average annual manure generation for the number of dairy cows and swine serving all anaerobic digester projects in the applicable state at the time of submission of a consistency application pursuant to section XX-10.4.

MG_{STATE} = average annual manure production of all dairy cows and swine in the state at the time of submission of a consistency application pursuant to section XX-10.4.

(b) The offset project is located at a farm with 4,000 or less head of dairy cows, or a farm with equivalent animal units, assuming an average live weight for dairy cows (lbs./cow) of 1,400 lbs., or, if the project is a regional-type digester, total annual manure input to the digester is designed to be less than the average annual manure produced by a farm with 4,000 or less head of dairy cows, or a farm with equivalent animal units, assuming an average live weight for dairy cows (lbs./cow) of 1,400 lbs.

(2) *Offset project description.* The offset project sponsor shall provide a detailed narrative of the offset project actions to be taken, including documentation that the offset project meets the eligibility requirements of paragraph (1) of this subdivision. The offset project narrative shall include the following information:

(i) Owner and operator of the offset project;

(ii) Location and specifications of the facility where the offset project will occur;

(iii) Owner and operator of the facility where the offset project will occur;

(iv) Specifications of the equipment to be installed and a technical schematic of the offset project; and

(v) Location and specifications of the facilities from which anaerobic digester influent will be received, if different from the facility where the offset project will occur.

(3) *Emissions baseline determination.* The emissions baseline shall represent the potential emissions of the CH_4 that would have been produced in a baseline scenario under uncontrolled anaerobic storage conditions and released directly to the atmosphere in the absence of the offset project.

(i) Baseline CH_4 emissions shall be calculated as follows**:**

$$E_b = \frac{V_m \times M}{2000} \times GWP$$

Where:

E_b = Potential CO_2e emissions due to calculated CH_4 production under site-specific anaerobic storage and weather conditions (tons);

V_m = Volume of CH_4 produced each month from decomposition of volatile solids in a baseline uncontrolled anaerobic storage scenario under site-specific storage and weather conditions for the facility at which the manure or organic food waste is generated (ft^3);

M = Mass of CH_4 per cubic foot (0.04246 lb/ft^3 default value at one atmosphere and 20°C); and

GWP = Global warming potential of CH_4 (28).

(ii) The estimated amount of volatile solids decomposed each month under the uncontrolled anaerobic storage baseline scenario (kg) shall be calculated as follows:

$VS_{dec} = VS_{avail} \times f$

Where:

VS = volatile solids as determined from the equation:

$VS = M_m \times TS_{\%} \times VS_{\%}$

Where:

M_m = mass of manure or organic food waste produced per month (kg)

$TS_{\%}$ = concentration (percent) of total solids in manure or organic food waste as determined through EPA 160.3 testing method (U.S.EPA Method Number 160.3, Methods for the Chemical Analysis of Water and Wastes (MCAWW) (EPA/600/4-79/020));

$VS_{\%}$ = concentration (percent) of volatile solids in total solids as determined through EPA 160.4 testing method (U.S.EPA Method Number 160.4, Methods for the Chemical Analysis of Water and Wastes (MCAWW) (EPA/600/4-79/020)); and

VS_{avail} = volatile solids available for decomposition in manure or organic food waste storage each month as determined from the equation:

$$VS_{avail} = VS_p + \tfrac{1}{2} VS_{in} - VS_{out}$$

Where:

VS_p = volatile solids present in manure or organic food waste storage at beginning of month (left over from previous month) (kg);

VS_{in} = volatile solids added to manure or organic food waste storage during the course of the month (kg). The factor of ½ is multiplied by this number to represent the average mass of volatile solids available for decomposition for the entire duration of the month;

VS_{out} = volatile solids removed from the manure or organic food waste storage for land application or export (assumed value based on standard farm practice); and

f = van't Hoff-Arrhenius factor for the specific month as determined using the equation below. Using a base temperature of 30° C, the equation is as follows:

$$f = \exp\left[\frac{E(T_2 - T_1)}{GC \times T_1 \times T_2}\right]$$

Where:

f = conversion efficiency of VS to CH_4 per month;

E = activation energy constant (15,175 cal/mol);

T_2 = average monthly ambient temperature for facility where manure or organic food waste is generated (converted from ^{o} Celsius to ^{o} Kelvin) as determined from the nearest National Weather Service certified weather station (if reported temperature ^{o} C > 5^{o} C; if reported temperature ^{o}C < 5^{o} C, then f = 0.104);

T_1 = 303.15 (30^{o} C converted to ^{o}K); and

GC = ideal gas constant (1.987 cal/K mol)

(iii) The volume of CH_4 produced (ft^3) from decomposition of volatile solids shall be calculated as follows:

$V_m = (VS_{dec} \times B_o) \times 35.3147$

Where:

V_m = volume of CH_4 (ft^3)

VS_{dec} = volatile solids decomposed (kg)

B_o = manure or organic food waste type-specific maximum methane generation constant (m^3 CH_4/kg VS decomposed). For dairy cow manure, B_o = 0.24 m^3 CH_4/kg VS decomposed. The methane generation constant for other types of manure shall be those cited at U.S. EPA, Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2010, Annex 3, Table A 180 (U.S. EPA, February 2017) , unless the project sponsor proposes an alternate methane generation constant and that alternate is approved by the REGULATORY AGENCY. If the project sponsor proposes to use a methane generation constant other than the ones found in the above-cited reference, the project sponsor must provide justification and documentation to the REGULATORY AGENCY.

(4) *Calculating emissions reductions.* Emissions reductions shall be calculated as follows:

$ER_t = E_b – E_p$

Where:

ER_t = CO_2e emissions reductions due to project activities (tons);

E_b = Potential CO_2e emissions due to calculated CH_4 production under site-specific anaerobic storage and weather conditions (tons);

E_p = CO_2e emissions due to project activities additional to baseline (tons), including, but not limited to, manure transportation, flaring, venting, and effluent management.

Emissions reductions may not exceed the potential emissions of the anaerobic digester, as represented by the annual volume of CH_4 produced by the anaerobic digester, as monitored pursuant to paragraph (5) of this

subdivision. CO_2 emissions due to transportation of manure and organic food waste from the site where the manure and organic food waste was generated to the anaerobic digester shall be subtracted from the emissions reduction calculated pursuant to subparagraphs (3)(i) through (iii) of this subdivision. Transport CO_2 emissions shall be determined through one of the following methods:

(i) Documentation of transport fuel use for all shipments of manure and organic food waste from off-site to the anaerobic digester during each reporting year and a log of transport miles for each shipment. Off-site is defined as a location that is not contiguous with the property where the anaerobic digester is located. CO_2 emissions shall be determined through the application of an emissions factor for the fuel type used. If this option is chosen, the following emissions factors shall be applied as appropriate.

(a) Diesel fuel: 22.912 lbs. CO_2/gallon.

(b) Gasoline: 19.878 lbs. CO_2/gallon.

(c) Other fuel: submitted emissions factor approved by the REGULATORY AGENCY.

(ii) Documentation of total tons of manure and organic food waste transported from off-site for input into the anaerobic digester during each reporting year, as monitored pursuant to subparagraph (5)(i) of this subdivision, and a log of transport miles and fuel type used for each shipment. CO_2 emissions shall be determined through the application of a ton-mile transport emission factor for the fuel type used. If this option is chosen, the following emissions factors shall be applied as appropriate for each ton of manure delivered, and multiplied by the number of miles transported.

(a) Diesel fuel: 0.131 lbs. CO_2 per ton-mile.

(b) Gasoline: 0.133 lbs. CO_2 per ton-mile.

(c) Other fuel: submitted emissions factor approved by the REGULATORY AGENCY.

(5) *Monitoring and verification requirements.* Offset projects shall employ a system that provides metering of biogas volumetric flow rate and determination of CH_4 concentration. Annual monitoring and verification reports shall include monthly biogas volumetric flow rate and CH_4 concentration determination. Monitoring and verification shall also meet the following requirements.

(i) If the offset project is a regional-type digester, manure and organic food waste from each distinct source supplying to the anaerobic digester shall be sampled monthly to determine the amount of volatile solids present. Any emissions reduction will be calculated according to mass of manure and organic food waste (kg) being digested and percentage of volatile solids present before digestion, consistent with the requirements at paragraph (3) and subparagraph (5)(iii) of this subdivision, and apportioned accordingly among sources. The project sponsor shall provide supporting material and receipts tracking the monthly receipt of manure and organic food waste (kg) used to supply the anaerobic digester from each supplier.

(ii) If the offset project includes the digestion of organic food waste eligible pursuant to subparagraph (1)(ii) of this subdivision, organic food waste shall be sampled monthly to determine the amount of volatile solids present before digestion, consistent with the requirements at paragraph (3) and subparagraph (5)(iii) of this subdivision, and apportioned accordingly.

(iii) The project sponsor shall submit a monitoring and verification plan as part of the consistency application that includes a quality assurance and quality control program associated with equipment used to determine biogas volumetric flow rate and CH_4 composition.

The monitoring and verification plan shall be specified in accordance with the applicable monitoring requirements listed in Table 8 below. The monitoring and verification plan shall also include provisions for ensuring that measuring and monitoring equipment is maintained, operated, and calibrated based on manufacturer's recommendations, as well as provisions for the retention of maintenance records for audit purposes. The monitoring and verification plan shall be certified by an independent verifier accredited pursuant to section XX-10.6.

Table 8. Monitoring requirements

Parameter	Measurement Unit	Frequency of Sampling	Sampling Method(s)
Influent flow (mass) into the digester	Kilograms (kg) per month (wet mass)	Monthly total into the digester	a) Recorded mass b) Digester influent pump flow c) Livestock population and application of American Society of Agricultural and Biological Engineers (ASABE) standard (ASAE D384.2, March 2005)
Influent total solids concentration (TS)	Percent (of sample)	Monthly, depending upon recorded variations	U.S. EPA Method Number 160.3, Methods for the Chemical Analysis of Water and Wastes (MCAWW) (EPA/600/4-79/020)

Parameter	Measurement Unit	Frequency of Sampling	Sampling Method(s)
Influent volatile solids (VS) concentration	Percent (of TS)	Monthly, depending upon recorded variations	USEPA Method Number 160.4, Methods for the Chemical Analysis of Water and Wastes (MCAWW) (EPA/600/4-79/020)
Average monthly ambient temperature	Temperature ^{o}C	Monthly (based on farm averages)	Closest National Weather Service-certified weather station
Volume of biogas produced by digester	Standard cubic feet (scf)	Continuous, totalized monthly	Flow meter
Methane composition of biogas produced by digester	Percent (of sample)	Quarterly	Bag sampling and third party laboratory analysis using applicable U.S. EPA test methods

XX-10.6 Accreditation of independent verifiers.

(a) *Standards for accreditation*. Independent verifiers may be accredited by the REGULATORY AGENCY to provide verification services as required of project sponsors under this Subpart, provided that independent verifiers meet all of the requirements of this section.

(1) *Verifier minimum requirements*. Each accredited independent verifier shall demonstrate knowledge of the following topics:

(i) Utilizing engineering principles;

(ii) Quantifying greenhouse gas emissions;

(iii) Developing and evaluating air emissions inventories;

(iv) Auditing and accounting principles;

(v) Knowledge of information management systems;

(vi) Knowledge of the requirements of this Subpart and other applicable requirements of this Part; and

(vii) Such other qualifications as may be required by the REGULATORY AGENCY to provide competent verification services as required for individual offset categories specified at section XX-10.5.

(2) *Organizational qualifications*. Accredited independent verifiers shall demonstrate that they meet the following requirements:

(i) Verifiers shall have no direct or indirect financial relationship, beyond a contract for provision of verification services, with any offset project developer or project sponsor;

(ii) Verifiers shall employ staff with professional licenses, knowledge, and experience appropriate to the specific category(ies) of offset projects at section XX-10.5 that they seek to verify.

(iii) Verifiers shall hold a minimum of one million U.S. dollars of professional liability insurance. If the insurance is in the name of a related entity, the verifier shall disclose the financial relationship between the verifier and the related entity, and provide documentation supporting the description of the relationship; and

(iv) Verifiers shall demonstrate that they have implemented an adequate management protocol to identify potential conflicts of interest with regard to an offset project, offset project developer, or project sponsor, or any other party with a direct or indirect financial interest in an offset project that is seeking or has been granted approval of a consistency application pursuant to subdivision XX-10.4(e), and remedy any such conflicts of interest prior to providing verification services.

(3) *Pre-qualification of verifiers*. The REGULATORY AGENCY may require prospective verifiers to successfully complete a training course, workshop, or test developed by the REGULATORY AGENCY or its agent, prior to submitting an application for accreditation.

(b) *Application for accreditation*. An application for accreditation shall not contain any proprietary information, and shall include the following:

(1) The applicant's name, address, e-mail address, telephone number, and facsimile transmission number;

(2) Documentation that the applicant has at least two years of experience in each of the knowledge areas specified at subparagraphs (a)(1)(i) through (v) of this section, and as may be required pursuant to subparagraph (a)(1)(vii) of this section;

(3) Documentation that the applicant has successfully completed the requirements at paragraph (a)(3) of this section, as applicable;

(4) A sample of at least one work product that provides supporting evidence that the applicant meets the requirements at paragraphs (a)(1) and (2) of this section. The work product shall have been produced, in whole or part, by the applicant and shall consist of a final report or other material provided to a client under contract in previous work. For a work product that was jointly produced by the applicant and another entity, the role of the applicant in the work product shall be clearly explained;

(5) Documentation that the applicant holds professional liability insurance as required pursuant to subparagraph (a)(2)(iii) of this section; and

(6) Documentation that the applicant has implemented an adequate management protocol to address and remedy any conflict of interest issues that may arise, as required pursuant to subparagraph (a)(2)(iv) of this section.

(c) *REGULATORY AGENCY action on applications for accreditation*. The REGULATORY AGENCY shall approve or deny a complete application for accreditation within 45 days after submission. Upon approval of an application for accreditation, the independent verifier shall be accredited for a period of three years from the date of application approval.

(d) *Reciprocity*. Independent verifiers accredited in other participating states may be deemed to be accredited in **[INSERT NAME OF RGGI STATE]**, at the discretion of the REGULATORY AGENCY.

(e) *Conduct of accredited verifiers.*

(1) Prior to engaging in verification services for an offset project sponsor, the accredited verifier shall disclose all relevant information to the REGULATORY AGENCY to allow for an evaluation of potential conflict of interest with respect to an offset project, offset project developer, or project sponsor. The accredited verifier shall disclose information concerning its ownership, past and current clients, related entities, as well as any other facts or circumstances that have the potential to create a conflict of interest.

(2) Accredited verifiers shall have an ongoing obligation to disclose to the REGULATORY AGENCY any facts or circumstances that may give rise to a conflict of interest with respect to an offset project, offset project developer, or project sponsor.

(3) The REGULATORY AGENCY may reject a verification report and certification statement from an accredited verifier, submitted as part of a consistency application required pursuant to subdivision XX-10.4(b) or submitted as part of a monitoring and verification report submitted pursuant to subdivision XX-10.7(b), if the REGULATORY AGENCY determines that the accredited verifier has a conflict of interest related to the offset project, offset project developer, or project sponsor.

(4) The REGULATORY AGENCY may revoke the accreditation of a verifier at any time given cause, for the following:

(i) Failure to fully disclose any issues that may lead to a conflict of interest situation with respect to an offset project, offset project developer, or project sponsor;

(ii) The verifier is no longer qualified due to changes in staffing or other criteria;

(iii) Negligence or neglect of responsibilities pursuant to the requirements of this Subpart; and

(iv) Intentional misrepresentation of data or other intentional fraud.

XX-10.7 Award and Recordation of CO_2 offset allowances.

(a) *Quantities of CO_2 offset allowances awarded, and subsequently recorded*.

(1) *Award of CO_2 offset allowances*.

(i) *CO_2 emissions offset projects*. Following the issuance of a consistency determination under paragraph XX-10.4(e)(2) and the approval of a monitoring and verification report under the provisions of subdivision (e) of this section, the REGULATORY AGENCY will award one CO_2 offset allowance for each ton of demonstrated reduction in CO_2 or CO_2 equivalent emissions or sequestration of CO_2.

(2) *Recordation of CO_2 offset allowances*. After CO_2 offset allowances are awarded under XX-10.7(a)(1), the **[REGULATORY AGENCY]** shall record such CO_2 offset allowances in the project sponsor's general account.

(b) *Deadlines for submittal of monitoring and verification reports.*

(1) For CO_2 emissions offset projects undertaken prior to January 1, 2009, the project sponsor must submit the monitoring and verification report covering the pre-2009 period by June 30, 2009.

(2) For CO_2 emissions offset projects undertaken on or after January 1, 2009, the monitoring and verification report must be submitted within 6 months following the completion of the last calendar year during which the offset project achieved CO_2 equivalent reductions or sequestration of CO_2 for which the project sponsor seeks the award of CO_2 offset allowances.

(c) *Contents of monitoring and verification reports.* For an offset project, the monitoring and verification report must include the following information.

(1) The project's sponsor's name, address, e-mail address, telephone number, facsimile transmission number, and account number;

(2) The CO_2 emissions reduction or CO_2 sequestration determination as required by the relevant provisions of section XX-10.5, including a demonstration that the project sponsor complied with the required quantification, monitoring, and verification procedures under section XX-10.5, as well as those outlined in the consistency application approved pursuant to paragraph XX-10.4(e)(2).

(3) A signed statement that reads "The undersigned project sponsor hereby confirms and attests that the offset project upon which this monitoring and verification report is based is in full compliance with all of the requirements of Subpart XX-10. The project sponsor holds the legal rights to the offset project, or has been granted the right to act on behalf of a party that holds the legal rights to the offset project. I understand that eligibility for the award of CO_2 offset allowances under Subpart XX-10 is contingent on meeting the requirements of Subpart XX-10. I authorize the REGULATORY AGENCY or its agent to audit this offset project for purposes of verifying that the offset project, including the monitoring and verification plan, has been implemented as described in the consistency application that was the subject of a consistency determination by the REGULATORY AGENCY. I understand that this right to audit shall include the right to enter the physical location of the offset project and to make available to the REGULATORY AGENCY or its agent any and all documentation relating to the offset project at the REGULATORY AGENCY's request. I submit to the legal jurisdiction of **[RGGI PARTICIPATING STATE]**."

(4) A certification signed by the offset project sponsor certifying that all offset projects for which the sponsor has received offset allowances under this

Subpart (or similar provisions in the rules of other participating states), under the sponsor's ownership or control (or under the ownership or control of any entity which controls, is controlled by, or has common control with the sponsor) are in compliance with all applicable requirements of the CO_2 Budget Trading Program in all participating states.

(5) A verification report and certification statement signed by an independent verifier accredited pursuant to section XX-10.6 that documents that the independent verifier has reviewed the monitoring and verification report and evaluated the following in relation to the applicable requirements at section XX-10.5, and any applicable guidance issued by the REGULATORY AGENCY.

(i) The adequacy and validity of information supplied by the project sponsor to determine CO_2 emissions reductions or CO_2 sequestration pursuant to the applicable requirements at section XX-10.5.

(ii) The adequacy and consistency of methods used to quantify, monitor, and verify CO_2 emissions reductions and CO_2 sequestration in accordance with the applicable requirements at section XX-10.5 and as outlined in the consistency application approved pursuant to paragraph XX-10.4(e)(2).

(iii) Such other evaluations and verification reviews as may be required by the REGULATORY AGENCY. The adequacy and validity of information supplied by the project sponsor to demonstrate that the offset project meets the applicable eligibility requirements of section XX-10.5.

(6) Disclosure of any voluntary or mandatory programs, other than the CO_2 Budget Trading Program, to which greenhouse gas emissions data related to the offset project has been, or will be reported.

(7) For offset projects located in a state or United States jurisdiction that is not a participating state, a demonstration that the project sponsor has complied with all requirements of the cooperating regulatory agency in the state or United States jurisdiction where the offset project is located.

(d) *Prohibition against filing monitoring and verification reports in more than one participating state*. Monitoring and verification reports may only be filed under XX-10.7 for projects that have received consistency determinations under XX-10.4(e)(2) Monitoring and verification reports may not be filed under XX-10.7 for projects that have received consistency determinations in other participating states.

(e) *REGULATORY AGENCY action on monitoring and verification reports*. The REGULATORY AGENCY will approve or deny a complete monitoring and verification report, in a format approved by the REGULATORY AGENCY, filed with the REGULATORY AGENCY pursuant to XX-10.7(d), within 45 days following receipt of a complete report. A complete monitoring and verification report is one that is in an approved form and is determined by the REGULATORY AGENCY to be complete for the purpose of commencing review of the monitoring and verification report. In no event shall a completeness determination prevent the REGULATORY AGENCY from requesting additional information in order to enable the REGULATORY AGENCY to approve or deny a monitoring and verification report submitted in a format approved by the REGULATORY AGENCY, and filed under XX-10.7.

Attachment 35

The Regional Greenhouse Gas Initiative
an initiative of Eastern States of the US

About the Regional Greenhouse Gas Initiative

The **Regional Greenhouse Gas Initiative (RGGI)** is a cooperative effort among eleven Eastern states to reduce carbon dioxide (CO_2) emissions from power plants within each participating state.

Together, the participating states have established a **regional cap** on CO_2 emissions, which sets a limit on the emissions from regulated power plants within the RGGI states. Over time, the regional cap declines, so that CO_2 emissions decrease in a planned and predictable way. Since its inception, RGGI emissions have reduced by more than 50%—twice as fast as the nation as a whole—and raised over $4 billion to invest into local communities.

Who are the RGGI states? *The participating RGGI states include Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont, and Virginia.*

How Does RGGI Work?

RGGI is a market-based cap-and-invest initiative. Within the RGGI states, regulated power plants must acquire one **RGGI CO_2 allowance** for every short ton of CO_2 they emit. The RGGI states distribute allowances at quarterly auctions, where they can be purchased by power plants and other entities. Some states hold a limited number of allowances in set-aside accounts to sell at a fixed price or otherwise distribute outside of the auction process.

Each participating state originates allowances in proportion to its share of the regional cap. To comply with their state's regulations, power plants sized 25 megawatts[1] or greater must acquire enough RGGI allowances to cover their emissions. See **Tracking and Compliance** on page 2 for more details.

Happening Now: Third Program Review

The RGGI states work together to develop a Model Rule, which acts as a template for each state to shape its own **CO_2 budget trading program**. Once a state has implemented its program it is able to participate in RGGI auctions and access other shared aspects of this regional effort.

The RGGI states periodically conduct **Program Review** to examine the successes, impacts, and design of their CO_2 budget trading programs, and to consider updates to the Model Rule and their individual state programs. During the first two Program Reviews, the states implemented changes that improved program design and reduced the regional emissions cap. In September 2021, the states launched the Third Program Review, which will include opportunities for public engagement. For more information, visit the Program Review page of the RGGI website.

Investing in a Clean and Equitable Future

*The RGGI states receive the proceeds from selling RGGI allowances, and each state has discretion over how to best use their proceeds. Most of the proceeds have been invested by states back into their communities, including funding of clean energy programs, energy efficiency, and bill assistance to local businesses and communities. Investments targeting low-income households have increased over time and reached 16% of total proceeds in 2019. View the **Investment of RGGI Proceeds** page of the RGGI website to see the latest report on how RGGI proceeds are supporting a clean energy future across the region.*

[1] In New York, power plants sized 15 megawatts or greater are regulated under RGGI.

About RGGI Auctions and Allowance Tracking

Auctions are the primary method by which the RGGI states distribute CO_2 allowances. Auctioning allowances ensures all parties have access to allowances under uniform terms, helps establish a market-based value for the price of CO_2 allowances, avoids windfall profits for power plant owners, and supports investments in a clean and equitable future. The RGGI states have established multiple ways to enhance market stability, described in **Auction Mechanisms** below. An independent market monitor provides oversight of the auctions, as well as activity on the secondary market, to ensure integrity of, and confidence in, the market. You can learn more and view the Market Monitor reports here.

Auction Mechanisms

The RGGI auction mechanisms are designed to provide some measure of stability to the market. The **Minimum Reserve Price** is the minimum price that allowances can be sold for at a RGGI auction. In 2021, the reserve price is $2.38 per allowance.

The **Cost Containment Reserve (CCR)** and **Emissions Containment Reserve (ECR)** are reserves of allowances that help provide market stability if the cost of reducing emissions is higher or lower than expected. CCR allowances are made available for sale at an auction if the allowance price would otherwise exceed a set trigger price. Conversely, ECR allowances are withheld from sale at an auction, if the price would otherwise fall below a set trigger price. In 2021, the CCR trigger price is $13.00 and the ECR trigger price is $6.00. For more information about auction mechanisms, visit the Elements of RGGI page of the RGGI website.

Setting the Auction Clearing Price

All the allowances sold at any one auction are sold at the same price. The price for an allowance is set at the value where demand for allowances equals the available supply.

To find this price, available allowances are awarded to bidders based on bid price from high to low until no allowances remain. The price of the lowest bid to be matched to an allowance becomes the ***auction clearing price*** *and is the value at which all allowances are sold for that auction. View the* ***Auction Tutorial*** *for more details about auction price setting.*

Tracking & Compliance

The acquisition, transfer, retirement, and surrender of RGGI CO_2 allowances is tracked on the RGGI CO_2 Allowance Tracking System (RGGI COATS) platform. Any individual who successfully sets up a RGGI COATS login and creates a RGGI COATS account can receive, transfer, and hold RGGI allowances within the RGGI COATS platform.

Every year, regulated power plants must surrender allowances equal to one half of their CO_2 emissions for that year. Every three years, called a **control period**, they must surrender allowances for all emissions from year three, plus all remaining emissions from years one and two. The three-year control period provides power plants flexibility for meeting the program requirements. More information on compliance is available in the Compliance section of the RGGI website.

Offset Allowances

Certain projects that reduce CO_2 and other greenhouse gas emissions outside of RGGI regulations may be eligible for awards of RGGI **CO_2 offset allowances**. To be eligible for offset allowances, a project must be located within one of the RGGI states and fall into one of the offset project categories accepted by that state. These project categories, and which states accept each category, can be found in the Offsets section of the RGGI website. Offset allowances are transferable and may be used by regulated power plants to meet up to 3.3% of compliance obligations. CO_2 offset allowances account for less than 0.01% of the total number of allowances issued by the program since its inception in 2009.

To learn more about RGGI, please visit the RGGI website or send a message to info@rggi.org.

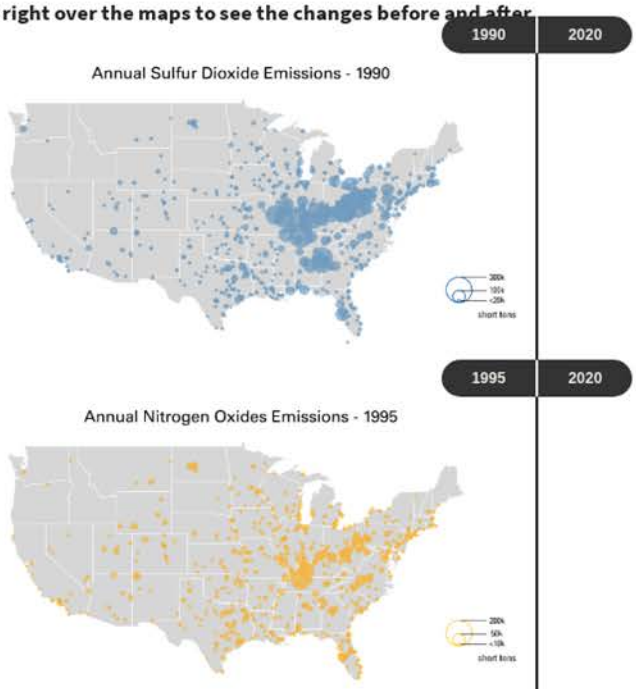
Acid Rain Program Results

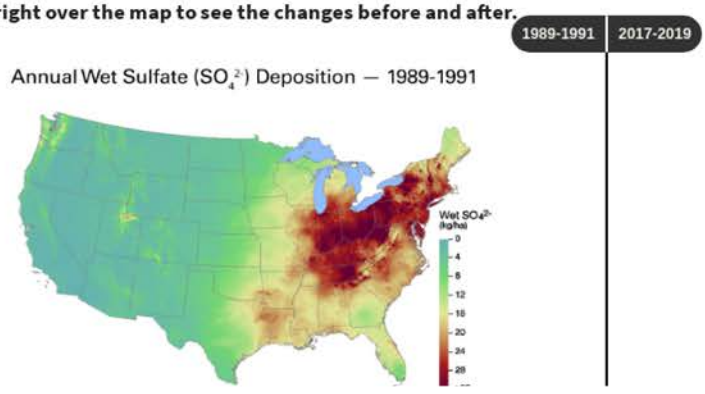
The Acid Rain Program (ARP) has delivered significant reductions of sulfur dioxide (SO_2) and nitrogen oxides (NO_X) emissions from fossil fuel-fired power plants, extensive environmental and human health benefits, and far lower-than-expected costs. Together with more recent power sector regulations, including the Cross-State Air Pollution Rule (CSAPR), and a rapidly changing energy sector, the ARP has helped deliver annual SO_2 reductions of over 93% and annual NO_X emissions reductions of over 87%. The Power Plant Emissions Trends page has maps and data highlighting these emissions reductions, and the Progress Reports provide an annual overview of program features and results, from compliance to air quality impacts.

Hover left to right over the maps to see the changes before and after.



These emissions reductions have led to major decreases in acid rain nationwide. Wet sulfate deposition – a common indicator of acid rain – dropped by 68% between 1989-1991 and 2017-2019. Additional data and maps detailing deposition and ambient air pollution are available on the Clean Air Status and Trends Network (CASTNET) website.

Hover left to right over the map to see the changes before and after.



The Long Term Monitoring program (LTM), another monitoring program within EPA, observes surface waters to determine the effects of acid rain on aquatic ecosystems. During the time period in which wet sulfate deposition decreased, LTM data show an 81% improvement in the number of monitored streams and lakes that experienced critical load exceedances, an indicator that reveals when acid deposition levels are causing harmful effects. The goal of this long-term program is to track whether the Clean Air Act Amendments (Plain English Guide to the Clean Air Act) have been effective in reducing the acidity of surface waters.

Next, learn more about the details of the Acid Rain Program.

Regional Greenhouse Gas Initiative
an Initiative of the Northeast and Mid-Atlantic States of the U.S.

Summary of RGGI Model Rule Updates
December 19, 2017

The Regional Greenhouse Gas Initiative (RGGI) is composed of individual CO_2 Budget Trading Programs in each RGGI participating state. Each participating state's CO_2 Budget Trading Program is based on the RGGI Updated Model Rule (2013), which was developed to provide guidance to states as they implemented the RGGI program. RGGI participating states have been conducting a Program Review, which is a comprehensive evaluation of program successes, program impacts, the potential for additional reductions, imports and emissions leakage, and offsets.

Proposed amendments to the Model Rule were developed by the RGGI state staff as part of the Program Review. This effort was supported by an extensive regional stakeholder process that engaged the regulated community, environmental non-profits, and other organizations with technical expertise in the design of cap-and-trade programs.

A summary of the proposed amendments to the RGGI Program, as detailed in the Model Rule, are discussed below.

Size and Structure of Cap and Allowance Apportionment (XX-5.1)

The regional emissions cap in 2021 will be equal to 75,147,784 tons and will decline by 2.275 million tons of CO_2 per year thereafter, resulting in a total 30% reduction in the regional cap from 2020 to 2030.

Budget Adjustments (XX-5.3)

The Model Rule contains language to address the private bank of allowances through one additional, distinct budget adjustment.

- The Third Adjustment for Banked Allowances, would adjust the base budget for 100 percent of the pre-2021 vintage allowances held by market participants as of the end of 2020, that are in excess of the total quantity of 2018, 2019, and 2020 emissions. The third adjustment timing and algorithm is spelled out in the Model Rule and would be implemented over the 5-year period, 2021-2025, after the actual size of the 2020 vintage private bank is determined.

Cost Containment Reserve (XX-5.3(d) and XX-9)

The Model Rule contains language for the continued use of a cost containment reserve (CCR) that will provide flexibility and cost containment for the program. The CCR would consist of a

fixed quantity of allowances, in addition to the cap, that would be held in reserve, and only made available for sale if allowance prices exceed predefined price levels.

- The Model Rule contains language for an annual CCR allowance quantity of 10% of the regional cap beginning in 2021 and each succeeding year thereafter.
- Allowances from the CCR would be fully fungible.
- The CCR allowances would be made available immediately in any auction in which demand for allowances at prices above the CCR trigger price exceeds the supply of allowances offered for sale in that auction prior to the addition of any CCR allowances.
- If the CCR is triggered, the CCR allowances would only be sold at or above the CCR trigger price.
- The CCR Trigger Price will be $13.00 in 2021 and rise at 7% per year, so that the CCR will only trigger if emission reduction costs are higher than projected.

Emissions Containment Reserve (XX-5.3(e) and XX-9)

The Model Rule contains language for the creation and use of an emissions containment reserve (ECR) that will respond to supply and demand in the market if emission reduction costs are lower than projected. States will withhold allowances from circulation to secure additional emissions reductions if prices fall below established trigger prices. At this time, Maine and New Hampshire do not intend to implement an ECR. Allowances withheld in this way will not be reoffered for sale.

- The Model Rule contains language for an annual ECR allowance withholding limit of 10% of the budgets of states implementing the ECR.
- The ECR trigger price will be $6.00 in 2021, and rise at 7% per year, so that the ECR will only trigger if emission reduction costs are lower than projected.

Offsets (XX-10.2 and XX-10.5)

The Model Rule contains language that eliminates two offset categories, the "SF_6 Offset Category (XX-10.5(b))" and the "End-Use Energy Efficiency Offsets Category (XX-10.5(d))," and updates and retains three categories that some States may continue to implement. Any awarded offset allowances would remain fully fungible across the states.

Miscellaneous

Reserve Price (XX-1.2)

The Model Rule retains language to increase the minimum reserve price by 2.5 percent each year.

This report is the product of the Regional Greenhouse Gas Initiative, Inc. (RGGI, Inc.). For regulatory matters, consult the regulations of each state cited throughout this report. RGGI, Inc. is a 501(c)(3) non-profit corporation formed to provide technical and administrative services to the RGGI CO_2 Budget Trading Programs of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont, and Virginia.

Executive Summary

Proceeds from the Regional Greenhouse Gas Initiative (RGGI) have powered significant investment in the energy future of participating Eastern states. This report reviews the benefits of programs funded in 2020 by $196 million in RGGI investments, which have reduced harmful carbon dioxide (CO_2) emissions while spurring local economic growth. The lifetime effects of 2020 RGGI investments are projected to avoid the release of 6.6 million short tons of carbon emissions. RGGI-funded programs also save consumers and businesses money, create jobs, and provide targeted assistance to low-income communities throughout the RGGI region. RGGI investments in 2020 are estimated to return $1.9 billion in lifetime energy bill savings to 65,000 households and 800 businesses that participated in programs funded by RGGI proceeds, while over 720,000 households and 38,000 businesses received direct bill assistance in 2020. As a whole, the RGGI states have reduced power sector CO_2 emissions over 50% since 2008, while the region's gross domestic product has continued to grow.

The benefits tracked in this report arise from RGGI investments in energy efficiency, clean and renewable energy, beneficial electrification, direct bill assistance, and greenhouse gas abatement. Any benefits associated with other funds (such as transfers to general funds) are outside the scope of this report.

RGGI states have individual discretion as to how they invest proceeds. Investments fall into five major categories:

Energy efficiency makes up 35% of 2020 RGGI investments and 53% of cumulative investments. Programs funded by these investments in 2020 are expected to return about $1.2 billion in lifetime energy bill savings to more than 56,000 participating households and over 700 businesses in the region and avoid the release of 4.6 million short tons of CO_2.

Clean and renewable energy makes up 18% of 2020 RGGI investments and 14% of cumulative investments. RGGI investments in these technologies in 2020 are expected to return over $600 million in lifetime energy bill savings and avoid the release of more than 1.7 million short tons of CO_2.

Beneficial electrification makes up 11% of 2020 RGGI investments and 3% of cumulative investments. RGGI investments in beneficial electrification in 2020 are expected to avoid the release of 177,000 short tons of CO_2 and return nearly $90 million in lifetime savings.

Greenhouse gas abatement makes up 5% of 2020 RGGI investments and 8% of cumulative investments. RGGI investments in greenhouse gas (GHG) abatement in 2020 are expected to avoid the release of more than 160,000 short tons of CO_2 and to return over $51 million in lifetime savings.

Direct bill assistance makes up 19% of 2020 RGGI investments and 16% of cumulative investments. Direct bill assistance programs funded through RGGI in 2020 have returned over $37 million in credits or assistance to consumers.

This is the first version of this report which includes beneficial electrification as its own investment category. In previous versions of this report, investments in beneficial electrification programs were included within the other major investment categories.

These investments, in concert with the broader energy policies in each RGGI state, have enabled the region to continue to set a national example in driving decarbonization while strengthening economic resilience.

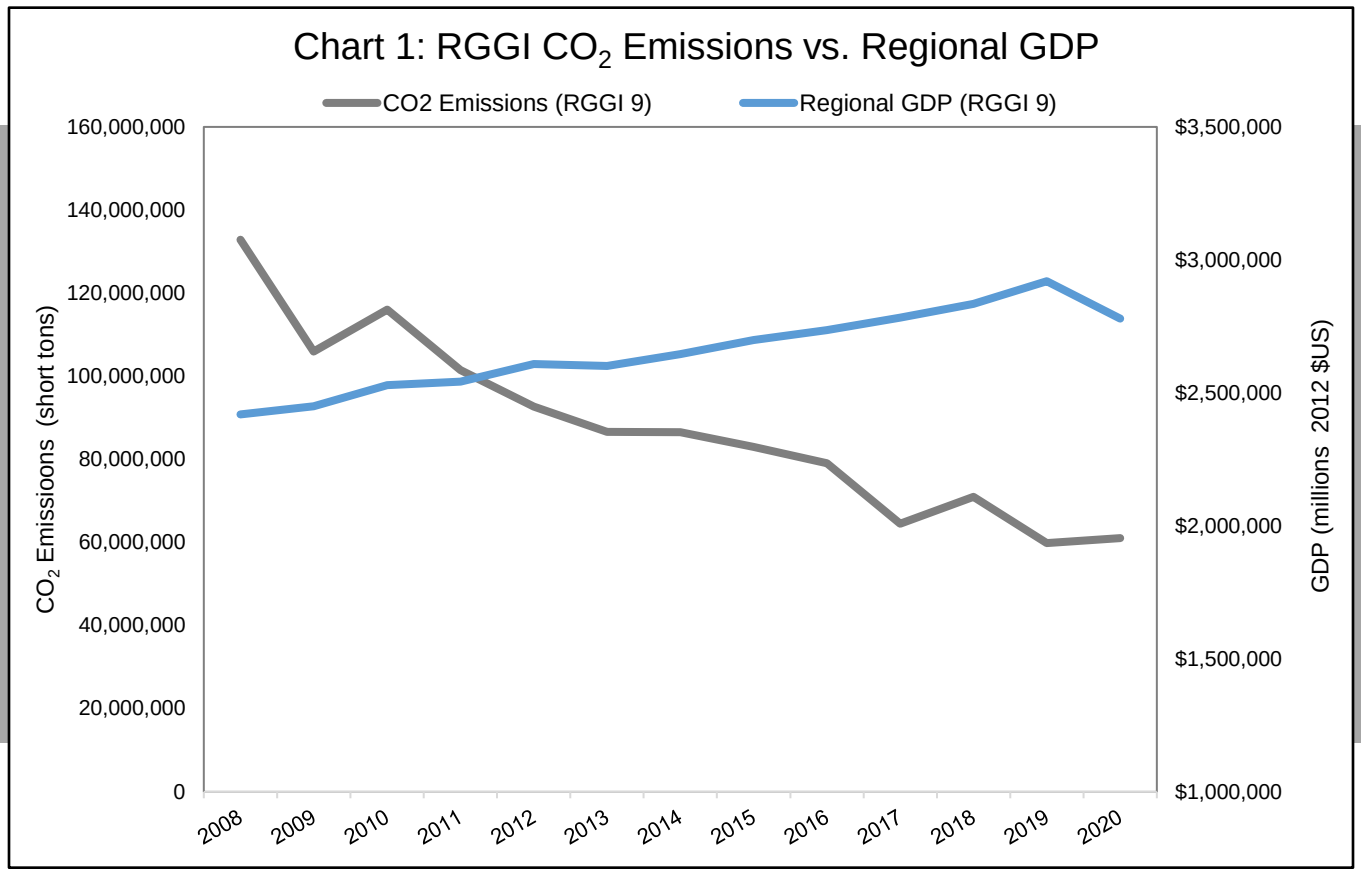
Introduction

The Regional Greenhouse Gas Initiative

RGGI is the nation's first multi-state initiative to reduce power sector CO_2 emissions. The RGGI states (Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont, and Virginia) establish a regional cap on the amount of CO_2 emissions that power plants can emit by issuing a limited number of tradable CO_2 allowances. Each allowance represents an authorization for a regulated power plant to emit one short ton of CO_2. Individual CO_2 budget trading programs in each RGGI state together create a regional market for CO_2 allowances. This allows market forces to determine the most cost-effective means of reducing emissions, and creates market certainty to drive long-term investments in clean energy. Each state's independent regulations are based on the RGGI Model Rule. New Jersey participated in RGGI from 2009 to 2011, and resumed its participation starting in 2020. RGGI investments in this report include the ten participating RGGI states in 2020.

The RGGI states have distributed 90% of CO_2 allowances through quarterly regional auctions, generating proceeds for reinvestment. The remaining allowances are allocated to state set-aside accounts, from which allowances may be distributed according to state-specific regulations or auctioned in future years. Each RGGI state has full discretion over the investment of RGGI proceeds and the administration of RGGI-funded programs.

The nine RGGI states that participated from 2009-2020 experienced a reduction of over 90 million short tons of annual power sector carbon emissions, even as the regional economy grew (see **Chart 1**).[1] This represents a reduction in power sector carbon emissions of over 50%.



[1] The nine RGGI states that participated for the entire 2009-2020 time period are CT, DE, ME, MD, MA, NH, NY, RI, and VT. The reduction in regional GDP in 2020 coincides with the onset of the COVID-19 pandemic.

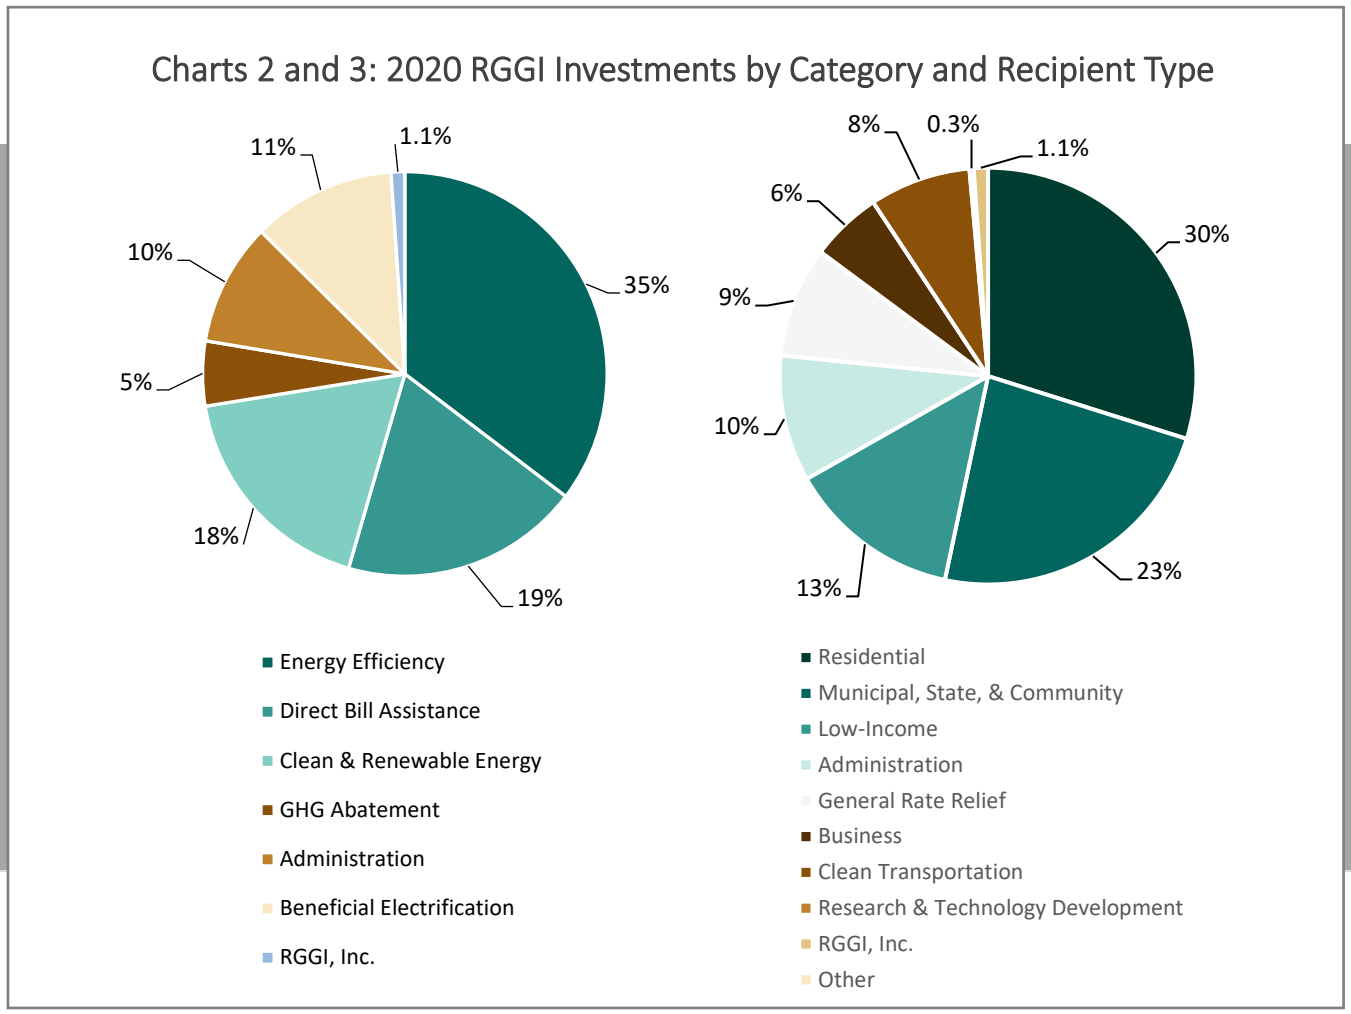
2020 RGGI Investments

This report estimates the benefits, such as energy bill savings and avoided CO_2 emissions, that arise from $196 million in 2020 RGGI investments. RGGI investments as defined within this report include investments in energy efficiency, clean and renewable energy, beneficial electrification, greenhouse gas abatement, and direct bill assistance, as well as administrative costs associated with these programs. This is the first version of this report which includes beneficial electrification as a separate category for the investment of proceeds. In previous reports, investments into beneficial electrification programs were included within the other major investment categories. This report focuses on 2020 annual investments. RGGI investments throughout the region cover a wide variety of programs.

Chart 2 shows 2020 RGGI investments divided among major program categories. **Chart 3** illustrates the same 2020 funds divided according to the type of end-user who benefits from the program or ultimately receives funding.

Many of the categories in Chart 3 can be seen as subcategories of those in Chart 2. Direct Bill Assistance is split between assistance for low-income consumers, and general rate relief for all consumers. GHG Abatement includes a wide variety of program types, including research funding and clean transportation programs. The Energy Efficiency and Clean Energy program categories mainly flow to residential, business, and municipal, state, & community recipients, with a substantial number of programs specifically serving low-income households.

Due to rounding, pie charts may not sum to exactly 100%.



In 2020, RGGI investments have saved participants money on their energy bills, created jobs, and reduced carbon emissions. Over their lifetime they will save participants an estimated $2 billion on energy bills, and avoid the emission of 6.7 million short tons of harmful CO_2 emissions. For details see **Table 1**.

RGGI investments benefit more than just those who directly participate in RGGI-funded programs. for example, money not spent on energy by families and businesses can be used in other ways that boost the economy. Reduced demand for energy also keeps power prices lower for everyone, and avoids investments in costly infrastructure to meet peak demand.

RGGI states have long been and continue to be leaders in energy efficiency, with millions of MWh saved. As the region's generation becomes cleaner, many states are also investing in beneficial electrification programs, which reduce carbon emissions by replacing direct fossil fuel use with electric power. Often, these programs result in an increases in MWh, but do reduce carbon emissions overall. As the grid becomes cleaner, the emissions from electrified appliances become cleaner, as opposed to the fixed emissions intensity of fossil-powered appliances.

Avoided MWh continues to be a relevant metric for energy efficiency and clean and renewable energy programs, and will be reported in the tables associated with these respective investment categories.

Table 1: Benefits of 2020 RGGI Investments

Category	Annual Benefits of 2020 Investments	Lifetime Benefits of 2020 Investments
Short Tons CO_2 Avoided	399,493	6,665,490
Energy Bill Savings	$143,819,935	$1,957,732,399

One of RGGI's strengths is the discretion held by each state to invest RGGI auction proceeds according to state-specific goals. This can present challenges for data collection; for example, a program offering discounts on efficient lightbulbs will collect quite different data from a program helping businesses to install large-scale equipment, or funding the installation of electric car charging stations. The data in this report are compiled using the output of state-based and program-based estimates for actual and projected savings and benefits. Methods for estimating program benefits differ across states and across programs. The appendix at the end of this report contains more details on how each metric is estimated for different types of programs.

States may also combine RGGI funds with funds from other sources. In many cases, the reported benefits from the program are adjusted based on the percentage of the program's funding that comes from RGGI. In cases where states determine a program could not have gone forward without RGGI funds, states will report the full benefits associated with that program.

Energy Efficiency

Energy efficiency remains the largest portion of 2020 RGGI investments, at 35%. Over the lifetime of the installed measures, 2020 RGGI investments in energy efficiency are projected to save participants nearly $1.2 billion on energy bills, providing benefits to more than 56,000 participating households and over 700 participating businesses. They are also projected to avoid the release of 4.6 million short tons of CO_2 (see **Table 2**).

Table 2: Benefits of 2020 RGGI Investments in Energy Efficiency

Category	Annual Benefits of 2020 Investments	Lifetime Benefits of 2020 Investments
Participating Households	56,412	n/a
Participating Businesses	737	n/a
Increased Employment	n/a	1400-1500*
Short Tons CO_2 Avoided	275,304	4,591,753
Energy Bill Savings	66,037,494	1,178,557,556
MMBtu Saved	1,869,047	31,427,411
MWh Saved	597,736	3,420,325

*Estimated job-years created.

Energy efficiency improvements can be achieved cost-effectively by upgrading appliances and lighting, weatherizing and insulating buildings, upgrading HVAC at offices, and improving industrial processes. For example, occupancy sensors automatically turn lights off when a room or building is not in use, saving significant amounts of energy. These programs allow consumers and businesses to take full advantage of modern appliances, heating, and cooling, increasing the comfort of homes, offices, and businesses while using less energy and saving on their energy bills.

Energy efficiency also creates jobs. Programs such as home retrofits directly spur employment gains in housing and construction, with 2020 RGGI investments projected to create an estimated additional 1400-1500 job-years across participating states. Lower energy costs also create numerous benefits across the economy, allowing businesses to expand and families to save and invest in other priorities.

Ultimately, all electricity consumers, not only those who make upgrades, benefit from energy efficiency programs. Lower overall demand for electricity results in lower wholesale electricity rates, as power plants with the highest costs do not run as often, and expensive transmission upgrades can be deferred in some cases. The full economy-wide benefits of energy efficiency are not modeled in this report. However, a range of other independent reports

have affirmed these widespread benefits of energy efficiency, including work by the Analysis Group, the Regulatory Assistance Project, and others.

RGGI-funded investments in energy efficiency, in concert with the broader energy policies in each RGGI state, have made the region a leader in this field. Six RGGI states once again ranked among 2020's top ten states for energy efficiency, according to the American Council for an Energy Efficient Economy.

Clean and Renewable Energy

Clean and renewable energy represents 18% of 2020 RGGI investments in the region. Over the lifetime of the projects installed in 2020, these investments are projected to offset $602 million in energy expenses. They are also projected to avoid the release of over 1.7 million short tons of CO_2 emissions (see **Table 3**).

Table 3: Benefits of 2020 RGGI Investments in Clean Energy

Category	Annual Benefits of 2020 Investments	Lifetime Benefits of 2020 Investments
Short Tons CO_2 Avoided	96,092	1,735,768
MWh Avoided*	192,903	3,473,936
MMBtu Avoided	25,965	576,144
Energy Bill Savings	$31,394,795	$601,955,014

*RGGI investments in clean and renewable energy decrease the electricity generated from marginal generating units, which are typically more expensive and carbon-intensive.

Clean energy systems require labor to install, which creates jobs and boosts local economic activity. Energy expenditures that might otherwise flow to out-of-state fossil fuel resources stay within the region. As with energy efficiency, “behind-the-meter” programs also contribute to lowering wholesale electricity prices by lowering the demand for electricity at the wholesale level. As demand for electricity decreases, the most expensive power plants run less often, driving long-term prices down for all consumers. Households and businesses both with and without clean energy systems save money on bills.

While RGGI investments are just a small part of widespread clean and renewable energy investments in the region, together these actions are having a measurable impact on the energy mix. Since 2008, RGGI states have increased their non-hydro renewable generation by 73%. In 2020 the RGGI states derived 50% of total generation from clean or renewable sources.

Beneficial Electrification

Beneficial electrification refers to programs that reduce carbon emissions by displacing direct fossil fuel use with electric power. In contrast to energy efficiency programs, which reduce electricity or fuels usage, beneficial electrification programs can increase MWh consumption, but result in a net reduction in carbon emissions. Examples include programs that promote the use of electric vehicles, reducing oil consumption, or the installation of electric heat pumps, reducing heating fuel and natural gas consumption.

Beneficial electrification represents 11% of 2020 RGGI investments in the region. Over their lifetime, the investments in beneficial electrification made in 2020 are expected to avoid 177,000 short tons of CO2 emissions and result in $90 million in customer bill savings. Beneficial electrification investments will yield even greater emissions reduction benefits over time, as renewables take up a larger portion of the electric grid composition. Investments in beneficial electrification programs, and the resulting bill savings, also lead to job creation and spur local economic activity.

In addition, some programs reported as energy efficiency, clean and renewable energy, or greenhouse gas abatement may include beneficial electrification components, but the outcomes of these projects are not reported under beneficial electrification.

Table 4: Benefits of 2020 RGGI Investments in Beneficial Electrification

Category	Annual Benefits of 2020 Investments	Lifetime Benefits of 2020 Investments*
Short Tons CO_2 Avoided	12,187	176,877
Energy Cost Savings**	$5,420,796	$89,589,982
MMBtu Saved	150,038	2,179,101
MWh Increased	10,089	151,330

*Although Beneficial Electrification is a new addition to the RGGI Proceeds report, Lifetime Benefits are calculated the same as other categories in the report. States use assumptions about the lifespan of their Beneficial Electrification investments in terms of years, and calculate lifetime benefits based on assumptions about their ISO's carbon intensity, energy cost, etc. over the lifespan of an investment to estimate Lifetime Benefits.

**Energy cost savings is the net result of increased MWh costs from beneficial electrification combined with the decrease in avoided fuel costs (i.e. heating oil, gasoline).

Greenhouse Gas Abatement

Greenhouse gas abatement (GHG abatement) is a broad category encompassing other ways of reducing greenhouse gases, apart from energy efficiency and clean and renewable energy. Approximately 5% of 2020 RGGI investments supported GHG abatement programs. Over their lifetime, the investments made in 2020 are expected to avoid the release of over 160,000 short tons of CO_2 (see **Table 5**).

Programs in the GHG abatement category may vary significantly, and may drive GHG emission reductions in multiple sectors. For example, technology, research, and development programs are tracked as GHG abatement, as they may lead to advancements resulting in the reduction of greenhouse gases. Climate change policy research is also tracked as GHG abatement.

GHG abatement programs vary in the types of benefits they provide. Some projects reduce electricity and fossil fuel use as part of their efforts to reduce overall emissions, generating economic benefits similar to those realized through energy efficiency and clean and renewable energy programs. Other projects may not return immediately trackable benefits within the scope of this report, but still provide important long-term benefits in climate preparedness and mitigation.

Table 5: Benefits of 2020 RGGI Investments in GHG Abatement

Category	Annual Benefits of 2020 Investments	Lifetime Benefits of 2020 Investments
Participating Households	2,999	n/a
Participating Businesses	28	n/a
Short Tons CO_2 Avoided	15,888	160,881
MMBtu Saved	222,821	2,228,214
Energy Bill Savings	$5,184,777	$51,847,774

Direct Bill Assistance

Direct bill assistance returns money to consumers as a rebate on their energy bills. Approximately 19% of 2020 RGGI investments have funded direct bill assistance. RGGI investments in direct bill assistance in 2020 returned $37 million in bill savings to energy consumers (see **Table 6**).

These programs provide rate relief to electricity consumers in the RGGI region. Some programs provide assistance specifically to low-income families, while other programs provide small on-bill credits to all consumers.

Direct bill assistance typically appears as a credit on a consumer's electricity bill. Direct bill assistance programs support economic activity by providing funds directly to consumers, who can then spend those funds on other priorities. Unlike energy efficiency or clean energy programs (which generate benefits for the lifetime of the installed measures), direct bill assistance programs provide benefits only for the length of the bill-assistance program. Direct bill assistance programs also do not reduce or affect wholesale electricity prices.

RGGI proceeds provide a small percentage of low-income direct bill assistance programs across the states. Other sources of funds come from on-bill system benefit charges, and federal funds in the case of LIHEAP programs.

Table 6: 2020 RGGI Investments in Direct Bill Assistance

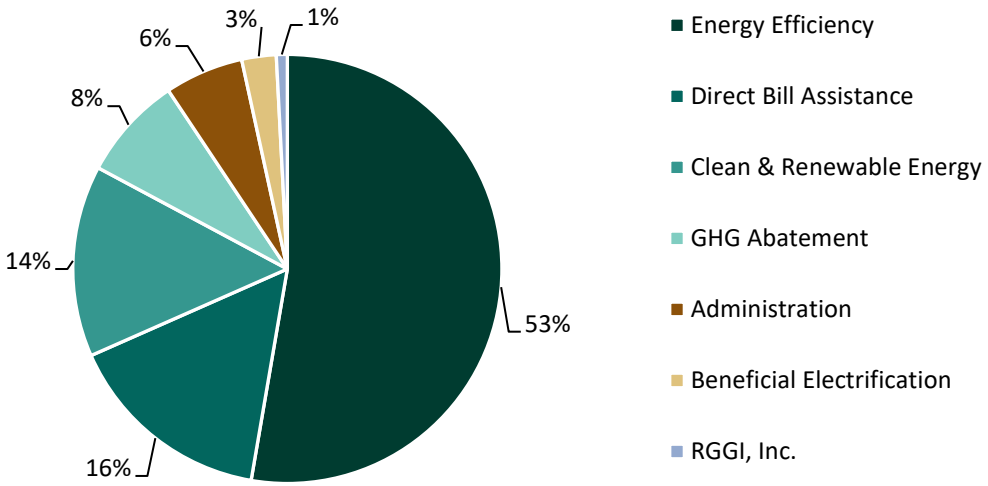
Category	Annual Benefits of 2020 Investments
Participating Households	722,874
Participating Businesses	38,580
Energy Bill Savings	$37,586,252

Cumulative Uses of Auction Proceeds

While this report focuses primarily on 2020 data, information on cumulative RGGI investments is provided in this section as an overview of RGGI's track record. **Chart 4**, below, shows the percentage of all-time RGGI investments directed to each of the major program categories.

This pie chart shows each program category as a percentage of all-time RGGI investments.

Chart 4: Cumulative RGGI Investments by Category



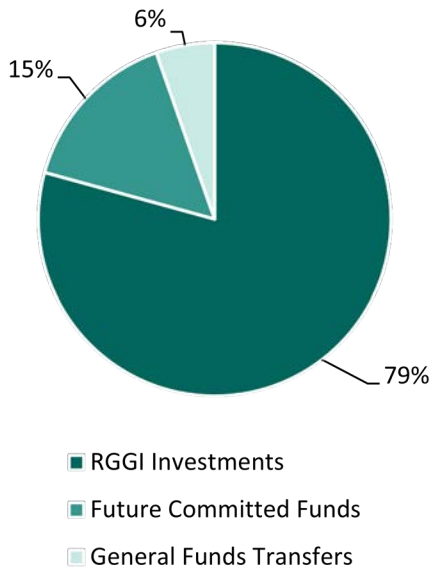
The states participating in RGGI invested $2.99B as of 2020.

RGGI investments are themselves a subset of total proceeds. Most RGGI proceeds through 2020 are defined as RGGI investments. Other uses of funds, such as transfers to state general funds, are outside the scope of this report. See **Chart 5**, below, for more details on total RGGI proceeds.

Two states report program data according to the fiscal year (July 1-June 30) rather than the calendar year. A fiscal year adjustment is used to compare numbers between fiscal-year and calendar-year states.

Chart 5: RGGI Investments as a Subset of Total Proceeds

Description	Funds
All Proceeds through Dec. 31, 2020	$3,801,985,568
Adjustment for Fiscal Year Reporting	-$39,673,943
General Funds Transfers	$199,700,000
Future Committed Funds	$571,395,708
RGGI Investments	**$2,991,215,917**



The pie chart shows three categories of funds, as a percentage of all proceeds **after** the fiscal year adjustment. The participating RGGI states invested $2.99B in the period covered by this report. This leaves $571M in funds that are yet to be invested.

All-time benefits metrics may be best understood as a general indication of the cumulative benefits of RGGI-funded investments since the program's inception. **Table 7** shows that the track record from all RGGI investments includes benefits on the order of billions in customer bill savings, and tens of millions of short tons of CO_2 avoided. Note that as the program's track record grows longer, all-time numbers may include changes in states' methodologies from year to year.

Table 7: All-Time Benefits of RGGI Investments

Category	Lifetime Benefits of All RGGI Investments
Participating Households	7,237,334
Participating Businesses	293,137
Short Tons CO_2 Avoided	49,523,308
Megawatt-Hours Saved	74,527,807
MMBtu Saved	255,317,388
Energy Bill Savings	$14,816,129,607

Previously reported cumulative data plus 2020 data may not sum exactly to updated cumulative data. This is due to state adjustments or corrections to prior cumulative calculations.

Connecticut

Connecticut primarily invests RGGI auction proceeds towards programs dedicated to the deployment of energy efficiency measures and improvements, and financing options for renewable energy projects. Connecticut allocates 69.5% of its auction proceeds to support the energy efficiency programs overseen by the Connecticut Energy Efficiency Board (CEEB) and administered by Eversource Energy and The United Illuminating Company, as well as those of the Connecticut Municipal Electric Energy Collective (CMEEC) and the Town of Wallingford – Electric Division (WED). Connecticut further allocates 23% to the Connecticut Green Bank to support the development of Class I renewable energy sources. The Department of Energy and Environmental Protection retains the remaining 7.5% for administrative purposes.

During 2020, Connecticut invested RGGI auction proceeds in the following programs:

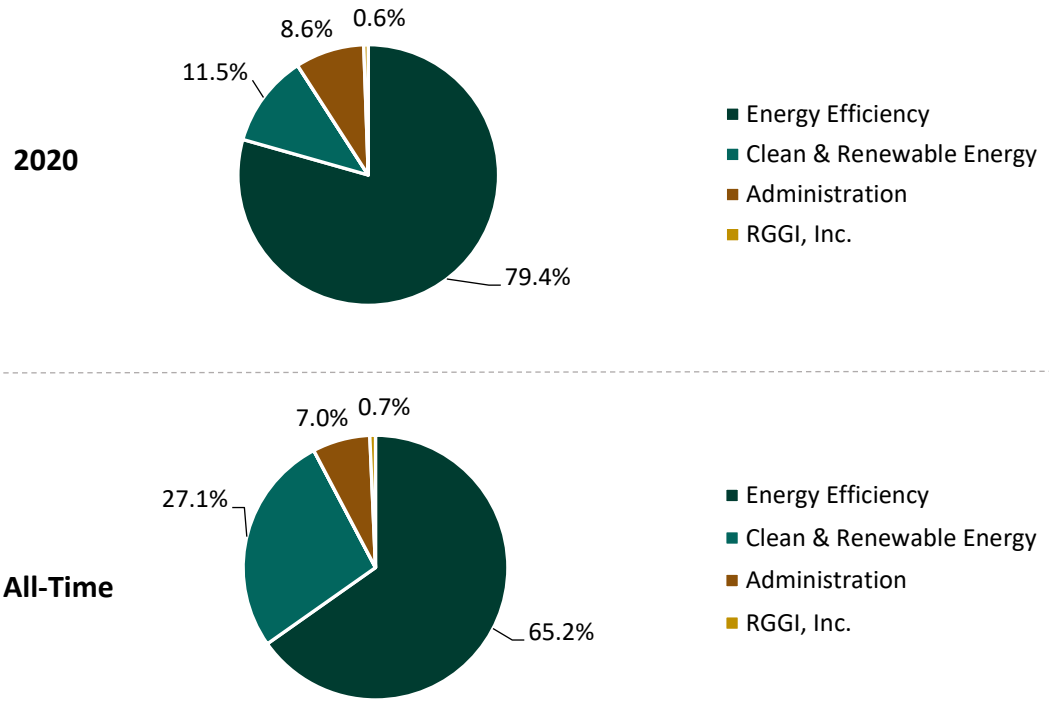
- Home Energy Solutions^{SM} Program: Under this program, Eversource Energy and The United Illuminating Company invested RGGI funds to conduct residential energy audits and install weatherization measures. Due to the investment of RGGI funds, Eversource and UI were able to extend participation to more than 8,000 homes in 2020 and avoid more than 12,000 tons of CO_2 emissions and conserve over 154,000 MMBtus of fossil fuel use.
- Home Energy Savings Program: Under this program, WED leveraged RGGI funds to perform residential energy audits and deploy weatherization measures. In 2020, WED served 198 homes and provided weatherization services to 108.
- Commercial Property Assessed Clean Energy (C-PACE) Program: Under this program, the Connecticut Green Bank offers low interest, zero-down payment financing for clean and renewable energy projects. In 2020, the Connecticut Green Bank invested RGGI proceeds in C-PACE to help finance eleven projects, four of which were completed in 2020. The remaining seven projects were completed in 2021. Since the inception of the C-PACE program, 111 projects have been completed.
- Various energy efficiency projects: CMEEC used RGGI funds toward the deployment of residential and commercial energy efficiency projects, ranging from the installation of heat pumps and mini splits to street lighting upgrades including the retrofit of street lighting on University of Connecticut's (UCONN) Avery Point campus.

Connecticut has cumulatively invested nearly $214 million in RGGI allowance proceeds toward programs and services dedicated to the deployment of energy efficiency measures and renewable energy technologies.

The American Council for an Energy-Efficient Economy (ACEEE) nationally ranked Connecticut seventh in its 2021 State Energy Efficiency Scorecard, which evaluated 2020 state energy efficiency efforts. Connecticut's continued Top Ten ranking is attributed to a range of energy-saving policies across the entire economy including:

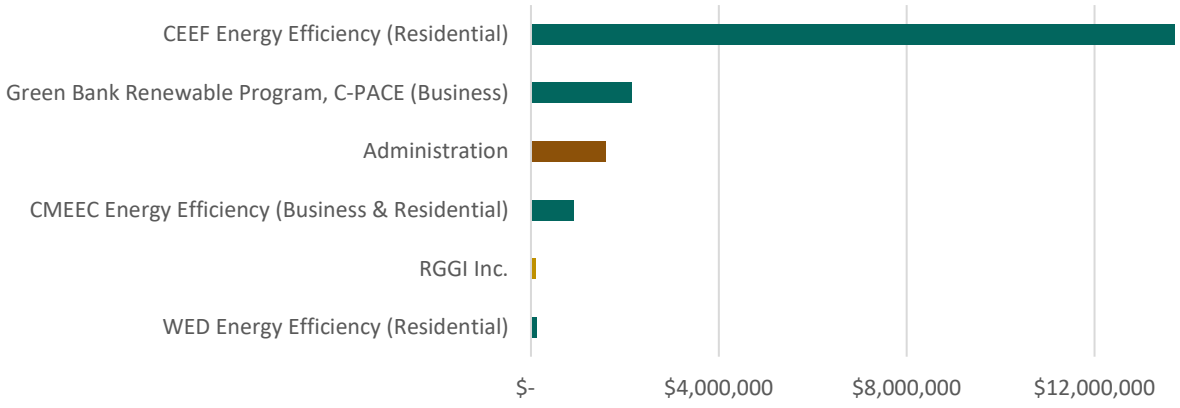
- Incentives for high-efficiency vehicles and adoption of California's ZEV program.
- Waivers of co-pays for certain energy efficiency programs to mitigate impacts from the COVID-19 pandemic.
- Launch of the Equitable Energy Efficiency Proceeding in order to increase participation in energy efficiency programs by members of communities that have traditionally been underrepresented.

Chart 6: 2020 Connecticut RGGI Investments by Category



Connecticut received $246M in proceeds from 2008-2020. RGGI investments represent $18.6M in 2020, and $214M cumulatively. $4M is committed to 2021 and future investments.

Chart 7: 2020 Connecticut RGGI Investments by Recipient



Connecticut RGGI investments represent $18.6M in 2020.

Program Highlight: Home Energy Solutions℠

The Home Energy Solutions℠ (HES) program is a home energy efficiency audit and energy conservation program, primarily funded by mandated conservation charges collected from electric and natural gas ratepayers, who in turn can receive its services. Connecticut's investment of RGGI proceeds in this program has provided funding for the deployment of services under the program to families who heat their homes with fuel oil or propane.

The HES program enables evaluation of a home's energy performance and installation of core weatherization and energy-saving measures such as sealing air leaks, installing energy-efficient lighting such as LEDs, faucet aerators, low-flow showerheads, and weather stripping. Participation in the HES program requires a co-pay, however, for much of 2020, the co-pay was waived in response to the emergence of the COVID-19 pandemic.

The HES program also provides families with customized reports highlighting additional opportunities and estimated cost savings for implementing deeper energy-saving measures. Participants may also receive rebates on these interventions such as improving insulation and installing energy-efficient mechanical equipment. HES participants may also be provided with the Department of Energy's Home Energy Score for their home, a standardized comparison of the home's energy usage to similar buildings, and recommendations for energy upgrades along with the estimated annual savings from those upgrades. HES participants can be provided with up to $7,500 in rebates to perform energy efficiency and equipment upgrades such as installation of ENERGY STAR rated appliances and improved home insulation. Low-interest rate financing options are also available. The average home in Connecticut receives about $1,000 in services and realizes $200-$250 in savings on their annual energy bills.

Success Story: UCONN at Avery Point

The UCONN at Avery Point campus, located on Long Island Sound at the mouth of the Thames River in Groton, CT is a public campus of the University of Connecticut offering liberal arts programs of study for approximately 564 enrolled students.

Groton Utilities (GU), a member of CMEEC, provides and maintains streetlights to this 72-acre campus. The recognition of the need to upgrade the pole top lighting fixtures was the catalyst for GU to embark on the replacement of the 121 high pressure sodium fixtures (175W each) with LED fixtures (99W each). The expenditure of $242,675 of RGGI funds for the UCONN at Avery Point project is anticipated to realize an annual energy savings and reduction in monthly peak demand of 53 MWh and 13 kW, respectively, and an estimated reduction of GHG emissions equivalent to 25 tons of CO_2.

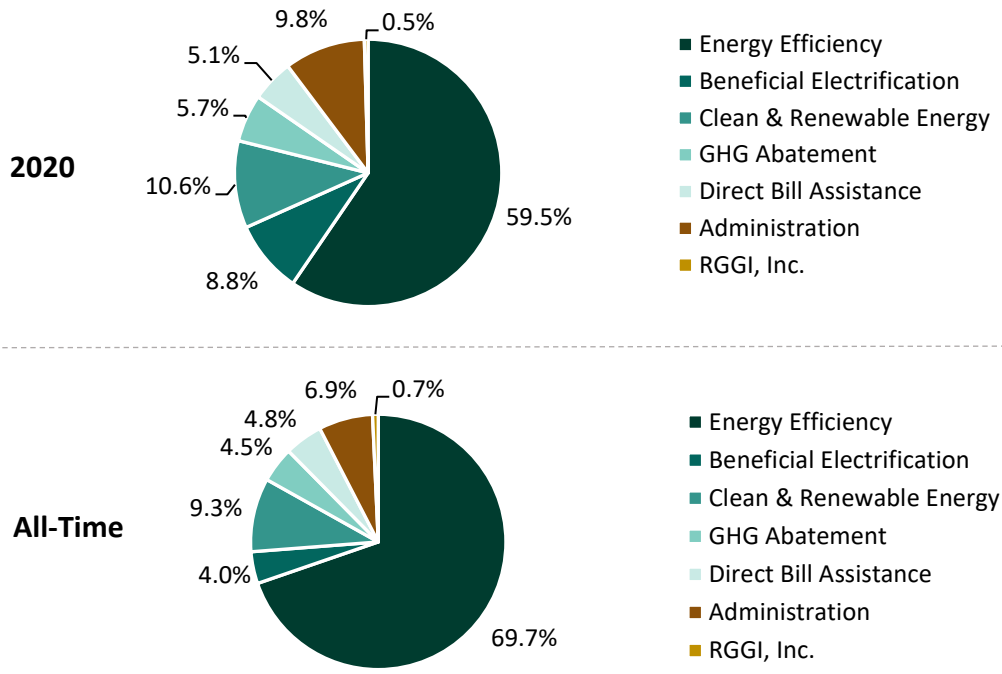
Delaware

Delaware invests RGGI allowance proceeds in a variety of programs that reduce energy use, reduce greenhouse gas emissions, and assist low-income families with energy bill payments. The suite of programs funded with RGGI allowance proceeds provides Delaware families and businesses with valuable assistance with energy efficiency improvements while providing opportunities for innovation in greenhouse gas reductions.

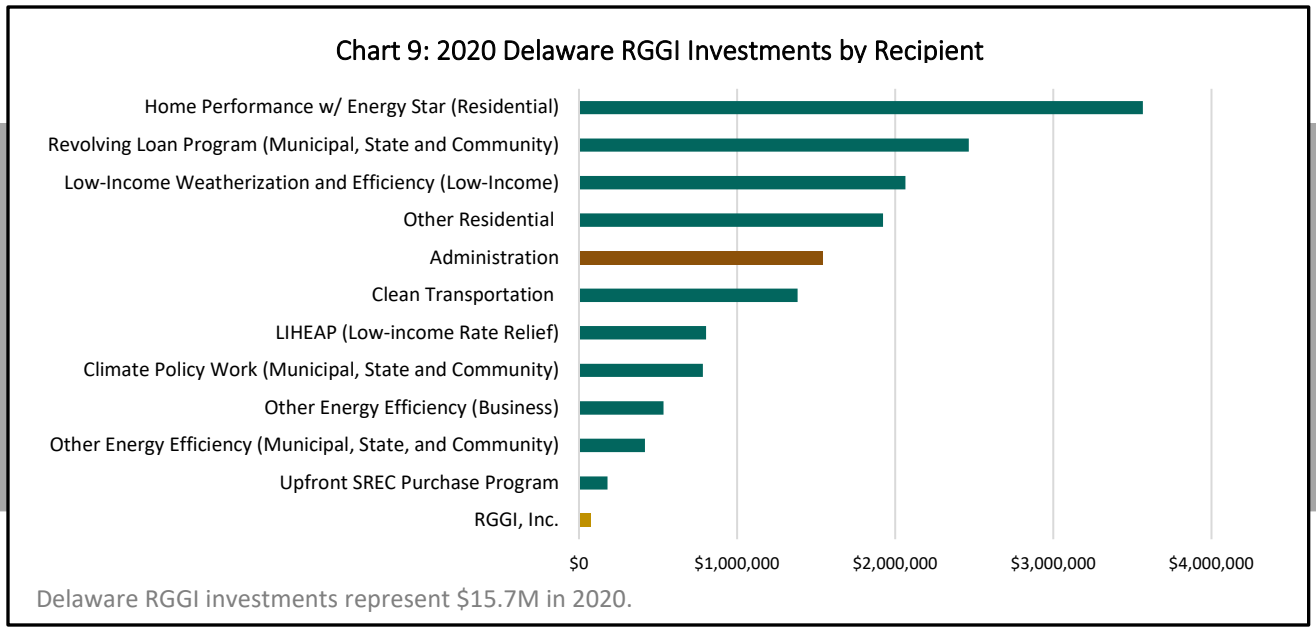
Delaware directs 65% of its allowance proceeds to the Delaware Sustainable Energy Utility (SEU). The SEU serves Delawareans by promoting the use of affordable, reliable, clean energy, and providing a variety of incentives for energy efficiency improvements.

In addition, Delaware directs ten percent of its allowance proceeds to the Delaware Department of Natural Resources and Environmental Control (DNREC) for development of innovative programs to reduce greenhouse gas emissions such as the Clean Transportation incentive program and infrastructure grants. Ten percent of proceeds is also directed to DNREC to implement the state's Weatherization Assistance Program which provides no-cost upgrades to homes to decrease energy use and decrease bills. Five percent of proceeds is also directed to a program to reduce energy bills for low-income customers. The remaining ten percent is reserved for administration of programs.

Chart 8: 2020 Delaware RGGI Investments by Category



Delaware received $149.8M in proceeds from 2008-2020. RGGI investments represent $15.7M in 2020, and $148.8M cumulatively. $1.3M is committed to 2021 and future programs.



Program Highlight: DESEU-Energize Delaware Home Performance with ENERGY STAR

The SEU flagship Home Performance with ENERGY STAR® program is going into its eighth year. This program offers a "whole house" approach to improving comfort and safety in the home and provides homeowners significant savings on their utility costs. Delaware homeowners learn ways to improve the energy efficiency of their homes through completion of a subsidized, comprehensive home energy assessment performed by certified contractors, and they also receive up to $200 of energy saving items such as LED light bulbs and pipe insulation.

After the assessment, homeowners making recommended energy-saving improvements can take advantage of rebates that make their home projects affordable. Reduced assessment costs and increased rebates are available to income-qualified Delawareans and also to property owners residing in Delaware's designated "Downtown Development Districts." Of the 1,749 home assessments completed in 2020, 1,196 homeowners received rebates. In total, SEU leveraged $3.5M in RGGI funds for the Home Performance with ENERGY STAR Program in calendar year 2020, resulting in about $490,000 in energy bill savings and over 2,000 metric tons CO_2 emissions avoided.

Success Story: Delivering Savings through Home Performance with ENERGY STAR

Delawareans and families across the country are experiencing higher utility costs and more strain on their budgets due to the COVID-19 pandemic. Even during the pandemic, SEU was able to keep the Home Performance with ENERGY STAR program operating and participating contractors working in a safe and efficient manner to provide home energy assessments and rebates for energy efficiency heating and cooling equipment, air sealing and insulation, and other water heating and weatherization measures. SEU provided reduced costs for the energy assessments, increased rebate amounts, and provided incentives for completed applications to keep contractors working and making projects more affordable during the pandemic. Rob and Cami Seward provided the following testimonial of their experience as 2020 participants in SEU's Home Performance with ENERGY STAR program:

"We were running an alternate A/C unit in the dining room and it was still 90 degrees in the house. This year is different! Because of your work evaluating our house and sealing and insulating the attic, it has been cool and comfortable all summer. No extra A/C unit needed! Our electric bill last July was $349 and this July it was $201. What a dramatic improvement! We are so happy with the house now that the work has been completed. Great Job sealing us up and cooling us down—We are so grateful to the Energize Delaware Team!"

Maine

The Efficiency Maine Trust (Efficiency Maine) is the independent administrator for programs to improve the efficiency of energy use and reduce greenhouse gases in Maine. The Trust does this primarily by delivering financial incentives on the purchase of high-efficiency equipment or changes to operations that help customers save electricity, natural gas, and other fuels throughout the Maine economy. The organization's purposes include the following:

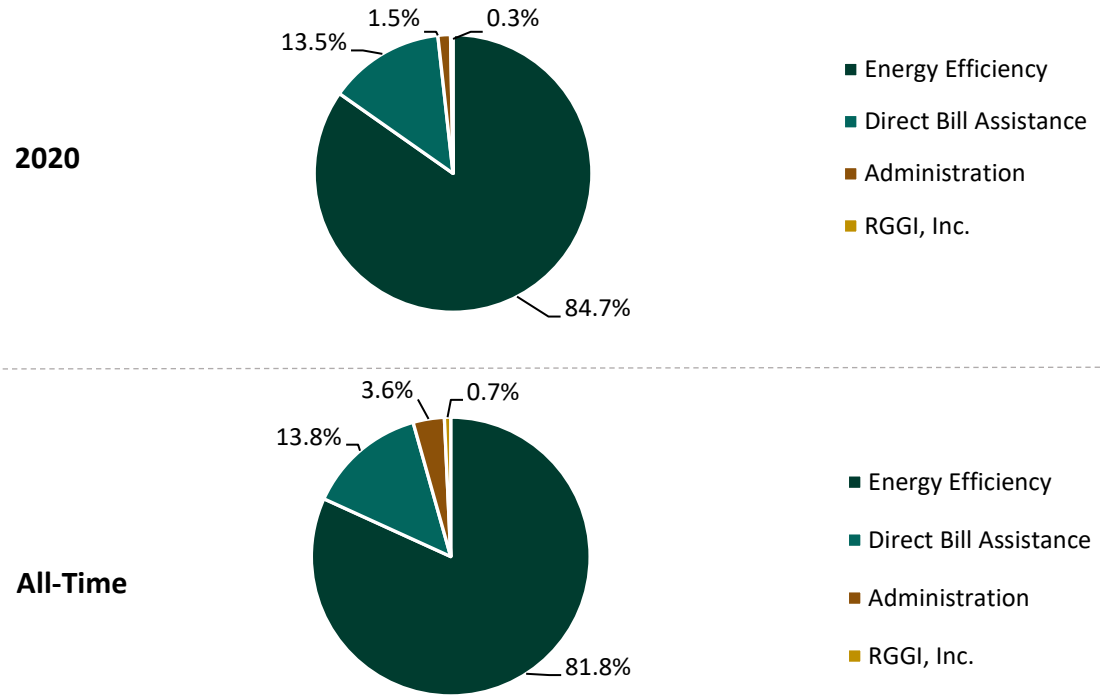
- Consolidating under one roof the funds for Maine's consumer-focused efficiency and alternative energy programs for all fuel types, including electric, natural gas, and unregulated fuels;
- Procuring distributed energy resources (such as efficiency and alternative energy) that cost less than traditional energy to help individuals and businesses meet their energy needs at the lowest cost; and
- Helping transform the energy market in Maine so that energy-efficient products, alternative energy equipment, and related energy services are more accessible and affordable to end-use customers.

Efficiency Maine's programs are funded primarily by a combination of electric and natural gas system benefit charges, Forward Capacity Market proceeds, and RGGI proceeds. During its 2020 fiscal year (FY2020), Efficiency Maine invested over $7.4 million in RGGI proceeds, directing approximately 98% towards a combination of energy efficiency programs and rate relief for large manufacturers; the remaining 2% went towards general administration. Though nearly all of Efficiency Maine's programs leveraged RGGI funding to some degree in FY2020, the bulk of funds were invested through the following five programs:

- *Home Energy Savings Program:* Drove market-based home weatherization and heating demand reduction by offering rebates and loans, providing customer education, and developing a vendor network.
- *Distributor Initiatives:* Rebated high efficiency boilers and furnaces to homes and businesses through the distributor channel
- *Retail Initiatives:* Rebated efficient wood stoves and pellet stoves in retail stores to heat the homes of Mainers
- *Commercial and Industrial (C&I) Prescriptive Program:* Provided fixed-price incentives for a prescriptive suite of "off-the-shelf" energy efficiency measures for C&I customers.
- *C&I Custom Program:* Targeted larger C&I customers by offering incentives for custom, site-specific energy efficiency projects that require unique engineering analyses.

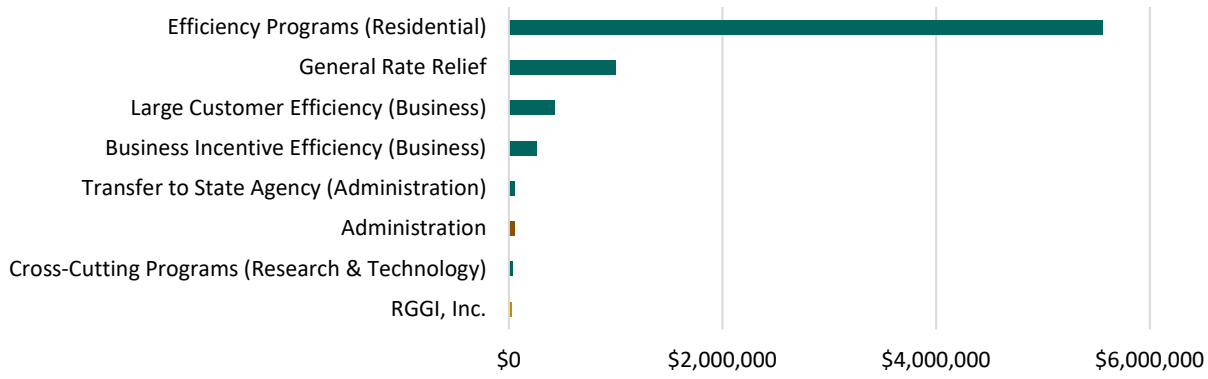
Over the lifetime of the investments made in FY2020, Maine's RGGI-funded efficiency measures are estimated to generate savings of over 2.15 million MMBtu in avoided consumption of natural gas and other heating or process fuels. These investments will lower participants' energy bills by more than $41 million.

Chart 10: 2020 Maine RGGI Investments by Category



Maine received $122.8M in proceeds from FY08-FY20. RGGI investments represent $7.4M in FY20, and $103M cumulatively. $13.4M is committed to 2021 and future programs.

Chart 11: 2020 Maine RGGI Investments by Recipient



Maine RGGI investments represent $7.4M in 2020.

Program Highlight: Home Energy Savings Program

Efficiency Maine's Home Energy Savings Program (HESP) serves as the framework for market-based residential weatherization and heating system improvements achieved through a combination of rebates, financing, and customer education. HESP raises awareness about the benefits of home weatherization and encourages Maine homeowners to make energy efficiency upgrades. Efficiency Maine's Low-Income Initiatives leverage this market-

based channel to target low- and moderate-income (LMI) customers by providing enhanced incentives for home weatherization (with an energy assessment) and high-performance heat pumps.

In the past, Efficiency Maine's ability to promote these tailored offerings to low-income households was limited; it required that participants be enrolled in the federally funded Low-Income Home Energy Assistance Program (LIHEAP). In 2017, the Maine State Housing Authority estimated that there were up to 176,000 low-income homes in Maine, yet only 40,000 were enrolled in LIHEAP. In FY2017, Efficiency Maine expanded eligibility criteria for this initiative to include LMI customers enrolled in any state or federal income-based program, as well as owners living in mobile homes and those living in homes with assessed property values below a certain threshold.

These eligibility changes, along with enhanced incentives, have helped drive dramatic growth in activity in Efficiency Maine's market-based LMI initiative. Indeed, overall participation rose from 40 homes in FY2016 to 1,444 homes in FY2021. (Though the COVID-19 pandemic initially dampened this growth trend in FY2020, data from FY2021 showed a strong rebound.) Rebates for heat pumps covered 1,213 units over the course of FY2021, up from 144 units in FY2017. The larger pool of potential customers and simplified criteria made this approach significantly easier for staff, contractors, and community organizations to promote Efficiency Maine's LMI offerings, and for participants to access it.

Overall, Efficiency Maine's market-based LMI offerings leveraged $15,000 in RGGI funds in FY2020. Low-income Mainers save an estimated 172 MMBtu annually in avoided energy consumption associated with heating oil and other fuels.

Success Story: Bath Iron Works

Bath Iron Works (BIW) is a major shipyard that has been building U.S. Navy warships in Bath, ME for over 100 years. The primary structural assembly building is nearly 170,000 square feet with 80-foot ceilings. It houses the majority of the facility's welding operations.

Originally, the assembly building's heat was provided by 19 Modine unit heaters equipped with steam coils. The building operated at a significant negative pressure; exhaust fans pulled air out of the building, and uncontrolled make-up air came in through infiltration. In these conditions, the building experienced fume accumulation, cold temperatures, and considerable energy loss. BIW therefore launched an effort to upgrade the building with the goals of improving air quality, increasing winter space temperature, reducing the negative pressure, and saving energy.

BIW's new high-efficiency air filtration units.

BIW received two separate proposals for new air filtration and make-up air systems – one high-efficiency, more expensive option, and one lower-efficiency, cheaper option. Both systems would accomplish the company's general goals for the project. By offering a financial incentive to defray the upfront incremental cost differential, Efficiency Maine was able to encourage BIW to select the high-efficiency alternative.

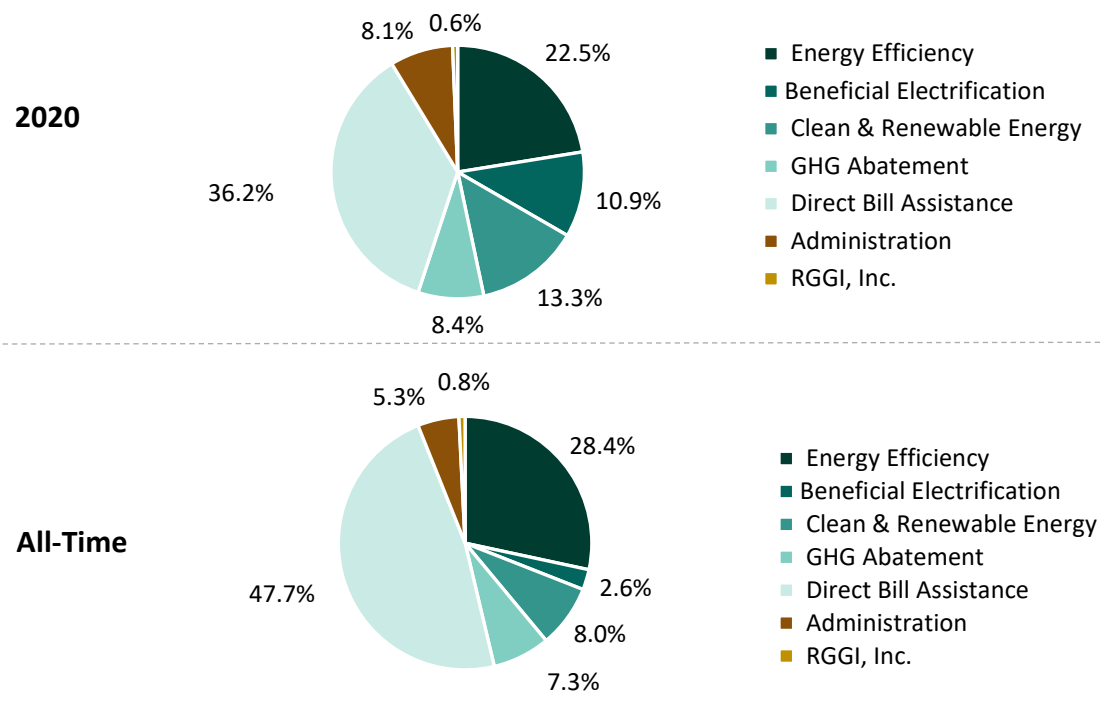
Given the relatively complex, site-specific nature of the project, BIW worked with Efficiency Maine's Commercial and Industrial (C&I) Custom Program. The program was able to validate the predicted energy impacts and offer a $752,000 incentive, funded partially with RGGI dollars. These investments will save BIW approximately 2.7 million kWh of electricity and 7,900 MMBtu of natural gas annually, reducing the company's operating costs for years to come.

Maryland

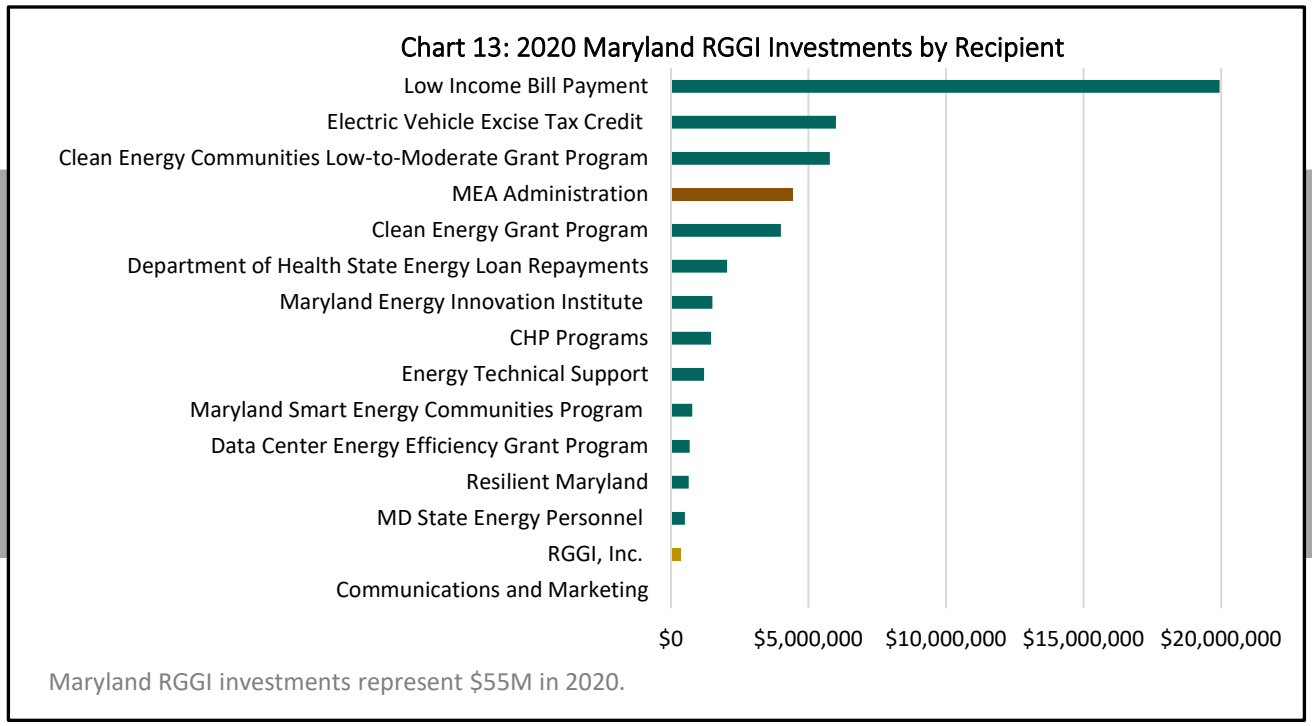
Maryland allocates proceeds from the sale of CO_2 allowances into the State's Strategic Energy Investment Fund (SEIF)—a special, non-lapsing fund administered by the Maryland Energy Administration (MEA). MEA deploys SEIF funds to promote affordable, reliable, and clean energy across Maryland's diverse regions and communities.

These programs are intended to reduce energy bills, create jobs in growing industries, help reduce greenhouse gas emissions, increase resiliency, and promote energy independence.

Chart 12: 2020 Maryland RGGI Investments by Category



Maryland received $736.8M in proceeds from 2008-2020. RGGI investments represent $55.0M in 2020, and $711.3M cumulatively. $25.5M is committed to 2021 and future programs.



Success Story: Public School Data Center Team Puts Energy Efficiency Lessons into Action

The Maryland Energy Administration (MEA) continues to develop innovative energy programs that drive economic development, energy resilience and recovery for Marylanders. Maryland was the first in the nation to offer a targeted energy efficiency program for data centers with the Data Center Energy Efficiency grant. Data centers use 100 – 200 times more energy than a typical office building, running 24 / 7 / 365. MEA provides Clean Energy Rebates to businesses, nonprofits, local governments, and State of Maryland government agencies and departments that install clean energy systems on facilities located in the state.

Data centers provide round-the-clock sensors to monitor power, temperature, humidity, fire, and other mechanical functionals for critical IT infrastructure. In 2017, US data centers required more than 90 billion kilowatt-hours of electricity, equal to the energy generated from 34 massive coal-powered plants. Energy efficiency at data centers has never been more important. Montgomery County Public Schools (MCPS) received a $127,000 Maryland's Data Center Energy Efficiency Grant (DCEEG) in 2018, to install more energy efficient technology in their data center. MCPS's data center operates, monitors, and provides technical support for central servers and related equipment allowing 24-hour access to essential student and administrative databases as well as payroll, student attendance and enrollment, retirement, asset management, financial management, report cards, and online ordering. MCPS implement numerous upgrades including server virtualization, replacement, and migration of storage area networks to reduce energy consumption of servers. Air flow optimization measures such as rack enclosure cooling blanking panels were also implemented, all as part of a multiphase data center improvement project. These upgrades are expected to save MCPS over $21,000 annually or 180,695 kilowatt hours, which is enough to power roughly 600 laptop computers for 8 hours. This project was co-sponsored by MCPS' Office of Technology and Innovation (OTI) and Department of Facilities Management's (DFM) Energy Resource Team. MCPS hopes to reinvest the grant funding to procure software that will give insight into actual server energy usage that is not presently available. This would facilitate and encourage informed decisions in prioritizing and pursuing larger ticket/cost items where greater energy savings and efficiencies could be realized. Before this project, MCPS did not consider energy efficiency or ENERGY STAR™ ratings when purchasing equipment.

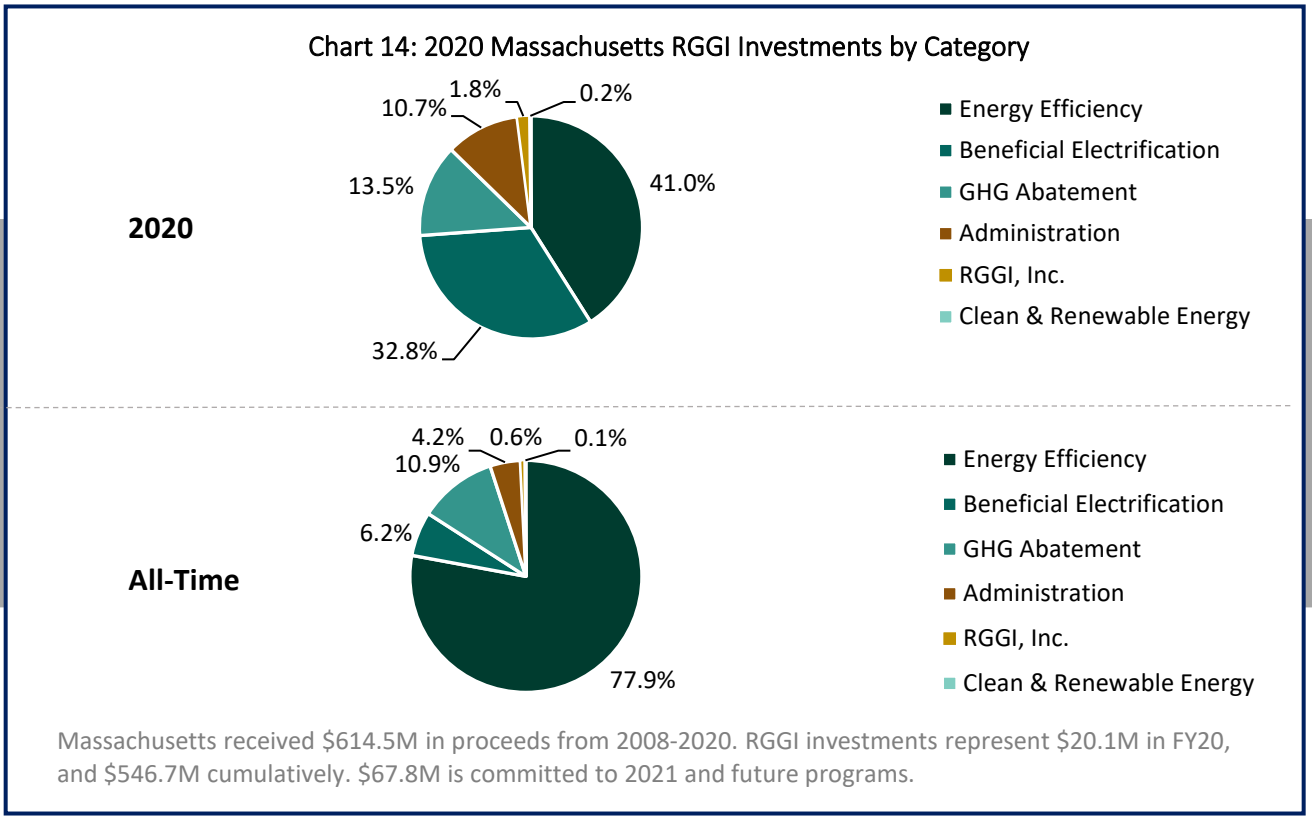
Massachusetts

Massachusetts leads the nation with bold and transformative policies and practices to address climate change. Signed into law in 2008, the *Global Warming Solutions Act (GWSA)* established a statewide limit on greenhouse gas (GHG) emissions of 25 percent below 1990 levels for 2020 and 80 percent below 1990 levels by 2050.[2] In 2020, Governor Baker signed *An Act Creating a Next Generation Roadmap for Massachusetts Climate Policy*, further committing the Commonwealth to net zero emissions in 2050.[3]

Massachusetts was one of the first states in the nation to set aggressive economy-wide goals to reduce GHG emissions across the electricity, thermal, and transportation sectors and enact a suite of policies and practices to reach those goals. However, emissions from the transportation sector remain the states' foremost challenge in reaching its goal of net zero emissions in 2050. Transportation is the largest source of GHG emissions, and it continues to grow.

The aggregate emissions of the light-duty fleet of vehicles on Massachusetts roads is determined by a combination of the makeup of registered vehicles and the number of miles driven. The overall composition of the state's registered vehicles changes over time as new vehicles are purchased, old vehicles that no longer function or pass inspection are removed, and vehicles move in and out of state. Persuading new vehicle buyers to purchase an electric vehicle (EV) instead of a gasoline vehicle reduces future emissions from the transportation sector as vehicle purchases today determine the composition of the fleet for the vehicle's lifetime.

Chart 14: 2020 Massachusetts RGGI Investments by Category

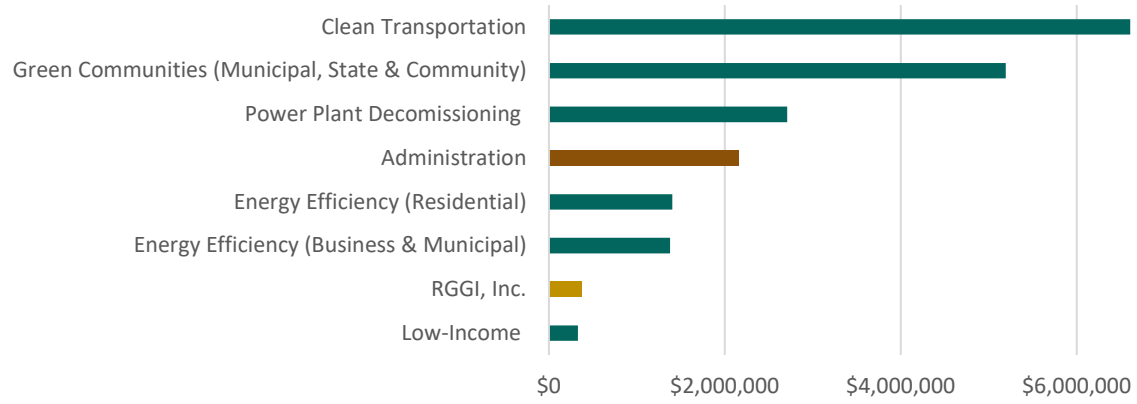


Massachusetts received $614.5M in proceeds from 2008-2020. RGGI investments represent $20.1M in FY20, and $546.7M cumulatively. $67.8M is committed to 2021 and future programs.

[2] An Act Establishing the Global Warming Solutions Act. Chapter 298 of the Acts of 2008, and as codified at M.G.L. c. 21N (Chapter 21N). Available at: https://malegislature.gov/laws/sessionlaws/acts/2008/chapter298

Available at: Governor Baker Signs Climate Legislation to Reduce Greenhouse Gas Emissions, Protect Environmental Justice Communities | Mass.gov

Chart 15: 2020 Massachusetts RGGI Investments by Recipient



Massachusetts RGGI investments represent $20.1M in 2020.

Program Highlight: MOR-EV

Launched in 2014, the *Massachusetts Offers Rebates for Electric Vehicles* (MOR-EV) program is an education and rebate program funded by the Executive Office of Energy and Environmental Affairs (EEA) and Department of Energy Resources (DOER) and is administered by the Center for Sustainable Energy (CSE) to increase the number of zero-emission vehicles (ZEVs) on roadways and reduce Massachusetts transportation sector GHG emissions. The MOR-EV program is designed to reduce GHG emissions in the transportation sector by influencing buyers to purchase an EV rather than a traditional gasoline-powered vehicle.

The program objective is to provide air pollution emission reductions for the Commonwealth by increasing the use of ZEVs MOR-EV offers rebates of up to $2,500 per electric vehicle and educates consumers and dealers about ZEV rebates and benefits. In 2020, more than 2,700 rebates were approved.

MOR-EV supports the Commonwealth's goals to reach 300,000 ZEVs on the roads by 2025. The program is designed to accelerate deployment of ZEVs in the Commonwealth by incentivizing residents to purchase or lease vehicles that will help:

- Reduce GHG emissions that contribute to climate change
- Protect public health and air quality by reducing transportation-related air pollution that contributes to smog formation and related health effects such as asthma and heart attacks
- Enhance energy diversity and security
- Save drivers money
- Promote economic growth in the Commonwealth

In 2020, the MOR-EV program avoided the use of nearly 23,000 barrels of oil used by light duty vehicles. The Commonwealth's program succeeded in avoiding more than 127,000 MMBtu and reducing GHG emissions by 10,317 short tons.

From its inception in 2014, the program has gone through several iterations, with an eye for changes towards improvement. A cost effectiveness report is currently being undertaken to examine the role of such changes within the program scope.

MOR-EV was one of the first programs of its kind in the United States and the performance of the program to date offers many lessons learned. As with any new initiative, there are successful aspects of the program as well as opportunities for improvement. Three challenges of the current program are financial sustainability, cost-effectiveness, and equity. These issues are high priorities for the next phase of the program, and the opportunities presented are focused on achieving these three priorities.

Success Story: Green Communities

The city of Methuen used its $268,640 Green Community Designation Grant to install three energy efficiency measures at its public library, new pumps and motors at a sewer pumping station, efficiency upgrades at the water treatment plant, new heating equipment at fire stations, and to replace insulation and vapor barriers on rooftop ductwork at an elementary school. These projects will save the city an estimated $31,000 a year in energy costs and reduce annual emissions due to municipal operations by 89 tons.

Three projects at the Nevins Library were designed to improve energy efficiency of the historic municipal building's heating and ventilation systems.

- Project #1 - Installation of demand controls to enable central programming and automation of heating, ventilation, and cooling.
- Project #2 - Installation of variable frequency drive controls for more efficient timing operation of air handling unit fan motors.
- Project #3 - Replacement of two outdated, inefficient fan motors of air handling unit pumps. This project was added as project team made a determination that two of the four air handling unit motors needed to be replaced to maximize energy efficiency benefits.

The sewer Pump and motor replacement involved replacing two obsolete pumps & motors at the Bolduc Street sewer pumping station in West Methuen.

The Bolduc Street station is the city's second largest sewer pump station. The two old 25-horsepower 3-phase motors, in addition to inefficient energy usage, required extensive maintenance for operation, including frequent cleaning and regular reassembly of both pumps. The new pumps have significantly reduced clogging of materials and maintenance costs at the station.

At the water treatment plant, grant funds supported the installation of two variable frequency drives to enable more efficient timing operation at the plant's hot water secondary pumps and the installation of an air source heat pump at the plant's backup generator facility. This will provide for more efficient pre-heating of the back-up generator system's engine block.

Two fire stations received heating equipment upgrades. An outdated, inefficient furnace heating office and living space on the second floor of the Central Fire Station was replaced with a more efficient gas-fired unit. Garage bay unit heaters at the North Fire station were replaced with more efficient models.

The final project replaced aging insulation and vapor barriers supporting a rooftop unit on an elementary school.

New Hampshire

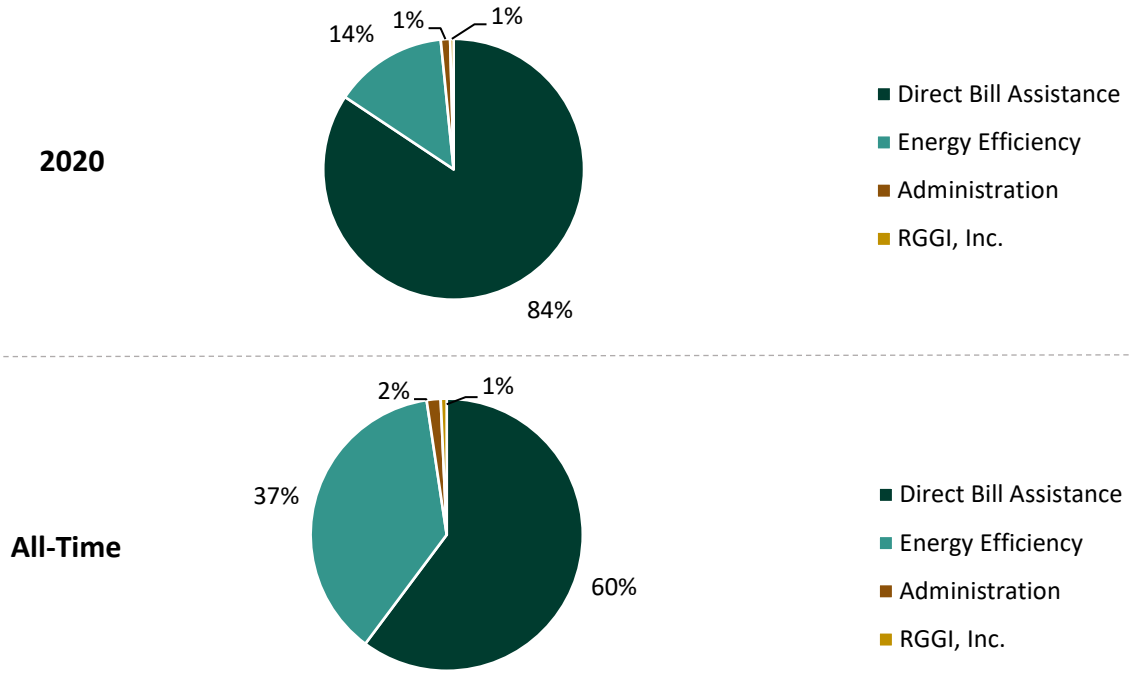
New Hampshire invests RGGI allowance proceeds in a variety of programs that reduce energy use in municipal and retail buildings, commercial and industrial facilities, and low-income households. RGGI allowance proceeds also provide direct bill assistance to reduce electric bills.

In 2020, New Hampshire received approximately $18.8 million in RGGI allowance proceeds, of which approximately $2.5 million was allocated to the Energy Efficiency Fund (EEF). The state's four electric utility companies administer energy efficiency fund programs through the EEF in combination with funds collected through the System Benefits Charge. Approximately $15.8 million was used to provide direct bill assistance to New Hampshire electric consumers, $0.1 million was allocated to an energy efficiency program focusing on moderate-income households, and the remaining RGGI auction proceeds of approximately $0.3 million covered RGGI-related administrative expenses.

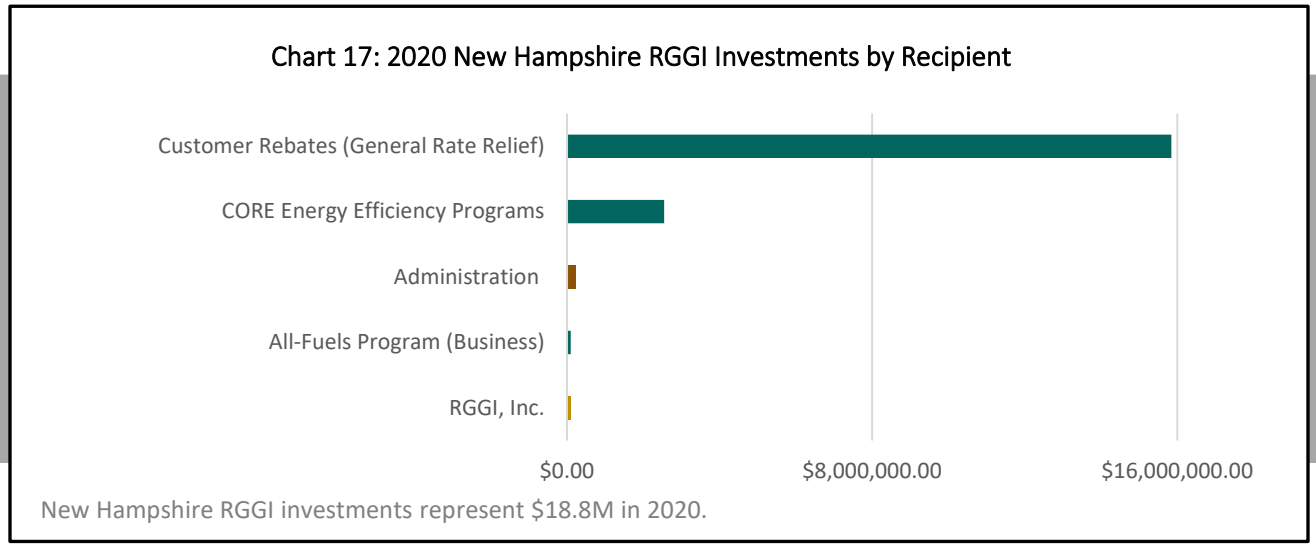
The state's electric utility companies' energy efficiency programs supported by RGGI funds include: a Municipal program; an income-eligible Home Energy Assistance program; and an All-Fuels weatherization program targeting moderate-income households. In 2020, EEF funds were used to accomplish the following:

- Installed energy efficiency measures in 163 municipal buildings;
- Weatherized and/or provided weatherization self-install "kits" to 476 income-eligible homes; and
- Worked closely with Community Action Agencies to develop moderate-income program details, outreach methods, and to identify eligible households for targeted outreach.

Chart 16: New Hampshire RGGI Investments by Category



New Hampshire received $176M in proceeds from 2008-2020. RGGI investments represent $18.8M in 2020, and $172M cumulatively.



Program Highlight: Efficiency Programs

For the measures installed in 2020, the Home Energy Assistance and Municipal programs will save approximately 53,712 MWh of electricity and 129,400 MMBtu over the expected life of the energy efficient equipment improvements. Associated bill savings over the lifetime of these improvements is estimated to be $10.5 million. The All-Fuels program will save approximately 23 MWh of electricity and 310 MMBtu over the expected life of the energy efficient equipment improvements made in 2020.

The All-Fuels program was launched in 2016. From 2016 through 2018 the program received $1.2 million of RGGI funding to support energy efficiency measures for retail businesses, and large commercial and industrial energy users. Beginning in 2019, the All-Fuels program supports energy efficiency measures for moderate-income residential energy users with household income of 200% to 300% of Federal Poverty Guidelines. Working with Community Action Agencies, the New Hampshire electric utilities will provide energy audits, and offer financial incentives for installation of energy efficiency measures. Beginning In 2019, this program will receive a total of $690 thousand of RGGI funding over a three-year period.

Success Story: Town of Carroll Public Safety Building and Town Hall

At their 2019 Town Meeting, Carroll voters overwhelmingly approved the proposal for a new Town Hall and Safety Building to be erected at a single, convenient location. The ultimate plan was to construct two separate buildings at the site of the now former, and since removed, town hall. This project presented an ideal opportunity for energy efficiency measures to be incorporated into the new structures through the RGGI-funded NHSaves Municipal Program and partner utility Eversource Energy (“Eversource”). Eversource worked with the project architects and contractors to include multiple energy efficiency measures in the project, resulting in structures that exceed building code efficiency requirements and containing multiple efficient measures, including above code insulation, double glazed windows with argon fill, LED lighting, and efficient heating and water systems.

The town formerly leased a building for its police headquarters and to house its Fire and Rescue departments at another, separate location. With the new 13,000 square foot Safety Building, Carroll is able to house its police and emergency-operations center, and the Twin Mountain Fire and Rescue department, all under one roof. Building spaces include a large apparatus bay, a workshop, fire chief offices, EMS offices, police chief offices, a secure, controlled entry way, evidence rooms, booking/holding areas, a training room, a kitchen, storage, and mechanical/electrical areas. Adjacent to the Safety Building is the new Town Hall, which is a 6,500 square foot structure. Its building spaces include a 1,500 square foot community room, library, historical room, offices/conference rooms, store, and mechanical/electrical areas.

The RGGI-funded NHSaves Municipal program not only allowed the Town of Carroll to construct the buildings they voted for, it also allowed for enhanced versions of the buildings with a more appealing return on investment. These

structures, as built, ensure reduced energy use, carbon emissions and energy bills for the town for many years to come compared to baseline structures that simply meet codes and standards. Together, the buildings are estimated to produce annual savings of 53,591 kWh, 8.0 kW, and 1,493 gallons of propane for the Town of Carroll each year for the useful life of the measures incorporated.

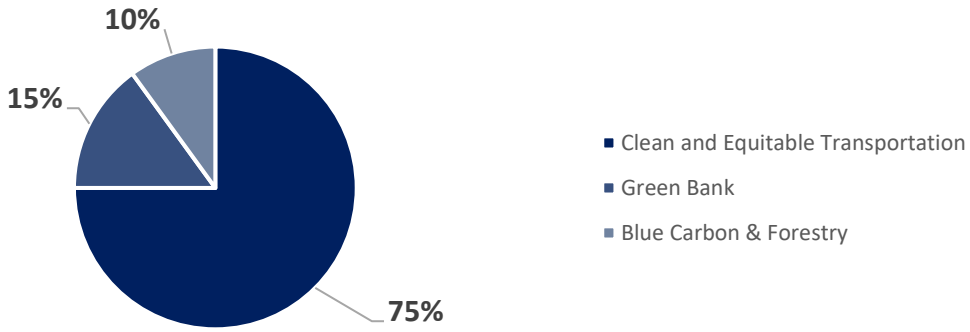
- 2020 Systems Benefit Charge Report to New Hampshire Legislature inc. RGGI Grant Program
- Report to New Hampshire Legislature on 2020 RGGI Program

New Jersey

New Jersey formally rejoined RGGI in 2020, and as part of its onboarding process released its *RGGI Strategic Funding Plan: Years 2020 through 2022*. This plan guides the investment of the state's auction proceeds for its first three years of participation, ensuring cross-agency coordination. By law, New Jersey's RGGI funding is allocated by percentage to three state agencies (60% to the New Jersey Economic Development Authority, 20% to the New Jersey Board of Public Utilities and 20% to the New Jersey Department of Environmental Protection) and each agency is required to spend funds within specific programs areas. The plan identifies cross-agency initiatives that will be funded by RGGI auction proceeds and how these investments complement the state's emissions reductions, clean energy, and environmental justice priorities. Funds from 2020 through 2022 are devoted to programs and projects that fall within the scope of four initiatives:

1. Catalyzing Clean, Equitable Transportation
2. Promoting Blue Carbon in Coastal Habitats
3. Enhancing Forests and Urban Forests
4. Creating a New Jersey Green Bank

Chart 18: New Jersey 2020-2022 Planned RGGI Investments by Category

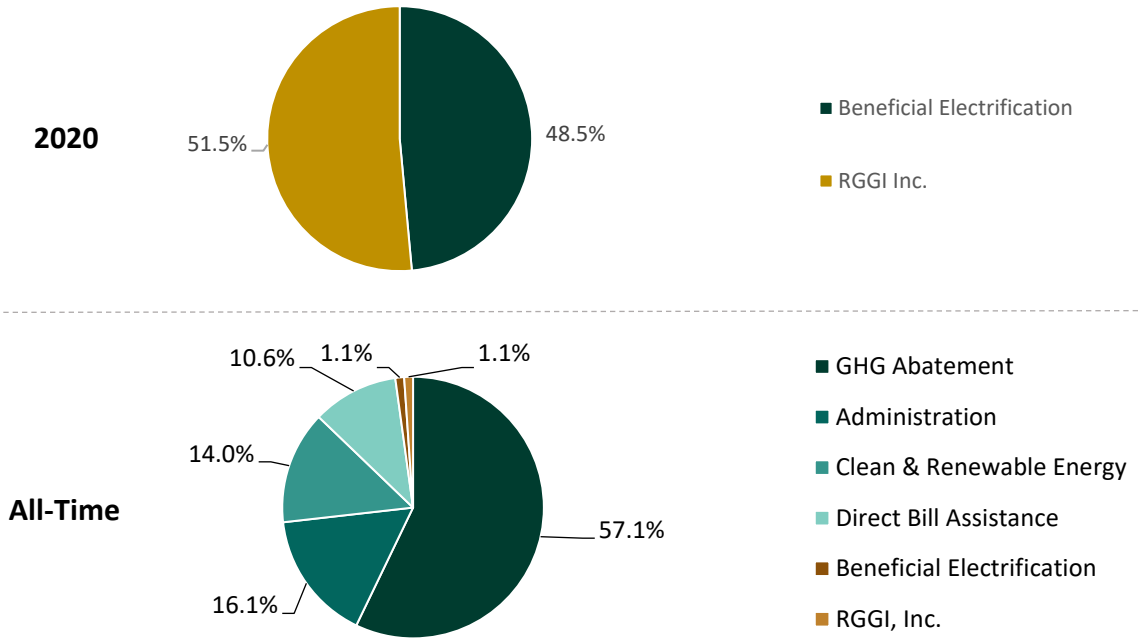


The majority of funding is dedicated to accelerating transportation electrification in the State, focusing on reducing emissions from transportation sources in communities disproportionately impacted by the effects of environmental degradation and climate change. Electrification of the transportation sector is essential for New Jersey to achieve its targets of a 50% reduction in greenhouse gas emissions by 2030 and an 80% reduction by 2050. Currently, transportation accounts for 41% of greenhouse gas emissions in the State, more than twice that of the second largest source, electric generation (19%).[4]

During 2020, the Economic Development Authority, in consultation with, the Board of Public Utilities and the Department of Environmental Protection worked closely with a consultant to develop a zero-emission medium and heavy-duty vehicle strategy, to guide its RGGI investments in clean and equitable transportation.

[4] New Jersey Greenhouse Gas Inventory, Mid-Cycle Update Report. NJ Department of Environmental Protection (NJDEP). 2021. https://www.nj.gov/dep/aqes/ghgarchive/MCU%20GHG%20Inventory_2021.pdf

Chart 19: New Jersey RGGI Investments by Category



New Jersey received $94M in proceeds in 2020. RGGI investments represent $1M in 2020, which are reflected in the 2020 chart above. New Jersey was an early participant in RGGI before withdrawing in 2012, and then resumed participation in 2020. New Jersey's first control period (2008-2012) proceeds investments total $43.6 million, which are included with 2020 investments in the All-Time investments chart.

Program Highlight: Supporting the Transition to Zero-Emission Commercial Transportation

New Jersey is uniquely situated along the Northeast corridor and has extensive transportation assets, including the nation's second busiest port and second densest road and rail network. Electrifying the State's transportation sector therefore requires a thoughtful approach to planning and implementation. To that end, the New Jersey Economic Development Authority, in consultation with the Department of Environmental Protection and the Board of Public Utilities, utilized RGGI funds to develop a strategic approach for establishing New Jersey as a zero-emission transportation hub with a focus on job creation and workforce development. This strategy works in concert with the State's Energy Master Plan and Global Warming Response Act 80x50 Report. As part of this effort, the zero-emission medium and heavy-duty market and supply chain were analyzed, a state strategy was proposed and a slate of new zero-emission medium- and heavy-duty vehicle programs and initiatives were conceptualized. Initial efforts focused on the development of the New Jersey Zero Emission Incentive Program (NJ ZIP), which was formally launched in April of 2021.

NJ ZIP is a voucher program for businesses and organizations purchasing new, electric, class 2b to class 6 vehicles. The program offsets the costs of purchasing electric medium-and heavy-duty vehicles by offering vouchers with base values ranging between $25,000 to $100,000. Additional bonuses are available for small businesses; women-, minority-, and veteran-owned businesses; vehicles that were manufactured in New Jersey; small businesses that scrapped their eligible gas- or diesel-powered medium- and heavy-duty vehicles; and vendors that invest in driver education and training. Funding is limited to companies operating in eligible communities, as defined as the greater Newark and Camden areas for NJ ZIP's inaugural round.

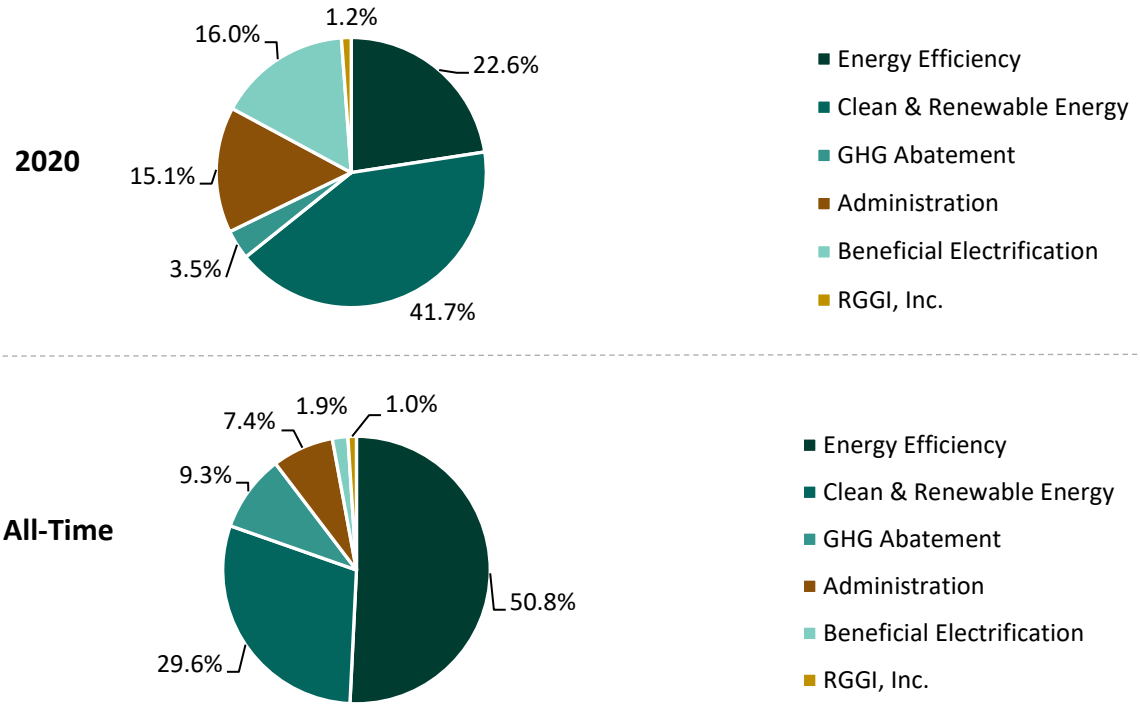
- New Jersey Zero Emission Incentive Program

New York

New York's robust record of climate action includes helping to establish RGGI as North America's first market-based program to reduce carbon emissions. The state affirmed its role as a climate leader with enactment of the Climate Leadership and Community Protection Act, one of the most aggressive climate polices of any major economy. The State has already reduced electricity emissions by 51% since 1990, with a 60% reduction from 2005 to 2019 in greenhouse gas emissions from sources covered by the RGGI program. Further reductions in electricity sector emissions will allow for needed shifts to electrify buildings and transportation. RGGI, alongside state policies such as the Clean Energy Standard, focused on renewable generation deployment, and the ten-year, $5 billion Clean Energy Fund, focused on buildings decarbonization, will continue to serve as a critical tool to reduce state-wide greenhouse gas emissions 40% from 1990 levels by 2030 and realize a zero-carbon electricity sector by 2040.

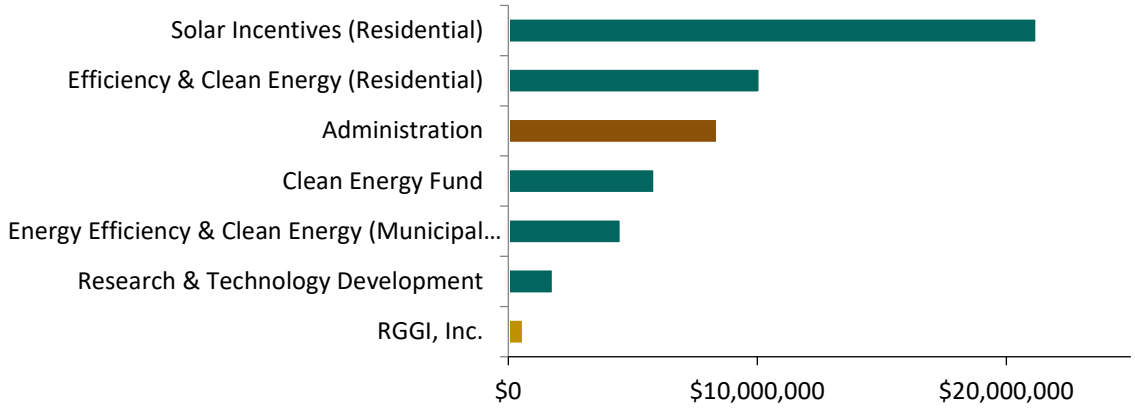
Proceeds generated through RGGI auctions allow New York to pursue opportunities for clean energy, energy efficiency, and carbon reduction that other state activities are not currently designed to reach. The demand for RGGI-supported programs underscores New Yorkers' desire for clean energy opportunities.

Chart 20: New York RGGI Investments by Category



New York received $1.4B in proceeds from 2008-2020. RGGI Investments represent $52.6M in 2020, and $1.1B cumulatively. $345.5M is committed to 2021 and future programs.

Chart 21: 2020 New York RGGI Investments by Recipient



New York RGGI investments represent $ 52.6M in 2020.

Program Highlight: REV Campus Challenge

The Energy to Lead Competition of NYSERDA's REV Campus Challenge initiative challenges colleges and universities across the State to develop and implement plans to advance building decarbonization and innovative, cost-effective clean energy solutions on their campuses and local communities. Institutions are encouraged to incorporate students, curriculum integration, and community engagement into their projects. Proposals with the best solutions to achieve deep energy savings and combat climate change through energy efficiency, renewables, or GHG emission reduction will win approximately $1 million each to help implement their plans. There were three rounds of the Energy to Lead Competition. The final round had proposals submitted in February 2020, and resulted in 18 proposals from 17 institutions. The latest updates from winning institutions of the first two rounds include:

- The State University of New York at Buffalo and its partners are close to finalizing advancement of an offsite solar venture that will enable the university to achieve their goal of 100% renewable purchased electricity. In addition, the university's sustainable living learning lab project, Garden, Relax, or Work (GRoW) Home, has been moved to the North Campus and interior/exterior construction is being finalized. The installation of 22,600 ground mount solar panels commenced in Q4 2020 and is expected to be completed by Q2 2021.
- Bard College filed an application with the Federal Regulatory Commission (FERC) on May 1, 2019 for an exemption from licensing for the Annandale micro hydropower project. FERC requested a stability analysis to also be completed while FERC continues to review the application. Bard College and Micro Hydro have submitted a response to FERC during Q4 2020 and FERC is finalizing their review of the full application package. Since the launch of their Micro Hydro New York website, Bard has released several blog posts about project status and FERC approval on a real-time basis.
- Suffolk County Community College (SCCC) completed the project design and construction documents for their Renewable Energy and STEM Center (RESC) to achieve Net Zero Energy (NZE) in Q3 2020. Following design completion, SCCC obtained a building permit for the RESC and issued an RFP to solicit a general contractor for the building's construction. SCCC selected and awarded a general contractor in Q4 2020 and construction began in Q2 2021.

Success Story: Workforce Development

The Green Jobs Green New York (GJGNY) Workforce Training and Development (WFD) initiative complements other NYSERDA and New York State Department of Labor (DOL) programs targeted at preparing individuals for energy efficiency, solar thermal, and solar electric careers in New York State. WFD programs help to build the State's capacity for long-term carbon reduction, facilitate energy education programs that will help build a clean

energy future, and provide long-term career opportunities for individuals seeking to work in clean energy. Specifically, GJGNY efforts are expanding the State Registered Apprenticeship Program and additional third-party accredited building trades programs by providing clean energy specific content in those training activities. Expectations are to increase access to technical training workshops for skill enhancement and certification. In addition, the GJGNY-supported programs are expected to bridge the gap between training and employment through on-the-job training incentives for businesses seeking to hire and train new workers while reaching out to low-income communities to expand training opportunities. From the program's inception a total of 4,184 New Yorkers were trained in a range of energy efficiency and renewable energy courses.

In 2020, NYSERDA advanced approximately $520,000 in GJGNY WFD funds that will be made available to eligible New York State employers. This program supports wages for new hires on a first-come, first-served basis for eligible clean energy businesses. The program includes higher wage subsidies for employers that hire workers with additional barriers to employment. On Long Island, GJGNY supported 51 total On the Job Training hires in 2019, and a total of 245 total for 2020 – which represents over 480% year-over-year growth in the program to support business hiring, even during the height of the COVID-19 pandemic.

Rhode Island

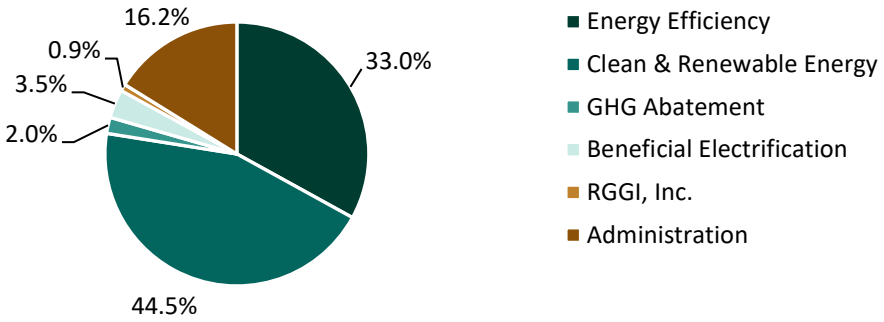
Rhode Island RGGI auction proceeds are allocated by the state's Office of Energy Resources (OER) to drive investment in – and expansion of – clean energy resources, including cost-effective energy efficiency and renewables. In doing so, OER seeks to support investment and job growth in Rhode Island's burgeoning clean energy sector; reduce barriers to consumer adoption of clean energy solutions; place downward pressure on long-term energy costs; and shrink the state's carbon footprint. RGGI auction proceeds are accelerating cleaner, more sustainable energy solutions across public and private sector institutions and in Ocean State communities. These investments are being made in a manner consistent with the Regional Greenhouse Gas Initiative Act, Rhode Island's State Energy Plan, its 2021 Act on Climate, and broader state energy and environmental policy goals.

In 2020, Rhode Island RGGI proceeds were allocated to support several important clean energy programs, including:

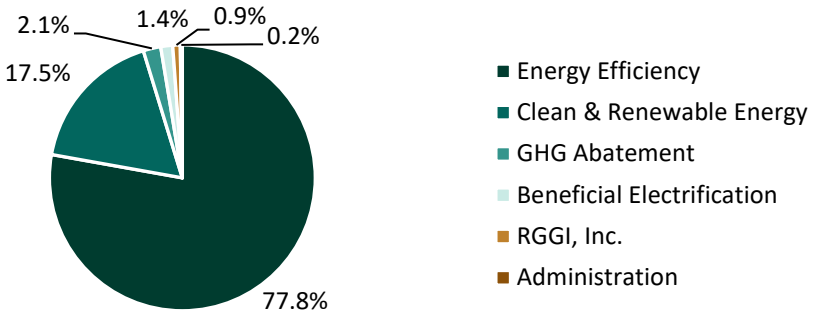
- Providing enhanced financial incentives to support Rhode Island municipalities with the conversion of local streetlights to high-efficiency LED technologies;
- Continued support for the Rhode Island Department of Environmental Management's Energy-Savings Trees program, which distributes trees to homeowners that can be strategically planted on their property and result in saving energy and lower utility bills;
- Advancement of the State Clean Energy Lead by Example program, which is supporting the adoption of energy efficiency and renewable energy projects at state government properties;
- Expanded cost-effective energy efficiency programs and incentives for utility customers located in the Pascoag Utility District;
- Support for the Rhode Island Infrastructure Bank's Efficient Buildings Fund (EBF). RIIB's EBF provides attractive, long-term financing to municipalities and quasi-public agencies for the completion of energy efficiency and renewable energy projects;
- Continued support for a Farm Energy Program that links local farms to energy efficiency and solar PV opportunities;
- Support for the Zero Energy for the Ocean State (ZEOS) program through collaboration with Rhode Island Housing and National Grid. This program is designed to help provide energy savings to low and moderate income (LMI) customers in Rhode Island;
- Support solar development on Brownfields through Rhode Island Commerce Corporation's Renewable Energy Fund; and
- Furthering solar PV adoption by Rhode Island homes and businesses through continued support of the state's Renewable Energy Fund.

Chart 22: Rhode Island RGGI Investments by Category

2020

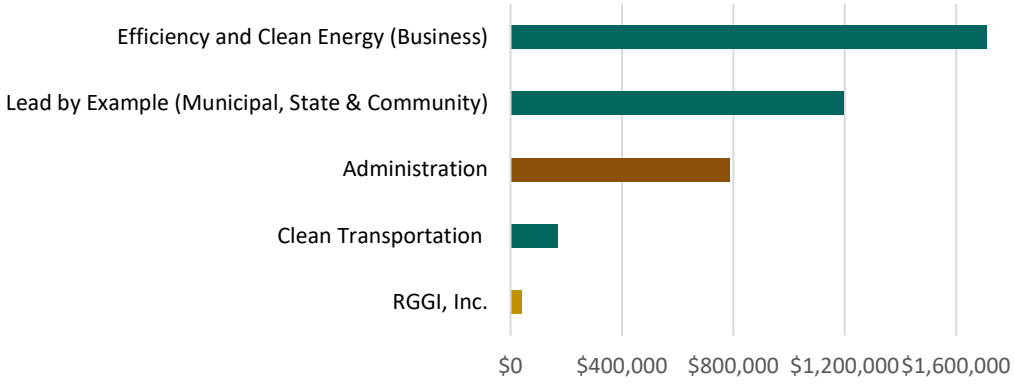


All-Time



Rhode Island received $81.9M in proceeds from 2008-2020. RGGI Investments represent $4.9M in 2020, and $55.7M cumulatively. $26.3M is committed to 2021 and future programs.

Chart 23: 2020 Rhode Island RGGI Investments by Recipient



Rhode Island RGGI investments represent $4.9M in 2020.

Success Story: Pascoag Utility District Battery Storage

The Pascoag Utility District (PUD) is a not-for-profit, quasi-municipal utility serving approximately 5,000 electric customers in the Pascoag and Harrisville sections of Burrillville, Rhode Island.

Their electric service territory is serviced by two feeder lines, one primary and one backup, which were meeting or exceeding maximum capacity during peak load conditions. After comparing options from a system impact study conducted to look for solutions to alleviate these grid concerns, PUD decided to undertake a "non-wires alternative" or NWA project to address this need rather than implement a traditional infrastructure upgrade to both feeder lines.

This NWA solution involved a substation expansion to allow both feeder lines to serve PUD's load simultaneously at peak conditions in combination with a 3 MW/9 MWh battery storage device that will allow PUD to dispatch stored power under contingency conditions or when one of the feeder lines is down.

This project is expected to cost approximately $2.3 million dollars, providing significant savings when compared to the estimated $6-$12 million cost of the traditional infrastructure upgrade. As a not-for-profit utility, maintaining low rates and reliable service are two of PUD's most important priorities, which this NWA solution advanced. In addition, this innovative project will better utilize clean energy resources in the Pascoag territory by charging during off-peak hours and deploy energy during high-load hours to reduce overall load on PUD's system. Having battery storage of this capacity also provides an important resiliency asset to this community that can be deployed during emergency situations or in response to extreme weather conditions to maintain critical services for their customers.

Further showcasing Pascoag Utility District's leadership and creativity was their pursuit of numerous funding channels to support this project. PUD was able to secure financing for some of the project costs through the Rhode Island Infrastructure Bank at well-below market interest rates while bringing on a strong institutional partner to support this project.

This project began construction in 2021 and is expected to be fully complete, interconnected, and operational in 2022 prior to the summer peak season. Once operational, it is anticipated that this clean energy project will deliver over 80 tons of CO2 reductions annually and provide significant reliability and grid optimization services to the community as well.

This project was funded with RGGI Proceeds.

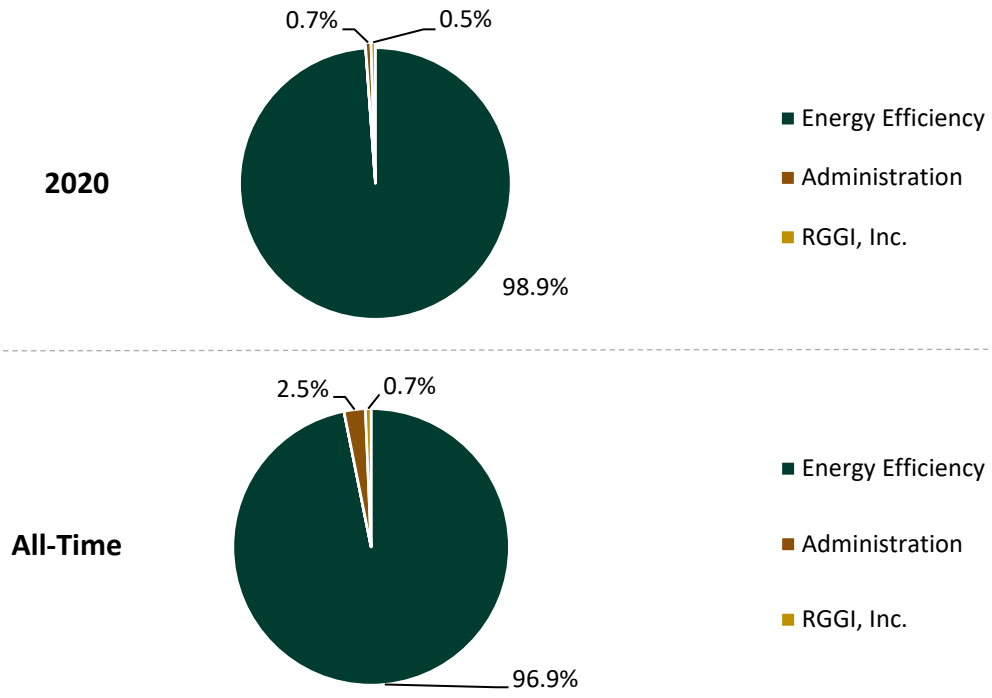
Vermont

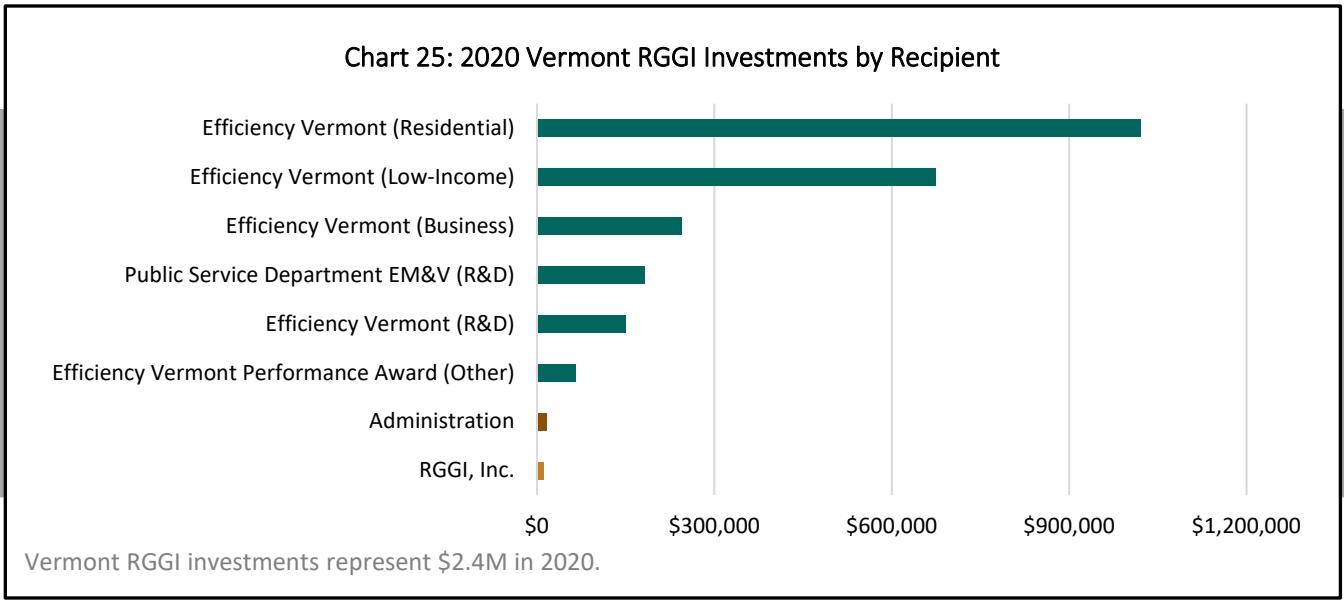
Vermont invests the majority of its CO_2 allowance proceeds in programs managed by Efficiency Vermont. RGGI funds allow Efficiency Vermont to expand its electrical energy efficiency programs to include thermal energy and process fuels efficiency programs. Efficiency Vermont's participation in the regional grid's forward capacity market also provides funds for this program expansion. Vermont's thermal energy and process fuels efficiency programs funded by RGGI through 2020 are estimated to result in lifetime energy savings of 4,672,229 MMBtu. These programs are estimated to avoid the emission of 278,837 short tons of CO_2, and to save participants $113,109,031 on their energy bills over the lifetime of those investments. Vermont's RGGI-funded programs have served approximately 12,326 households and 689 businesses. Programs currently supported by CO_2 allowance proceeds include the Home Performance with ENERGY STAR® service for residential customers, the Building Performance service providing incentives for efficiency services to small business customers, the Home Energy Loan for residential customers, low-income energy efficiency services through 3E Thermal project management, custom commercial thermal efficiency projects, and technologies including woodstoves and heat pumps.

Efficiency Vermont, the nation's first ratepayer-funded energy efficiency utility, is overseen by the Vermont Public Utility Commission, and implemented by VEIC. Efficiency Vermont's programs have a proven track record of saving energy and money for commercial, industrial, and residential consumers. These and other energy efficiency programs helped to rank Vermont third in the nation in 2020, according to the American Council for an Energy Efficient Economy (A CEEE) State Energy Efficiency Scorecard.

Chart 24: Vermont RGGI Investments by Category



Vermont received $28.2M in proceeds from 2008-2020. Vermont investments represent $25.8M cumulatively. In 2020, Vermont received $2.5M in proceeds, $176k of which is committed to 2021 and future programs.



Program Highlight: Home Performance with ENERGY STAR and Home Energy Loan

The Efficiency Vermont Home Performance with ENERGY STAR service is an incentive-based program for single-family Vermont residences to lower utility bills and increase home comfort and safety by installing insulation, air sealing, and ventilation (heating systems improvements are also recommended). Vermonters can access comprehensive thermal efficiency retrofits, incentives to offset project costs, and low-no interest rate financing. Customers hire a participating Efficiency Excellence Network, Building Performance Institute certified, contractor. This allows customers to receive incentives up to $5,500, requires the contractor to meet Vermont residential building energy codes and standards, health and safety and program requirements, and provides quality assurance for projects.

The Efficiency Vermont Home Performance with ENERGY STAR service officially launched in 2005. In 2008, when the Vermont Legislature set a statewide goal to weatherize 80,000 homes by the year 2020, the Home Performance with ENERGY STAR service was galvanized. The legislation sought to harness energy efficiency as a driver of savings for consumers and economic development in Vermont. Home Performance with ENERGY STAR is one of the primary programs contributing to these goals.

Home Performance with ENERGY STAR is a national brand managed by the U.S. Department of Energy (U.S. DOE). Across the US, 50 organizations sponsor local programs under this brand. Although local programs differ, they follow the same basic structure to ensure a comprehensive, whole-house approach to energy efficiency and maximize long-term savings for homeowners. The key components of the Home Performance with ENERGY STAR program approach are outlined by U.S. DOE and implemented in Vermont by Efficiency Vermont.

The RGGI funded portion of the Efficiency Vermont Home Energy Loan program provides residential customers financing for Home Performance with ENERGY STAR projects and other thermal efficiency projects, including woodstoves (pellet and cord wood), and central pellet heating systems with income-based interest-rate buydowns and loan loss reserve support for participating lenders.

Success Story: RGGI Funds Help VT Accelerate Moderate-Income Weatherization Support

Efficiency Vermont helps Vermonters who don't qualify for low-income assistance weatherize their homes by providing rebates that offset the project costs. A substantial portion of the funding for these incentives has come from RGGI revenues, which have helped Efficiency Vermont build its robust Home Performance with ENERGY STAR program.

Leading up to 2020, Efficiency Vermont was able to support between 800-1,100 households each year through the Home Performance with ENERGY STAR program. This strong annual participation allowed the weatherization market to develop over time and positioned the state to make significant enhancement when the opportunity presented itself.

Such an opportunity came in 2019, when the legislature passed, and Governor Scott enacted, Act 62, allowing Efficiency Vermont to repurpose existing budget dollars from its electric energy efficiency budget as a result of operational efficiency cost savings, to help more moderate-income Vermonters weatherize their homes. With a strong Home Performance with ENERGY STAR program already well established, thanks in part to the sustained investment of RGGI funds over time, Efficiency Vermont was able to rapidly deploy these funds as increased incentives for moderate income Vermonters in 2020.

Efficiency Vermont reinvigorated and expanded the existing weatherization offer to provide up to 75% off project costs, with 0% interest financing for 60 months, and the first six months of payments would be paid for by Efficiency Vermont. It was paired with a robust, multimedia campaign.

The impact was immediate. Once the cost came down through the upfront incentive, and homeowners could break the remaining cost into low monthly payments (about $50 a month), the demand for weatherization surged statewide.

Steve Dunn, Program Manager for the DOE Home Performance with ENERGY STAR program, said that Efficiency Vermont is leading the effort to improve energy efficiency in homes, which lowers energy costs and improves home comfort and safety for thousands of families across the state, including communities that are not able to afford the cost of energy efficiency improvements.

Jill Neitlich and husband Flynn of Wardsboro, VT joined thousands of other Vermonters in 2020 by taking advantage of weatherization incentives through Efficiency Vermont's Home Performance with ENERGY STAR program.

"By providing low-moderate income families access to weatherization programs, Efficiency Vermont has made sure that the energy savings and health benefits of weatherization improvements are available to the families who need it most," said Dunn.

Thanks to consistent funding for more than a decade through RGGI and other revenues, Efficiency Vermont was able to tap into a proven, fully developed Home Performance with ENERGY STAR program in 2020 to ramp up the program and extend its reach to thousands of Vermonters who most needed it.

As the Vermont Public Utility Commission stated in its Act 62 Final Report to the legislature, "Efficiency Vermont was able to quadruple the number of projects it completed by reducing up-front project costs. In August and September 2020, increased funding allowed Efficiency Vermont to complete four to five times the number of projects historically completed in those months."

Weatherization directly supports Vermonters, boosts a growing workforce, and reduces greenhouse gas emissions. The past decade has proved that our statewide system of delivering these benefits has been effective. 2020 proved that without a stable, long-term source of additional funding like RGGI, Vermont would have missed out on the opportunity to help thousands more Vermonters. Efficiency Vermont looks forward to continuing its successful partnerships to serve Vermonters and support our state's goals for many years to come.

Glossary and Methodology

Program Categories

Administration
Funds directed to administrative overhead expense associated with all RGGI-funded programs, including outsourced and in-house overhead expenses.

Beneficial Electrification
Programs designed to reduce fossil fuel consumption by implementing or facilitating fuel-switching to replace direct fossil fuel use with electric power. Examples include incentives for electric vehicles and home appliances, and installation of electric vehicle infrastructure. Program costs include evaluation and measurement.

Clean and Renewable Energy
Programs directed at accelerating the deployment of renewable or other non-carbon emitting energy technologies. Program costs include evaluation and measurement. Examples include incentives for residential solar panels, financing of commercial renewable energy projects through green banking, research and development of new energy technologies.

Direct Bill Assistance
Programs providing energy bill payment assistance, including direct bill assistance to low-income ratepayers. Program costs include evaluation and measurement.

Energy Efficiency
Programs designed to improve energy efficiency by reducing overall energy use without degrading functionality. This includes programs directed at assisting low-income families and small businesses. Program costs include evaluation and measurement. Examples: home energy audit programs, home and building weatherization, energy efficient appliance or industrial equipment rebate programs, compact fluorescent light bulb programs, and energy efficiency workforce training programs.

Greenhouse Gas Abatement
Programs promoting the research and development of advanced energy technologies, the reduction of vehicle miles traveled, the reduction of emissions in the power generation sector, tree-planting projects designed to increase carbon sequestration, and other initiatives to reduce greenhouse gases. Program costs include evaluation and measurement.

RGGI, Inc.
Funds provided to RGGI, Inc. to support and implement state CO_2 Budget Trading programs.

General Terms

RGGI Investments
RGGI Investments are the proceeds generated by RGGI CO_2 allowance auctions that have been invested by the RGGI states in the energy efficiency, clean and renewable energy, GHG abatement, and direct bill assistance programs discussed in this report.

Future Committed
Future committed funds are the proceeds generated by RGGI CO_2 allowance auctions that have not yet been invested by the RGGI states. Future committed proceeds represent funds that could be invested by the state in 2020 and beyond.

Current Period
The twelve-month period covered by this report, which may be either the fiscal year or calendar year 2020, as defined by each state.

Benefits and Statistics

Annual (2020)
A measure of one year's worth of benefits from all measures installed in 2020. Note that actual realized benefits in the year 2020 may differ slightly from the 2020 annual benefits, since measures may be installed at different times during the year.

Lifetime (2020)
The full benefits of measures installed in 2020, including benefits to be realized in the future. The lifespan of installed measures varies by type of measure and by program, and is calculated and provided by program administrators. For example, an industrial boiler would likely be estimated to provide benefits over a longer lifespan than an LED lightbulb. Measure lifespans used in this report typically range between 5-25 years.

Lifetime (All-Time)
The total estimated lifetime benefits of all measures installed since the inception of the RGGI program. This includes the full lifetime benefits of measures installed in previous years, in addition to the lifetime benefits of 2020 measures.

Funds Invested
Total dollar amount of RGGI proceeds invested in a program or category over a given period. For programs that are partially funded by RGGI, only the amount provided by RGGI funds is included.

Participating Households: Programs
Number of households that have directly received assistance as a result of each program (e.g. number of homes weatherized, number of households receiving home energy audits, etc.). Households participating in more than one program may be counted under each program they have participated in (e.g. a completed home energy audit constitutes a participating household even if the household may elect to further participate in programs to install recommended measures). For multi-family dwellings, each unit within the multi-family home may be considered to be a household. For retail programs such as lightbulb distribution, households may be extrapolated from the number of items distributed.

Participating Households: Direct Bill Assistance
Number of households receiving direct bill assistance or energy bill rebates funded through RGGI proceeds. Bill assistance programs vary by state; in some cases rebates may be returned to all customers, while in other cases they may be targeted to low-income customers or to specific customer types.

Participating Businesses: Programs
Number of "end-user" businesses who have directly received assistance as a result of the program (e.g. number of businesses whose offices were weatherized, number of businesses receiving grant assistance to install energy efficiency measures, etc… via a grant, loan, or rebate). Businesses participating in more than one program will be counted under each program they have participated in (e.g. a completed audit constitutes a Participating Business even if the business may elect to further participate in programs to install recommended measures).

Participating Businesses: Direct Bill Assistance
Number of businesses receiving direct bill assistance or energy bill rebates funded through RGGI proceeds.

Increased Employment
Total estimated job-years created as a result of RGGI funds invested, estimated on a regional basis based on literature review.

MWh Avoided
Estimated total MWh projected to be avoided as a result of RGGI funds invested, calculated using program-specific savings as defined by each state.

MMBtu Avoided
Estimated total MMBtu projected to be avoided as a result of RGGI funds invested, calculated using program-specific savings as defined by each state.

Energy Bill Savings
Estimated gross amount saved as a result of RGGI funds invested (initial investment in installed measures is not deducted). Calculated using program-specific savings, as defined by each state. Estimates of lifetime energy bill savings are given in current year dollars as of the start of the savings, and in most cases are not discounted into the future. Where discounts are applied, they are noted on state-specific pages.

CO_2 Emissions Avoided
Estimated total number of short tons of CO_2 avoided as a result of funds invested, calculated using a program-specific formula as defined by each state.

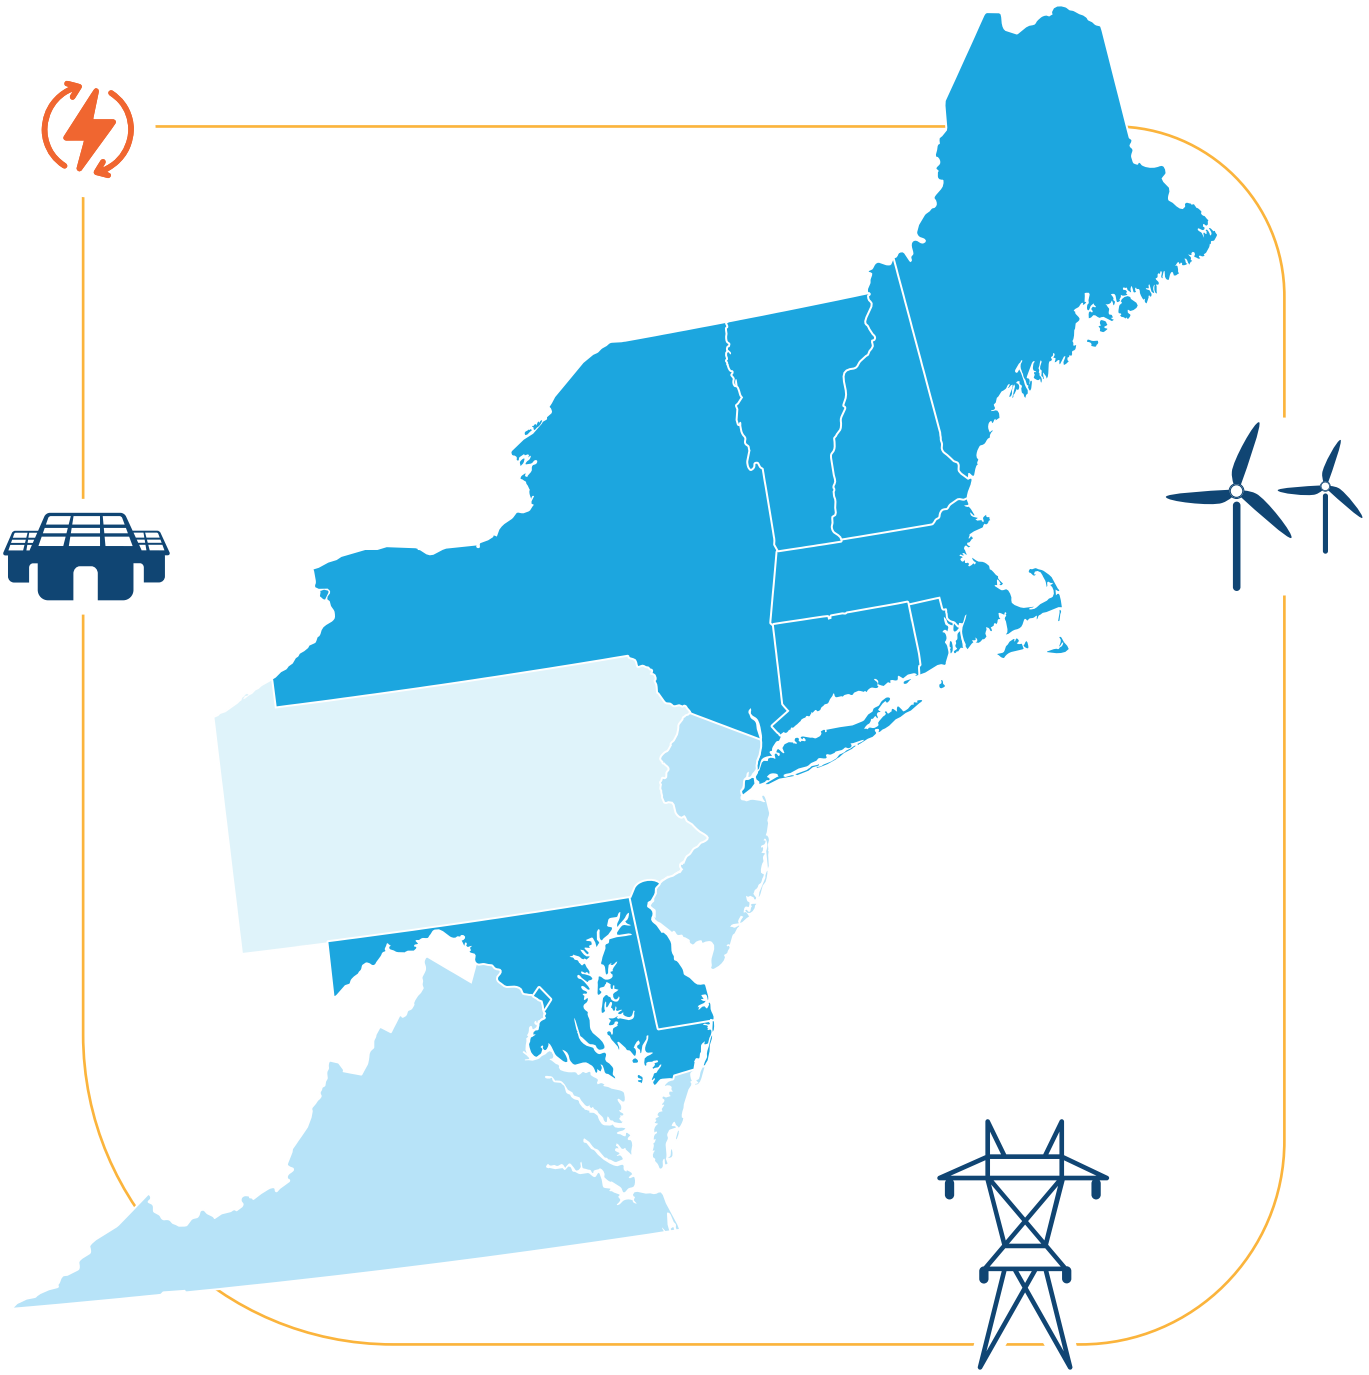
The Regional Greenhouse Gas Initiative

10 Years in Review



2019

Acadia Center

Executive Summary

Through ten years of operation, the Regional Greenhouse Gas Initiative (RGGI) has helped Northeast and Mid-Atlantic states[1] achieve significant reductions in emissions of carbon dioxide (CO_2) and other pollutants from the electric power sector. The country's first program designed to reduce climate change-causing pollution from power plants has provided a wealth of lessons to be incorporated into the next generation of climate policies, from successes to build on to opportunities for improvement.

The participating states have experienced substantial benefits from RGGI since 2008, the year before the program launched. Concerns that climate policy would make states less competitive have been directly refuted by RGGI's experience: the RGGI program is helping participating states outperform the rest of the country. Since 2008:

- **CO_2 emissions from RGGI power plants have fallen by 47%,** outpacing the rest of the country by 90%;
- **Electricity prices in RGGI states have fallen by 5.7%**, while prices have *increased* in the rest of the country by 8.6%;
- **GDP of the RGGI states has grown by 47%**, outpacing growth in rest of the country by 31%;
- **RGGI states have generated $3.2 billion in allowance auction proceeds**,[i] the majority of which have been invested in energy efficiency and renewable energy programs; and
- **RGGI-driven reductions in co-pollutant emissions have resulted in over $5.7 billion in health and productivity benefits.**[ii]

Much has changed since RGGI was launched, beyond the climate, economic and health improvements described above. Most notably, climate policy has advanced by leaps and bounds. When RGGI was implemented, it was just the second program in the world to regulate carbon emissions, and the first to require polluters to pay for emissions allowances (permits to emit pollution). Now, there are 57 national or subnational carbon pricing programs in place,[iii] many of them drawing on lessons learned from RGGI.

At the same time, findings from the scientific community have made the urgency of climate action increasingly hard to ignore. If the planet is to avoid crossing the 1.5 degree warming threshold, global annual GHG emissions need to be reduced by 45% from 2010 levels by 2030.[iv] To make a meaningful difference in reducing the catastrophic costs of climate change, we need urgent action.

Finally, sound climate policy needs to be oriented around climate justice. Programs designed to reduce GHG emissions must be good for the planet and for communities. In the RGGI context, that means improving air quality in environmental justice communities, ensuring that underserved populations have access to RGGI-funded energy efficiency and clean energy programs, and importantly, that those communities have a say in shaping the policy.[v] While there is much more to do to protect vulnerable communities from power plant pollution, states must also act with urgency to reduce locally-harmful pollution from other sources, most notably transportation.

---

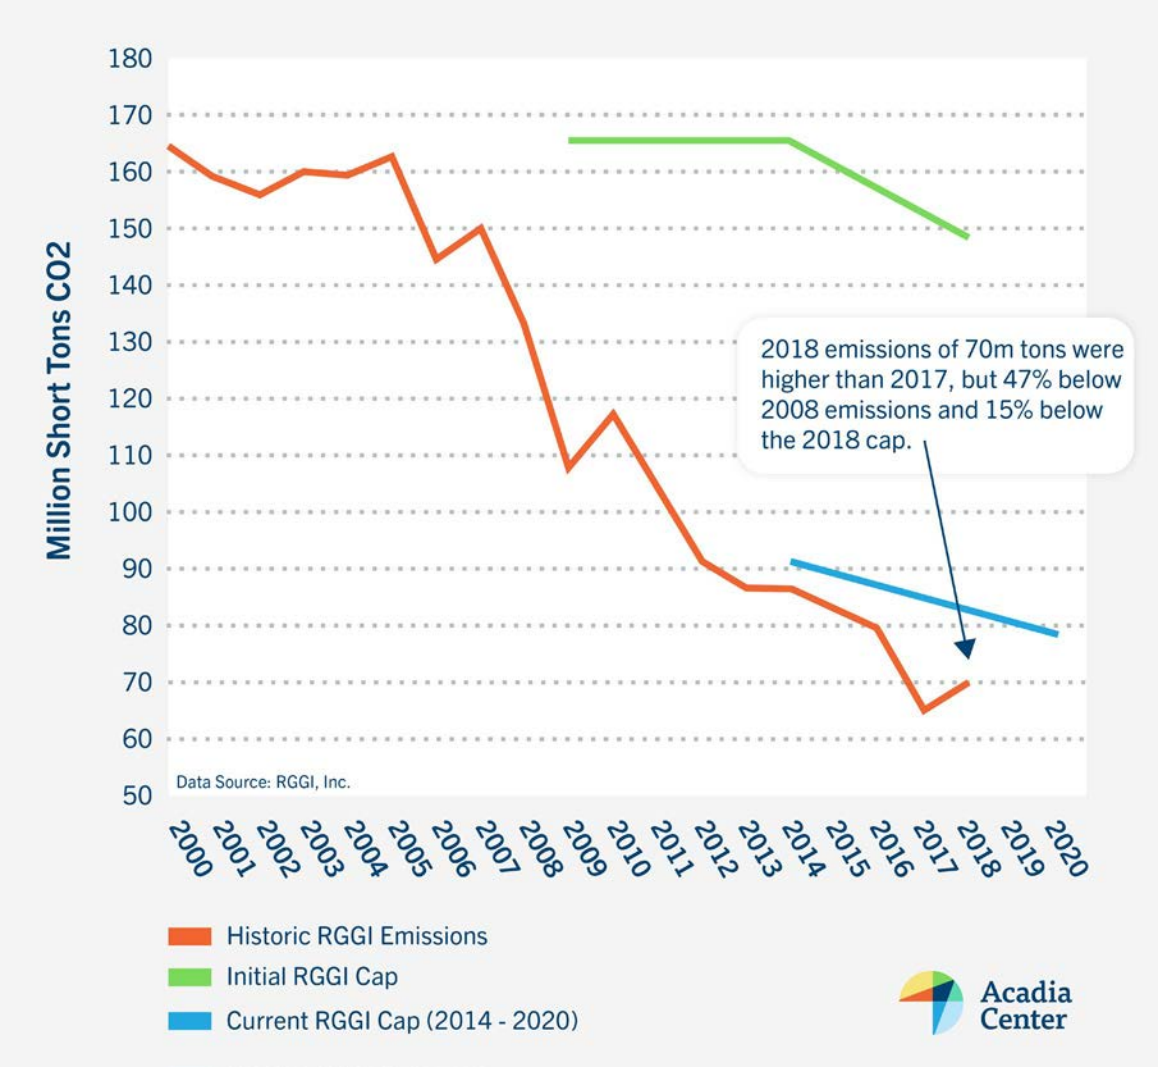
[1] Analysis in this report covers the currently participating RGGI states: Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont. [*Footnotes elaborate on points within this report, whereas endnotes cite references and provide detailed analytic methodologies where relevant.*]

Emissions Trends and RGGI Cap Dynamics

Rapid CO_2 Reductions Outpace the Rest of the Country

States participating in RGGI have seen a steep decline in CO_2 emissions from power plants over the last 10 years. Since 2008, the year before the program launched, RGGI emissions have fallen from 133 million short tons of CO_2 to 70 million tons in 2018, shown in Figure 1. The impressive electric sector emission reductions achieved in RGGI states over that time period have outpaced reductions in the rest of the country by a staggering 90%. While the RGGI program has not been the sole factor behind the region's rapid electric sector decarbonization, earlier analysis shows that it has been a key driver—and accelerator—of emission reductions from power plants.[vi]

Figure 1: RGGI Cap and Historic Emissions – Nine RGGI States



As Figure 2 shows, rapidly declining RGGI emissions and an oversupply of allowances have kept RGGI allowance prices relatively low. From Auctions 8 to 18, RGGI allowances sold at the reserve price—the lowest price at which allowances can be sold through auction—and the highest RGGI auction clearing price since the program launched was $7.50 per allowance. For comparison, the 2019 auction reserve price in California and Quebec's cap-and-invest program is $15.62 per allowance.[vii] This higher reserve price provides a greater incentive to pursue additional CO_2 abatement measures.

Figure 2: Quarterly RGGI Emissions and Auction Clearing Prices

Aligning the RGGI Cap with Current Emissions and the Climate Crisis

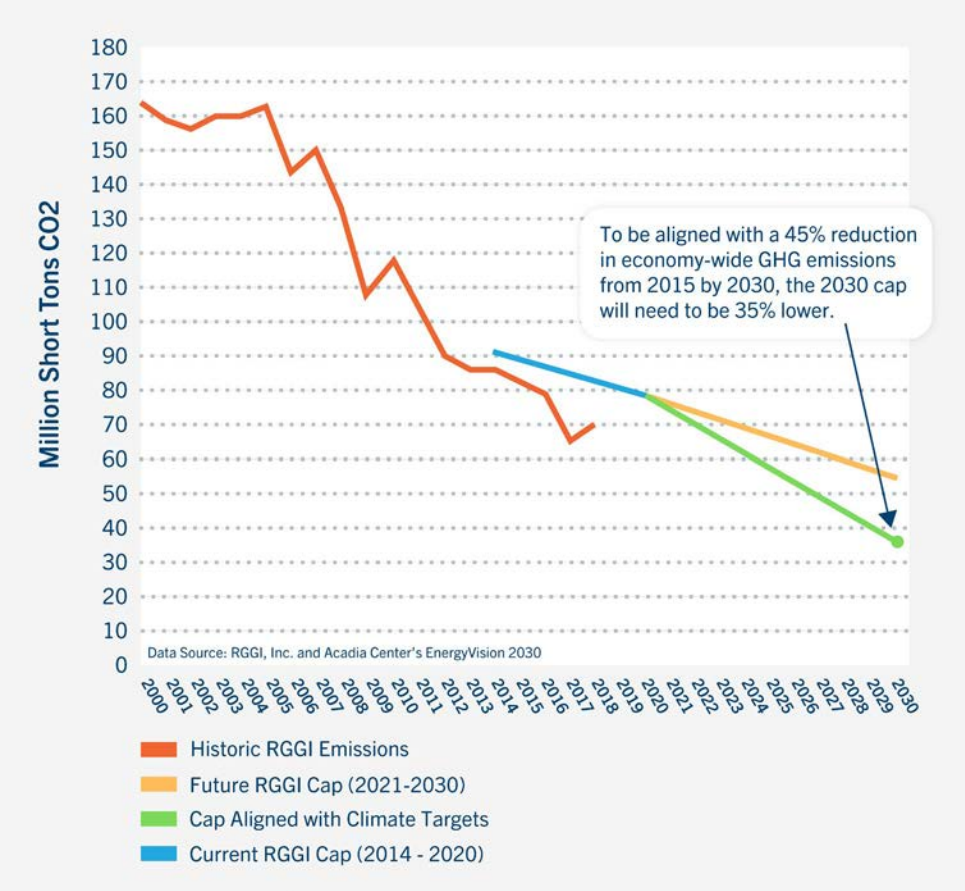
Through the first half of 2019 it appears the trend of declining RGGI emissions will continue, with RGGI COATS[viii] data showing the lowest first-half emissions in the program's history (see Figure 2).[ix] The fact that RGGI emissions have been well below the RGGI cap in every year of the program's history, as shown in Figure 1, is good for the climate and encouraging for future decarbonization efforts, but it also highlights the need for certain program reforms.

Chief among these reforms is a more stringent cap on emissions. In 2017, at the conclusion of the latest RGGI Program Review, the RGGI states committed to a new cap from 2021-2030 with a slightly faster emission reduction trajectory than the cap in place from 2014-2020. The extension of the cap and the increased ambition are positive steps, and the 2030 cap level of 54.7 million short tons commits the region to a 30% reduction in electric sector CO_2 emissions beyond the 2020 requirement. In addition to the lower cap, the Program Review resulted in measures that will strengthen the program by constraining RGGI allowance supply and limiting future emissions.[x] A third adjustment for banked allowances will eliminate the allowance surplus accrued through 2020, higher Cost Containment Reserve (CCR) price triggers will help avoid unnecessary increases in allowance supply, and the innovative Emissions Containment Reserve (ECR) will help the RGGI states secure additional, low-cost emission reductions.[xi]

Despite these measures to strengthen the program, a more ambitious RGGI cap is necessary. 2018 emissions are already well below the new, more ambitious cap set for 2021. In fact, 2018 emissions are already below the cap level set for 2023. To be most effective, the RGGI cap needs to more closely reflect the new, lower-carbon reality of the region's electric sector and the science-based GHG reduction targets adopted by the RGGI states.

The region's electric sector CO_2 emissions will need to be far below the 2030 cap if the region is to achieve its economy-wide GHG reduction goals. Acadia Center's EnergyVision 2030[xii] finds that for the Northeast states to achieve a 45% reduction in economy-wide GHG emissions by 2030 (from 2015 levels), the region would need to achieve a 57% reduction in electric sector GHG emissions by 2030 (compared to a 20% reduction from transportation and 30% reduction from buildings). As shown in Figure 3, if that 57% reduction from 2015 were applied to the RGGI cap, it would yield a 2030 cap of 35.8 million short tons: a 35% lower RGGI cap than what the states have agreed to. This more ambitious electric sector decarbonization will make it possible for the region to achieve greater emission reductions through the electrification of other sectors.

Figure 3: Aligning the Future RGGI Cap with Climate Targets



Of course, achieving economy-wide climate targets will require significant action to reduce GHG emissions from all sectors. There are critical carbon pricing policies currently in development or under consideration that, if implemented, will steer the region in the right direction. At the state level, momentum is building around carbon pricing bills that would establish a price on CO_2 emissions from sectors not covered by RGGI. Across the region, the 12 states of the Transportation & Climate Initiative (TCI) are developing a multi-state cap-and-invest program to reduce CO_2 emissions from the transportation sector.[xiii] Both of those policies can build on the best of the RGGI model, but in order to be most effective, they will depend on a decarbonized electric sector.

Economic Trends and Electricity Prices

RGGI's Economic Impacts

RGGI has generated significant economic benefits for states participating in the program. By selling allowances, RGGI states raise revenue to reinvest in energy efficiency, renewable energy, and other consumer programs that increase economic activity in participating states. The majority of program revenue (58% through 2016[xiv]) has been invested in energy efficiency programs that reduce consumers' bills and reduce demand for power. Lower power demand resulting from energy efficiency means fewer emissions from power plants, and less money leaving the region to pay for imported fossil fuels. Energy bill savings increase consumer spending, benefiting businesses that offer goods and services in the region. According to independent macroeconomic analysis of

RGGI through 2017, **the program has created over $4 billion in net economic gains and over 44,000 job-years of employment.**[xv]

Economic Growth and Emissions

The RGGI states have managed to rapidly reduce CO_2 emissions without impeding economic growth. In fact, the region has proven that decarbonization and economic growth can go hand in hand. While the country as a whole has been experiencing declining CO_2 emissions and economic growth, the RGGI states have seen faster economic growth and steeper CO_2 reductions. As shown in Figure 4, from 2008 (before RGGI's launch) to 2018, **RGGI states' economies grew by 46.9% versus 35.8% in states that do not regulate or put a price on carbon emissions** (this group of 40 states, referred to below as the "rest of the country", does not include California, which has similarly outpaced national growth since capping carbon emissions[xvi]). Over the same 2008 to 2018 period, **emissions in the RGGI region dropped by 46% versus 24% in the rest of the country**.[xvii]

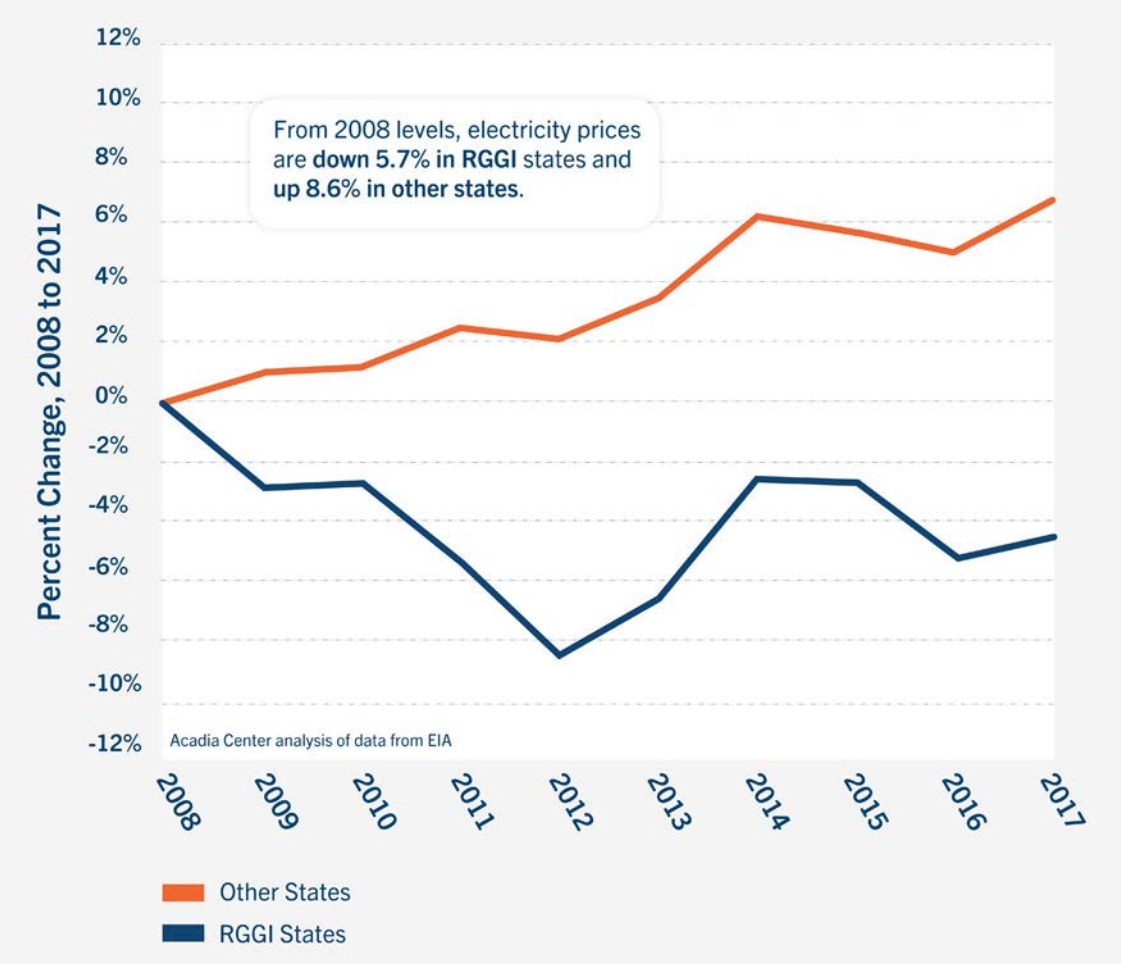
Figure 4: Change in Economic Growth and Emissions, 2008 to 2018

Electricity demand has historically been tied to economic growth, with electricity consumption and related emissions increasing during periods of economic expansion and decreasing in economic downturns. This correlation has been broken in the RGGI region, a new reality that appears to be mirrored—though slightly less dramatically—at the national level. A decade of RGGI and decarbonization of the electric power sector demonstrates that emissions reductions can be achieved as the economy grows.

Electricity Prices

Average retail electricity prices in the region have decreased since RGGI took effect. Comparing retail electricity prices from 2008 to 2017 shows that prices have dropped by 5.7% across the region.[xviii] While RGGI's direct impact on electricity prices is difficult to isolate from other factors, it is evident that the program has not caused electricity prices to rise from 2008 levels, in part due to RGGI-funded investments in energy efficiency. Concerns that climate policy will make states less competitive are directly refuted by RGGI's experience: RGGI states are faring much better than the rest of the country on electricity price trends. As shown in Figure 5, while RGGI's electricity prices have fallen from where they were in 2008, the rest of the country[2] has experienced an 8.6% increase in retail electricity prices over the same period.

Figure 5: Volume-Weighted Electricity Prices, 2008 to 2017



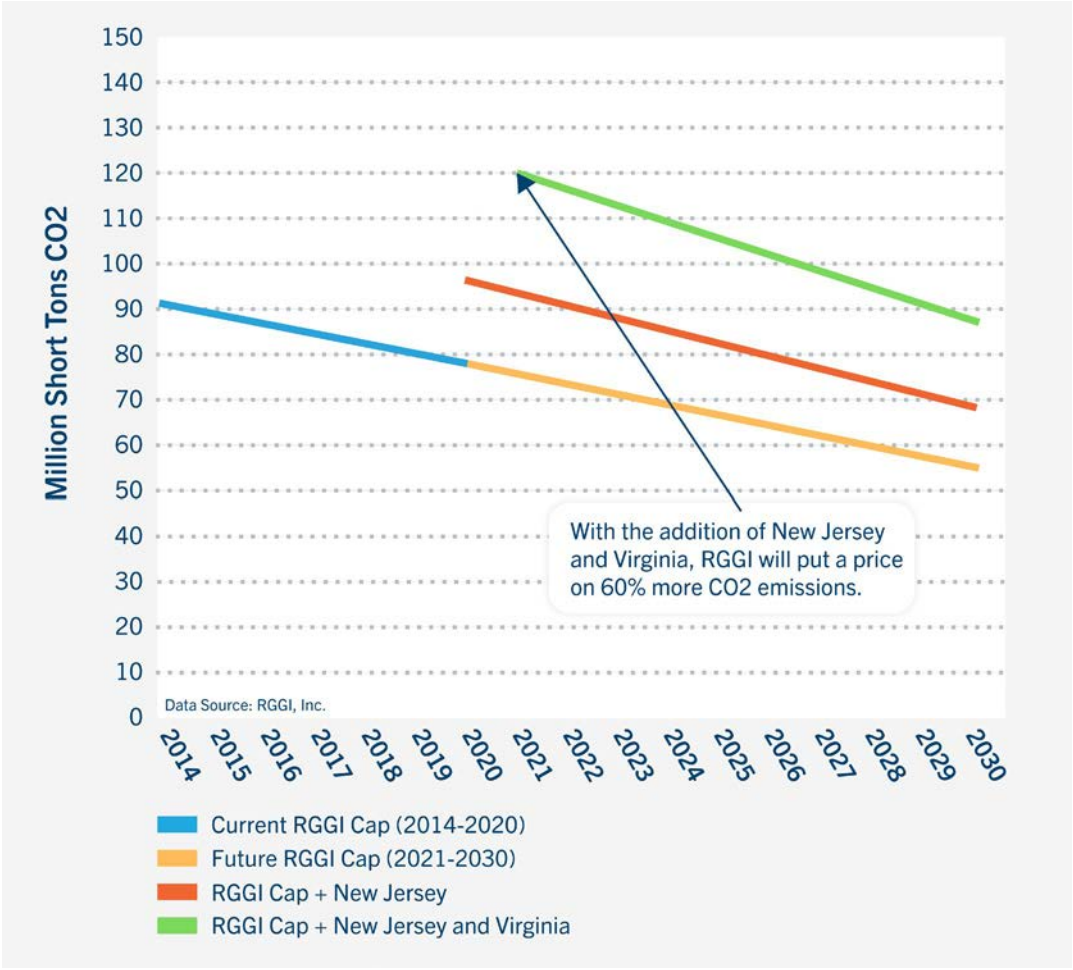
[2] The "rest of the country" excludes California, which, like the RGGI states, has implemented a cap-and-invest program to reduce CO_2 emissions.

Welcoming Additional States

There are currently nine states participating in the RGGI market, but that number is poised to grow to 11 by 2021. New Jersey is set to be the first addition, with the New Jersey Department of Environmental Protection adopting regulations in the summer of 2019 to rejoin the RGGI program on January 1st, 2020.[xix] This will mark New Jersey's return to the program, as the state participated in RGGI as a founding member until then-Governor Christie removed the state from the program in 2011. It appears likely that Virginia will follow New Jersey, with regulations approved to participate in a carbon trading program linked with the RGGI market.[xx] Virginia's participation in the RGGI market is expected to begin on January 1st, 2021.

Regulations in both New Jersey and Virginia would implement state CO_2 emission budgets aligned with the 2020-2030 RGGI cap, requiring a 30% reduction in region-wide emissions over that time period. The addition of these two states to the program will represent a substantial expansion, both in terms of CO_2 emissions and economic weight. By adding New Jersey and Virginia to the program, the combined GDP of the RGGI states would rise from $3.3 trillion to $4.5 trillion, a 35% increase, the equivalent of the world's 4th largest economy. As shown in Figure 6, expanding the RGGI cap to include these states would increase the amount of CO_2 emissions that face a carbon price by 60%.

Figure 6: RGGI Cap with New Jersey and Virginia



Conclusion

RGGI has successfully demonstrated the viability of a market-based program to reduce CO_2 emissions from the power sector while generating benefits for participating states. RGGI's experience has disproven the concerns most frequently associated with capping emissions from the power sector. Emissions have declined rapidly, far more dramatically than projected, without stifling economic growth. RGGI's reinvestment model has benefited the regional economy and increased employment while accelerating deployment of renewable energy and funding energy efficiency programs. The region's residents now pay lower electricity prices than before the program began and breathe cleaner air.

The RGGI states have committed to build on this success by extending the program through 2030. In the coming years the RGGI states will need to conduct another Program Review to reevaluate how the program aligns with the achievement of state climate targets.

A cleaner electric grid will prove vital to delivering significant CO_2 reductions from the electrification of transportation and buildings – the two other key sectors that must be decarbonized to avert climate disaster. By strengthening RGGI and applying lessons learned from the program to the transportation sector, the region can take meaningful action to address vehicle pollution—the largest source of CO_2 emissions in the country. Many of the RGGI states are currently building on their track record of bipartisan collaboration to develop a regional cap-and-invest program for the transportation sector through the Transportation and Climate Initiative (TCI). If this program applies the best of the RGGI model while delivering an even bolder, more equitable framework, the region will be well on its way to a low-carbon future that works for all.

THE ECONOMIC IMPACTS OF THE REGIONAL GREENHOUSE GAS INITIATIVE ON NINE NORTHEAST AND MID-ATLANTIC STATES

Review of RGGI's Third Three-Year Compliance Period (2015-2017)

Paul J. Hibbard
Susan F. Tierney
Pavel G. Darling
Sarah Cullinan

April 17, 2018

An independent research project of

THE RGGI PROJECT SERIES

Acknowledgments

This is an independent report on the economic impacts of RGGI program implementation, primarily covering the third three-year period of the program (2015-2017), which is known as Compliance Period 3. This Report complements two previous studies completed by Analysis Group in November 2011 and July 2015 on RGGI's Compliance Periods 1 and 2 (2009-2011 and 2012-2014, respectively). The analytic method and structure of this Report follow closely upon those used in the prior reports in order to ensure methodological consistency and provide continuity in focus, content and the consideration of lessons learned. Where relevant in this Report, we include data, information and observations particular to the 2015-2017 period, and elsewhere summarize developments and outcomes in all three Compliance Periods, covering all nine years of RGGI (2009-2017).

This Report is part of the RGGI Project Series: a series of independent and nonpartisan research and analysis projects to inform and assist leaders and stakeholders in the Northeast and other states.

This Report was prepared by Analysis Group with funding from the Barr Foundation, Energy Foundation, Merck Family Fund, Devonshire Foundation, Environmental Trust, Seal Bay Foundation, Betterment Fund, John Merck Fund, and New York Community Trust. Dr. Susan Tierney, co-author of this report, is a trustee of the Barr Foundation and a director of the Energy Foundation; consistent with both foundations' policies, Dr. Tierney had no involvement in the review or approval of those foundations' grants to the RGGI Project Series.

The authors wish to thank the foundations for their support of this independent analysis. We also thank Laurie Burt, of Laurie Burt, LLC and the Project Coordinator for the RGGI Project Series, for her input and assistance throughout this project. The authors also wish to note their sincere appreciation to members of the technical advisory group who reviewed and provided helpful comments on analytic methods and results:

Joshua Gould, ConEdison
Carrie Jenks and Chris Van Atten, MJ Bradley & Associates
John Larsen, Rhodium Group
Paul Miller, NESCAUM (Northeast States for Coordinate Air Use Management)
Karen Palmer, Resources for the Future
Kathleen Robertson, Exelon Corporation
Matt Stanberry, Advanced Energy Economy
Matthew Suhr and Eileen Howe, Calpine Corporation

The Report, however, reflects the analysis and judgment of the authors alone and does not necessarily reflect the views of the foundations, Ms. Burt, or any advisory group member. Finally, the authors recognize and thank their colleagues at Analysis Group (Ben Dalzell, Grace Howland, and Jake Silver) for their significant analytic support throughout the project.

About Analysis Group

Analysis Group is one of the largest economic consulting firms globally, with more than 850 professionals in 14 offices in North America, Europe, and Asia. Analysis Group provides economic, financial, and business strategy consulting to leading law firms, corporations, and government agencies.

Analysis Group's energy and environment practice area is distinguished by expertise in economics, finance, market modeling and analysis, regulatory issues, and public policy, as well as significant experience in environmental economics and energy infrastructure development. Members of Analysis Group's practice have worked for a wide variety of clients including: energy producers, suppliers and consumers; utilities; state regulatory commissions and other public agencies; tribal governments; power system operators; foundations; financial institutions; start-up companies; and others. 1. EXECUTIVE SUMMARY

Overview and Context

In 2009, ten Northeastern and Mid-Atlantic states launched the Regional Greenhouse Gas Initiative ("RGGI"), the country's first market-based program to reduce emissions of carbon dioxide ("CO_2") from existing and new power plants.[1] The scope of RGGI is significant: the current set of RGGI states account for more than one-eighth of the population in the U.S. and more than one-seventh of the nation's gross domestic product. It is thus important to evaluate and understand the program's performance and outcomes. Through their development and implementation of the RGGI program, these states have gained first-mover policy experience and have collaborated to form a multi-state emission-control policy that has reduced CO_2 emissions from the power sector and operated seamlessly with well-functioning and reliable electricity markets.

Recently, other states have expressed interest in implementing carbon-control programs that are similar in structure to RGGI's approach. One option for those states would be for active collaboration to allow for trading of CO_2 allowances among affected sources in these states and the current RGGI states.[2] Insights and observations gleaned from an analysis of RGGI's performance could thus be valuable not only to the RGGI states as they consider future policy recommendations but also to other states and regions as they develop their own plans to reduce CO_2 emissions.

This Report analyzes the economic impacts of RGGI's most recent three-year compliance period, which spanned 2015 through 2017. This analysis follows our two prior reports on the economic impacts of RGGI: the 2011 Report (hereafter "AG 2011 Report") which assessed the economic impacts of RGGI's first three-year compliance period (2009-2011), and the 2015 Report (hereafter "AG 2015 Report") which assessed the economic impacts of RGGI's second three-year compliance period (2012-2014).[3]

---

[1] The ten original RGGI states were Connecticut, Delaware, Massachusetts, Maryland, Maine, New Hampshire, New Jersey, New York, Rhode Island, and Vermont. New Jersey participated in the first three years of the RGGI program, and withdrew its participation at the end of 2011.

[2] See, *e.g.*, the recent statement by Ben Grumbles, Secretary of the Maryland Department of the Environment and Chair of the RGGI, Inc. Board of Directors, regarding RGGI's interest in sharing information "…with any state that is interested, and especially look forward to further discussions with Virginia and New Jersey." (See https://rggi.org/sites/default/files/Uploads/Auction-Materials/39/PR031618_Auction39.pdf)

[3] Paul J. Hibbard, Susan F. Tierney, Andrea M. Okie, and Pavel G. Darling, *The Economic Impacts of the Regional Greenhouse Gas Initiative on Ten Northeast and Mid-Atlantic States*, November 2011 (available at http://www.analysisgroup.com/uploadedfiles/content/insights/publishing/economic_impact_rggi_report.pdf); and, Paul J. Hibbard, Andrea M. Okie, Susan F. Tierney, and Pavel G. Darling, *The Economic Impacts of the Regional Greenhouse Gas Initiative on Nine Northeast and Mid-Atlantic States*, July 2015 (available at http://www.analysisgroup.com/uploadedfiles/content/insights/publishing/analysis_group_rggi_report_july_2015.pdf). The analytic method and structure of this Report were modeled closely on those of the prior reports, and in this report we carry forward observations from RGGI's first six years (to the extent still relevant), so as to support methodological consistency and continuity in focus, content and the consideration of lessons learned.

There have been a number of relevant developments since our last economic review of RGGI in 2015. The electric industry has experienced changes in power-generation economics, emission-control requirements, and wholesale market structures in the RGGI region. In addition, absent federal requirements, a number of states continue to seek to address greenhouse-gas ("GHG") emissions through an assortment of policy mechanisms. Finally, the RGGI states have undertaken a second comprehensive Program Review, completed in December 2017, which led to modified elements of the program including adopting a 30-percent reduction in the regional cap between 2020 and 2030.

In this Report, we examine RGGI's recent economic performance under these changing economic and regulatory realities. We hope that the results of our assessment and lessons learned are useful not only to the RGGI states but also to others that have expressed interest in establishing carbon control programs (including with the possibility of linking to or participating in the RGGI program).[4]

RGGI has now been operating for over nine years. In every year, CO_2 emission allowances have entered the market through coordinated (centralized) regional auctions. Owners of fossil-fueled power plants have spent nearly $2.8 billion to buy CO_2 allowances over the nine years. In turn, offer prices in the regional wholesale electricity markets reflect these purchases, and grid operators in these regions use these offer prices to dispatch power plants economically while maintaining system reliability.

Since 2009, the RGGI states have received virtually all of the nearly $2.8 billion in proceeds from CO_2-allowance auctions and disbursed them back into the economy in various ways, including through expenditures on: energy efficiency ("EE") measures and programs; renewable energy ("RE") projects; GHG-emission reduction measures; direct electricity consumer bill assistance, including for low-income households; and education and job training programs. These local investments keep more of the RGGI states' energy dollars in their region, and reduce the amount of dollars that leave the region to pay for fossil fuel resources produced outside the RGGI states.

What We Study in this Report:
The Economic Impacts of RGGI (2015-2017)

Our analysis tracks the path of RGGI-related dollars over the past three years as they leave the pockets of fossil-fuel power generators to buy CO_2 allowances, show up in electricity prices and customer bills, make their way into state expenditure accounts, and then roll out into the economy through the expenditure of the allowance auction proceeds.

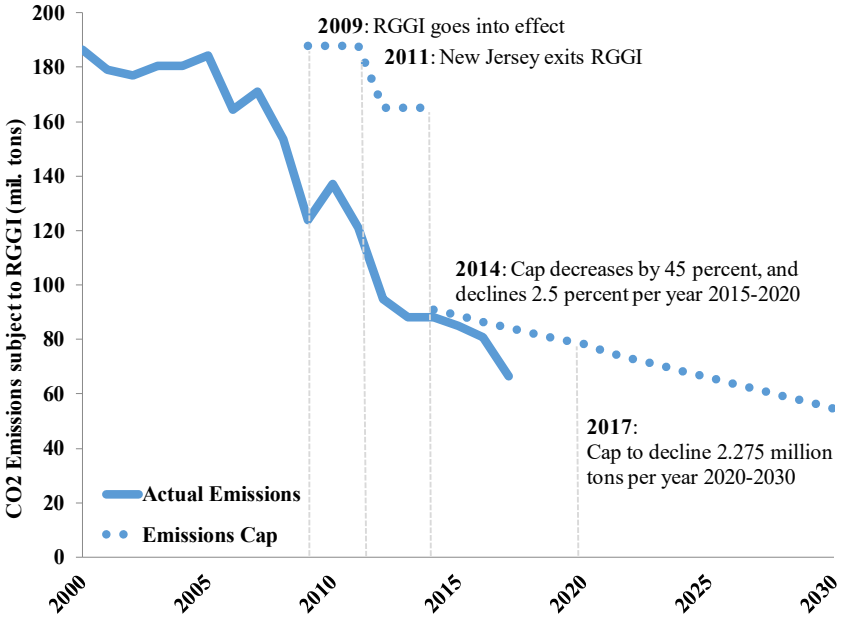
Our analysis thus focuses on the actual economic activity that results from RGGI: known CO_2 allowance prices; observable CO_2 auction results; dollars distributed from the auction to the states; actual state-government decisions about how to spend the allowance proceeds; measurable reductions in energy use from energy-efficiency programs funded by RGGI dollars; traceable impacts of lower energy use on wholesale power prices; and concrete value added to the economy.

By carefully examining the RGGI states' implementation of the program to date, based on real historic data, we hope to provide a foundation for observations that can be used by others in the design of CO_2 control programs going forward.

[4] See, *e.g.*, RGGI Inc., Statement on Proposed Virginia Greenhouse Gas Rule, November 9, 2017.

Throughout the RGGI program's implementation, power system reliability has been maintained. And as shown in Figure ES-1, CO_2 emissions from power generation have decreased in the RGGI region (due to RGGI program design and implementation but also broader economic and industry factors).[5]

Figure ES-1
Actual CO_2 Emissions in the RGGI States and Evolution of the RGGI CO_2 Emissions Cap



Source: RGGI, Inc. data from the RGGI CO_2 Allowance Tracking System (COATS), accessed March 2, 2018.

With these many insights, we address several questions in this Report: What happened to the roughly $1 billion in proceeds from the sale of CO_2 allowances over the 2015-2017 period? Has the RGGI program produced net economic benefits to these states in Compliance Period 3 (as it did in the first two compliance periods)? Are there new learnings from the outcomes of the RGGI program to date beyond those identified and described in our prior reports?

Finally, in this Report we consider the implications of our analysis for continued implementation in the RGGI states, and for states considering development of their own carbon reduction programs and/or coordination with a broader CO_2 trading region.

[5] RGGI, Inc. data show that CO_2 emissions from RGGI electric generation sources decreased by 75.8 million short tons, or *53.3 percent* compared to the average baseline emissions between 2006 and 2008. Note that these figures exclude New Jersey, which was a RGGI member during the first compliance period. Data available at https://www.rggi.org/allowance-tracking/rggi-coats, accessed April 4, 2018.

Results

Over the last three years (2015-2017), the RGGI program led to $1.4 billion (net present value ("NPV")) of net positive economic activity in the nine-state region.[6] Each RGGI state's electricity consumers and local economy also experienced net benefits from the RGGI program. When spread across the region's population, these economic impacts amount to nearly $34 in net positive value added per capita. Figure ES-2 shows the net economic value to the nine-state RGGI region as a whole, with results also broken out by power system region (with the six New England states participating in the ISO-New England electrical region, with New York participating in the one-state NYISO system, and with Maryland and Delaware participating in the multi-state PJM power system).

Figure ES-2
Net Economic Impact of the Implementation of RGGI During the 2015-2017 Period (NPV, 2018$)

Notes: [1] Figures are reported in 2018 dollars (NPV), converted using a 3-percent public discount rate. [2] Total economic value added reflects the impacts of state spending of RGGI proceeds, including net electric sector impacts to consumers and power plant owners, non-electric benefits, and the economic impact of program spending.

RGGI's net positive economic outcome results in large part from the states' decisions to sell CO_2 allowances via a centralized auction and then to use the auction proceeds in various ways that address state policy objectives. This approach has been in place in all three RGGI compliance periods. As in the prior years, during the 2015-2017 period the states received and spent the roughly $1.0 billion in auction proceeds primarily on EE measures, community-based RE projects, customer bill assistance, other GHG-emission reduction measures, and on research, education and job training programs.

[6] All results for Compliance Period 3 are reported in 2018 dollars, with results reported using a 3-percent "public" discount rate. See the Appendices for a discussion of public and private discount rates.

These economic benefits reflect the complex ways that RGGI dollars interact within local economies.

Compared to energy-related dollar flows that would occur in the absence of the RGGI program, energy-related expenditures with RGGI lead to more purchases of goods and services in the RGGI states' local economies. Take the use of the auction proceeds on EE measures, for example: Such expenditures include payments for engineering services for energy audits, sales of energy-efficient equipment, dollars spent to train those installers, and state taxes collected on all of these activities. Together, these dollar flows have direct and indirect multiplier effects locally and regionally.

The size of RGGI's economic impacts varies by state and region, in large part because the states spent their RGGI auction proceeds differently.[7] Different expenditures have different direct and indirect effects on their economies and on their electric systems. For example, a state's use of RGGI dollars to pay for EE measures that reduce electricity consumption and to invest in RE facilities with low operating costs both served to lower electricity prices in wholesale power markets (as compared to a "without-RGGI" scenario). This in turn lowers consumers' electricity bills over time.

Local investment of RGGI dollars on energy efficiency and renewable energy offset the impact on electricity prices resulting from CO_2 allowance costs.

On the one hand, the inclusion of the cost of CO_2 allowances in wholesale prices tends to increase wholesale electricity prices in the RGGI region at the beginning of the 2015-2017 period. But these near-term impacts are more than offset during these years and beyond, because the states invest a substantial amount of the RGGI auction proceeds on EE programs that reduce overall electricity consumption and on RE projects that reduce the use of higher-priced power plants. Consumers gain because their overall electricity bills go down. Since RGGI's commencement in 2009, energy and dollar savings resulting from all states' investments in EE and RE has more than offset the wholesale market price increases associated with inclusion of allowance costs in market bids.

Energy consumers enjoy a net gain of $220 million as a result of the RGGI program (2015-2017), as their overall energy bills drop over time.

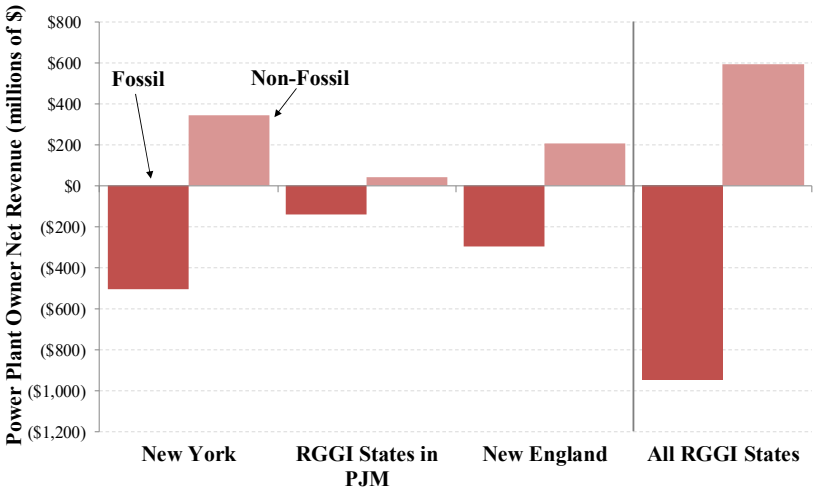
Net benefits accrue to residential, commercial and industrial customers. Consumers of electricity save $99 million, and consumers of natural gas and heating oil save $121 million. These amounts are in addition to the economic benefits they receive as members of the local economies of the RGGI states where the allowance auction proceeds are spent.

[7] Overall, the distribution of spending across the RGGI states was as follows: 52% on EE; 18% on RE projects; 13% on bill-payment assistance to consumers; 7% on program administration; 4% on GHG-emission reduction programs; 3% on clean technology research and development; 2% on education, outreach, and job training; and 1% for payments into a general fund. Individual state expenditures varied significantly across these categories.

Power system changes that result from RGGI include: different dispatch order of power plants; plants with lower CO_2 emissions having a competitive advantage; and owners of emitting power plants recovering the costs of CO_2 allowances in the short run while experiencing lower output and revenues in the long run.

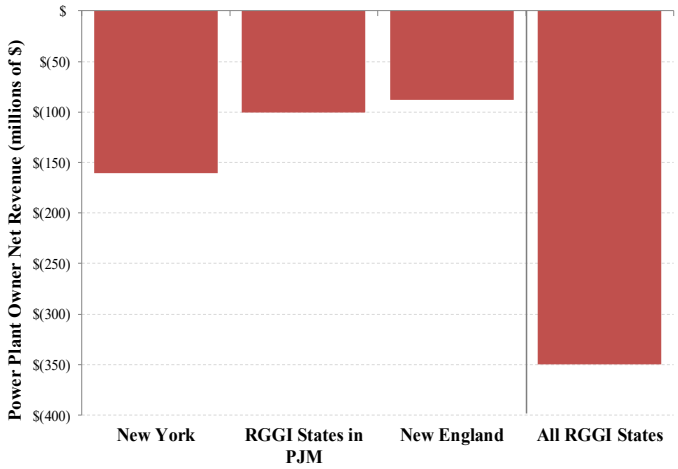
Including a price on CO_2 emissions tends to shift the power plant dispatch order and increase output of lower- and zero-carbon-emitting sources of power. Although RGGI requires owners of emitting power plants to purchase CO_2 allowances, power plant owners as a group recover all of their early expenditures on CO_2 allowances through the increase in wholesale electricity prices in the near term. But the net effect of the program tends to reduce the revenues of owners of plants over time as a result of RGGI expenditures on EE, which lower the demand for power. Plants with relatively high carbon emissions (*e.g.*, coal-fired or oil-fired units) collect less revenues over time while owners of zero-carbon generating sources (*e.g.*, nuclear, wind, solar, hydro) get the benefit of being paid higher wholesale market prices that reflect CO_2 allowance costs, without having to buy allowances. Figure ES-3 shows the changes in net revenues for power plant owners as a result of the RGGI program, with results broken out by location and by power-plant fuel type. Carbon-emitting power plant owners generally lose revenue ($940 million), while owners of nuclear and renewable resources gain ($590 million). On an NPV basis, total revenues to the power-generation sector drop by nearly $350 million through our forecast period (ending in 2027), as shown in Figure ES-4.

Figure ES-3
Net Revenue Change to Power Plant Owners (by Power-Plant Fuel Type and Electrical Region) as a Result of RGGI Implementation During the 2015-2017 Period (NPV, 2018$)



Notes: [1] Figures are reported in 2018 dollars (NPV), using a 3-percent public discount rate. [2] Figures include PROMOD outputs for energy prices and revenues and for capacity-market revenue changes that are calculated separately. [3] "Fossil" includes natural gas, oil, and coal-fired generators. "Non-fossil" includes nuclear, hydro, pumped storage, wind, solar, and biomass.

Figure ES-4
Net Revenue Change Across All Power Plant Owners, by Region, as a Result of RGGI Implementation During the 2015-2017 Period (NPV, 2018$)

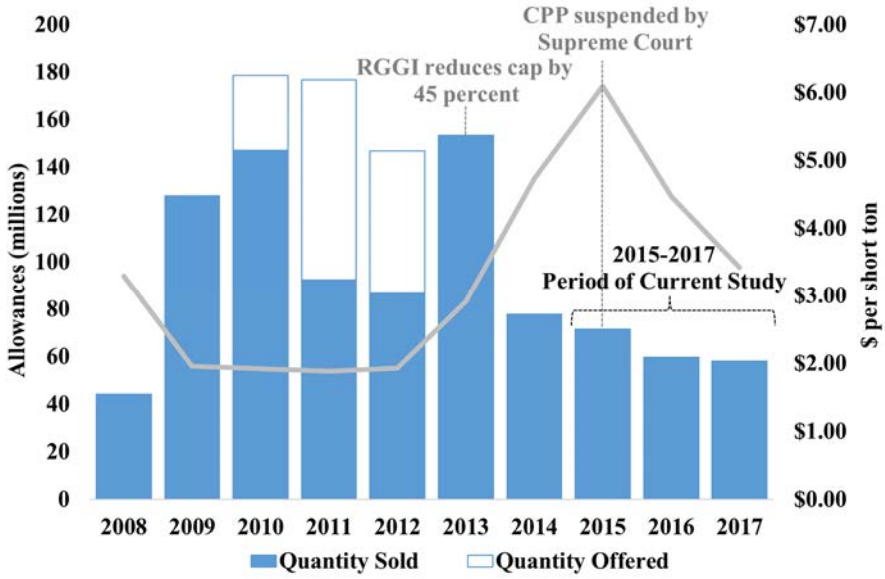


Notes: [1] Figures are reported in 2018 dollars (NPV), using a 3-percent public discount rate. [2] Figures include PROMOD outputs for energy prices and revenues and for capacity market revenue changes calculated separately.

Compared to RGGI's earlier two compliance periods (2009-2011 and 2012-2014), the amount of CO_2 allowances sold dropped in recent years, while clearing prices were on average higher, which had a mostly offsetting effect on the relative magnitudes of economic effects experienced in Compliance Period 3.

The RGGI states lowered the regional CO_2 emissions cap by 45 percent in 2014 and further tightened it by 2.5 percent per year thereafter, during the current study period (see Figure ES-1). The current compliance period was the first that involved a significantly tightened and declining cap (see Figure ES-1). This tightening supply of CO_2 allowances, in combination with other market and policy factors, initially elevated the price of allowances and, in turn, the wholesale power prices in the different parts of the RGGI region. Total auction proceeds in Compliance Period 3 ended up being only slightly lower than in each of the prior two periods (by less than ten percent), reflecting the offsetting impact of higher allowance prices and lower allowance volumes sold (as shown in Figure ES-5).

Figure ES-5
RGGI Auction Allowances and Clearing Prices



Notes:
[1] Clearing prices are weighted averages, based on number of allowances sold.
[2] In 2014 and 2015, the Cost Containment Reserve ("CCR") trigger price was exceeded and additional allowances above what were originally offered into the market were ultimately presented and sold to market participants. In 2014 and 2015, 5 million and 10 million additional allowances were sold, respectively.
Source: RGGI, Inc., http://www.rggi.org/market/co2_auctions/results.

Observations

Based on these results as well as those in our prior assessments of the first two RGGI compliance periods, we have a number of observations that we summarize here. We hope that these provide useful information for the RGGI states as they consider how the program is performing relative to its original goals and for other states and stakeholders who are interested in carbon emission-control policies and programs.

As in its first six years, the RGGI program's third three-year compliance period continued to generate substantial economic benefits for the states while reducing CO_2 emissions.

Economic value added

Our analysis of RGGI impacts over the past three years took into consideration the program's effects on power system dispatch, costs to consumers, revenues to electric generators, and overall performance of the economies in the participating states. Even taking into account decreased revenues to the owners of emitting power plants (and to power-plant owners as a whole), we found positive macroeconomic impacts to the states due to the net benefits to electric consumers and the expenditures of the CO_2 allowance proceeds. RGGI led to approximately $1.4 billion in economic value added (NPV, 2018$) as a result of program implementation in the 2015-2017 period. Thus, the RGGI program continues to generate economic value for its member states.

Jobs

Taking into account the gains and losses to consumers and producers, RGGI Compliance Period 3 led to overall job increases amounting to thousands of new jobs over time. Some of the RGGI job impacts may be permanent, while others may be part-time or temporary. According to our analysis, the net effect is that RGGI activity during the 2015-2017 period leads to over 14,500 new job-years, cumulative over the study period, with each of the nine states experiencing net job-year additions. Jobs that result from RGGI-related expenditures occur in many parts of the economy, with examples including workers who perform efficiency audits and who install energy efficiency measures in residences and commercial buildings, and staff performing training on energy issues.

Fossil-fuel production and imports

Over the past three years, RGGI helped to lower the total number of dollars (by $1.37 billion (NPV, 2018$)) its member states sent outside their region in the form of payments for fossil fuels for power generation and other purposes. Most of the RGGI states' electricity comes from fossil fuels, even though these states produce little coal, natural gas, or oil. Because the RGGI program lowered these nine states' total fossil-fired power production and also reduced their use of natural gas and oil for heating, RGGI reduced the total dollars sent out of state for these energy resources.

Continuation of RGGI program benefits above and beyond the first six years

Our findings on economic impacts of RGGI's third three-year compliance period are consistent with the findings and observations we made with respect to the first and second three-year compliance periods. Those prior assessments revealed net economic benefits to the states participating in the program, including growth in economic output, increased jobs, reinvestment of energy dollars in local/state economic activity, long-run wholesale electricity cost reductions, and CO_2 emission reductions.

Many factors have changed in the electric industry and the economy since we completed our economic analyses of the RGGI program for Compliance Period 1 (2009-2011) and for Compliance Period 2 (2012-2014). These changes have affected the conditions (*e.g.*, lower gas prices, generation retirements and additions) analyzed in our assessment of Compliance Period 3.

For many reasons (such as the different vintages of each of our studies and notably the year in which we report NPV results), the results of our three studies are not directly additive. Even so, across the three studies, we have found net economic benefits to the RGGI states. Recognizing that these studies have reported outcomes in different-year dollar values, each of our assessments has found positive benefits for the participating RGGI states: $1.6 billion (NPV, in 2011$), $1.3 billion (NPV, in 2015$), and $1.4 billion (NPV, in 2018$) for Compliance Periods 1, 2, and 3 respectively.[8] Our studies have also found that the RGGI-related expenditures led to job creation in each of the three

[8] In addition to our prior studies of the RGGI program, RGGI, Inc. and others have conducted studies of the economic impacts of the program. We discuss the differences in these studies later on in this report.

compliance periods of approximately: 16,000 job-years (as of 2011); 14,200 job-years (as of 2015); and 14,500 (as of 2018), respectively.[9]

Thus our modeling of the three compliance periods indicates that, its first decade, RGGI's carbon cap-and-trade program has generated net positive economic value for the participating states' economies on the order of $4 billion dollars.[10] States' participation in RGGI has led to tens of thousands of job-years while also helping to reduce carbon emissions in the RGGI states' electric sector. At the same time, annual carbon-emissions have dropped nearly 50 percent since the program's start in 2009 (for many reasons, including implementation of RGGI).

RGGI's first nine years (2009-2017) provide empirical evidence that carbon-control programs for the power sector can provide positive economic outcomes.

Review of the nation's first multi-state CO_2 emission-control program provides useful information for states that are considering emission-reduction options.

Despite a recent lack of progress at the federal level, many state policymakers continue to focus their attention on the various alternatives for reducing emissions of CO_2 from the electricity sector (and other sectors). A wide range of alternatives are available including cap-and-trade programs, carbon tax/pricing approaches, energy research and development ("R&D") funding, consumer-funded procurements of low- and zero-carbon energy sources, rate policies supporting distributed-energy resource development, and funding of energy efficiency measures. The diverse set of policy options used reflects many states' interest in finding cost-effective and workable ways to cut CO_2 emissions. Lessons learned from RGGI's implementation can inform states as they consider their options.

The experience of the RGGI states, including their initial efforts that began in 2003 to work together to develop a multi-state, market-based CO_2 control program, through the nine years of program administration to date, provides a wealth of information. Their experience provides many lessons, most notably that states can collaborate successfully in developing programs to control CO_2 emissions, and market-based CO_2-allowance trading programs – combined with state-driven centralized auctions of CO_2 allowances and with local reinvestment of auction proceeds – can help states meet emission-reduction targets while generating positive economic benefits.

RGGI's positive impacts on state economies are additive to the purpose and expected benefits of the program.

RGGI is not and never was meant to be an economic development program. RGGI's purpose is to reduce CO_2 emissions from power generation in order to help mitigate the economic, social, and environmental risks of climate change. As shown in Figure ES-1, RGGI has contributed to

[9] These reflect "job-years," and do not identify what portion of these numbers are associated with permanent versus temporary jobs. Job-years are reported cumulatively over the full study period.

[10] As noted earlier, while the economic results from our three studies are not directly additive, we have used the same foundational analytic methods, assumptions, and data sources across all three studies in order to ensure consistency in study results. While changes in the assumptions used in our earlier studies – *e.g.*, to reflect current market conditions and expectations – could change the results (in either direction), we expect such changes would be small given the consistency in the level of allowance proceeds collected and used by the RGGI states and in the benefits we have found across our studies.

significant reductions in emissions of CO_2 across the RGGI region. In our economic analysis of the RGGI program, however, we do not attempt to quantify the potential long-term benefits of reducing the risks of climate change. The focus of our analysis is specific and narrow: to review the direct impacts of program implementation on the economies of the RGGI states, in order to test the presumption that controlling emissions of CO_2 will somehow lead to negative consequences for states that take action. Our results – which instead reveal positive economic impacts – should be viewed as additive to whatever other benefits flow from reducing climate-change risks.

The RGGI model has successfully achieved CO_2 reductions through a cooperative multi-state framework that preserves state authority.

The states that comprise the RGGI region are highly diverse in many ways: their political settings and policy objectives vary widely across the states and have even changed significantly *within* states over time; their electric-generating portfolios differ substantially in size, technologies, fuel mix, and age; their economic bases vary; and the states have unique legal and regulatory structures that oversee energy, utility, and environmental policies. Despite these differences, however, the RGGI states' experience confirms the possibility that states can work together, particularly when doing so is likely to lower compliance costs and generate economic benefits. The states have designed a multi-state CO_2 program consistent with sound economic principles, completed the stakeholder, legislative, and regulatory steps necessary to adopt and implement the program, and smoothly administered the program and integrated it with wholesale electricity markets. In addition, over just ten years the states have completed two top-to-bottom programmatic reviews and agreed upon major changes to the framework. The RGGI states continue to implement the RGGI platform with an eye towards inclusion and a willingness to collaborate with other states outside the current nine-state region.

Mandatory, market-based carbon-control mechanisms are functioning properly in wholesale electricity markets and have not adversely affected system reliability.

RGGI's nine years of experience supports a conclusion that market-based CO_2 emission-control programs can produce positive economic impacts and meet emission objectives while dovetailing smoothly into the normal operation of power systems. RGGI's implementation has not adversely affected power system reliability in New England, New York, or PJM. Further, RGGI provides an important example of how states' public policies can be integrated into federally regulated competitive wholesale markets – an issue with which FERC, state regulators, and the courts are actively wrestling.

The design of the CO_2 market in the RGGI states has allowed for the creative use of public assets in support of diverse state energy/environmental policy and economic outcomes.

The joint decision by the RGGI states to make their CO_2 allowances available to the market through a unified auction has generated substantial revenues for public use. This approach transferred the value of emissions allowances from the public sector to the private sector at a monetary cost. Had the allowances been given away for free, the states would not have had the benefit of the auction proceeds and instead would have transferred away significant public economic value to owners of power plants (which in the RGGI region are merchant generators, not owned by electric distribution utilities). The states' use of allowance proceeds helped them meet a wide variety of social, fiscal, and environmental policy goals, such as assisting low-income customers, achieving advanced energy

policy goals, and restoring wetlands, among other things. Notably, however, auctioning of allowances is not necessary for the efficient and effective functioning of the cap-and-trade program design itself. Individual states may still determine their preferred method of moving allowances into the market, which could include auctions, direct allocation, and other mechanisms that may move allowances into the market while transferring or consigning auction value in whole or in part to other entities (such as electric distribution utilities or generating asset owners).

> How allowance proceeds are used affects their economic impacts: Use of auction proceeds to invest in energy efficiency produces the biggest economic bang per buck, in terms of net positive benefits to consumers and to the economy.

The RGGI Memorandum of Understanding ("MOU") fully supports the reality that states place different weights on various goals they hope to accomplish through participation in the program, and that the states will make their own decisions about how to allocate allowances to the market and how to use the proceeds from allowance auctions. But from a strictly economic perspective, some uses of proceeds clearly deliver economic returns more readily and substantially than others. For example, RGGI investment in EE leads to lower electrical demand, lower wholesale power prices, and lower consumer electricity bills. These savings remain in the pockets of electricity users, and the EE investments also produce positive macroeconomic impacts locally as more dollars stay in and contribute to the local economy. We observe that use of the RGGI dollars provides positive multiplier effects in the RGGI states' economies, especially compared to other uses of the auction proceeds.

The RGGI states' experience during 2015-2017 differed along a number of dimensions relative to the first six years of the program.

The RGGI program as implemented during the 2015-2017 period took place in the context of a changing industry and regulatory landscape and with significant changes adopted and implemented by RGGI states. Specifically:

- During 2017, the RGGI states used the six years of prior program experience as they undertook a top-to-bottom review of RGGI, and made a number of changes in the program.
- Many states adjusted how they spent RGGI auction proceeds over time, shifting the use of allowance revenues to reflect changing program and state objectives.
- Fossil fuel prices changed significantly since the start of the program, with natural gas prices (and in turn, wholesale electricity prices) having decreased substantially.
- Electric resources have shifted, with accelerated retirements of older and less efficient (and in most cases, higher-emitting) generating units, and with distributed and central-station renewable energy resources growing at a rapid pace in many of the RGGI states.

Such factors have the potential to influence the administration of RGGI and associated power system and economic impacts. For example, the lower average natural gas prices in 2015-2017 relative to the prior six years led to lower electricity prices in wholesale power markets, which had the effect of reducing the economic value of RGGI-funded EE programs for electricity and heating consumers. Also, the tightening of RGGI's CO_2 emissions cap contributed to an increase in allowance prices, the operating costs of affected generating units, and impacts on wholesale electric prices. The lower number of allowances available to the market, however, was in part offset by higher allowance prices,

and thus only slightly reduced auction proceeds available to RGGI states during the 2015-2017 period.

Despite the shifting context for RGGI, the core elements of the program – including a declining CO_2 emissions cap, allowance auctions, reinvestment of auction proceeds, active trading of allowances, monitoring of program administration, participation and outcomes, and cooperation among a diverse set of states and stakeholders – operate in ways that continue to produce positive economic and programmatic results for the participating states.

2. THE REGIONAL GREENHOUSE GAS INITIATIVE

Overview and Purpose

With the first auction of CO_2 allowances in late 2008, ten states in the Northeast and Mid-Atlantic regions initiated RGGI, a multi-state market-based program to reduce emissions of CO_2.[11] In doing so, the states created the country's first mandatory program to cap emissions of CO_2 from power generation sources, with the cap set initially at 188 million short tons of CO_2 annually across the ten-state RGGI region. The regional cap is apportioned to states in a manner based generally on emissions from the affected sources (*i.e.*, fossil fuel power plants that are 25 megawatts or more in size), and in accordance with specific state allowance budgets agreed upon by the states.

As originally designed, the cap would decline by 2.5 percent per year beginning in 2015, to reach an overall reduction of 10 percent of CO_2 emissions by 2018.[12] Under the Revised Model Rule, released in February 2013 and discussed further below, the RGGI states revised the regional emissions cap downward to 91 million tons in 2014 and maintained the original 2.5-percent per-year reduction to the regional cap for the years 2015 through 2020. Under the 2017 Model Rule, released in December 2017, the cap will be further reduced by an additional 30 percent between 2020 and 2030.

Although they had the option to distribute allowances for free, each state decided at the outset of the program in 2009 to distribute the vast majority of CO_2 emission allowances into the market through a centralized auction, administered by RGGI, Inc., the non-profit organization set up by the states to run the program.

The states developed the RGGI program over several years starting in late 2003 to begin to address the risks associated with climate change. Given the electric sector's significance as a source of CO_2 emissions, the states focused attention on the goal of designing and implementing a program to reduce CO_2 emissions from power generation within the signatory states. The states acted more than a decade ago, commencing with their December 2005 Memorandum of Understanding ("MOU"), in which they concluded that: (1) climate change is occurring; (2) it poses serious potential risks to human health and the environment; (3) delay in addressing CO_2 emissions will make later investments in mitigation and adaptation more difficult and costly; and (4) a market-based carbon allowance trading program will create strong incentives for the development of lower-emitting energy sources and energy efficiency, and reduce dependence on imported fossil fuels.[13]

Market-Based Mechanism

RGGI is an emissions-control program based on market principles. Similar to that of other market-based programs administered for control of nitrogen oxides (NO_x) and sulfur dioxide (SO_2), the

[11] The ten states are Connecticut, Delaware, Massachusetts, Maryland, Maine, New Hampshire, New Jersey, New York, Rhode Island, and Vermont. New Jersey participated in the first three years of the RGGI program, withdrawing its participation at the end of 2011.

[12] Information on RGGI is drawn from various fact sheets on the website of RGGI, Inc., the non-profit organization established by the states to administer the RGGI program. (See http://www.rggi.org/)

[13] Regional Greenhouse Gas Initiative Memorandum of Understanding, December 20, 2005 (hereafter referred to as "MOU"), pages 1-2.

foundation of the RGGI program is an annual cap on emissions of CO_2 in aggregate for all affected sources in the states that participate in the program. Affected or "regulated" sources in a given state generally include all fossil-fueled electric power generators with a capacity of equal to or greater than 25 megawatts. Program compliance is relatively straightforward: shortly after the end of each three-year compliance period (*e.g.*, with Compliance Period 3 covering 2015, 2016 and 2017), every affected source must retire a number of allowances equal to the total tons of CO_2 emissions from the source over the three-year compliance period (one allowance equals one ton of emissions). Affected units may obtain allowances at various points in time prior to the end of the compliance period.

The states' selection of a market-based control program for CO_2 emissions from the power sector reflects the history and success within this region of market-based programs established under the federal Clean Air Act for control of SO_2 and NO_x emissions. It is also a natural fit for the electric industry given the ease with which allowance costs can be incorporated into competitive wholesale electricity market pricing systems.[14] Affected sources obtain (*e.g.*, purchase) allowances, which then becomes part of their cost to produce power at their generating unit and is included as part of their offer prices to participate in wholesale markets. This mechanism allows wholesale prices to reflect carbon prices, leading over time to industry operational decisions (relating to power plant dispatch) and asset investment decisions that reflect the most efficient compliance path for individual regulated entities as well as for the industry as a whole. In this context, the use of a market-based control program for CO_2 encourages efficiency in power dispatch decisions and long-run efficiency for achieving compliance with the market-based cap on emissions.

The CO_2 emissions cap is administered through limiting the quantity of allowances issued into the market in a given year. For example, 188 million allowances were available for the year 2009, and 84.3 million were available for 2017. The owners of affected power plants generally obtain CO_2 allowances by purchasing them through the initial auctions (held quarterly), or by purchasing or otherwise transferring them in a secondary market.

RGGI allows for flexible compliance in a number of ways. First, recognizing the long-lived nature of CO_2 in the atmosphere, compliance is required not annually, but on a three-year basis. That is, sources can purchase, bank, and use allowances bought at any auction for a given compliance period within the three-year compliance period, and need only demonstrate compliance (through retiring allowances in amounts equal to emissions) shortly after the end of that same period. In fact, allowances can be purchased and banked for use beyond the compliance period in which they were purchased. Second, sources can meet up to 3.3 percent of their CO_2 compliance obligation through

[14] The bulk-power electric systems of the nine RGGI states are part of the centrally administered wholesale markets and integrated grids operated by three entities, called Regional Transmission Organizations ("RTOs"): ISO-New England (for the six New England states); the New York Independent System Operator (NYISO) (which is a single-state market); and PJM (for Delaware and Maryland). (PJM also includes power systems in 11 other states and the District of Columbia, which are not part of the RGGI program.) In each of these three RTOs, the wholesale power market has evolved over time into a comprehensive electricity market construct (including energy, capacity, and ancillary services) that shapes the operations of the fleet of power plants in an efficient and reliable way in real time. This electricity market construct also affects the near-term and long-term incentives for the addition of new generating capacity (or the retirement of existing capacity).

the purchase of offsets – that is, GHG-reduction projects outside the power sector.[15]

Allowance Disbursement to the RGGI States and into the Market

In each year, the amount of allowances in the regional cap have been apportioned to the participating states according to an agreed-upon ratio that roughly reflects each state's relative share of regional CO_2 emissions from the power sector as of a historical time period.[16] Under the original terms of the 2005 MOU, the RGGI states agreed that each state would be allowed to determine how it would allocate its share of allowances among owners of power plants and other potentially interested parties, so long as 25 percent of the state's allowances are allocated "for a consumer benefit or strategic energy purpose."[17] As it turned out, all of the participating states decided to disburse virtually all of their allowances through a joint allowance-auction process.

Allowances move into the market in the first instance through a central auction process conducted quarterly by RGGI, Inc. on behalf of the RGGI states.[18] An independent market monitor assesses the performance of the auctions to ensure that they are administered according to auction rules, and that there is no anti-competitive behavior in the market. Participation in the auctions is open to any entity meeting qualification requirements (*e.g.*, financial security requirements), with a ceiling of 25 percent placed on purchases by a single buyer or group of affiliated buyers in each auction.

Proceeds from the quarterly auctions – which are determined by quantities sold and auction clearing price (subject to a reserve (floor) price that is currently $2.15 per allowance)[19] – are distributed to states, and states determine how to use the funds. The final auction in the study period occurred in December 2017, with all of the approximately 14.7 million allowances offered for sale selling at an auction clearing price of $3.80 per allowance.[20] Figure 1 shows RGGI proceeds by state and region over the first three compliance periods.

---

[15] The Revised Model Rule released in February 2013 provides a new offset category known as "sequestration of carbon due to reforestation, improved forest management or avoided conversion" that RGGI states may adopt in lieu of the previous "afforestation" category.

[16] See, for example, the original apportionment in the 2005 MOU, Section 2.C.

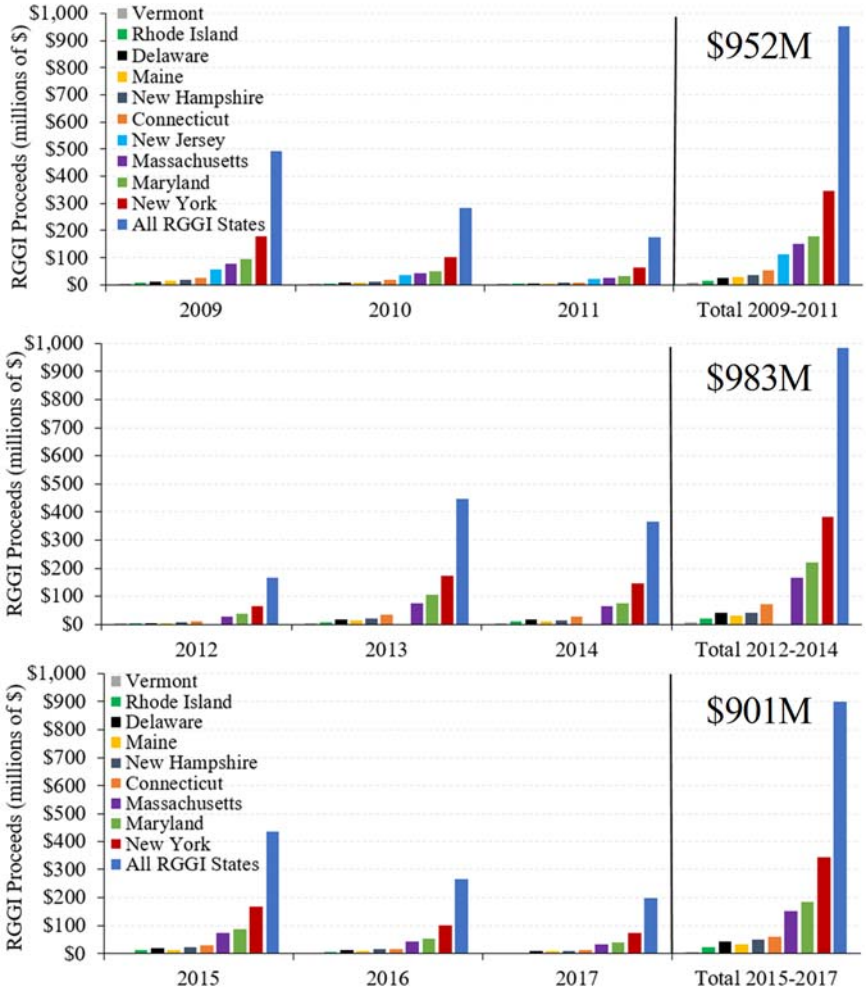
[17] "Consumer benefit and strategic energy purposes include the use of the allowances to promote energy efficiency, to directly mitigate electricity ratepayer impacts, to promote renewable or non-carbon-emitting energy technologies, to stimulate or reward investment in the development of innovative carbon emissions abatement technologies with significant carbon reduction potential, and/or to fund administration of this Program;" MOU, Section 2.G.

[18] After the allowances are in the hands of market participants, they may be bought and sold on the secondary market (without revenues flowing to the RGGI states).

[19] The minimum reserve price in 2014 was set at $2.00 and, per the RGGI Model Rule, was set to increase by 1.025 percent each year thereafter. (See https://www.rggi.org/sites/default/files/Uploads/Program-Review/12-19-2017/Model_Rule_2017_12_19.pdf)

[20] In addition, 10 million cost-containment-reserve ("CCR") allowances were also available for sale in Auction 38, none of which have been sold. (See https://www.rggi.org/auction/38). The CCR is a fixed additional supply of allowances that only becomes available for sale if CO_2 allowance prices exceed a certain "trigger" price level, which was $10 in 2017, rising 2.5 percent each year thereafter through 2020 (to account for inflation). After 2020, the trigger price will rise by 7 percent in each subsequent year. (See https://www.rggi.org/sites/default/files/Uploads/Program-Review/12-19-2017/Model_Rule_2017_12_19.pdf)

Figure 1
RGGI CO_2-Allowance Auction Proceeds by State by Compliance Period



Notes: [1] Figures include Auctions 1-38. Auction proceeds from Auctions 1 and 2 (occurring in 2008) are included in 2009. All other values are expressed in nominal dollars in the year the auction proceeds were generated. [2] Figures do not include fixed-price sales proceeds.
Source: RGGI, Inc.

Use of Auction Proceeds and Other Allowance Revenues

The use of auction proceeds varies by state, consistent with enabling state legislation, regulation and policy. Examples of how the states used their funds include investment in EE programs, investment in community-based or private-sector installation of RE or advanced power generation systems, credits to reduce consumers' electricity bills,[21] funding of state government operations through

[21] Note that our study focuses on changes in wholesale electricity prices. Although we recognize that other factors affect the extent to which *retail* electricity prices and electricity bills reflect changes in the world of retail ratemaking, we use the change in wholesale prices as a proxy for changes in consumers' payments for electricity.

allocation to state general funds, education and job training programs, and administration of the RGGI program or other GHG-reduction initiatives. The ways the states used the auction proceeds during the time period reviewed in this study (Compliance Period 3, covering 2015-2017) are discussed in detail below.

RGGI Program Reviews

The RGGI program was designed with a number of specific elements of review and evaluation. The original MOU provided for a comprehensive review to occur in 2012 that would include an evaluation of program successes, program impacts, the potential for additional reductions, imports and emissions leakage, and offsets. That program review took place in 2012. A second program review was conducted in 2017. Each of these reviews culminated in a revised Model Rule, which reflected the outcome of an extensive regional stakeholder process that engaged the state agencies, the regulated community, environmental groups, consumer and industry advocates, and other interested organizations with technical expertise in the design of cap-and-trade programs.

The states' 2012 program review revealed: (1) a significant excess supply of allowances relative to actual emission levels in the region; and (2) a finding that the then-current cost-control measures in the program, which were based upon expansion of the percentage of offset allowances allowable for compliance, would likely be ineffective in controlling costs if the emissions cap was made binding. As a result, the RGGI states revised the original program cap downward[22] and established a Cost Containment Reserve ("CCR") through the release of an Updated Model Rule.[23] These changes were implemented by the RGGI states.

The RGGI states' 2017 program review similarly resulted in: (1) a 30-percent reduction in the cap between 2020 and 2030 (a decline of 2.275 million tons per year); (2) additional adjustments to the cap to account for banked allowances at the end of 2020; (3) setting the size of the CCR to be equal to 10 percent of the cap, and increasing the trigger price to be equal to $13.00 in 2021; and (4) implementation of an Emissions Containment Reserve ("ECR") in 2021, through which states

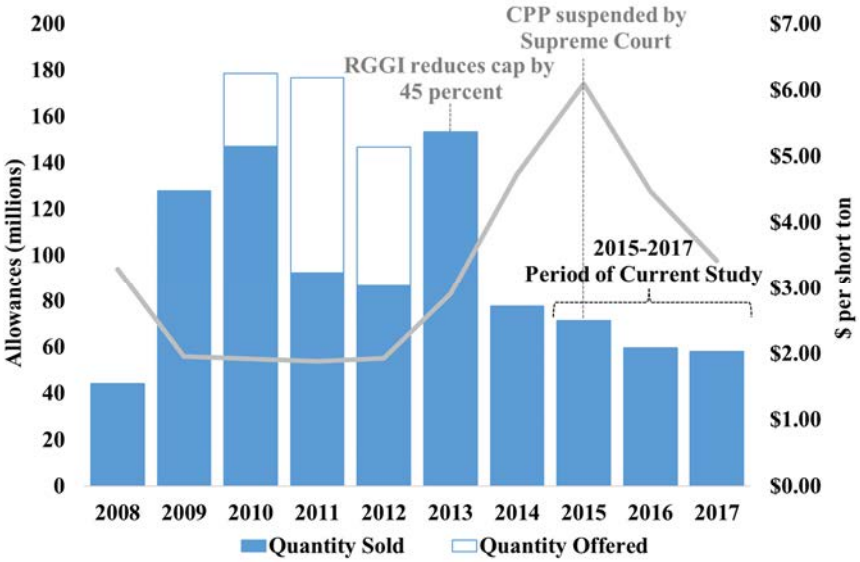
[22] Under the 2013 Updated Model Rule, the regional emissions cap was set equal to 91 million tons for 2014. Afterwards, the regional emissions cap and each RGGI state's individual emissions budget was set to decline 2.5 percent each year from 2015 through 2020. The 2013 Updated Rule also addressed the bank of allowances held by market participants with two interim adjustments for banked allowances: The first adjustment was to be made over a 7-year period (2014-2020) for the first control period private bank of allowances and a second adjustment was to be made over a 6-year period (2015-2020) for the 2012-2013 period private bank of allowances. (See https://rggi.org/sites/default/files/Uploads/Design-Archive/2012-Review/2013-02-11/Recommendations_Summary.pdf and https://rggi.org/sites/default/files/Uploads/Design-Archive/Model-Rule/2012-Program-Review-Update/Summary_of_Model_Rule_Changes_02_07_13.pdf)

[23] The Updated Model Rule established a CCR, which is a reserved quantity of allowances additional to the cap and that is only available to be released into the market if defined allowance price triggers are exceeded. In 2014, the amount of additional allowances in the CCR equaled 5 million short tons, and 10 million short tons were provided each year thereafter.

withhold allowances to achieve emissions reductions if prices fall below the established trigger price, which will start at $6.00.[24]

These reductions in RGGI's cap have resulted in several outcomes in recent years. Fewer allowances are being offered and sold. The auctions are producing higher clearing prices (and thus higher compliance costs). And together, the lower number of allowances at higher prices have led to slightly lower auction proceeds to RGGI states when compared to the first and second compliance periods. As summarized in Figure 2, over 128 million fewer allowances were sold in Compliance Period 3 at a cost of $1.67 more per allowance as compared to Compliance Period 2. Auction proceeds sent to states participating in RGGI decreased to approximately $901 million during Compliance Period 3, down from $983 million in Compliance Period 2 and $952 million in Compliance Period 1.

Figure 2
Summary of RGGI CO_2-Allowance Auction Results: Clearing Prices and Amounts Offered and Sold



Notes: [1] Clearing prices are weighted averages, based on number of allowances sold. [2] In 2014 and 2015, the Cost Containment Reserve ("CCR") trigger price was exceeded and additional allowances above what were originally offered into the market were ultimately presented and sold to market participants. In 2014, 5 million additional allowances were sold, and in 2015, 10 million additional allowances were sold.

Prior Analysis Group Reviews of the RGGI Program

Prior Reports on Economic Impacts of RGGI's First & Second Compliance Periods

Analysis Group has previously measured the economic impacts of RGGI's first six years (*i.e.*, Compliance Periods 1 and 2). Our 2011 and 2015 Reports presented the results of our analysis,

[24] See "RGGI States Announce Proposed Program Changes," August 23, 2017, https://rggi.org/sites/default/files/Uploads/Program-Review/8-23-2017/Announcement_Proposed_Program_Changes.pdf.

which led us to make the following observations about the RGGI experience with respect to Compliance Periods 1 and 2:

- *Mandatory, market-based carbon control mechanisms are functioning properly and can deliver positive economic benefits.* During the initial six years of experience with RGGI, the pricing of carbon in Northeast and Mid-Atlantic electricity markets was seamless from an operational point of view, and generated economic value added to the RGGI region of roughly $1.6 billion and $1.3 billion, respectively, in each of the two compliance periods.[25]
- *The RGGI Model has successfully achieved CO_2 reductions through a cooperative framework that preserves state authority*. The states that comprise the RGGI region are highly diverse, including politically and in their state policies, and have continued to change over the course of the RGGI program. Despite these differences, the RGGI states have successfully navigated the complications that can arise from efforts to coordinate regulatory and policy objectives across state lines. RGGI confirms the possibility that states can work together, particularly when doing so is likely to lower compliance costs and generate economic benefits.
- *The states used CO_2 allowance proceeds creatively – supporting diverse policy and economic outcomes.* The states' use of allowance proceeds not only provides economic benefits, but also has helped them meet a wide variety of social, fiscal, and environmental policy goals.
- *RGGI reduces the region's payments for out-of-state fossil fuels.* RGGI helped to lower the total dollars these states sent outside their region in the form of payments for fuel, as the fuels that power the region's fossil-fueled generators come from outside the region. Implementation of RGGI and the use of auction proceeds for EE and RE power production, through reducing generation and shifting the generation mix towards non-fossil resources, reduces the flow of dollars that essentially pay for fossil fuels used in power production in the RGGI states.
- *The design of the CO_2 market in the RGGI states affected the size, character, and distribution of public benefits.* The joint decision by the RGGI states to make their CO_2 allowances available to the market through a unified auction generates substantial revenues for public use. This approach transferred emissions rights from the public sector to the private sector at a monetary cost (rather than transferring them for free). Had these allowances been given away for free, the states would not have had the benefit of the auction proceeds and instead would have transferred that economic value to owners of power plants.
- *How allowance proceeds are used has affected their economic impacts.* The RGGI states used their RGGI allowance proceeds very differently, in ways that affect the net benefits within the electric sector and in the larger state economy. From a strictly economic perspective, some uses of proceeds clearly deliver economic returns more readily and substantially than others. For example, RGGI-funded expenditures on EE depress regional electrical demand, power prices, and consumer payments for electricity. This benefits all consumers through downward

[25] Given the vintages of those prior studies, all Compliance Period 1 results are reported in 2011 dollars (as described in our 2011 report), while all Compliance Period 2 results are in 2015 dollars (as described in our 2015 report). The results are presented on a net present value basis using a public discount rate of 3 percent. For additional results see the AG 2011 and AG 2015 Reports.

pressure on wholesale prices, even as it particularly benefits those consumers that actually take advantage of such programs, implement EE measures, and lower both their overall energy use and monthly energy bills. These savings stay in the pockets of electricity users directly. But there are also positive macroeconomic impacts as well: the lower energy costs flow through the economy as collateral reductions in natural gas and oil in buildings and increased consumer disposable income (from fewer dollars spent on energy bills), lower payments to out-of-state energy suppliers, and increased local spending or savings. Consequently, there are multiple ways that investments in EE lead to positive economic impacts; this reinvestment thus stands out as the most economically beneficial use of RGGI dollars. Other uses also provide macroeconomic benefits, even if they do not show up in the consumers' pockets in the form of lower energy bills.

- *States have demonstrated the capability to manage RGGI program costs and benefits in a way that is fair and protects low-income customers.* The RGGI states have done this by focusing both public policy objectives and normal ratemaking practices on fair outcomes when considering how to invest RGGI proceeds. Proceeds spent on direct customer bill assistance and EE programs targeted to low-income populations, for example, achieve these goals. Market-based mechanisms, such as RGGI, also offer unique opportunities to minimize overall social costs while reducing CO_2 emissions, by providing flexibility in how reductions are achieved, which ensures the lowest possible cost to consumers.
- *RGGI produced new jobs.* Taking into account consumer gains, power plant owners' losses, and net positive economic impacts, RGGI implementation led to overall job increases, estimated to be between 14,000-16,000 job-years in both Compliance Periods 1 and 2.
- *Timing differences in program costs versus benefits affects results.* Positive economic impacts associated with the distribution and spending of allowance proceeds tend to lag cost incurrence (and price impacts) by a year or more in many states. States can improve economic impacts by ensuring quick and efficient use of allowance revenues.
- *Value added in the economy for states' funding of various programs strongly outweighs the direct and induced effects of power-generator revenue loss.* RGGI's impacts affect many part of states' economies. RGGI proceeds were spent on economic activities affecting the electric sector, other energy uses (*e.g.*, natural gas use in buildings), support for low-income residents to meet their energy bills, educational activities, and general fund support. The positive economic multipliers associated with these expenditures contributed to net positive effects of the program in the RGGI states. On an NPV basis, these gains are larger than the direct impacts on the electric sector, where there were net positive electric consumer impacts but net revenue losses to power plant owners.
- *A region's pre-existing generating mix affects economic impacts.* Since power generation resources have different CO_2 emission impacts – with coal-fired generation having higher combustion-related CO_2 emissions than other electricity generating resources – the amount of coal in a particular state's generating mix affects the costs of the RGGI program.

2017 Report on Voluntary Cooperation on Allowance Trading Among States

A July 2017 Analysis Group report entitled "RGGI and Emission Allowance Trading, Summer 2017 Update"[26] reviewed the rationale and potential mechanisms for expansion of emission-allowance trading opportunities between sources in RGGI states and in other states that might be considering participation in or otherwise linking to the RGGI program and trading platform. This issue remains relevant, in light of Virginia moving forward with legislative priorities to participate with RGGI states, and New Jersey recently issuing an executive order to reinstate its prior participation in RGGI.[27] Moreover, the RGGI states have indicated their willingness to engage in discussions with other states – and, in particular, with Virginia and New Jersey – that may want to participate in RGGI in whole or in part.[28]

The AG 2017 Report reviewed the possibility of expanded CO_2-allowance trading among states, and considered the various design features that could accompany an expanded trading platform. In particular, this study considered the rationale for maximizing the size of the trading region, noting that a "…tradeable-allowance structure operates well in both regulated and competitive electric-industry contexts and integrates seamlessly with electricity market operations…[and] a broader trading market with more participants creates the opportunity to lower overall costs of compliance."[29] That report noted that while expanding RGGI to include other states might affect the level of state auction revenues (since, all else equal, expanding the compliance footprint should lower the marginal cost of CO_2 control and thus lower the price of auctioned allowances), this potential effect is part of a program that achieves the longer-run benefits of a broader allowance trading footprint.[30]

Finally, the AG 2017 Report identified and reviewed a set of key emission-allowance trading considerations and specific allowance-trading design considerations, which we summarize here in Tables 1 and 2.[31]

Table 1: Key Emission-Allowance Trading Considerations

Threshold Issue	Description	Key Considerations
Larger Trading Region	RGGI is a nine-state program with a large share of the U.S. economy with demonstrated ability to reduce CO_2 emissions in the affected region. Additional states' participation in RGGI states is likely to achieve additional cost-effective control of carbon emissions from the power plants.	Emission-control programs based on allowance trading in the broadest possible region support least-cost compliance and provide appropriate signals to market participants for infrastructure investment and power plant operation. Broader trading also reduces the likelihood of market monopoly or illiquid trading. Expanded trading may impact auction revenues to RGGI states as a short-term effect of a longer-term reduction in emission-control compliance costs.
The Importance of Regional Trading Considerations and External Collaboration	RGGI is uniquely positioned to support the expansion of a multi-state CO_2 trading market in the U.S.	RGGI is a flexible program that provides for low-cost CO_2-emissions reduction that could benefit from trading emissions across an expanded geographic region. RGGI states' decisions about key program designs and trading rules can affect other states' decisions about whether to join this program.
Auction Revenue Considerations	RGGI initially disburses almost all carbon allowances into the market through a central auction, and returns auction revenues to state governments. The states use those revenues to further GHG-emission reduction goals. Expanded trading may reduce auction revenues because allowance prices would likely fall with broader trading.	The RGGI states have effectively used auction revenues to further CO_2-emission-reduction and EE goals, among other uses. Although broader trading could improve overall efficiency of carbon-reduction approaches, it could also reduce revenues to RGGI states as a result of lowered allowance prices. While short-term revenues may fall, the long-term efficiencies and cost decreases of broader trading will likely outweigh the impacts of short-term revenue reductions.

Table 2: Specific Market-Based Carbon-Control Program-Design Considerations

Threshold Issue	Description	Key Considerations
Program Structure and Minimum Requirements	RGGI operates according to a core set of compliance and reporting obligations established in the MOU and the Model Rule, and according to state regulations. RGGI will likely need to establish a set of similar requirements for non-RGGI trading partners.	Key considerations related to program structure and minimum requirements for additional participants in the program include the emissions caps that trading partners adopt, the sources covered under CO_2 regulation, the method of disbursing allowances, and emissions-reporting and compliance guidelines.
Allowance Comparability	The RGGI states have achieved substantial reductions in regional CO_2 emissions over time, resulting in increasing allowance values. RGGI also employs a CCR and price floor and is considering an ECR.	In considering how to ensure fungibility of CO_2 allowances across trading regions, RGGI states need to consider whether and how to require other new states (that seek to join and/or link up with the RGGI trading program) to set CO_2 caps that match the stringency of the current RGGI cap, and whether to require that trading partners abide by price floors and have their own CCR and ECR reserves are issues. To facilitate broader trading regions, RGGI could proactively identify a strategy for setting comparable emissions caps and therefore creating fungible allowances with new trading partners.
Allowance Distribution	RGGI does not dictate how allowances are initially distributed, although RGGI recommends that states reserve at least a portion of allowances for public purposes. In practice, nearly all RGGI allowances are distributed initially through a central auction.	Initial disbursement of allowances does not affect the value or "opportunity cost" of allowances in the market, and thus does not affect the aggregate cost of compliance or the price of electricity generation. Thus, there is little reason to condition trading on the distribution of allowances. The method of distributing allowance into the market does, however, affect who gets the value of the allowances, with some approaches (*e.g.*, free distribution) potentially leading to potential "windfalls" to particular entities while other approaches (*e.g.*, auctions) retaining value for the public.
Emission Allowance Tracking	RGGI uses a standardized system to track the creation, trading, and retirement of emissions allowances.	RGGI could allow non-RGGI trading partners to participate in RGGI allowance auctions and in the secondary markets, tracking their activity through RGGI CO_2 Allowance Tracking System (COATS), or RGGI could require partner states to demonstrate substantial equivalence between other tracking programs and COATS.
Market Monitoring	RGGI requires careful monitoring of the allowance market to guard against hoarding and other forms of market manipulation.	RGGI's market monitoring has provided a great deal of comfort to states in the program that the program performs well as a market-based approach. Such oversight of market activities is arguably more important with broader trading regions and more market participants. RGGI may want to consider conditioning any new state partnerships upon those states relying on some form of market oversight or assurance mechanism.

Observations from the Implementation of RGGI to Date (2009-2017)

Based on these several studies, we observe that well-designed CO_2 pollution control programs (1) can operate with modest impacts on electricity rates in the first instance, and (2) can produce long-term benefits in the form of lower electricity bills and positive economic value to state and regional economies. A multi-state approach to carbon control can integrate seamlessly into the reliable performance of electric systems and can lead to efficient price signals affecting power plant dispatch, reducing emissions, and providing opportunities for cost-effective compliance costs for producers, to the benefit of consumers.

RGGI's success in producing these outcomes can in part be attributed to many program design and implementation features:

- *Program design and revision process* – The initial RGGI design and the subsequent revisions adopted by the RGGI states in 2013 (under the Updated Model Rule) occurred through collaborative processes involving a diverse set of states and other stakeholders. Participation included representatives not only from state agencies, but also from industry, environmental groups, experts and think tanks, and other organizations. Each state that elected to join RGGI obtained authority to do so through its legislature and/or regulatory mechanisms (as appropriate in each state). RGGI developed a 'model rule' that outlined the core design elements of the program, and then each state adopted its own enabling authority to allow it to participate. This meant that the participating states did not need to adopt a formal interstate compact under federal law, while still allowing the participating states to establish a coordinated and common mechanism for incorporating a carbon price into their power-system dispatch and operations;
- *Careful attention to policy design* – The process leading up to RGGI's initial design and subsequent implementation and revisions over time took care to address various elements of the program: establishing emission limits and allocation approaches; establishing processes to auction allowances; allowing for the free trade of allowances subsequent to their initial movement into the market; establishing periodic demonstrations of compliance; and allowing flexibility for states to use auction revenues in a manner consistent with their own policy objectives;
- *Common auction and trading platforms* – Ultimately, each RGGI state voluntarily decided to distribute the vast majority of its CO_2 emission allowances through a common, centralized auction administered by the organization (RGGI, Inc.) set up by states to run the program. This centralized administration and tracking of allowance ownership (which allowed for allowances to change hands subsequent to the initial auction) provides participating RGGI states with ease of implementation, allows for shared governance, and supports effective and efficient monitoring of a single allowance trading market; and
- *State allowance revenue decisions* – The use of auction proceeds has varied across the states and over time, consistent with agreements among the states and with each state's enabling authority. In practice, however, the majority of RGGI auction proceeds have been reinvested in EE and RE projects in part reflecting the states' interest in mitigating the impact of the program on wholesale electricity prices and consumer electricity costs. This practice is the source of many of the electricity and economic benefits we find in our analysis.

Comparability of Different Studies of RGGI Program Impacts

The methods used in this Report's analysis are solely focused on measures of *economic* impacts. They trace the dollars collected through the RGGI auctions and measure the full range of economic impacts in the electric markets and on states' economies that result from state spending of RGGI's CO_2 allowance auction proceeds. The results reflect a comparison of a world with and without these RGGI-related effects, holding all else equal. This approach does not take into account other potential measures of economic benefits (such as climate risk mitigation and air quality or other human health and environmental impacts), and thus differs from other studies of RGGI's impacts in this regard.

For example, RGGI, Inc. has developed reports reviewing the impacts of the use of RGGI auction proceeds in 2014 and 2015 ("Benefits Studies"). These reports differ from our study in a number of important ways, including:

- The Benefits Studies focused on the community-level impacts (*e.g.*, the number of participating households and businesses, energy bill savings, and the number of workers trained) of how RGGI dollars are spent locally.
- The Benefits Studies characterize the magnitude of potential environmental benefits by estimating and reporting CO_2 emissions avoided, equivalence to other mitigation actions (*e.g.*, taking cars off the road), MWh saved, and MMBtu saved;
- The Benefits Studies evaluate impacts in aggregate over the full course of RGGI program administration (as opposed to a single Compliance Period), and report impacts by investment categories (*e.g.*, EE, Clean and Renewable Energy, GHG Abatement);
- The Benefits Studies do not attempt to capture power-system dispatch impacts or induced impacts on RGGI states' economies.

Such differences between the Benefits Studies and our analysis make it difficult (if not inappropriate) to directly compare their results. Similarly, the methods applied in other independent reports are not comparable to the focus or analytic approach here. Each study has its own objectives and methods, applies varied analytic approaches, model platforms, and/or timeframes, and seeks to inform a different set of questions. It is important to understand these distinct elements when comparing results across studies.

3. PURPOSE AND METHOD FOR THE ANALYSIS OF COMPLIANCE PERIOD 3

Overview

From 2015 through 2017 (*i.e.*, Compliance Period 3), the auction of RGGI CO_2 emission allowances has resulted in the collection and disbursement to states of approximately $901 million. (See Figure 1) This Compliance Period 3 revenue is slightly less than the amounts collected in prior Compliance Periods: $952 million collected in Compliance Period 1 (2009-2011) and $983 million collected in Compliance Period 2 (2012-2014).[32]

Consistent with how we conducted our assessments in our AG 2011 and 2015 Reports, our analysis of Compliance Period 3 follows the allowance auction revenues and identifies the economic impacts of its use. Namely, we track the path of RGGI-related dollars as they leave the pockets of power plant owners who buy CO_2 allowances to demonstrate compliance, show up in electricity prices and customer bills, make their way into state expenditure accounts, and then roll out into the economy in one way or another. This analysis focuses on the actual impacts of verifiable economic activity: known CO_2 allowance prices as reflected in actual auction prices over time; observable CO_2 allowance auction proceeds (nearly $901 million in Compliance Period 3); dollars distributed to the RGGI states as a result of each auction; actual state-government decisions about how to spend the allowance proceeds; measurable reductions in energy use from EE programs funded by RGGI dollars; traceable impacts of such expenditures on prices within the power sector; and concrete economic activity and value added to the states' economies. By carefully examining the states' implementation of RGGI to date, based on real data about expenditures inside and outside of the electric sector and our calculation of value added from RGGI program implementation, we track the extent to which RGGI program implementation represents a positive or negative impact on the economies of the RGGI states.

There are four major elements of our review, each of which is discussed in more detail in the sections that follow:

1. We first established the **scope and overall framework of the analysis**, to create an integrated analytic framework that separates and highlights RGGI state impacts based on known historical program implementation data (*i.e.*, during Compliance Period 3), from other factors and impacts outside the region or associated with forecasts or projections. This scope of analysis thus included modeling of actual funds received and spent by the states, and actual impacts on electricity markets, as well as an assessment of the impacts of RGGI program expenditures on the larger economy.
2. Next we conducted a thorough review of **data and information on each state's use of revenues collected from the sale of RGGI allowances**. We initially received data from RGGI detailing each state's programs that received RGGI funding, and how much RGGI funding each program received in each year of Compliance Period 3. We supplemented this

[32] The dollars reported here are in nominal dollars. For comparison purposes, we have converted these amounts into real dollars (2018$), by inflating them based on the Consumer Price Index. With these conversions into real dollars (2018$), Compliance Period 1 proceeds amounted to $1.08 billion, Compliance Period 2 proceeds were $1.05 billion and Compliance Period 3 proceeds totaled $0.94 billion.

information as needed by researching individual programs to understand the specific activities that were being funded, and by relying in some instances on the work done in our prior studies. The purpose of this step was to track how RGGI revenues were disbursed (from RGGI, Inc. to the states) as a result of auctions occurring during Compliance Period 3, how disbursed funds were used by the states, and what impacts resulted from associated program implementation. Part of this analysis resulted in information about the use of allowance proceeds that affected activity in the electric sector (*e.g.*, how expenditures on EE programs affected the level of energy use in various portions of the day and in different seasons of the year) and in other parts of the economy (*e.g.*, how different program expenditures provided job training, or purchases of equipment, as described further below).

3. Third, we modeled **electric sector outcomes** from both the incurrence of increased costs associated with affected facilities' compliance obligations (namely, the purchase of allowances and changes in the electric supply offers and wholesale market clearing prices consistent with those CO_2 allowance costs), and the effect of changes in electric generation and demand associated with the use of funds to spur investment in EE and advanced energy technologies. Our electric sector analysis was conducted using the PROMOD model.[33]
4. Fourth, we modeled **macroeconomic outcomes**, combining electric sector outcomes – positive and negative – with expenditures in all sectors of the economy associated with the use of RGGI funds in the nine states. This produced an overall picture of how RGGI program implementation has affected the economy, including multiplier effects associated with the impacts on consumer electricity payments, power plant owners' costs and revenues, and the flow of RGGI-related dollars through other sectors of the economy. Our macroeconomic analysis was conducted using the IMPLAN model.[34]

It is clear from our program research and results that different investment portfolios by states resulted in different impacts from both economic and non-economic perspectives. Because our analysis focuses only on economic impacts, it does not shed light on the core objectives of the RGGI program – namely, addressing the economic, social, health and environmental risks associated with climate change, health benefits associated with ancillary reductions in other pollutants, or reduced health and environmental impacts associated with other effects of fossil-fuel generation. While we recognize that these were the key motivators of states acting to control emissions of CO_2, our focus was more narrowly on the economic (monetized) impacts of RGGI program implementation.

[33] The PROMOD model and our analysis of electric sector impacts are described in detail in the Appendix of this Report. Note that PROMOD allowed for estimation of electric-energy market impacts while capacity-market impacts were calculated separately.

[34] The IMPLAN model and our analysis of macroeconomic impacts are described in detail in the Appendix of this Report.

Scope of Analysis

Overview

To carry out our analysis of economic impacts of RGGI, we ran power-system dispatch models and macroeconomic models under two scenarios: the "RGGI case," which is effectively the world as it actually occurred during Compliance Period 3; and the counterfactual "no-RGGI case," which involves changes to model inputs and assumptions to create conditions depicting a world in which the RGGI program had not been in place as of the beginning of 2015. The difference in economic impacts between the two cases reflects RGGI's incremental impacts during Compliance Period 3.

In constructing the scope of our analysis, we were guided by three key objectives: first, we wanted to focus on impacts only within the RGGI states (the geographic perspective). Second, we wanted to identify near-term and longer-term impacts associated only with RGGI's implementation during Compliance Period 3 (2015-2017) (the temporal perspective). Third, we wanted results that were grounded as much as feasible in actual, known expenditures, programs, and impacts (the empirical perspective).

From a geographic perspective, we focused our analyses on the activities and impacts exclusively within the RGGI states. While some money from RGGI spending that flows outside of the RGGI states affects the economies of states outside the RGGI region (for example, for the manufacture of light bulbs or insulation used in energy efficiency programs, or flows of dollars to the federal government associated with changes in income), we did not try to report those out-of-region impacts in our analysis. Similarly, in the power-system modeling, our evaluation of impacts on power plant owners (also referred to as producers or generators here) and energy consumers was limited to those groups located within RGGI states.

From a temporal perspective, we focused our analysis on the third RGGI Compliance Period. We isolated the impacts of RGGI-related dollars associated with Compliance Period 3 only (2015-2017). This means that we included in power pricing the cost to power producers of obtaining RGGI allowances in the third three years of the program, and we included in power and economic sectoral investments only RGGI revenues that were spent during the third three years of the program.

Focusing on these three years of RGGI dollars, we tracked actual dollars collected from power producers during the 12 auctions that have occurred during Compliance Period 3, taking place from March 2015 through December 2017. The funds from these auctions flowed to the states immediately, with states spending them (or programming them for later expenditures, or spending previously collected dollars) during the 2015-2017 time period. Within the electric system, the impacts of these initial auctions also show up during the 2015-2017 period, as power plant owners priced the value of CO_2 allowances into prices they offer in regional wholesale markets. The macroeconomic impacts occur over the time period that allowance proceeds are collected and spent (2015-2017), but there are longer-term effects associated with the imprint of EE and RE project expenditures made during that period on energy use for the following decade (through 2027[35]). We

[35] As described in more detail later in this report, we assume a ten-year lifetime for installed EE measures and RE projects and conservatively truncate our modeling period after 10 years despite these resources having impacts (in the case of EE) and useful lives (in the case of RE) beyond then.

thus track these direct effects of RGGI to date in the near term (*i.e.*, Compliance Period 3), and in the long term track secondary impacts from expenditure of RGGI dollars by the states (for EE-related expenditures from 2015-2017, and from the implications of those EE measures on electricity use from 2015-2027).

From the perspective of modeling data and assumptions, we focus our analysis on known quantities associated with actual results from the third three years of the program. That is, we do not forecast allowance prices; we use actual allowance prices as they revealed themselves through the auctions. We do not estimate future program revenues, since we were focused on actual RGGI auction proceeds to date. We do not project how future revenues will be spent by states, since we rely entirely upon how the states have actually decided to spend allowance proceeds received to date. We make no assumptions about states' participation in RGGI going forward. Nor do we project impacts associated with programs funded through RGGI dollars collected in future years.

The goal of our analysis is thus to identify those incremental economic impacts associated with implementation of RGGI during Compliance Period 3: known allowance prices and revenues; known distribution of revenues to states; actual or committed expenditures associated with state proceeds; and observable impacts associated with RGGI-funded program implementation. In this sense, our analysis should be viewed as a snapshot of impacts associated with a finite period – Compliance Period 3 – of RGGI program administration, and not a projection or forecast of how RGGI may, could or should evolve.

To accomplish our goal, however, we had to establish what these programs meant from an economic perspective, in order to create the "no-RGGI" counterfactual case, against which we compare the actual economic outcomes during the 2015-2017 time period (which included RGGI).

Data Collection and Processing

Overview

Our analysis began with the collection and processing of data related to RGGI program implementation in each of the nine states. Identifying and tracking the use of RGGI proceeds is fundamental to our analysis, and has been facilitated by states' reporting of their expenditures to RGGI, Inc. on a quarterly basis. This process also involved the translating of expenditures on EE measures and new RE projects into impacts on power-system energy consumption and electricity peak loads in various seasons and days of the year.

In the end, we were able to obtain most of the necessary data from the information reported to and by RGGI, Inc. Where information was missing or incomplete, we took successively deeper steps to fill in data gaps, sort out inconsistencies, establish proxy values, and/or arrive at a workably complete data set for use in the study.

Data Gathering

Approach

The first anchor point for our data analysis is the level of revenues collected through the quarterly auctions of allowances (approximately $901 million) during Compliance Period 3. We collected data on the sales of allowances into the market and on the allocation of those auction revenues to states. Total revenue allocations to states are shown in Figure 1.

Participating RGGI states report their spending of RGGI proceeds to RGGI, Inc. on a quarterly basis. RGGI, Inc. publishes these data and breaks expenditures down into the following seven investment categories: EE, clean and renewable energy, GHG abatement, direct bill assistance, administration, RGGI, Inc. administration, and transfers to the general fund.

Using these data, we traced and categorized in detail the actual use of RGGI auction proceeds for funding to various types activities, and identified the effects of the funded activities, programs, and investments. By "effects" we mean the tangible results of the expenditures that are significant or important from the standpoint of measuring power system dispatch and economic impact through the PROMOD and IMPLAN modeling effort. For example, what are the annual household electricity savings, on- and off-peak, associated with specific EE measures? How many MWh of generation will flow annually from an installed solar photovoltaic ("PV") systems using RGGI dollars? Identifying such effects involved (1) collecting data and estimates by RGGI, Inc. on such effects, and (2) applying best-practice estimation methods where data across states were missing, incomplete or inconsistent.

Process

Our process for cataloguing the collection, allocation, disbursement, and use of RGGI allowance revenues involved three basic steps:

- We first collected and reviewed data on expenditures of RGGI auction proceeds and on the estimated effects of RGGI-funded programs from public sources. The public sources of information included publicly available reports on RGGI and/or separately on state energy efficiency programs.
- Using the existing data, we organized it to format the data for input into the PROMOD and IMPLAN models.

Based on our review of the data, the similarities in spending vehicles across RGGI states, and the levels of disaggregation needed for model inputs, we divided program spending into seven categories. These categories are described below, and expenditures by category for each electric market region (New England, New York, and PJM RGGI states), as well as for the entire RGGI footprint, are presented in Table 2 and Figure 3, below.

1) *Energy Efficiency and Other Utility Programs* – Because much of the RGGI funds were spent on EE measures, and because different measures lead to different impacts on consumers' demand for electricity, we grouped information on EE programs into residential retrofit/new construction and commercial retrofit/new construction categories.

2) *Renewable Investment* – This includes grants to programs and investments focused on the development, distribution, and installation of renewable or advanced energy technologies. We assume that this investment was largely supporting solar PV installations.

3) *Education and Job Training* – This includes monies used for programs (i) to educate business and residential consumers about energy consumption and the availability of programs to reduce consumption, and (ii) train workers with new skills and knowledge in industries and activities that contribute to lowering energy use (*e.g.*, installation of EE measures) or the production and distribution of renewable or other advanced energy technologies.

4) *Clean Technology Research/Development* – This includes grants and other funding to support research or other public/private groups focused on the furthering R&D related to GHG emissions (*e.g.*, clean technologies, alternative transportation, carbon sequestration).

5) *Direct Energy Bill Assistance* – This includes use of RGGI funds to provide payment credits or other means to reduce bills paid by consumers for electricity and heating/cooling. In some cases, investments in this category are targeted to low-income households.

6) *GHG Reduction Programs* – The GHG reduction programs include a variety of expenditures aimed at reducing GHG emissions (*e.g.*, R&D grants for CO_2- emission abatement technologies, direct investment in "green" start-up companies, efforts to reduce vehicle miles traveled, climate change adaption measures, investments in existing fossil-fuel fired power plants to make them cleaner and/or more efficient).

7) *Program Administration* – RGGI Program Administration refers to RGGI auction proceeds used by each RGGI state to cover costs associated with the administration of the state's CO_2 Budget Trading Program and/or related consumer benefit programs.

The amounts of funds spent by program category (by RGGI state, by electrical region for the RGGI states and for the nine-state RGGI region as a whole) are show in Table 3 and Figure 3, below.[36]

[36] Between 2015 and 2017, the RGGI states spent more on RGGI-related programs than the revenues collected during Compliance Period 3 auctions. The analysis presented in this study models the full amount of state spending on RGGI programs during this period.

Table 3
Spending of RGGI Proceeds by Category and by State, Electrical Region and RGGI Region
Compliance Period 3 (in $ millions)

	Energy Efficiency	Clean Technology R&D	Direct Bill Assistance	GHG Programs	Program Administration	Renewable Investment	Education, Outreach, and Job Training	General Fund	**Total**

Modeling Approach

Overview

Since our goal was to track the incremental impact on the economy resulting from the purchase and use of RGGI allowances and from the states' use of those RGGI allowance proceeds during Compliance Period 3, we needed to (1) construct a counterfactual electric system that did not reflect RGGI impacts and (2) develop an analysis that followed the flow of RGGI dollars through the economy. We provide the details of our assessment tools in the Appendix of this Report, which describes the IMPLAN and PROMOD models in greater detail.

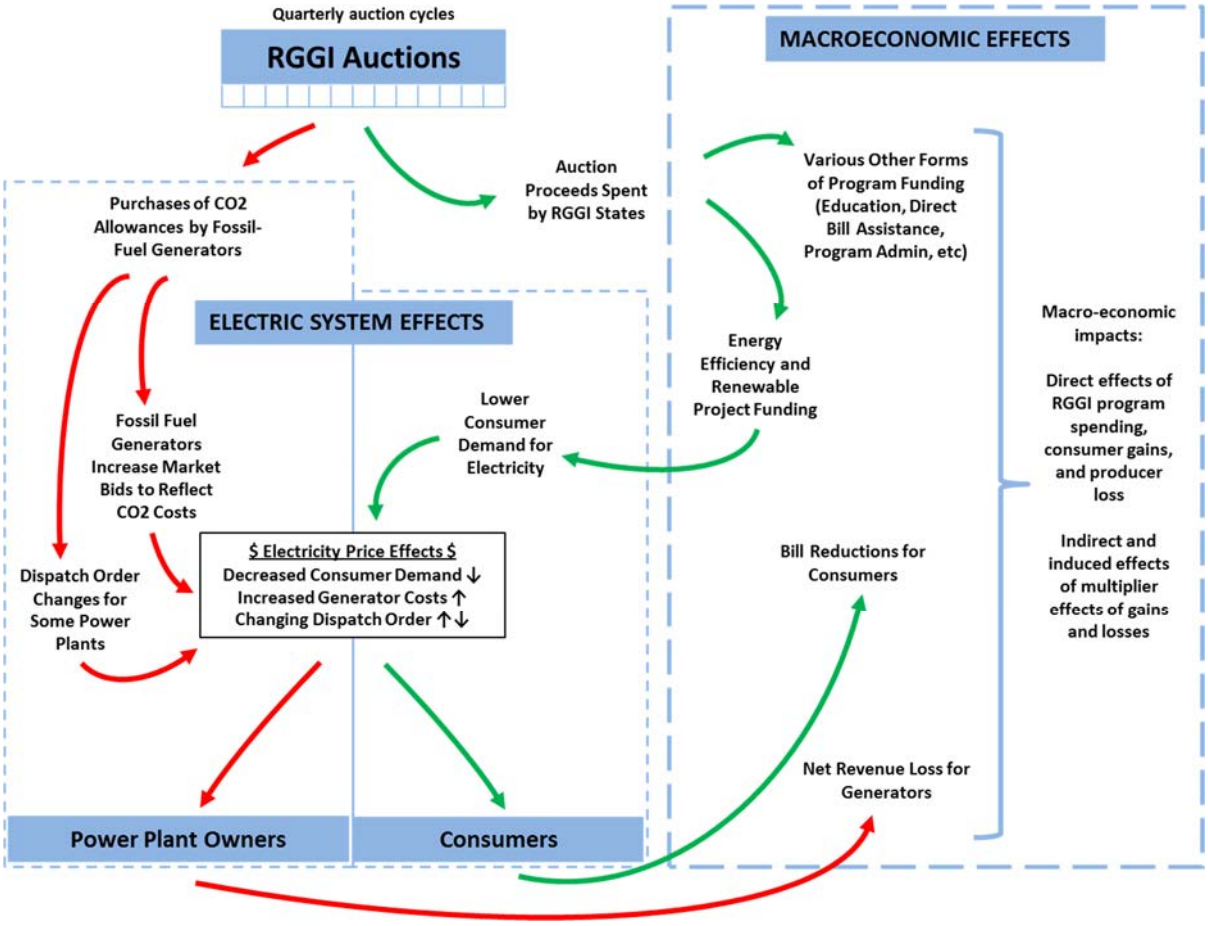
With respect to impacts on the general economy, RGGI allowance proceeds have two effects. First, when the states use RGGI proceeds to fund an activity (such as EE) those monies have a direct impact in the form of purchases of goods and services in the economy. Second, in one way or another, many states reinvest allowance proceeds to affect costs in the power sector (*e.g.*, to facilitate cost-effective reductions in power-sector emissions of CO_2, and/or to mitigate the impact of the RGGI program on consumers' electricity costs). Thus, both the compliance obligation and the use of RGGI proceeds create changes in the power sector, in the form of changes in power plant owners' costs, offer prices bid into wholesale electricity markets, and consumer spending on electricity bills. In aggregate, these changes in spending lead to revenue gains and losses (to power plant owners) and gains and losses (to consumers), which, in turn, affect economic flows in the economy.

To estimate these impacts on the economies of RGGI states, we model changes to the electric system and macroeconomic outcomes. The general flow of data and modeling outcomes is depicted in Figure 4.

Our modeling approach combines analysis of power sector effects (through modeling using PROMOD), and analysis of macroeconomic effects (through use of IMPLAN). The foundation of our modeling analysis is, in effect, a comparison between two scenarios run through the models. In the PROMOD model, we run a dispatch of the regional power systems "with" and "without" RGGI, and include in each run the same core conditions: power system infrastructure both in place and as it evolves over the modeling period (that is, transmission configurations and power plant additions and retirements); local and regional forecasts of electric energy and peak load by service territory over the modeling period; and projections of fuel prices and allowance prices for NO_x and SO_2; and so forth.[37] In the IMPLAN analysis, we start with economic relationships that exist among providers and users of goods and services in the nine RGGI states, and then we introduce the direct expenditures (RGGI proceeds) and the revenue gains and losses to electricity consumers and power producers (from the PROMOD model).

[37] Forecasts of load, fuel and other prices are needed for the period after 2017 to analyze the impact of the energy efficiency and renewable investments made during the 2015-2017 period.

Figure 4
Flow of Data and Modeling Outcomes in our Analysis of RGGI's Impacts on the Electric System and State Economies



The two cases in PROMOD can be described as follows:

- RGGI Scenario – In the RGGI scenario, the power system is modeled as it is. That is, the RGGI case represents the world as it has evolved with RGGI in place and operating as it did during Compliance Period 3. It includes all of the programs, measures, investments, and funding that are associated with the third RGGI compliance period, and all of the impacts on the power system and economy associated with the use of RGGI funds.
- No-RGGI Scenario – In order to create the counterfactual against which we compare and contrast the RGGI case, we create a scenario configured to represent the power system and economy as it would have progressed absent expenditure of RGGI-related dollars in Compliance Period 3. In order to do this, we relied on all of the data and representations of RGGI investments and associated effects described in the previous section, and removed those investments and effects from the RGGI scenario. But for these changes, all elements of the modeling process are identical across cases.

We then traced the dollar differences in these two PROMOD runs (with and without RGGI) through the macroeconomic IMPLAN model to capture the impacts of these electric sector outcomes; we also injected funds related to the states' direct expenditures of RGGI program dollars in IMPLAN.

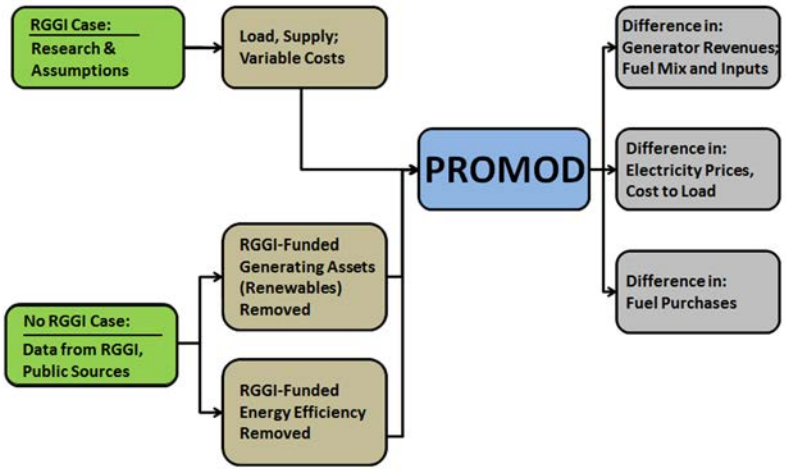
In the following sections, we summarize the power system and macroeconomic models, and highlight a few key factors of the modeling approach that help to interpret the results. More detail is available in the Appendix.

Power Sector Analysis

RGGI has two primary effects in wholesale power markets. First, marginal power prices are at times increased by the additional CO_2 allowance cost to affected (fossil-fired) power generating facilities. Second, demand and marginal prices are at times decreased by the amount and type of EE measures and RE projects installed as a result of spending RGGI allowance proceeds.

Using the PROMOD power system dispatch simulation model, we quantified these net impacts on regional and local electric-system loads, power prices, and revenues to power producers associated with implementation of the RGGI program in the third compliance period. (See the Appendix for a detailed description of the PROMOD modeling platform, the core logic for which is explained briefly below.) These relationships are summarized in Figure 5. Using PROMOD, we created the "with RGGI" case (benchmarking the modeling results to the actual electric output that was observed in 2015-2017) and then constructed a counterfactual "no-RGGI" case. Comparing the results of the two cases provided information about the incremental effect of RGGI's Compliance Period 3 on power system users and producers.

Figure 5
Diagram of PROMOD Modeling Inputs and Outputs for RGGI Impacts on the Electric System



Traditional cost-minimizing strategies in the dispatch of power systems involve use of production-cost information to determine which power plants operate at different times of the day to meet changing load conditions. In competitive wholesale electric market regions like the Northeast and Mid-Atlantic regions, decisions on which power plants to turn on and off are made based primarily on bids submitted by power plant owners indicating the price at which they are willing to supply power

into the markets. Provided the market is sufficiently competitive, price bids should approximate marginal production costs of the facilities in the system. Generally, prices in wholesale markets are set hourly based on the last generating unit dispatched – that is, the most expensive unit that was needed to meet hourly load.

The PROMOD power system model is configured to comprehensively simulate the dispatch of the power system on an hourly level based on power plant marginal costs, subject to various operational and transmission system constraints that can alter dispatch order (and thus prices) in real time. The PROMOD model simulates system dispatch based on, and reflecting: (1) the operational characteristics and marginal production costs of every generating facility in the power region being studied (in this case, New England, New York, and PJM); (2) the configuration of and limits on transfers of power across the transmission system, comprising every transmission line and other system components in place; and (3) algorithms designed to reflect the operational constraints of power plants, such as the time it takes to start units and to ramp them up to various power levels, the minimum time they must be on, and the minimum time they must be off. Given the level of detail in how PROMOD represents the power system – that is, down to very small power plants and specific transmission system components and limits – it is able to simulate and produce power prices, unit output, emissions, costs to loads (*e.g.*, wholesale supply to consumers), producer revenues, and other factors. PROMOD calculates these metrics on an hour-by-hour basis, and with a high degree of geographic resolution (that is, down to a utility's service territory, or a specific substation).

Given this level of detail, we are able to model investments in EE and the development of new generation using RGGI funds at a detailed state- and utility-specific level. This allowed us to capture the impact of such investments on the wholesale prices that consumers pay – and that power producers are paid – on hourly and locational bases. As shown conceptually in Figure 5 above, we simulated the dispatch of the three regional power systems that contain the RGGI states for each hour of the modeling period (January 2015 through December 2027) for both the "with RGGI" and "no-RGGI" cases.[38] Based on the output of those two cases, we calculate changes in (1) unit dispatch, (2) wholesale electric prices, (3) payments to power producers, and (4) payments by consumers.

We used the PROMOD output and associated calculations of changes in generator and consumer prices, revenues, and payments in two ways. First, the data are used to describe the impacts on generators and consumers from the perspective of the electric system only – that is, how much more or less do power plant owners get paid as a result of RGGI program investment effects? How much more or less do consumers pay for electricity as a result of RGGI program investment effects? How does that differ by region? How do these electric system impacts change with time? The impact on power plant owners and consumers associated with the RGGI program – which is focused on the electric sector only – is an important consideration in program design and effectiveness.

Secondly, we use the output data from PROMOD as inputs to the IMPLAN model. From a macroeconomic perspective, the end result of changes in power-system costs, revenues, and payments are (a) changes in economic conditions for power plant owners (affecting their ability to spend and save in the general economy), and (b) changes in the level of disposable income enjoyed by consumers as a result of RGGI's impact on wholesale electricity prices which affects their spending

[38] See the Appendix for more information about PROMOD and the modeling area.

and saving in the general economy. Consequently, changes in these two factors serve as inputs to the general economic model (described below), along with other categories of RGGI program investment.

Macroeconomic Model

As previously noted, changes in power producer revenues and consumer incomes associated with electric-system impacts lead to these larger direct and indirect impacts in the economy as a whole. Other economic impacts also need to be taken into account: those related to the actual direct spending of RGGI auction proceeds by government agencies (and in turn, indirectly by the recipients of the RGGI-funded grants). Additionally, these other impacts result from the multiplier effects of these changes in consumer income and producer revenues and from the purchases of goods and services in the economy by those who receive RGGI-related spending from the states.

Consequently, in order to model macroeconomic impacts, we combine the changed revenues and spending that come from the PROMOD model with all categories of the direct investment of RGGI allowance revenues in the macroeconomic model, IMPLAN. IMPLAN is a social accounting/input-output model that attempts to replicate the structure and functioning of a specific economy (*e.g.*, a state or a country), and is widely used in public and private sector economic impact analyses. It estimates the effects on a regional economy of a change in economic activity by using baseline information capturing the relationships among businesses and consumers in the economy based on historical economic survey data that track flows of money through the economy. IMPLAN tracks dollars spent in a region, including dollars that circulate within it (*e.g.*, transfers of dollars from consumers to producers), dollars that flow into it (*e.g.*, purchases of goods and services from outside the local economy), and dollars that flow outside of it (*e.g.*, payments to the federal government). The model thus examines inflows, outflows, and interactions within the economy under study.

The IMPLAN model allows one to investigate interactions in the RGGI region and the individual states within it, and to calculate various economic impacts in that economy when a new activity (such as investments in EE or use of funds to support a state's general fund or assistance to help consumers pay their energy bills or lost revenues for owners of power plants) involves money flows around the economy. Specifically, the model captures various impacts, including:

- *Employment impacts* (the total number of jobs created or lost);
- *Income impacts* (the total change in income to employees that results from the economic activity); and
- *"Value-added" impacts* (the total economic value added to the economy, which reflects the gross economic output of the area less the cost of the inputs).

Although we report employment impacts of our analysis, we focus primarily on the "value-added" impacts produced by the model, reflecting the combination of the following economic effects of the change in money flow associated with RGGI:

- *Direct effects:* the initial set of inputs that are being introduced into the economy. In our study, these include the direct effects of RGGI on owners of power plants as a whole, on energy consumers (end users of electricity, natural gas and heating oil), and use of RGGI proceeds to buy goods and services in the economy (*e.g.*, investment in EE, work training programs, bill payment assistance for low-income consumers).

- *Indirect effects:* the new demand for local goods, services and jobs that result from the new activity. Examples include the spending on labor to retrofit buildings with EE measures, or to train workers in these skills. Some RGGI auction proceeds lead to payments for things to suppliers located outside the local region (*e.g.*, the purchase of efficient lighting equipment or solar panels manufactured outside of the RGGI region); IMPLAN traces those dollars that do not stay within the local economy when dollars are spent on RGGI-related activities.
- *Induced effects:* the increased spending of workers resulting from income earned from direct and indirect economic activity.

Modeling Factors

To calculate the impacts of RGGI, we needed to make a number of assumptions about the systems and economies that we are studying. These assumptions relate to: (1) the relevant boundaries (*e.g.*, geographic, temporal) of the analysis, (2) the methods for putting dollar flows occurring during different time periods into a common economic framework; (3) key modeling parameters in the power system; and so forth. We highlight a few of these below and explain them further in the Appendix.

Focus on Compliance Period 3

First, the analysis does not specifically control for any RGGI-funded investments in EE or supply before 2015 or after the program's third compliance period. For modeling purposes alone, and in order to isolate the incremental effects only of Compliance Period 3, we made no assumptions about RGGI continuing beyond 2017, nor did we attempt to isolate (and remove) the impacts of RGGI-related activity that occurred during the program's first six years. Further, we do not assume that there is a price on carbon through other regional, state, or federal legislation at any point during the modeling period (through half of 2027). Neither assumption should be interpreted as a judgment or expectation about the likelihood one way or the other of continued RGGI program implementation, or the emergence of a national carbon-pricing regime. Constructing the analysis in this way is specifically intended to allow for focus on the specific incremental impacts of RGGI implementation during Compliance Period 3, holding all else equal.

Timing of Economic Impacts that Affect the Power Sector

The focus on actual expenditures and impacts in only the third three years of program implementation, in combination with the application of a discount rate, ends up highlighting the fact that RGGI benefits lag behind RGGI costs. The costs show up in electric system impacts to wholesale prices immediately, during the first three years of the modeling period (*i.e.*, Compliance Period 3), while the benefits to a certain extent flow to consumers over the entire study period (starting at the beginning of 2015 and then through 2027). Conversely, the benefits flow to owners of power plants early on (when marginal power prices are higher), with outer-year effects diminishing those net positive revenues received during the three years of the third compliance period.

Indeed, there is a lag between the incurrence of costs in the "with RGGI" case and the timeframe in which installation of EE measures funded through RGGI allowance revenues begin to affect demand, supply, and prices in the outer years.

Representation of Energy Efficiency Programs

Given the various uses of RGGI funds for EE, there are two major analytic challenges in the PROMOD modeling effort: First, we needed to determine an assumed duration or lifetime for savings from particular measures (for example, for how long does installation of insulation continue to produce savings?). Second, we needed to develop a way to map annual energy and peak load savings onto estimates of impacts on load in every hour of the year.

In all of the RGGI states where EE programs are in place, there is substantial documentation of estimates of annual energy savings and, in some cases, contributions to reductions in peak loads. There is a long history of EE implementation and measurement and verification efforts to support engineering and statistical estimates of how the installation of a given EE measure actually translates into annual savings, distribution of savings across the hours of the year, and measure lifetimes. A number of entities summarize these figures, and we relied on these data to calculate the lifetime and load-impact characteristics of the various EE programs funded by RGGI dollars.[39]

As part of our AG 2011 Report of RGGI's first compliance period, we reviewed where available (and on a program-by-program and measure-by-measure basis) the estimates of measure lives developed by states and utilities and currently used in programs, based on the past few decades of experience in administering EE programs. We calculated weighted average measure life assumed by states and utilities across the range of measures, and found that virtually all programs have measure lives in excess of ten years; on average, measure lives were 12-13 years. In our modeling, we conservatively truncated measure savings at ten years. Consistent with that approach, we adopted the same ten-year measure life for our analysis of the third compliance period.[40] In some areas of the RGGI region, states have estimated how EE-related savings break down on a seasonal basis (summer or winter) and on a daily basis (on- or off-peak). We used the analysis done in our AG 2011 and 2015 Reports for the same purpose here, using information about specific programs and breakdowns of timing for when savings occurred.[41]

Using these characterizations of EE program impacts, we calculated hourly adjustments to load for each EE program, and in aggregate for all programs used these to adjust hourly load in the PROMOD model.

[39] Specifically, we relied on data from the Northeast Energy Efficiency Partnership's (NEEP) Regional Energy Efficiency Database (REED). (See http://www.neep.org/initiatives/emv-forum/regional-energy-efficiency-database)

[40] For this analysis, we confirmed this assumption using data from NEEP. We found that the weighted average measure life across all RGGI states in 2015 and 2016 was approximately 11 years.

[41] For this analysis, we confirmed this assumption using Energize Connecticut, "Connecticut Program Savings Document: 12th Edition for 2017 Program Years," October 31, 2016, page 313 (available at https://www.energizect.com/sites/default/files/2017%20CT%20Program%20Savings%20Document_Final.pdf).

4. RESULTS

Overview

Focusing exclusively on economic impacts of the RGGI program during Compliance Period 3, our report sheds considerable light on how the cap-and-trade program affects prices in electricity markets and in the economies of the participating states. As noted previously, the report does not address the many other objectives that underpinned the RGGI states' adoption of the program, or economic impacts that flow over time from reducing damages associated with climate change.[42]

The states implemented the RGGI program by distributing virtually all of the CO_2 allowances through quarterly auctions, with auction revenues distributed to states in accordance with the RGGI state budget allocation.[43] This approach had an important impact on program outcomes because it meant, in effect, that the public benefitted by transferring the value of allowances to the market at market prices (rather than for free, as was largely done in other SO_2 and NO_x allowance-trading programs). The public received the benefits associated with the allowance value, through the states' use of auction proceeds to pursue specific energy- and non-energy-related public policies, including providing an opportunity to both address some of the potential cost impacts of RGGI program implementation, and to pursue other key public policy objectives.

RGGI auctions for the Compliance Period 3 generated approximately $901 million. These auction revenues were distributed to (or held by) states in the following amounts:[44]

- $61.8 million for Connecticut
- $43.4 million for Delaware
- $32.2 million for Maine
- $182.7 million for Maryland
- $154.3 million for Massachusetts
- $50.6 million for New Hampshire
- $345.1 million for New York
- $23.9 million for Rhode Island
- $6.9 million for Vermont

(Figure 1 (above) shows the proceeds received in each year by the nine states in each of the three compliance periods.)

These dollars have three types of economic impacts:

---

[42] The RGGI States' MOU has a preamble that recognizes the common objectives of the states' own policies "to conserve, improve, and protect their natural resources and environment in order to enhance the health, safety, and welfare of their residents consistent with continued overall economic growth and to maintain a safe and reliable electric power supply system." The MOU also declares a common goal of the states of "reducing our dependence on imported fossil fuels will enhance the region's economy by augmenting the region's energy security and by retaining energy spending and investments in the region…" Additionally, the original RGGI MOU states that delay in addressing GHG emissions will make later investments in mitigation and adaptation more difficult and costly, and that a market-based carbon allowance-trading program will create strong incentives for the development of lower-emitting energy sources and energy efficiency. (MOU, pages 1-2).

[43] Where allowances were not distributed via auction, they were sold directly to affected sources, again retaining the value of the allowances sold for public purpose.

[44] Between 2015 and 2017, the RGGI states spent more on RGGI-related programs than the revenues collected during Compliance Period 3 auctions. The analysis presented in this study models the full amount of state spending on RGGI programs during this period.

1. *Impact on the general economy.* Our "bottom line" finding is that RGGI has produced positive results for the economies of the RGGI states. This finding reflects two primary contributing factors:
   - the direct investment of RGGI allowance auction proceeds in various economic activities); and
   - the *net* impact on two countervailing effects: net losses to power plant owners (in the form of lower revenues over time as a result of RGGI spending), and net gains to electricity consumers (in the form of lower electricity bills over time).

   These economic "value added" impacts flow from both the direct, indirect and induced effects of injecting RGGI dollars into various economic activities.

2. *Impact on the electric system.* Observable electric-sector impacts include overall changes to power plant owner revenue streams (from both increased costs for obtaining and using CO_2 allowances, and from changes in the price and quantity of power sales); and overall changes to payments by electric consumers for the purchase of electricity (resulting from lowering total electricity demand and from changes in market prices).

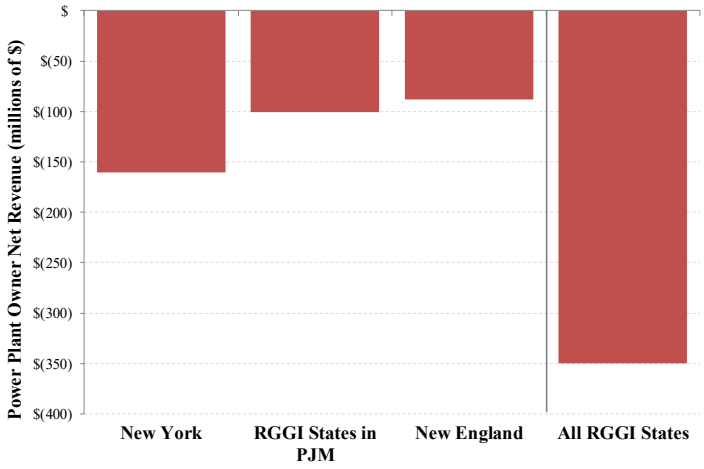
3. *Other effects.* These include changes in employment and payments for fuel that flow from the impacts of the use of RGGI allowance revenues in the electric system and the local economy.

Impacts on the RGGI States Combined

Impact on Electric Producers

From the perspective of the power generation sector, the RGGI program as implemented during the 2015-2017 period led to an overall drop in electric market revenues to owners of generating assets of just less than $350 million (on an NPV basis). Although owners of emitting power plants had to purchase CO_2 allowances, as a group they recovered all of their early expenditures during the 2015-2017 period; in the long run, however, RGGI-driven EE leads to lower sales of electricity than would otherwise occur without RGGI in place and this ends up eroding power plant owners' electric market revenues over time. The net impact to electric power plant owners as a group is summarized by region in Figure 6.

Figure 6
Net Revenue Change Across All Power Plant Owners, by Region, as a Result of RGGI Implementation During the 2015-2017 Period (NPV, 2018$)

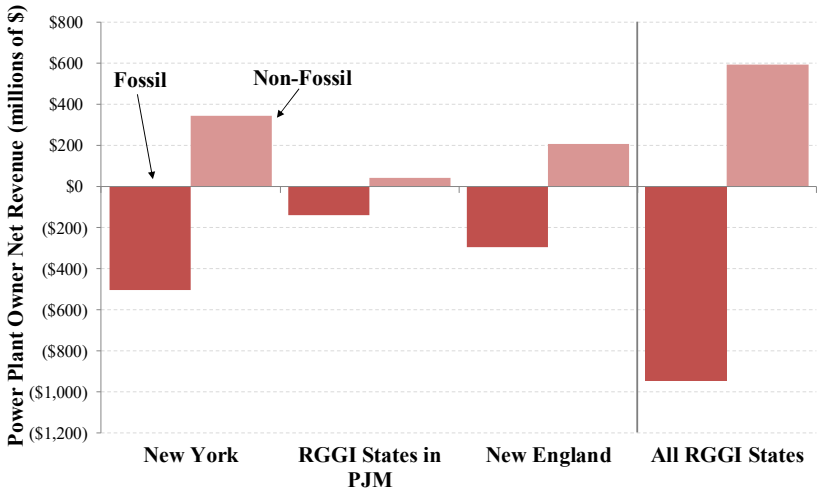


Notes: [1] Figures are reported in 2018 dollars (NPV), converted using a 3-percent discount rate. [2] Figures include PROMOD outputs and capacity market loss calculations calculated separately.

These impacts, however, are not distributed equally across power plant owners. RGGI affords a competitive advantage to power plants with CO_2 emissions lower than their competitors'. In the near term, while owners of emitting resources recover their costs to operate – including the cost of CO_2 allowances – the net effect of the program can reduce profits for owners of plants with relatively high carbon emissions (*e.g.*, coal-fired power plants).[45] On the other hand, owners of low- or zero-carbon generating sources (*e.g.*, nuclear, wind, solar, hydro) get the benefit of being paid higher market prices that reflect CO_2 allowance costs, without having to buy allowances. See Figure 7, which shows the breakdown by fuel type of changes in net revenues for power plant owners. As one would expect, carbon-emitting power plant owners generally lose revenue, while owners of nuclear and renewable resources gain during the three years of program implementation.

[45] Note that clearing prices in the three electrical regions we modeled reflect the opportunity cost of CO_2 allowances of the marginal generator in each hour. To the extent that an owner of a relatively high-emitting generating unit purchased an allowance at a higher cost than the opportunity cost of the marginal producer, and has a higher carbon intensity for a given unit of electricity produced, that owner may not fully recover its cost to purchase CO_2 allowances through energy-market revenues.

Figure 7
Net Revenue Change to Power Plant Owners (by Power-Plant Fuel Type and Electrical Region) as a Result of RGGI Implementation During the 2015-2017 Period (NPV, 2018$)

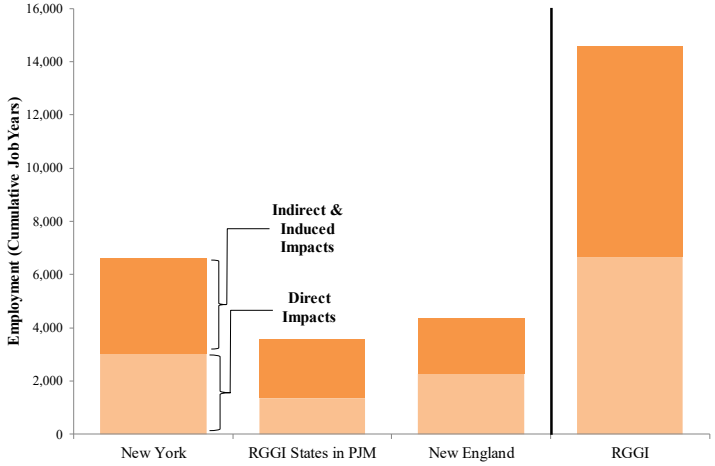


Notes: [1] Figures are reported in 2018 dollars (NPV), converted using a 3-percent discount rate. [2] Figures include PROMOD outputs and capacity market revenue changes calculated separately. [3] Fossil includes natural gas, oil, and coal fired generators. Non-fossil includes nuclear, hydro, pumped storage, wind, solar, and biomass.

Employment and Reduced Payments for Fossil Fuels

In addition to an economic benefit, the use of RGGI proceeds results in a positive employment impact through an increase of over 14,500 new job-years (see Figure 8), and reduced payments to out-of-region providers of fossil fuels by nearly $1.37 billion (NPV) as a result of RGGI's operations during Compliance Period 3.

Figure 8
Net Employment Impact to RGGI States as a Result of RGGI Implementation During the 2015-2017 Period (Cumulative Job Years)



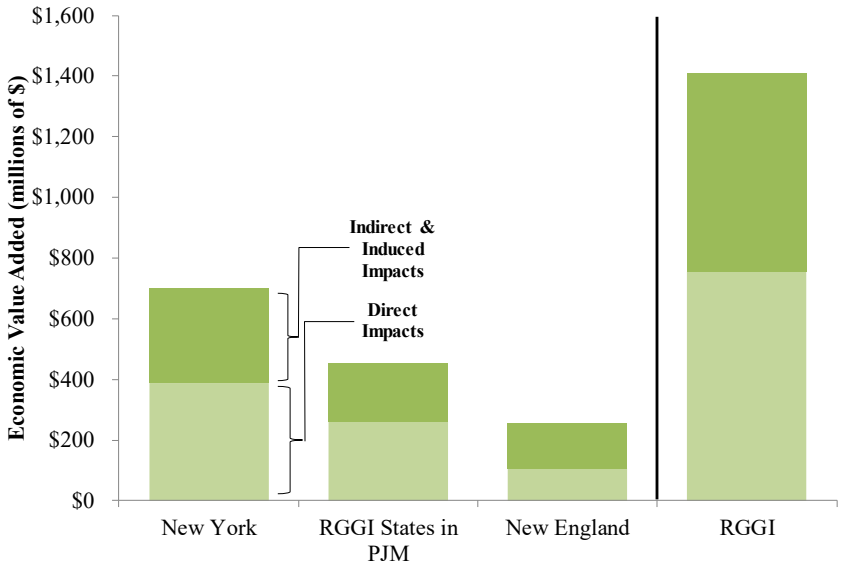
Note: Figures represent employment in terms of cumulative job-years over the study period.

Contributions to Economic Impact

As noted above, RGGI's third compliance period produced a net positive economic benefit of $1.4 billion ($NPV). As previously mentioned, this includes net electric sector impacts to electric consumers and power plant owners, in addition to the non-electric benefits and program spending that result from state spending of RGGI proceeds.[46] As these individual impacts ripple through the economy, they have the net effect of producing positive economic value.

This can be seen in Figure 9, which shows the direct, indirect, and induced economic impacts to the nine-state region from the individual components described above.

Figure 9
Net Economic Impact to RGGI States as a Result of RGGI Implementation During the 2015-2017 Period (NPV, 2018$)



Note: [1] Figures are reported in 2018 dollars (NPV), converted using a 3-percent discount rate. [2] Total economic value added includes the impacts of state spending of RGGI proceeds, including net electric sector impacts to consumers and power plant owners, non-electric benefits, and the economic impact of program spending.

[46] Note that analyzing the economic value added means that a dollar of direct spending does not translate into a direct effect of one dollar of value added. For example, if a dollar is spent in a state on light bulbs, the direct value added is only the net revenue and income of the retail store where the light bulb was purchased, thus excluding the manufacturing costs of the light bulb itself if it was manufactured outside the state. The same holds true for the direct revenue change to power plant owners. Direct electric consumer bill impacts are assumed to be equal to the value added to electric consumers given that any reduction in electric spending equates to a proportional increase in actual value to electric consumers.

5. OBSERVATIONS AND CONCLUSIONS

Based on these results as well as those in our prior assessments of the first two RGGI compliance periods, we have a number of observations that we summarize here. We hope that these provide useful information for the RGGI states as they consider how the program is performing relative to its original goals and for other states and stakeholders who are interested in carbon emission-control policies and programs.

As in its first six years, the RGGI program's third three-year compliance period continued to generate substantial economic benefits for the states while reducing CO_2 emissions.

Economic value added

Our analysis of RGGI impacts over the past three years took into consideration the program's effects on power system dispatch, costs to consumers, revenues to electric generators, and overall performance of the economies in the participating states. Even taking into account decreased revenues to the owners of emitting power plants (and to power-plant owners as a whole), we found positive macroeconomic impacts to the states due to the net benefits to electric consumers and the expenditures of the CO_2 allowance proceeds. RGGI led to approximately $1.4 billion in economic value added (NPV, 2018$) as a result of program implementation in the 2015-2017 period. Thus, the RGGI program continues to generate economic value for its member states.

Jobs

Taking into account the gains and losses to consumers and producers, RGGI Compliance Period 3 led to overall job increases amounting to thousands of new jobs over time. Some of the RGGI job impacts may be permanent, while others may be part-time or temporary. According to our analysis, the net effect is that RGGI activity during the 2015-2017 period leads to over 14,500 new job-years, cumulative over the study period, with each of the nine states experiencing net job-year additions. Jobs that result from RGGI-related expenditures occur in many parts of the economy, with examples including workers who perform efficiency audits and who install energy efficiency measures in residences and commercial buildings, and staff performing training on energy issues.

Fossil-fuel production and imports

Over the past three years, RGGI helped to lower the total number of dollars (by $1.37 billion (NPV, 2018$)) its member states sent outside their region in the form of payments for fossil fuels for power generation and other purposes. Most of the RGGI states' electricity comes from fossil fuels, even though these states produce little coal, natural gas, or oil. Because the RGGI program lowered these nine states' total fossil-fired power production and also reduced their use of natural gas and oil for heating, RGGI reduced the total dollars sent out of state for these energy resources.

Continuation of RGGI program benefits above and beyond the first six years

Our findings on economic impacts of RGGI's third three-year compliance period are consistent with the findings and observations we made with respect to the first and second three-year compliance periods. Those prior assessments revealed net economic benefits to the states participating in the program, including growth in economic output, increased jobs, reinvestment of energy dollars in

local/state economic activity, long-run wholesale electricity cost reductions, and CO_2 emission reductions.

Many factors have changed in the electric industry and the economy since we completed our economic analyses of the RGGI program for Compliance Period 1 (2009-2011) and for Compliance Period 2 (2012-2014). These changes have affected the conditions (*e.g.*, lower gas prices, generation retirements and additions) analyzed in our assessment of Compliance Period 3.

For many reasons (such as the different vintages of each of our studies and notably the year in which we report NPV results), the results of our three studies are not directly additive. Even so, across the three studies, we have found net economic benefits to the RGGI states. Recognizing that these studies have reported outcomes in different-year dollar values, each of our assessments has found positive benefits for the participating RGGI states: $1.6 billion (NPV, 2011$), $1.3 billion (NPV, 2015$), and $1.4 billion (NPV, 2018$) for Compliance Periods 1, 2, and 3 respectively.[47] Our studies have also found that the RGGI-related expenditures led to job creation in each of the three compliance periods of approximately: 16,000 job-years (as of 2011); 14,200 job-years (as of 2015); and 14,500 (as of 2018), respectively.[48]

Thus our modeling of the three compliance periods indicates that, its first decade, RGGI's carbon cap-and-trade program has generated net positive economic value for the participating states' economies on the order of $4 billion dollars.[49] States' participation in RGGI has led to tens of thousands of job-years while also helping to reduce carbon emissions in the RGGI states' electric sector. At the same time, annual carbon-emissions have dropped nearly 50 percent since the program's start in 2009 (for many reasons, including implementation of RGGI).

RGGI's first nine years (2009-2017) provide empirical evidence that carbon-control programs for the power sector can provide positive economic outcomes.

Review of the nation's first multi-state CO_2 emission-control program provides useful information for states that are considering emission-reduction options.

Despite a recent lack of progress at the federal level, many state policymakers continue to focus their attention on the various alternatives for reducing emissions of CO_2 from the electricity sector (and other sectors). A wide range of alternatives are available including cap-and-trade programs, carbon tax/pricing approaches, energy research and development ("R&D") funding, consumer-funded procurements of low- and zero-carbon energy sources, rate policies supporting distributed-energy

---

[47] In addition to our prior studies of the RGGI program, RGGI, Inc. and others have conducted studies of the economic impacts of the program. We discuss the differences in these studies later on in this report.

[48] These reflect "job-years," and do not identify what portion of these numbers are associated with permanent versus temporary jobs. Job-years are reported cumulatively over the full study period.

[49] As noted earlier, while the economic results from our three studies are not directly additive, we have used the same foundational analytic methods, assumptions, and data sources across all three studies in order to ensure consistency in study results. While changes in the assumptions used in our earlier studies – *e.g.*, to reflect current market conditions and expectations – could change the results (in either direction), we expect such changes would be small given the consistency in the level of allowance proceeds collected and used by the RGGI states and in the benefits we have found across our studies.

resource development, and funding of energy efficiency measures. The diverse set of policy options used reflects many states' interest in finding cost-effective and workable ways to cut CO_2 emissions. Lessons learned from RGGI's implementation can inform states as they consider their options.

The experience of the RGGI states, including their initial efforts that began in 2003 to work together to develop a multi-state, market-based CO_2 control program, through the nine years of program administration to date, provides a wealth of information. Their experience provides many lessons, most notably that states can collaborate successfully in developing programs to control CO_2 emissions, and market-based CO_2-allowance trading programs – combined with state-driven centralized auctions of CO_2 allowances and with local reinvestment of auction proceeds – can help states meet emission-reduction targets while generating positive economic benefits.

RGGI's positive impacts on state economies are additive to the purpose and expected benefits of the program.

RGGI is not and never was meant to be an economic development program. RGGI's purpose is to reduce CO_2 emissions from power generation in order to help mitigate the economic, social, and environmental risks of climate change. As shown in Figure ES-1, RGGI has contributed to significant reductions in emissions of CO_2 across the RGGI region. In our economic analysis of the RGGI program, however, we do not attempt to quantify the potential long-term benefits of reducing the risks of climate change. The focus of our analysis is specific and narrow: to review the direct impacts of program implementation on the economies of the RGGI states, in order to test the presumption that controlling emissions of CO_2 will somehow lead to negative consequences for states that take action. Our results – which instead reveal positive economic impacts – should be viewed as additive to whatever other benefits flow from reducing climate-change risks.

The RGGI model has successfully achieved CO_2 reductions through a cooperative multi-state framework that preserves state authority.

The states that comprise the RGGI region are highly diverse in many ways: their political settings and policy objectives vary widely across the states and have even changed significantly *within* states over time; their electric-generating portfolios differ substantially in size, technologies, fuel mix, and age; their economic bases vary; and the states have unique legal and regulatory structures that oversee energy, utility, and environmental policies. Despite these differences, however, the RGGI states' experience confirms the possibility that states can work together, particularly when doing so is likely to lower compliance costs and generate economic benefits. The states have designed a multi-state CO_2 program consistent with sound economic principles, completed the stakeholder, legislative, and regulatory steps necessary to adopt and implement the program, and smoothly administered the program and integrated it with wholesale electricity markets. In addition, over just ten years the states have completed two top-to-bottom programmatic reviews and agreed upon major changes to the framework. The RGGI states continue to implement the RGGI platform with an eye towards inclusion and a willingness to collaborate with other states outside the current nine-state region.

Mandatory, market-based carbon-control mechanisms are functioning properly in wholesale electricity markets and have not adversely affected system reliability.

RGGI's nine years of experience supports a conclusion that market-based CO_2 emission-control programs can produce positive economic impacts and meet emission objectives while dovetailing smoothly into the normal operation of power systems. RGGI's implementation has not adversely

affected power system reliability in New England, New York, or PJM. Further, RGGI provides an important example of how states' public policies can be integrated into federally regulated competitive wholesale markets – an issue with which FERC, state regulators, and the courts are actively wrestling.

> The design of the CO_2 market in the RGGI states has allowed for the creative use of public assets in support of diverse state energy/environmental policy and economic outcomes.

The joint decision by the RGGI states to make their CO_2 allowances available to the market through a unified auction has generated substantial revenues for public use. This approach transferred the value of emissions allowances from the public sector to the private sector at a monetary cost. Had the allowances been given away for free, the states would not have had the benefit of the auction proceeds and instead would have transferred away significant public economic value to owners of power plants (which in the RGGI region are merchant generators, not owned by electric distribution utilities). The states' use of allowance proceeds helped them meet a wide variety of social, fiscal, and environmental policy goals, such as assisting low-income customers, achieving advanced energy policy goals, and restoring wetlands, among other things. Notably, however, auctioning of allowances is not necessary for the efficient and effective functioning of the cap-and-trade program design itself. Individual states may still determine their preferred method of moving allowances into the market, which could include auctions, direct allocation, and other mechanisms that may move allowances into the market while transferring or consigning auction value in whole or in part to other entities (such as electric distribution utilities or generating asset owners).

> How allowance proceeds are used affects their economic impacts: Use of auction proceeds to invest in energy efficiency produces the biggest economic bang per buck, in terms of net positive benefits to consumers and to the economy.

The RGGI Memorandum of Understanding ("MOU") fully supports the reality that states place different weights on various goals they hope to accomplish through participation in the program, and that the states will make their own decisions about how to allocate allowances to the market and how to use the proceeds from allowance auctions. But from a strictly economic perspective, some uses of proceeds clearly deliver economic returns more readily and substantially than others. For example, RGGI investment in EE leads to lower electrical demand, lower wholesale power prices, and lower consumer electricity bills. These savings remain in the pockets of electricity users, and the EE investments also produce positive macroeconomic impacts locally as more dollars stay in and contribute to the local economy. We observe that use of the RGGI dollars provides positive multiplier effects in the RGGI states' economies, especially compared to other uses of the auction proceeds.

The RGGI states' experience during 2015-2017 differed along a number of dimensions relative to the first six years of the program.

The RGGI program as implemented during the 2015-2017 period took place in the context of a changing industry and regulatory landscape and with significant changes adopted and implemented by RGGI states. Specifically:

- During 2017, the RGGI states used the six years of prior program experience as they undertook a top-to-bottom review of RGGI, and made a number of changes in the program.
- Many states adjusted how they spent RGGI auction proceeds over time, shifting the use of allowance revenues to reflect changing program and state objectives.
- Fossil fuel prices changed significantly since the start of the program, with natural gas prices (and in turn, wholesale electricity prices) having decreased substantially.
- Electric resources have shifted, with accelerated retirements of older and less efficient (and in most cases, higher-emitting) generating units, and with distributed and central-station renewable energy resources growing at a rapid pace in many of the RGGI states.

Such factors have the potential to influence the administration of RGGI and associated power system and economic impacts. For example, the lower average natural gas prices in 2015-2017 relative to the prior six years led to lower electricity prices in wholesale power markets, which had the effect of reducing the economic value of RGGI-funded EE programs for electricity and heating consumers. Also, the tightening of RGGI's CO_2 emissions cap contributed to an increase in allowance prices, the operating costs of affected generating units, and impacts on wholesale electric prices. The lower number of allowances available to the market, however, was in part offset by higher allowance prices, and thus only slightly reduced auction proceeds available to RGGI states during the 2015-2017 period.

Despite the shifting context for RGGI, the core elements of the program – including a declining CO_2 emissions cap, allowance auctions, reinvestment of auction proceeds, active trading of allowances, monitoring of program administration, participation and outcomes, and cooperation among a diverse set of states and stakeholders – operate in ways that continue to produce positive economic and programmatic results for the participating states.

APPENDIX

MODELING OF ELECTRIC SYSTEM IMPACTS:

PROMOD

Electric System Model Overview: PROMOD

The PROMOD Model

PROMOD is an electric market simulation model marketed by Ventyx. PROMOD provides a geographically and electrically detailed representation of the topology of the electric power system, including generation resources, transmission resources, and load. This detailed representation allows the model to capture the effect of transmission constraints on the ability to flow power from generators to load, and thus calculates Locational Marginal Prices ("LMPs") at individual nodes within the system. PROMOD and similar dispatch modeling programs are used to forecast electricity prices, understand transmission flows and constraints, and predict generation output. Ventyx simulation-ready data includes data on Eastern Interconnection network structure, resources, fuel prices, basis differentials, and demand.

To calculate the impacts of RGGI on power system operations and outcomes, we used PROMOD to simulate the "with RGGI" and "without RGGI" systems that serve the nine RGGI states,[1] with the difference between the two simulations being the direct incremental impacts of RGGI on the power system. These two simulation runs otherwise maintained the same inputs, in terms of fuel prices, power plants available to be dispatched, power plant operational characteristics, NO_x and SO_2 allowance costs, baseline load levels, and so forth. The "with RGGI" case was benchmarked to actual power system operations in the historical months of the 2015-2017 time period (in New England, New York, PJM). With this as a starting point, several core assumptions (*e.g.*, load levels that change as a result of energy efficiency investments, removal of renewable resources resulting from RGGI investments, removal of the cost of RGGI CO_2 allowances) were changed, and the model re-run to simulate the "without RGGI" case. As described further below, the simulation period is the historical 2015-2017 period, along with a 10-year tail period (through July of 2027) to capture the implications of energy efficiency programs implemented through use of RGGI allowance proceeds generated to date. PROMOD outputs include changes in power plant operations (*e.g.*, revenues, costs), emissions, and prices.

Fuel Prices in the Power Sector

Natural Gas

Natural gas prices are calculated as a Henry Hub base price plus a regional Hub basis differential. From January 2015 through March 2017, the Henry Hub price is based on Ventyx/PROMOD data. From April 2017 through January 2018, the Henry Hub price is a monthly average of historical daily NYMEX spot prices. From February 2018 through

[1] As described below, we simulated these systems (PJM, NYISO, ISO-NE) using a database that also includes Canada's system (which is interconnected to NY and ISO-NE) and Midwest ISO (which is interconnected to PJM).

March 2019, the Henry Hub price is based on NYMEX futures prices. From April 2019 through December 2027, the base Henry Hub NYMEX price is grown at the rate of change in the Energy Information Administration's (EIA's) Annual Energy Outlook (AEO) Henry Hub spot price.[2] To capture the delivered price of natural gas into the region of interest, we use the regional basis price differentials from PROMOD throughout the whole study period. These basis differentials may change based on assumed infrastructure improvements over time.

Other Fuels

Distillate oil and Residual oil prices are based on Ventyx fuel price forecasts. Coal prices are based on Ventyx unit-level fuel price forecasts.

Power Plants: Existing Units, Unit Retirements and Additions

The set of power plants is based on actual plants operating within eastern PJM, NYISO, ISO-NE, Ontario, and MISO. We made changes to this dataset (identical in the "with RGGI" and "without RGGI" runs) to reflect unit retirements and power plant additions (*e.g.*, to meet the states' renewable portfolio standards (RPS)). Unit retirement decisions are based on assumed retirements in the PROMOD generator dataset, which rely on information from Ventyx as of April 2017. Some of these retirements have been adjusted as the result of a review of planning documents published by PJM, NYISO, and ISO-NE, along with press releases. Unit additions listed in PROMOD's generator dataset have not been adjusted.

Renewables

RPS MWh targets by state are sourced from Lawrence Berkeley National Labs (LBNL) for PJM and NYISO and from the updated ISO-NE RPS Workbook for ISO-NE. In NYISO and ISO-NE, beginning in 2018, we add renewable capacity sufficient to meet 50 percent of the renewable target in each region and assume that the other 50 percent of each state's RPS target is met through alternative compliance payments rather than new renewable energy. In PJM, this assumption would result in growth far above the historic levels observed. Thus, in PJM we assume that growth in RPS eligible resources continues at the recent historic rate of development and that any target not met with RPS eligible generation is met with an alternative compliance payment. In NYISO and ISO-NE, the composition of incremental renewable capacity is based on the proportional distribution of renewable technology types in the current interconnection queues of each region while in PJM the composition of incremental renewable capacity is based on the proportion of additions in recent years. To determine the incremental capacity required to meet this energy demand, average historical

[2] In all cases where NYMEX data is grown at an AEO growth rate, the method is as follows:

- The growth rate used is the rate of change between two specific AEO annual data points, rather than the overall AEO growth rate for a particular fuel.
- The growth rate is applied to the data point for the same month in the prior year, rather than the immediately preceding month.

capacity factors by technology type and by region were obtained from the SNL Financial power plant database.

Generic Capacity Additions to Meet Resource Adequacy

After the incremental addition of renewable capacity and retirement of units as discussed above, we analyzed the extent to which each region's capacity satisfied forecasted resource adequacy requirements in each year, based on each region's capacity planning process. This review determined that additional resources were required in NYISO during each scenario, so new capacity was added based on generic natural gas combined cycle and gas turbine plants. The operating characteristics of these new plants are assumed to be the same as recently built natural gas generating units. The units were placed on the high-voltage transmission network in each region to maximize deliverability. Combined cycle and gas turbine plants were both added to the system.

Emissions costs

RGGI-Related CO_2 Allowance Prices

Prices for CO_2 allowances were modeled for each month in Compliance Period 3 using the most-recent quarter's actual CO_2 allowance price as revealed by auction clearing prices for auctions 27 through 38. No CO_2 price was assumed after December 2017, in light of the assumption that all needed CO_2 allowances had been purchased as of the 38th auction to cover CO_2 emissions during the second three-year compliance period.

NO_x and SO_2 Allowance Prices

NO_x and SO_2 allowance prices are based on Ventyx price forecasts.

Load Forecasts

RTO-level load forecasts are provided by Ventyx, and based on RTO planning documents. ISO-NE data is based on adjusted (*e.g.*, for EE, PDR, and PV) load from the 2017 CELT Report. NYISO data is based on adjusted load from the 2017 Gold Book. PJM data is based on adjusted load from the 2017 PJM Load Forecast Report.

Load Profiles

To account for the impact of energy efficiency savings on hourly load in the "without RGGI" case (*i.e.*, when load is increased to account for the removal of RGGI-funded EE programs), data on energy efficiency spending from each RGGI state were aggregated by program type. Total energy savings from each program type were divided proportionally to load, based on a typical hourly profile of energy savings resulting from each program type. From here, hourly state savings for each year were determined and modeled in each RGGI zone. Similarly, state spending on renewables was assumed to be for distributed solar PV, and converted to state load savings using LBNL average solar costs and SNL capacity factors. Total state load

savings were proportionally assigned to constituent service areas based on native load in each area.

General Adjustments

Outages

Random generator outages are calculated once using PROMOD's algorithm, and fixed between the "with RGGI" and "without RGGI" cases.

Generator Maintenance

Scheduled generator maintenance is fixed between the "with RGGI" and "without RGGI" cases to fulfill unit maintenance requirements.

MODELING OF MACROECONOMIC IMPACTS:

IMPLAN

Macroeconomic Model Overview: IMPLAN

Our analysis of macroeconomic impacts of RGGI uses the "IMPLAN" model. IMPLAN (which stands for "IMpact analysis for PLANning") is a social accounting/input-output ("I/O") model that attempts to replicate the structure and functioning of a specific economy.[3] IMPLAN is widely used for economic impact assessments in the public and private sectors.

Input/output models are based on long-standing, well-established and broadly accepted methodologies designed to estimate the impacts on a regional economy of a change in economic activity. Such models are based on a methodology established decades ago by economists for tracking the effects on changes in the inputs or outputs of an industry (or some other segments of an economy) as they ripple through the economy.

The broad conventional approach to examining these economic flows is to rely on national economic input-output account survey data. These data are based on census information collected from businesses that track the flows of dollars into and out of enterprises. The data make up the basis for the input/output tables that reflect the movement of dollars within an economy and the multiplier effects that reflect the role of dollars in influencing different multiplier effects in different segments of economies. The Bureau of Economic Analysis within the U.S. Department of Commerce collects information related to these relationships among different segments of regional economies. Over the years, these economic accounts are verified and serve as the basis for a wide variety of macroeconomic metrics (such as Gross Domestic Product, Gross State Product, and countless other economic variables). The IMPLAN databases used for the RGGI region (and the nine RGGI states individually) are rooted in these national economic account information sources.

The IMPLAN model allows one to investigate various interactions in a defined economy (in this case, the RGGI region and the individual states within it), and to calculate various economic impacts in that economy when a new activity affects money flows around the economy (such as investments in energy efficiency, assistance in helping customers pay their energy bills, lost revenues for owners of power plants, etc.).

IMPLAN relies on a detailed system of accounting for relationships among different parts of the economy, and relies on national economic data for the specified region. The model tracks dollars spent in a region, including dollars that circulate within it (*e.g.*, transfers of dollars from consumers to producers), dollars that flow into it (purchases of goods and services from outside the local economy), and dollars that flow outside of it (*e.g.*, payments to the federal government). The model thus examines inflows, outflows, and interactions within the economy under study.

Specifically, the model captures various effects, including:

[3] Information provided on IMPLAN's website, available at http://www.implan.com/. IMPLAN (now known as IMPLAN Pro) is a proprietary tool with accompanying data files for different regions which provides the ability to create complete, extremely detailed Social Accounting Matrices and Multiplier Models of local economies.

- *Employment effects* (the total number of job-years created or lost);
- *Income effects* (the total change in income to employees that results from the economic activity); and
- *"Value-added" effects* (the total economic value added to the economy, which reflects the gross economic output of the area less the cost of the inputs).

In our analysis, we focused on added value, since this is the overall measure of change in macroeconomic activity.

There are various ways in which the new activity creates impacts, each of which is separately tracked by the model:

- *Direct effects:* the initial set of inputs that are being introduced into the economy. In our study, this included the direct effects of RGGI on owners of power plants ("producers") as a whole, on energy "consumers" (consumers of electricity, natural gas and heating oil), and use of RGGI proceeds to buy goods and services in the economy (*e.g.*, investment in energy efficiency, work training programs, bill-payment assistance for low income consumers, etc.).
- *Indirect effects:* the new demand for local goods, services and jobs as a result of the new activity, such as the purchase of labor to retrofit buildings with energy efficient measures, or to train workers in these skills. Some RGGI auction proceeds may lead to payments for things outside the local region (*e.g.*, the purchase of efficient lighting equipment or solar panels manufactured outside of the RGGI region), and thus represents a way that such funds do not stay within the local economy after having been generated by power plant owners' purchases of CO_2 allowances.
- *Induced effects:* the increased spending of workers resulting from income earned from direct and indirect economic activity.

Direct effects are determined by an "Event" as defined by the user (*i.e.*, a $10 million dollar purchase of worker training is a $10 million dollar direct effect; a $10 million dollar contribution to clean energy R&D is a different $10 million dollar direct event).[4] The indirect effects are determined by the amount of the direct effect spent within the study region on supplies, services, labor and taxes. Finally, the induced effect measures the money that is re-spent in the study area as a result of spending from the indirect effect. Each of these steps recognizes an important leakage from the economic study region spent on purchases outside of the defined area. Eventually these leakages will stop the cycle.

[4] Note that analyzing the economic value added means that a dollar of direct spending does not translate into a direct effect of one dollar of value added. For example, if a dollar is spent in region on light bulbs, the direct value added is only the net revenue and income of the retail store where the light bulb was purchased, thus excluding the manufacturing costs of the light bulb itself.

More specifically, the effects are:

- *Direct effects* - The set of expenditures applied to the predictive model (*i.e.*, I/O multipliers) for impact analysis. It is a series of (or single) production changes or expenditures made by producers/consumers as a result of an activity or policy. These initial changes are determined to be a result of this activity or policy. Applying these initial changes to the multipliers in an IMPLAN model will then display how the region will respond, economically, to these initial changes.
- *Indirect effects* - The impact of local industries buying goods and services from other local industries. The cycle of spending works its way backward through the supply chain until all money leaks from the local economy, either through imports or by payments to value added.
- *Induced effects* - The response by an economy to an initial change (direct effect) that occurs through re-spending of income received by a component of value added. IMPLAN's default multiplier recognizes that labor income (employee compensation and proprietor income components of value added) is not a leakage out of the regional economy. This money is recirculated through the household spending patterns causing further local economic activity.

State Economic Database

Our IMPLAN analysis of the RGGI states was based on the most recent state data files (2016) for each of the nine states, as available from IMPLAN. These state-level data files include information for a set of highly disaggregated industries, sorted generally by their 4 and 5 digit NAICS codes.[5]

IMPLAN data files are compiled from a wide variety of sources including the U.S. Bureau of Economic Analysis, the U.S. Bureau of Labor, and the U.S. Census.[6] They include information about regional employment, income, value-added, household and government consumption. Examples include: employee compensation; proprietary income; federal, state and local taxes affecting income, sales, real estate, and so forth; personal consumption expenditures at nine income levels; federal government purchases (military and non-military) and investments; purchases by local and state governments (including educational institutions); inventory purchases; capital formation; foreign exports; and inter-institutional transfers. They also include unique national input-output structural matrices and unique annual trade flow models.

[5] NAICS codes are tied to the North American Industry Classification System, which is the standard used by Federal statistical agencies in classifying business establishments for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy.

[6] The IMPLAN data files use federal government data sources including the following federal programs: Bureau of Economic Analysis Benchmark I/O Accounts of the US and Output Estimates; Bureau of Labor Statistics Covered Employment and Wages (ES202) Program and Consumer Expenditure Survey; Census Bureau County Business Patterns, Decennial Census and Population Surveys, Censuses and Surveys; Department of Agriculture Crop and Livestock Statistics; and US Geological Survey.

Expenditure Categories Used in IMPLAN Modeling

In our IMPLAN analysis, we assigned RGGI expenditures into a variety of IMPLAN sector categories, based on assumptions about the character of the economic activity tied to each particular category of RGGI programs.

For example, expenditures on energy efficiency were modeled mainly as either residential (construction of new single- or multi-family structures, or maintenance and repair of residential structures) or commercial/industrial (construction of new commercial structures or maintenance and repair of non-residential structures). Other non-energy efficiency examples include RGGI-related expenditures on: education and outreach programs (modeled as other educational services); electric consumer bill changes and direct bill assistance (modeled based on IMPLAN defined demand for electricity in a particular state); revenue changes to power plant owners (modeled as electric power generation); administration (modeled as other administrative services); and renewable generation development (modeled as construction of new power and communication structures).

DISCOUNT RATE

Discount Rate Overview

Our analysis involves the assessment of costs (*e.g.*, expenditures and investments, decreases in revenues) and benefits (*e.g.*, lower electricity bills for consumers, added value in the economy) that occur in different periods of time. We examine the flow of dollars associated with the purchase of CO_2 emissions allowances in the RGGI auctions that took place in 2015 through 2017, the impact of these allowances in electricity prices during this time period, and the impact of RGGI-funded programs on electric system outcomes and the macro-economy from 2015-2027. Thus the study period, in one way or another, spans from 2015 to 2027.

To compare these benefits and costs properly, we discount all dollar flows into net present values as of 2018. We calculate the net present value by applying an appropriate discount rate to dollar flows in different years, and then subtracting the sum total of discounted costs from the sum total of discounted benefits.

The discount rate is the tool that accounts for the time value of money – the concept that a dollar today is typically worth more than the same amount of money in the future because of the opportunity cost of money. A dollar today could be put into an investment or an interest-bearing activity that will typically cause it to grow in value, so that dollar today is worth more to its holder than a dollar received in the future. Further, inflation diminishes the purchasing power of dollars over time. And uncertainty about future economic outcomes, combined with a preference for nearer-term gratification, typically causes a dollar in hand today to be worth more than one tomorrow. The higher the discount rate, the lower is the present value of future cash flows.

Our analysis required choosing an appropriate discount rate. Our analysis reflects dollars in the hands of producers, who are largely private enterprises, and consumers, made up of households, businesses, government energy users, and others. RGGI-funded activities add value to the macro-economy of a wide range of actors in the nine RGGI states in the Northeastern and Mid-Atlantic region. The choice of an appropriate discount rate needs to properly reflect the opportunity costs of these various private and public entities in society.

There is a deep literature on the proper discount rate to use in analyzing certain public policies or activities involving society rather than particular producers or consumers.

- **A private discount rate** is used when analyzing the investment options of private enterprises. The appropriate private discount rate varies, depending upon whether the economic analysis focuses on a single company (where that company's weighted average cost of capital would be appropriate) versus a group of companies (where the appropriate discount rate would reflect their collective opportunity costs).

- **A different discount rate** may be appropriate for use by government agencies when they analyze investments, when consumers look at their economic options, or when evaluating the rate at which society as a whole is willing to trade off present for future benefits.

- **Government discount rate**: For example, in 1992, the federal government's Office of Management and Budget issued OMB Circular No. A-94, "Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs." This document established guidance for discount rates used in benefit-cost and other types of economic analysis by federal agencies, with updates on certain discount rates to use when the interest rate and inflation assumptions in the budget are changed. Because "public investments and regulations displace both private investment and consumption," OMB's recommended discount rate for public investments was a real discount rate of 7 percent, which "approximates the marginal pretax rate of return on an average investment in the private sector in recent years."[7] Various analyses that involve "internal government investments" with effects on increased government revenues or decreased government costs (like "an investment in an energy-efficient building system that reduces Federal operating costs") should use a discount rate reflecting a Treasury bond with a comparable maturity to the investment. But where a government activity provides "a mix of both Federal cost savings and external social benefits," where possible the "Federal cost savings and their associated investment costs may be discounted at the Treasury rate, while the external social benefits and their associated investment costs should be discounted at the 7 percent real rate." At the time the circular was written in 1992, a 10-year Treasury was 7 percent nominal and 3.6 percent real. Over the last decade, these Treasury rates on average were 2.9 percent nominal and 1.0 percent real.[8]

- **Consumption discount rate:** Real-world conditions create differences between opportunity costs of consumers relative to private actors and governments: "Among other things, private sector returns are taxed (often at multiple levels), capital markets are not perfect, and capital investments often involve risks reflected in market interest rates. These factors drive a wedge between the *social rate* at which consumption can be traded through time (the pre-tax rate of return to private investments) and the rate at which *individuals* can trade consumption over time (the post-tax consumption rate of interest). …[For example:] …Suppose the market rate of interest, net of inflation, is 5%, and that taxes on capital income amount to 40 percent of the net return. In this case, private investments will yield 5%, of which 2% is paid in taxes to the government, with individuals receiving the remaining 3%. From a social perspective, consumption can be traded from the present to the future at a rate of 5%. But individuals effectively trade consumption through time at a rate of 3% because they owe taxes on investment earnings. As a result, the

[7] OMB Circular No. A-94 (1992), "Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs." See http://www.whitehouse.gov/omb/circulars_a094/.

[8] OMB Budget Assumptions – Nominal and Real Treasury Interest Rates for Different Maturities (from the annual budget assumptions for the first year of the budget forecast), November 27, 2017. See https://www.whitehouse.gov/wp-content/uploads/2017/11/DISCHIST-2018-1.pdf.

consumption rate of interest is 3%, which is substantially less than the 5% social rate of return on private sector investments (also known as the social opportunity cost of private capital)."[9]

- **Social discount rate**: "Social discounting… is discounting from the broad society-as-a-whole point of view that is embodied in benefit-cost analysis (BCA). *Private discounting*, on the other hand, is discounting from the specific, limited perspective of private individuals or firms. Implementing this distinction can be complex… using a given private discount rate instead of a social discount rate can bias results as part of a BCA."[10]

Recent guidance provided by the U.S. Environmental Protection Agency makes the following recommendations for discount rates to use in analyzing programs that involve flows to various entities in society over different periods of time, especially when "there is a significant difference in the timing of costs and benefits, such as with policies that require large initial outlays or that have long delays before benefits are realized."[11]

> "Calculate the NPV using the consumption rate of interest. This is appropriate for situations where all costs and benefits occur as changes in consumption flows rather than changes in capital stocks, *i.e.*, capital displacement effects are negligible. As of the date of this publication, current estimates of the consumption rate of interest, based on recent returns to Government-backed securities, are close to 3%. Also calculate the NPV using the rate of return to private capital. This is appropriate for situations where all costs and benefits occur as changes in capital stocks rather than consumption flows. The Office of Management and Budget estimates a rate of 7% for the opportunity cost of private capital."[12]

For these various reasons, we used a 3 percent ("public" or "social") discount rate in our analysis.

Attachment 41

State Air Pollution Control Board

Report to the Board

Travis A. Voyles
Acting Secretary of Natural and Historic Resources
August 31, 2022

RGGI is a Bad Deal for Virginia

RGGI Is Not Working—Whether you agree with the principals of a cap and trade regime, the way RGGI is set up for VA does not work.

Burden—Costs passed on to the consumer without any change in behavior by the electricity providers due to VA's regulatory structure.

Abandoned Responsibility—Forfeited our important decision-making rights to Northeastern states who have more say over our energy policy than any VA consumer.

Funding—Virginians don't need a regressive energy tax through RGGI to fund important programs. These are not the goals that RGGI was meant to achieve.

***Action*—Complete repeal by end of 2023, ending VA's participation in RGGI.**

Current Regulatory Framework

Virginia Clean Economy Act

- requires shift in generation mix to 100% renewable by 2050

Clean Energy and Community Flood Preparedness Act

- established mechanisms to join RGGI
- specified DCR/DHCD programs to receive funding

Regional Greenhouse Gas Initiative (RGGI)

Youngkin Administration

January 2022 Governor's Executive Order 9 – *Protecting Ratepayers from the Rising Cost of Living due to the Regional Greenhouse Gas Initiative*

- Directive to re-evaluate cost/benefits, repeal the trading rule, and remove VA from RGGI

March 2022 DEQ Report – *VA Carbon Trading Rule and RGGI Participation: Costs and Benefits*

March 2022 DEQ Report

Key Takeaways:

- RGGI operates as a direct tax because all fees paid are passed through to the ratepayers per Virginia Legislation.
- By design, utilities are not penalized for failure to meet RGGI CO_2 emissions since they can pass on the costs to the ratepayers, and consumers are unable to avoid these costs since they do not have the opportunity to switch electric providers.
- Other states designed their systems to provide rebates to their ratepayers, and while Virginia consumers were originally told the program would return the proceeds to the ratepayers, instead the General Assembly chose to disburse the funds through grant programs.
- The costs of compliance with the trading rule and participation in RGGI are materializing in higher electricity rates for all ratepayers, and future rate increases due to RGGI are expected and will be tied to the allowance prices which are difficult to predict.

The Path Forward—*Process*

Regulatory Action

- Repeal the trading rule and end VA's participation in RGGI
- Full Administrative Process Act (APA) process
- Notice of Intended Regulatory Action (NOIRA)

Timing—Complete repeal by the end of 2023

- 3-year compliance/control period of RGGI
- Contractual agreement with RGGI Inc.

Provides For Stable Withdrawal for Regulatory Certainty

- Smooth and orderly exit
- Avoid market disruptions

The Path Forward—*Rationale*

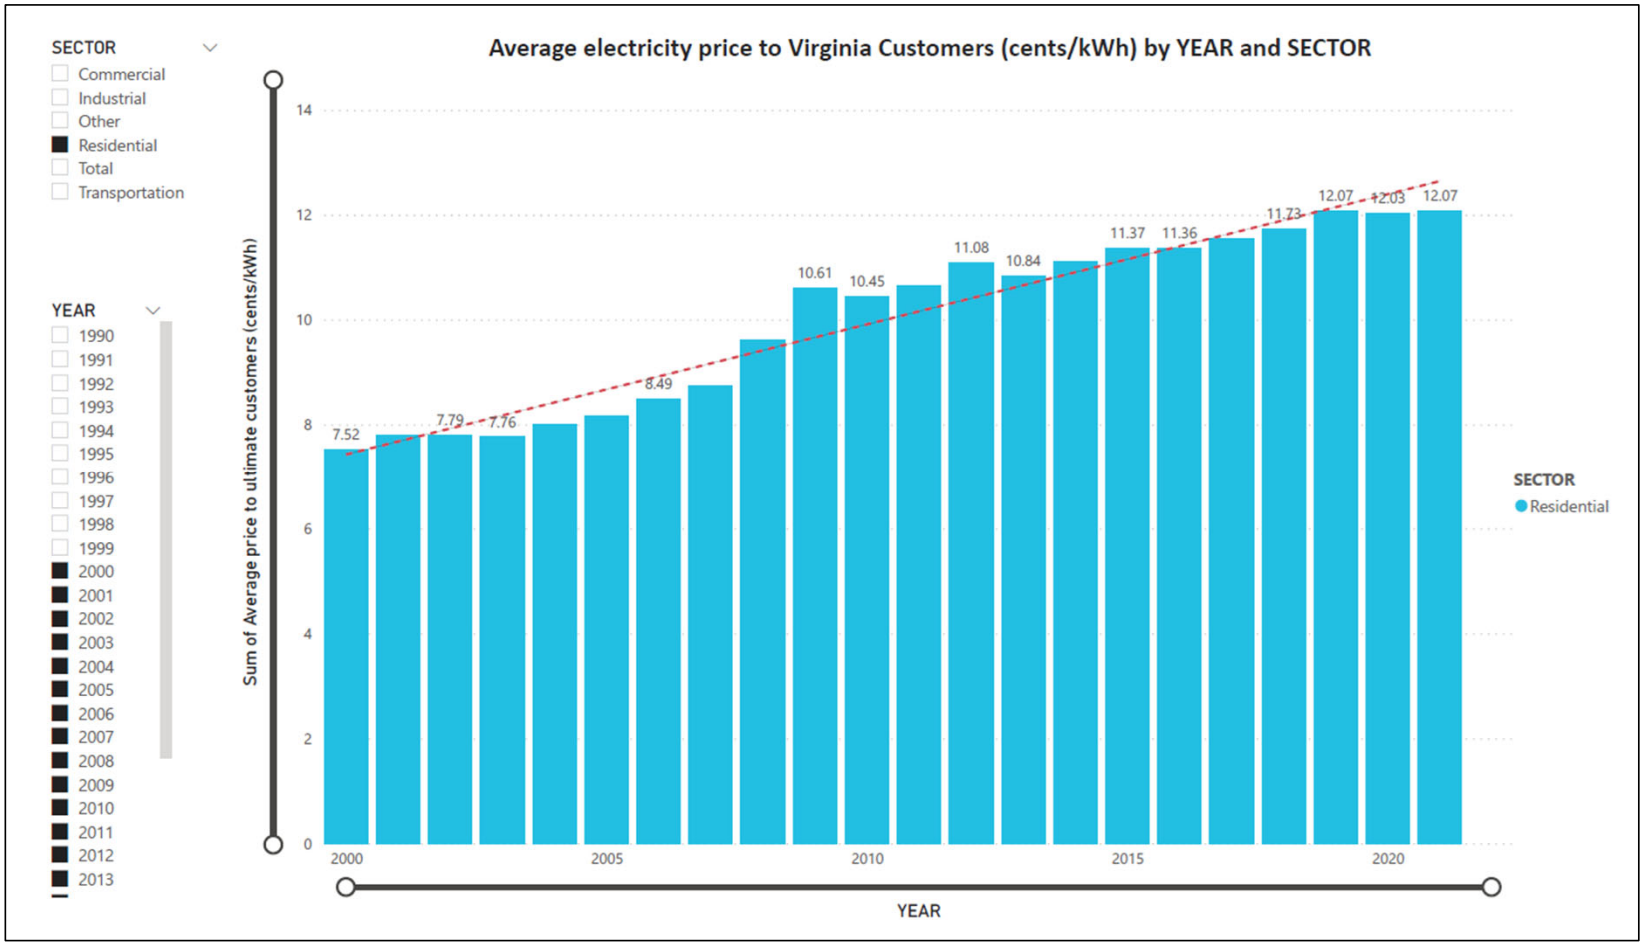
- Increasing Energy Costs
- Virginia's Energy Independence
  - No Control of RGGI Costs
- RGGI Effectiveness and Burden
  - Direct Consumer Tax
  - Duplicative Transition Cost of RGGI
  - Emissions Reductions without RGGI

Increasing Energy Costs

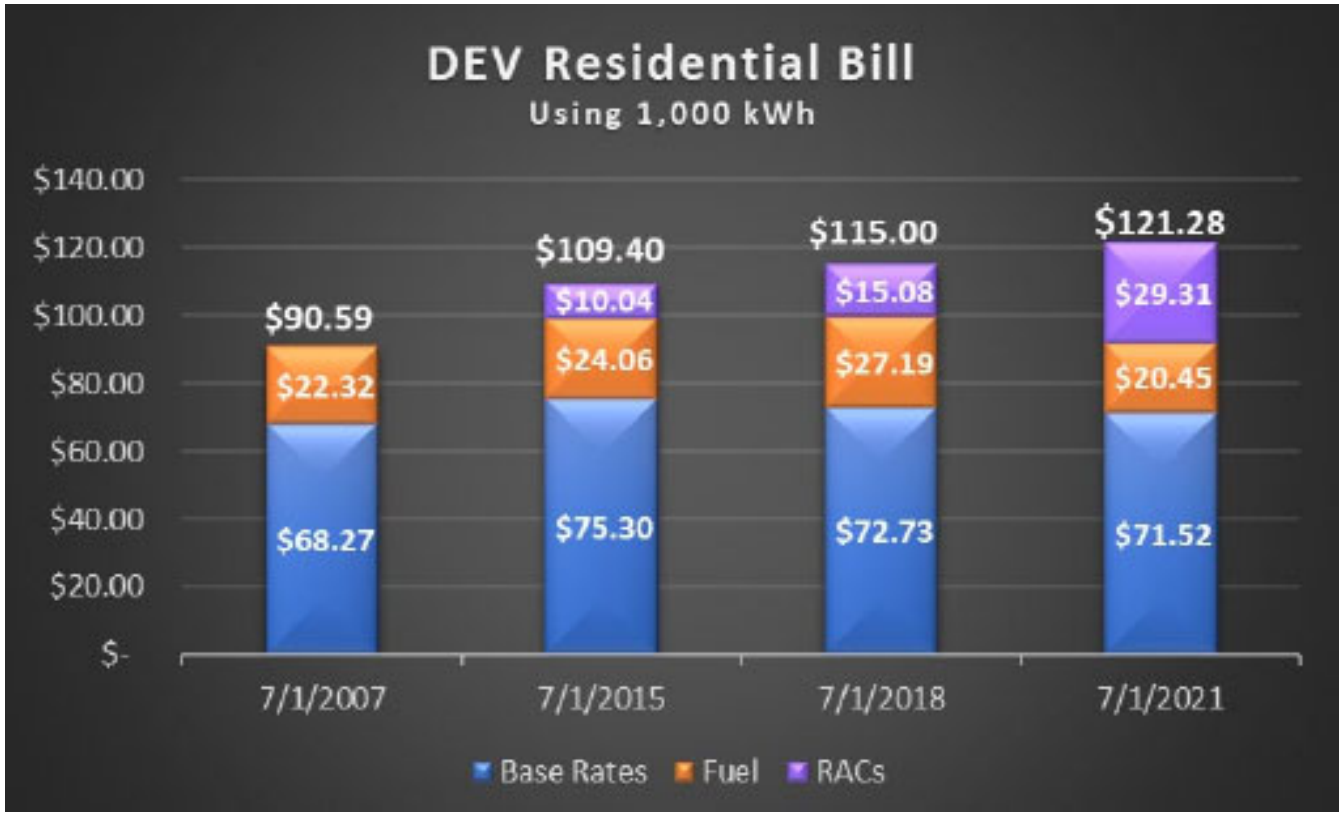
- Over the past 15 years, an average monthly residential bill for a Dominion customer has increased by over $30 – roughly 34%
  - $90.59 (2007) → $121.28 (late 2021)

- Consumer energy prices up 41.6% in the last year
  - June 2022 alone +9%
  - Natural gas price index is sharply higher (+38%)
    - NG is the predominant fuel in VA
  - Resulting in rate adjustments amounting to +18%

Increasing Energy Costs



Increasing Energy Costs



Increasing Energy Costs

DEV Electric Utility Residential Bills

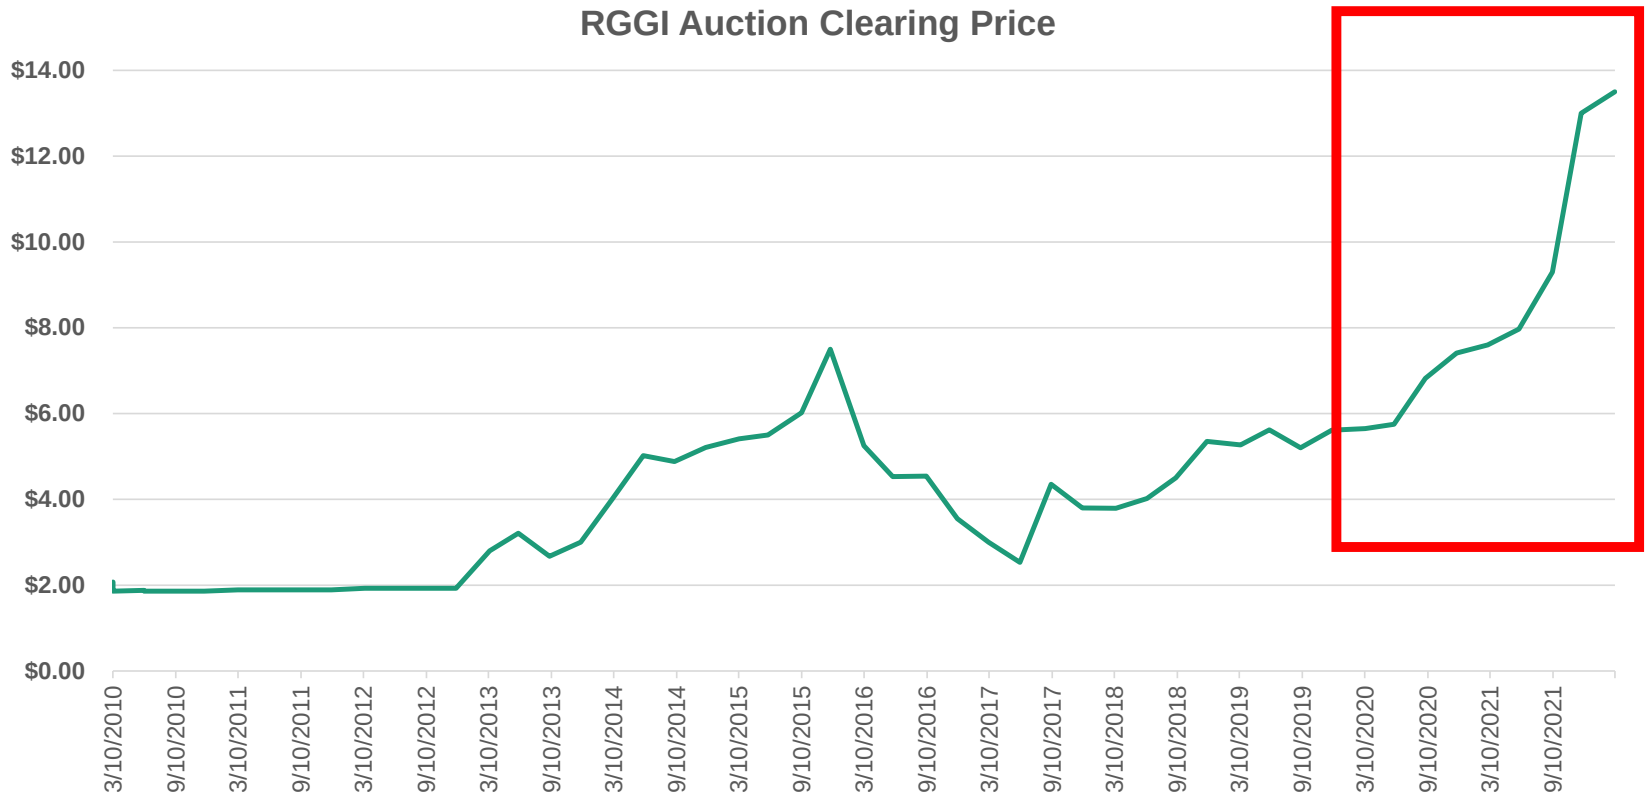
Energy Independence—*No Control of RGGI Costs*



RGGI Burden & Effectiveness – *Direct Consumer Tax*

- Unlike other RGGI states, VA's electric utilities are noncompetitive monopolies.
- VA regulated rate structure provides no incentive for utilities to reduce emissions or compliance costs.

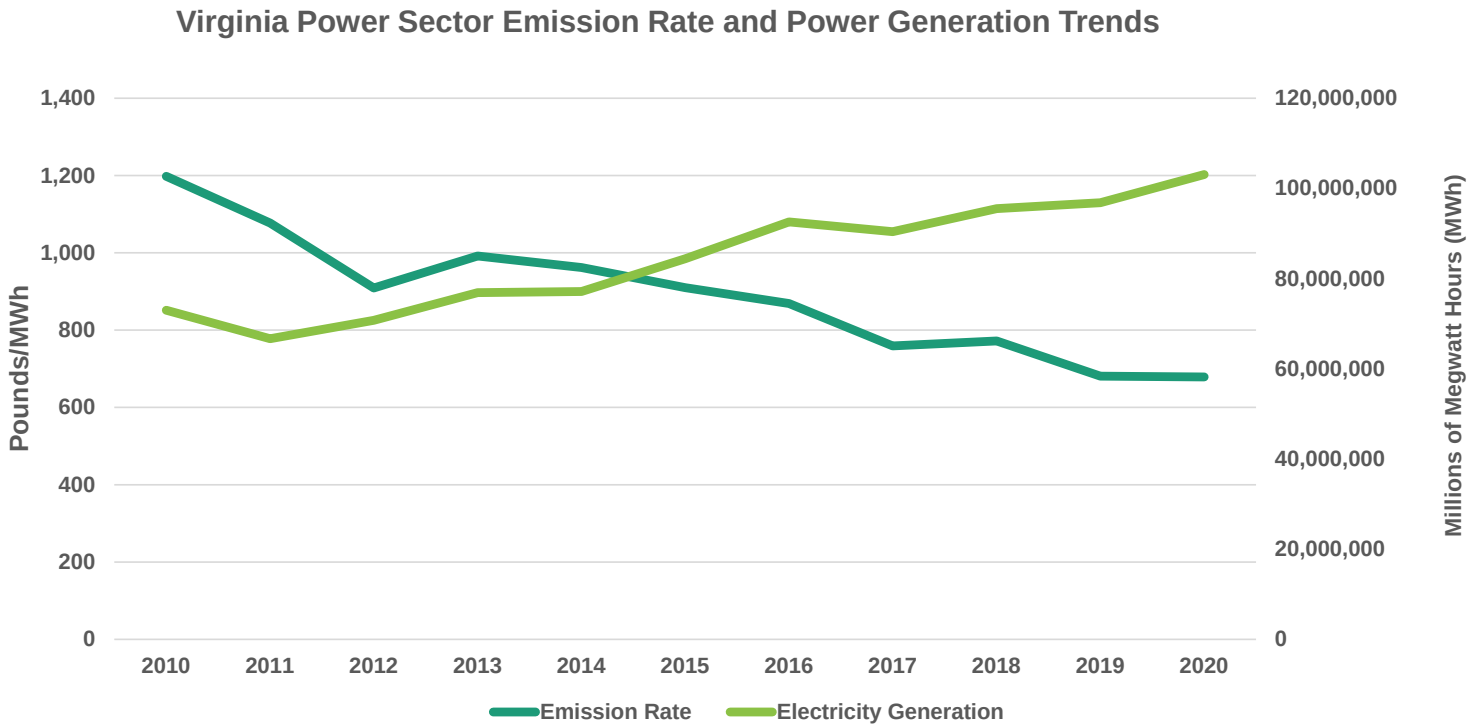
RGGI Burden & Effectiveness – *Emissions Reduction Without RGGI*

- Power sector is already getting cleaner for many other reasons
- Power sector average CO_2 emission rate with a 43% reduction from 2010 to 2020
- Emission rate decrease while in-state electricity generation has increased by 41% from 2010 to 2020



RGGI is a Bad Deal for Virginia

RGGI Is Not Working—Whether you agree with the principals of a cap and trade regime, the way RGGI is set up for VA does not work.

Burden—Costs passed on to the consumer without any change in behavior by the electricity providers due to VA's regulatory structure.

Abandoned Responsibility—Forfeited our important decision-making rights to Northeastern states who have more say over our energy policy than any VA consumer.

Funding—Virginians don't need a regressive energy tax through RGGI to fund important programs. These are not the goals that RGGI was meant to achieve.

***Action*—Complete repeal by end of 2023, ending VA's participation in RGGI.**

February 21, 2022

Voters would cut grocery tax; require vaccines for first responders, teachers, medical pros but not for students; keep teaching impact of racism on society, not ban CRT

Summary of Key Findings

1. A majority of Virginia voters prefer spending the state budget surplus on underfunded government services, such as education, public safety and social services (59%), rather than providing tax cuts or tax rebates (38%).
2. Voters overwhelmingly support cutting the 2.5% grocery tax, either by a total repeal (47%) or by giving low-income Virginians a tax credit (25%).
3. Voters support teaching how racism continues to impact American society (63% to 33%) and oppose a ban on the teaching of Critical Race Theory in public schools (57% to 35%).
4. Virginia voters support vaccine mandates for first responders (58%), teachers (57%) and medical providers (61%), while opposing mandates for elementary students (55%) and middle school students (51%). On masks in schools, voters say health data should be used to determine mask requirements (56%) versus leaving the decision to parents (41%).
5. Voters strongly support stationing a police officer in every school (70%).
6. On abortion, a plurality oppose a 24-hour waiting period (49% to 44%), while a majority oppose requiring an ultrasound (57% to 36%) and a ban on abortions at 6 weeks (58% to 33%).
7. Voters support the state's membership in the Regional Greenhouse Gas Initiative carbon cap-and-trade program (67% to 26%) and the Virginia Clean Economy Act (67% to 28%), a law requiring the state to generate 100% of its electricity from renewable energy by 2050.

Analysis

As the General Assembly passes crossover and moves into the second half of its 2022 session, Virginia registered voters are split on the direction of the state, their views of Governor Glenn Youngkin, and key agenda items before legislators. While Virginia voters

show support for some of Governor Youngkin's proposals, including a repeal of the grocery tax and placing a police or resource officer in public schools, a majority of registered voters do not support the governor's environmental policy proposals or a ban on the teaching of Critical Race Theory.

State of things: When asked about the direction of the Commonwealth, 45% say Virginia is headed in the right direction, while 41% say the wrong direction. Views about the right/wrong direction of the Commonwealth have remained relatively consistent over the last four years. After his first few weeks in office, Governor Youngkin's job approval is mixed, with 41% saying they approve of the job the governor is doing and 43% indicating disapproval; 16% say they don't know.

Differences are largely along partisan lines, with 80% of Republican voters saying Virginia is heading in the right direction, compared to 22% of Democrats and 45% of Independents. On Governor Youngkin's job performance, 85% of Republicans approve, while 81% of Democrats disapprove, and Independents are fairly split (42% approve, 36% disapprove, 22% don't know).

"In this highly polarized environment, we see partisans running to their corners on how they view the direction of the Commonwealth and the job of the governor," said Quentin Kidd, Academic Director of the Wason Center. "Youngkin's approval numbers are certainly lower than those of recent governors in Wason Center polling early in their term."

Direction of the country and presidential approval: Virginia voters are pessimistic about the direction of the country amid an ongoing pandemic and economic uncertainty. Only 22% of Virginia registered voters say the United States is headed in the right direction, compared to 67% percent who say the wrong direction. That is decidedly more pessimistic than over the past four years. President Biden's job approval numbers reflect this overall discontent, with 40% saying they approve of his job performance, compared to 53% who disapprove; 7% say they don't know. A year ago, Biden's approval among Virginia voters stood at 57%.

"Virginian's views have soured markedly on the direction of the country compared to a year ago when they are more optimistic after President Biden's election," said Kidd. "That pessimism is also reflected in Biden's dramatic drop in approval."

Taxes and the budget: Governor Youngkin has proposed to repeal the state's 2.5% grocery tax. In this survey, 47% of Virginia voters support a full repeal; 25% support granting a tax credit for low-income residents to offset the grocery tax; 24% say the grocery tax should remain as is.

With the state budget showing a significant surplus, a majority of Virginia voters would prioritize spending the surplus on underfunded government services, such as education, public safety and social services (59%), while 38% say the surplus should go back to Virginia citizens in the form of tax cuts or tax rebates.

Climate change: On environmental issues associated with renewable energy and climate change, Virginia voters show concern and support for government policy to address those concerns.

Most voters said potential climate change effects are having an impact on Virginia. On sea level rise, 44% of voters see major impact, 30% see minor impact, 20% see no impact and 7% say they don't know. On harm to wildlife and ecological systems, 46% see major impact, 31% see minor impact, 17% see no impact and 7% don't know. On hurricanes, floods and other extreme weather, 41% see major impact, 35% see minor impact, 23% see no impact and 2% don't know. As to long periods of hot weather, 41% see major impact, 34% see minor impact, 24% see no impact and 2% don't know.

A majority of Virginia voters say climate change should be either a top priority (34%) or a medium priority (32%) for the governor and General Assembly, while 33% indicate the issue should be a low priority (22%) or not a priority at all (11%). "It's not surprising to see

many Virginia voters say climate change should be a priority for their state government," said Rebecca Bromley-Trujillo, Research Director of the Wason Center. "Sea level rise, harm to ecosystems and extreme weather largely accord with scientists' expectations of climate effects here."

Governor Youngkin proposes to repeal the Virginia Clean Economy Act, a law passed in the Democratic-controlled legislature in 2020 and signed by Governor Ralph Northam that would require electric utilities in the state to produce 100% of their energy from renewable resources by 2050. Two-thirds (67%) of Virginia voters surveyed support this law, while just over a quarter (28%) oppose it. By a similar margin (67% to 26%), voters support another environmental policy targeted by the Youngkin administration, the Regional Greenhouse Gas Initiative, under which Virginia participates in a carbon cap-and-trade program with other states to reduce carbon pollution.

Teaching about race; stationing police in public schools: Virginia voters largely support teaching how racism continues to impact American society today (63% support/strongly support to 33% oppose/strongly oppose). In addition, a majority oppose a government ban on the teaching of Critical Race Theory in Virginia public schools (57% oppose/strongly oppose to 35% support/strongly support). While Critical Race Theory is currently not specifically taught in K-12 public schools in the state, the topic gained political traction during the 2021 gubernatorial campaign and Governor Youngkin signed an executive order banning its teaching on his first day in office. Demonstrating how politically charged the specialized term has become, differences in this survey emerge primarily along partisan lines, with Democrats heavily opposing a ban (82% oppose/strongly oppose) and Republicans supporting a ban (63% support/strongly support). While a majority of both white and Black voters oppose a ban, significant gaps are apparent (73% of Black voters and 53% of white voters oppose a ban; 19% of Black voters and 42% of white voters support a ban).

A large majority of Virginia voters support Governor Youngkin's proposal to require the placement of a police or resource officer in every Virginia public school (70% support/strongly support to 25% oppose/strongly oppose).

Abortion: Some Virginia Republican lawmakers proposed to reinstate restrictive abortion laws that were repealed under Democratic control in 2020, including a law mandating a 24-hour waiting period before a woman could have an abortion and a law requiring a woman to undergo an ultrasound before having an abortion. A plurality of Virginia voters oppose the 24-hour waiting period requirement (49% oppose/strongly oppose to 44% support/strongly support) and a solid majority oppose an ultrasound requirement (57% oppose/strongly oppose to 36% support/strongly support). A comparably large majority also oppose a ban on abortions once a fetal heartbeat is detected around the 6th week of pregnancy (58% oppose/strongly oppose to 33% support/strongly support).

COVID-19 vaccination and mask requirements: A majority of Virginia voters support vaccine requirements for people in jail or prison (57%), first responders (58%), members of the U.S. military (58%), teachers (57%), medical providers (61%), and members of Congress (56%). Virginia voters are split on vaccine requirements for college students (50% yes to 48% no), federal government employees (50% yes to 48% no), organizations/businesses with federal government contracts (48% yes to 50% no), state government employees (50% yes to 48% no), and high school students (49% yes to 49% no). A slight majority oppose a vaccine requirement for middle school students (47% yes to 51% no) and a larger majority oppose a vaccine requirement for elementary school students (42% yes to 55% no).

On masking in public schools, a majority of Virginia voters indicate that school mask requirements should be determined by health data and information from health experts (56%) versus a decision left to parents (41%). This result runs counter to a law just passed by the 2022 General Assembly and signed by Governor Youngkin allowing parents to opt their children out of mask mandates rather than leave the decision to local school boards.

Medical Aid and Dying: A majority of Virginia voters support allowing a mentally capable adult with a terminal disease the right to request and obtain medication to end their life (64% agree/strongly agree). Virginia voters are even more supportive of this allowance for a mentally capable adult with a terminal disease who has less than six months to live (66% agree/strongly agree).

How the survey was conducted:

The results of this poll are based on 701 interviews of registered Virginia voters, conducted January 26 – February 15, 2022. Percentages may not equal 100 due to rounding. The margin of error for the whole survey is +/-4.2% at the 95% level of confidence. This means that if 50% of respondents indicate a topline view on an issue, we can be 95% confident that the population's view on that issue is somewhere between 54.2% and 45.8%. The margin of error for subgroups may be higher. All error margins have been adjusted to account for the survey's design effect, which is 1.3 in this survey. The design effect is a factor representing the survey's deviation from a simple random sample and takes into account decreases in precision due to sample design and weighting procedures. In addition to sampling error, the other potential sources of error include non-response, question wording, and interviewer error.

The data reported here are weighted using an iterative weighting process on region, age, race, sex, and education to reflect as closely as possible the demographic composition of registered voters in Virginia. Parameters for the weights used in this survey come from the 2020 Census, 2017 and 2019 American Community Survey, and the Census Bureau's Population Estimates Program (PEP).

Attachment 45

JANUARY 27, 2023

State of the Commonwealth 2023

Virginians Give Governor Solid Marks, Think Commonwealth Doing Alright; Give President Low Marks, Think Country Heading in Wrong Direction; Prefer Governor Stay Right Here in the Commonwealth

Same Dynamic on Education: 41% of Virginians Give Their Local Public Schools an “A” or “B” Grade; Only 13% Grade National Public Schools that High

Virginians Support: Recreational Marijuana Sales; Staying in the Regional Greenhouse Gas Initiative; Parental Approval For Changes in Student Gender ID; And Narrowly Back Income Tax Cut; But Oppose Corporate Tax Cut Proposal

Summary of Key Findings

1. A plurality of Virginians think the Commonwealth is headed in the right direction (45% to 37%), while 50% approve of the job Governor Youngkin is doing. Still, Virginians prefer that the Governor not run for president (59% to 29%).
2. Virginians are pessimistic about the direction of the country (19% right direction to 73% wrong direction); dissatisfaction is reflected in Biden’s approval rating (38% approve to 57% disapprove).
3. Virginia voters support recreational marijuana sales (60%) and allowing any interested localities to host casinos should their residents approve one in a referendum (55%).
4. Virginia voters strongly support staying in the Regional Greenhouse Gas Initiative (66%) and support the Virginia Clean Economy Act (62% to 33%).
5. 41% of Virginians Give Their Local Public Schools an “A” or “B” Grade; Only 13% Grade National Public Schools that High.
6. Virginia voters also show support for requiring parental approval for K- 12 students to be referred to by a different pronoun from their birth certificate (59% to 36%).
7. Virginians would prefer to keep state abortion laws as is (43%) compared to 29% who would prefer less restrictive laws and 23% who want more restrictive laws on abortion.
8. A plurality of Virginia voters support lowering Virginias individual income tax rate (48% to 43%), but oppose a cut to Virginia’s corporate income tax rate (57% to 37%).

Analysis

As the General Assembly enters its third week of the 2023 session, Virginia registered voters are relatively split on a number of key agenda items before state legislators. Virginia voters show support for some of Governor Youngkin's policies, including narrow support for a reduction in the state income tax and requiring parental approval for students to be referred to by a different pronoun from their birth certificate in K-12 public schools. On the other hand, a majority of registered voters do not support the governor's environmental policy proposals, abortion restrictions, or his corporate tax cut proposal. Still, half of Virginia voters approve of the job Governor Youngkin is doing and are more optimistic about the direction of the Commonwealth than the state of the nation.

State of things: When asked about the direction of the Commonwealth, 45% say Virginia is headed in the right direction, while 37% say the wrong direction, with 11% are mixed. Views about the right/wrong direction of the Commonwealth have remained relatively consistent over the last four years. Governor Youngkin's job approval remains steady from nearly a year ago at 50%, while 36% indicate they disapprove and 14% say they don't know.

Differences are largely along partisan lines, with 67% of Republican voters saying Virginia is heading in the right direction, compared to 23% of Democrats and 47% of Independents. On Governor Youngkin's job performance, 83% of Republicans approve, while 74% of Democrats disapprove; 54% of Independents signal their approval.

Still, Virginians prefer that the Governor not run for president in 2024. 59% say Governor Youngkin should not run for president in 2024 while 29% say he should. Another 8% are unsure while 5% say they don't know. A plurality of Republicans (46%) support a presidential run, while 38% of Republicans do not like the prospect. Independents are opposed to a run with 58% saying don't do it. Democrats, as would be expected, are do not want to see the Governor run, with 82% opposed.

Direction of the country and presidential approval: Virginia voters continue to be pessimistic about the direction of the country. Only 19% of Virginia registered voters say the United States is headed in the right direction, compared to 73% percent who say the wrong direction; 6% are mixed and 2% say they don't know. President Biden's job approval numbers reflect this overall discontent, with 38% saying they approve of his job performance, compared to 57% who disapprove; 5% say they don't know. A year ago, Biden's approval among Virginia voters stood at 40%.

K-12 education: When it comes to grading Virginia K-12 public schools, Virginians view their local schools more positively than the nation's. 41% give Virginia schools an A or B grade, while 28% give a C, followed by 13% D and 9% F. When asked about the nation's public schools only 13% give an A or B grade with most giving public schools outside of Virginia a C (39%), D (20%), or F (15%).

Tax policy: Governor Youngkin's tax proposals receive mixed reviews. Virginians narrowly support his proposal to lower Virginia's top individual income tax rate from 5.75% to 5.5% (48% support, 43% oppose; 9% don't know). A majority oppose a cut to Virginia's corporate income tax rate from 6% to 5% (57% oppose to 37% support; 6% don't know).

Environmental Policy: Virginians continue to support remaining in the Regional Greenhouse Gas Initiative (RGGI) (66% to 24%; 10% don't know), a regional carbon cap and trade program joined by 11 states aimed at reducing greenhouse gas emissions.

While there are partisan differences on RGGI, a plurality of Republicans still support staying in the program (42% to 40%), while Democrats show considerable support (92% to 4 %); Independents also show support (62% to 29%). Younger Virginia voters show higher support than those 45+ (71% to 62%).

Virginians also continue to support the Virginia Clean Economy Act (62% support to 33% oppose; 6% don't know), a law passed in the Democratic-controlled legislature in 2020 and signed by Governor Ralph Northam that requires electric utilities in the state to produce 100% of their energy from renewable resources by 2050. This program has also been targeted for repeal by the Governor and Republican Virginia lawmakers.

Abortion: When asked about abortion policy in the Commonwealth, most Virginia voters believe abortion laws should remain as is (43%), followed by support for less restrictive laws (29%), and some support for more restrictive abortion laws (23%). Several bills that would require more restrictions on abortions have been proposed in the 2023 General Assembly session, and Governor Youngkin has called for a ban on abortions at 15 weeks with exceptions for life of the mother, rape and incest.

A similar number of partisans on both sides of the political aisle support keeping abortion law as is (45% of Democrats compared to 39% of Republicans and 46% of Independents). Still, partisan differences emerge with 44% of Republicans supporting more restrictive abortion laws compared to only 1% of Democrats and 26% of Independents. There is also a modest gender gap on this issue with 75% of women indicating they either want abortion laws to remain as is (45%), or laws to be less restrictive (30%). 68% of men support leaving laws as is (41%) or less restrictive (27%).

Marijuana and Casinos: Virginians support allowing the retail sale of recreational marijuana in Virginia (60% to 34%; 6% don't know). While Democrats show strong support (73% to 21%), Republicans are heavily split (44% support to 47% oppose). In addition, there is a clear age gap on this issue with those aged 18-44 showing higher support than 45+ (72% to 50%).

"Marijuana has proved to be a major topic of discussion in the current General Assembly session given the unusual nature of current Virginia law," said Rebecca Bromley-Trujillo, Research Director of the Wason Center. "As it stands, it is legal to possess and cultivate small amounts of marijuana, but retail sale is still not allowed. The Governor has largely shied away from answering questions about his stance, while both Democrats and Republicans have proposed a range of bills on the subject. It remains to be seen whether lawmakers can actually come to an agreement, however."

Currently, five Virginia localities have been given the opportunity to hold a referendum to allow for hosting a casino in their locality, and Virginia's first temporary casino opened in Bristol last year, with the first permanent casino opening in Portsmouth this year. Virginians now indicate they support allowing any interested localities to host casinos as well if their voters were to approve of one in a referendum (55% support to 38% oppose). Support is largely bipartisan with Independents indicating the highest levels of support at 59%, followed by 58% of Democrats and 50% of Republicans.

Survey Demographics n=1038

How the survey was conducted:

The results of this poll are based on 1038 interviews of Virginia registered voters, including 231 on landline and 807 on cell phone, conducted January 13- January 23, 2023. Percentages may not equal 100 due to rounding. The margin of error for the whole survey is +/- 3.8% at the 95% level of confidence. This means that if 50% of respondents indicate a topline view on an issue, we can be 95% confident that the population's view on that issue is somewhere between 53.8% and 46.2%. The margin of error for subgroups may be higher. All error margins have been adjusted to account for the survey's design effect, which is 1.6 in this survey. The design effect is a factor representing the survey's deviation from a simple random sample and takes into account decreases in precision due to sample design and weighting procedures. Sub-samples have a higher margin of error. In addition to sampling error, the other potential sources of error include non-response, question wording, and interviewer error. The response rate (AAPOR RRI Standard Definition) for the survey was 11%. Five callbacks were employed in the fielding process. Live calling was conducted by trained interviewers at Christopher Newport University and Dynata. The data reported here are weighted using an iterative weighting process on region, age, race, sex, and education

to reflect as closely as possible the population of Virginia's registered voters. Parameters for the weights come from the 2020 Census and the 2021 American Community Survey 1-year Estimates.

DEQ
VIRGINIA DEPARTMENT OF ENVIRONMENTAL QUALITY

State Air Pollution Control Board

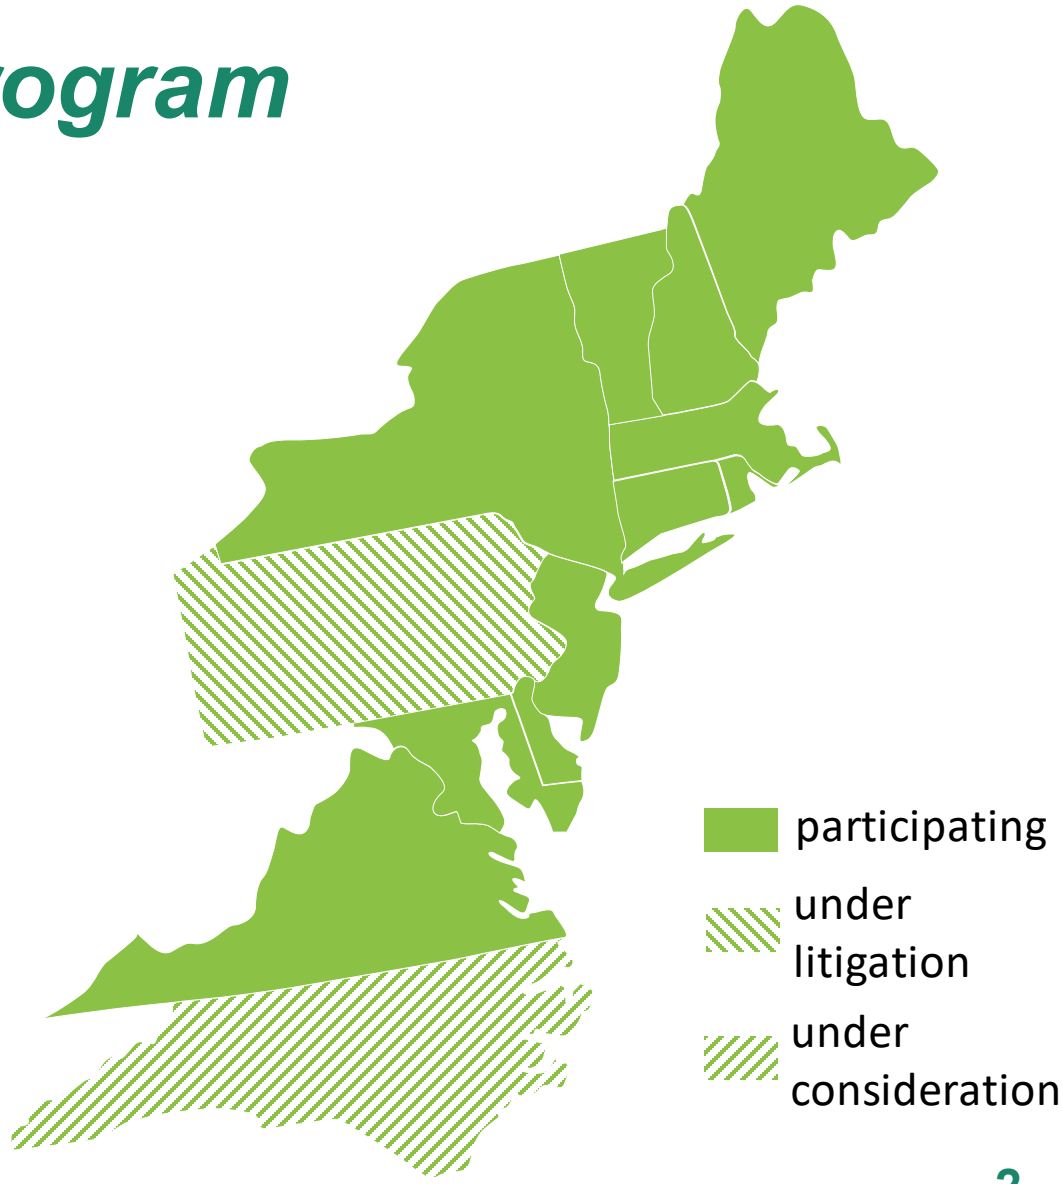
Proposed Regulation: Repeal CO_2 Budget Trading Program, 9VAC5 Chapter 140 (Rev. A22)

Travis A. Voyles
Acting Secretary of Natural and Historic Resources
December 7, 2022

Background—*The RGGI Program*

The Regional Greenhouse Gas Initiative (RGGI) is a carbon cap-and-trade program covering fossil fuel-fired electric generating units in 11 northeast and mid-Atlantic states

- CT, DE, MA, MD, ME, NH, NY, PA, RI, VA, VT
- NC (*considering*)
- PA (*on hold*)



Background—*The RGGI Program*

- All participating RGGI states regulate:
  - ***Fossil-fuel (carbon-based) emissions*** from ***electric generating units*** 25MW or greater
- Each CO_2 "Budget Source" must hold a CO_2 allowance for every ton of CO_2 emitted during a 3-year "control period"
  - Compliance determined by comparing number of tons of CO_2 emitted with number of allowances contained in facility's compliance account over 3-year control period
- CO_2 allowances are purchased in quarterly auctions run by RGGI, Inc.
  - Proceeds returned to states to be used for consumer benefit *or* strategic energy purpose
- RGGI in VA:
  - Existing industrial and biomass units exempted
  - Rule became effective July 10, 2020—First auction March, 5, 2021
  - 7 auctions to date with >40 million allowances sold and $452M returned to the state

Current Regulatory Framework

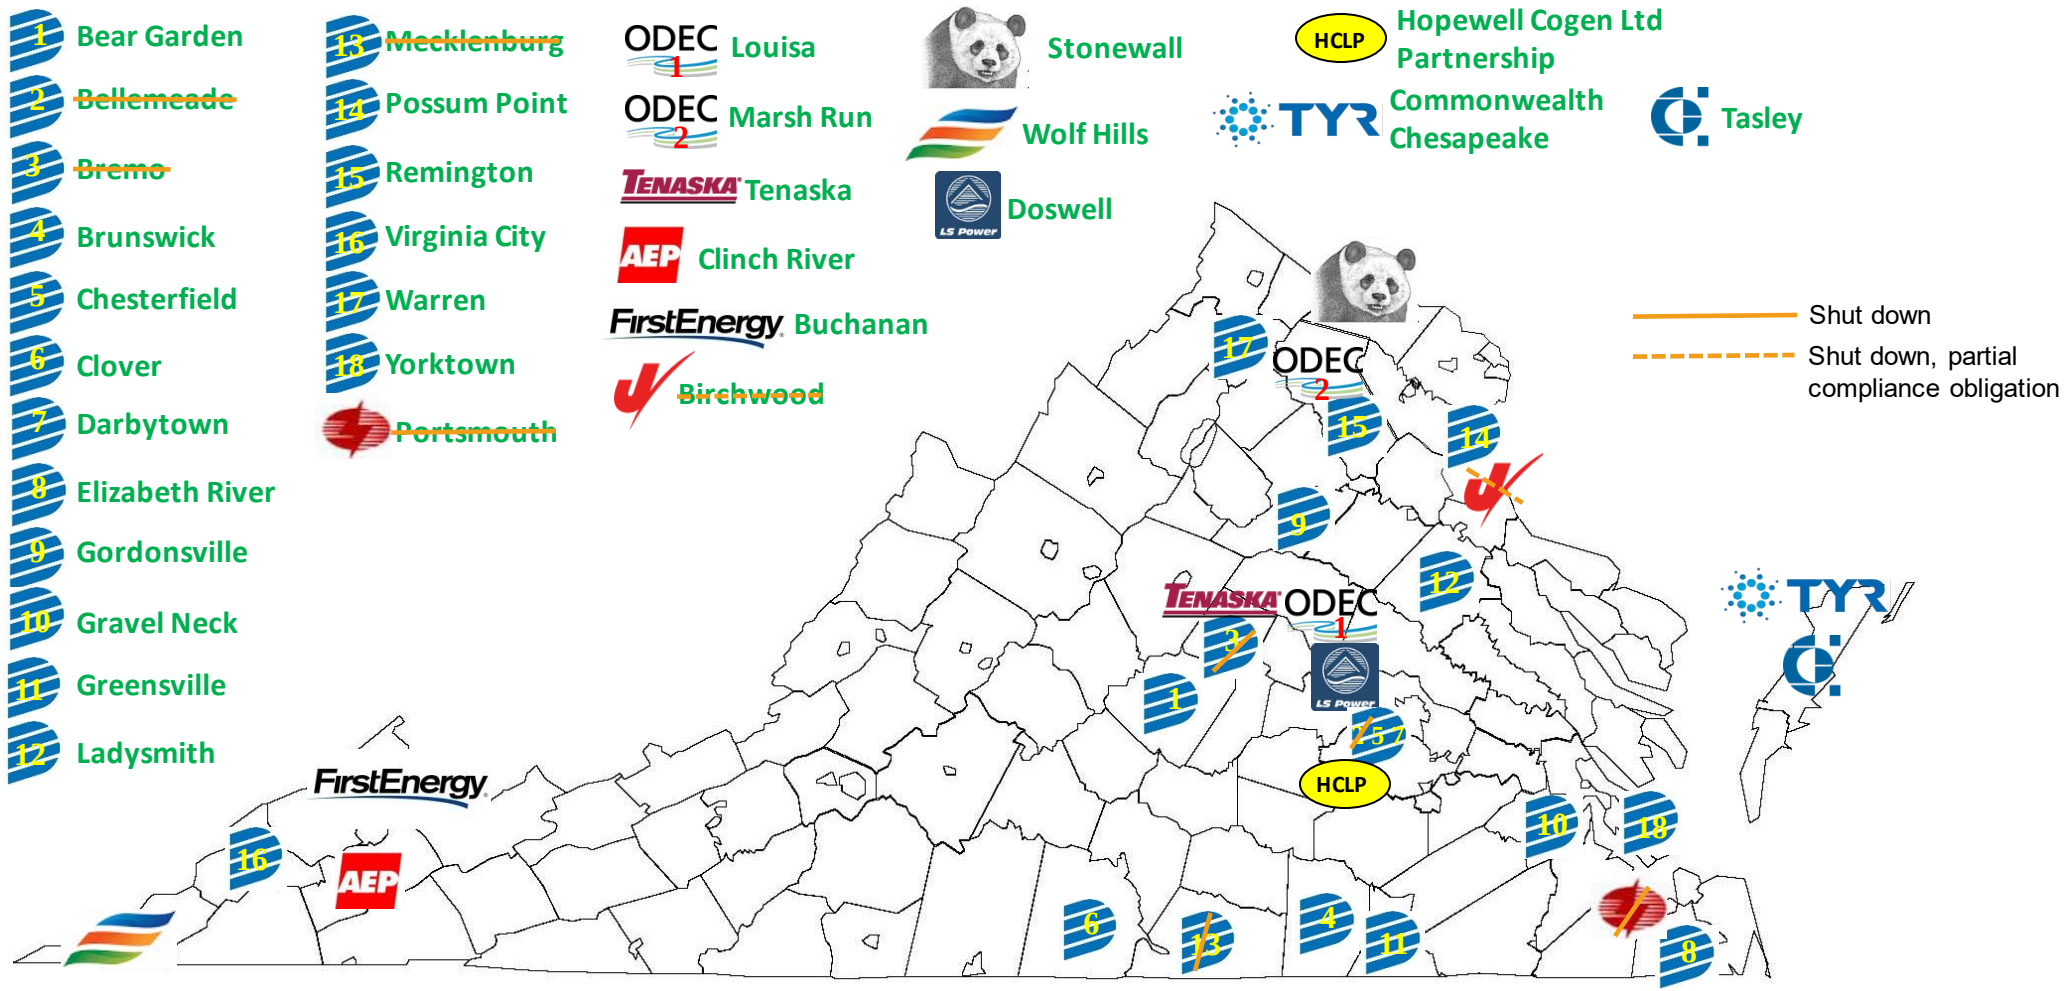
Virginia Clean Economy Act

- requires shift in generation mix to 100% renewable by 2050

Clean Energy and Community Flood Preparedness Act

- established mechanisms to join RGGI
- specified DCR/DHCD programs to receive funding

Regional Greenhouse Gas Initiative (RGGI)



Fossil fuel-fired electric generating units with ≥ 25 MW capacity

Youngkin Administration

January 2022 Governor's Executive Order 9 – *Protecting Ratepayers from the Rising Cost of Living due to the Regional Greenhouse Gas Initiative*

Directive—that SNHR and DEQ:

- Provide a full report re-evaluating the costs and benefits of participation in RGGI in view of all available data.
- Take all necessary steps to so that any proposed regulation to the State Air Pollution Control Board can be immediately presented for consideration for approval for public comment.
- Notify RGGI of the review and the Governor's intent to withdraw from RGGI, whether by legislative or regulatory action.

March 2022 DEQ Report – *VA Carbon Trading Rule and RGGI Participation: Costs and Benefits*

March 2022 DEQ Report—*Key Findings*

- RGGI operates as a direct tax because all fees paid are passed through to ratepayers.
- Utilities are not penalized for failure to meet RGGI CO_2 emissions since they can pass on the costs to the ratepayers, and consumers are unable to avoid these costs since they do not have the opportunity to switch electric providers.
- Other states designed their systems to provide rebates to their ratepayers. Virginia consumers were originally told the program would return proceeds to the ratepayers but the General Assembly chose to disburse the funds through grant programs.
- The costs of compliance with the trading rule and participation in RGGI are materializing in higher electricity rates for all ratepayers, and future rate increases due to RGGI are expected and will be tied to the allowance prices which are difficult to predict.

The Path Forward—*Process*

Regulatory Action

- Repeal the trading rule and end VA's participation in RGGI
- Full Administrative Process Act (APA) process
- Notice of Intended Regulatory Action (NOIRA)—Proposed—Final
  - Transition section added at the end of rule

Timing—Complete repeal by the end of 2023

- 3-year compliance/control period of RGGI
- Contractual agreement with RGGI Inc.

Provides For Stable Withdrawal for Regulatory Certainty

- Smooth and orderly exit
- Avoid market disruptions

The Path Forward—*Rationale*

Increasing Energy Costs

Virginia's Energy Future

- No Control of RGGI Costs

RGGI Effectiveness and Burden

- Direct Consumer Tax
- Duplicative Transition Cost of RGGI
- Emissions Reductions without RGGI

Standard (*Full*) Regulatory Development—*NOIRA Stage*

- Agency submitted NOIRA for executive branch review
- Agency authorized by Governor to submit NOIRA for publication.
- NOIRA is published in the *Virginia Register*
- 30-day public comment period (Town Hall and email)
  - Began September 26, 2022
  - Ended October 26, 2022
  - Summary and response to comments found in Agency Background Document

NOIRA Process—*Comments*

- 838 Town Hall Comments
  - General—51 supportive, 730 against
  - Against—
    - 11 substantive (CBF, Ceres, Virginia Clinicians, Nature Conservancy, Climate Action Alliance of the Valley VaLCV, C2ES, VCN, CCA)
    - 6 local governments (Cities of Arlington, Alexandria, Hampton, Fairfax, Charlottesville; Town of Colonial Beach)
- Emails—225 against the proposal sponsored by VaLCV with about 16 general comments against
- Written substantive comments from:

pro	con
Dominion	ACEEE
VMA	ALA
	EDF
	Hampton Roads Planning District Commission
	International Emissions Trading Association
	James River Association
	New Virginia Majority
	Northern Virginia Regional Commission
	SELC
	Virginia Energy Efficiency Council

Standard (*Full*) Regulatory Development—*Proposed Stage*

- Agency considers public comment and drafts proposed regulation
- Board adopts proposed regulation
- Agency submits proposed regulation for executive branch review
- Agency is authorized by Governor to submit proposed regulation for publication
- Proposed regulation is published in the *Virginia Register*
- 60-day public comment period

Standard (*Full*) Regulatory Development—*Final Stage*

- Agency considers public comment and drafts final regulation
- Board adopts final regulation
- Agency submits proposed regulation for executive branch review
- Agency is authorized by Governor to submit final regulation for publication
- Final regulation is published in the *Virginia Register*
- Regulation becomes effective

Regulatory Process—*What's Next*

- **December 7, 2022—Proposed regulation presented to the Board**
  - If approved, proceed to:
- Executive Review—
  - Department of Planning and Budget
  - Secretary of Natural and Historic Resources
  - Office of Regulatory Management
  - Governor
- Publication in *Virginia Register*
  - Commences a 60-day public comment period
- Final Stage—Board meeting in 2023
- Regulation effective 30 days after publication in the *Virginia Register*

Adoption Process

- The regulation is subject to the state administrative procedures for full process regulations under the Administrative Process Act (*NOIRA—Proposed—Final*)

- *Today's Action*—Approve request to propose for public comment the repeal of Part VII of 9VAC5-140, CO_2 Budget Trading Program to be issued for public comment in accordance with the APA

RGGI is a Bad Deal for Virginia

RGGI Is Not Working—Whether you agree with the principals of a cap and trade regime, the way RGGI is set up for VA does not work.

Burden—Costs passed on to the consumer without any change in behavior by the electricity providers due to VA's regulatory structure.

Abandoned Responsibility—Forfeited our important decision-making rights to Northeastern states who have more say over our energy policy than any VA consumer.

Funding—Virginians don't need a regressive energy tax through RGGI to fund important programs. These are not the goals that RGGI was meant to achieve.

***Action*—Complete repeal by end of 2023, ending VA's participation in RGGI.**

Department Recommendation

- That the board authorize the department to issue the proposal for public comment in accordance with the APA.

Virginians rally for RGGI carbon market as Pennsylvania cools to idea

Author **Karin Rives**

Theme **Energy**

Workers at a Consol Energy mine in Pennsylvania. The coal producer was one of several companies to seek a court injunction barring the state from participating in Regional Greenhouse Gas Initiative carbon auctions.
Source: S&P Global Commodity Insights

Over the past month, 838 people and organizations in Virginia weighed in on Gov. Glenn Youngkin's initial proposal to pull the state from the Regional Greenhouse Gas Initiative. More than 95% said the Commonwealth should remain part of the 12-state carbon market.

The level of support for the program reflects the popularity of flood mitigation and coastal resilience projects that are paid for with the proceeds from the RGGI allowance auctions, said Cale Jaffe, a University of Virginia law professor.

"These are bread-and-butter infrastructure projects with money going directly to local governments," Jaffe said in an interview. "If Virginia were to withdraw from RGGI, how do you fill this budgetary hole and fund programs local governments have come to depend upon?"

Another factor likely driving public engagement is that half of the $452.2 million raised by the RGGI auctions for Virginia since March 2021 was earmarked for energy-efficiency upgrades for low-income residents, Jaffe said.

By the time the one-month comment period closed Oct. 26, the vast majority of respondents to the Youngkin administration's notice of intended regulatory action had turned thumbs down on the move, a tally by S&P Global Commodity Insights showed. Youngkin, a Republican, is expected to push forward with the rulemaking to take the state out of RGGI once the public comments have been reviewed.

The public support for the RGGI in Virginia stands in contrast to the heated debate in Pennsylvania, one of the nation's largest producers of natural gas and coal. Legal challenges from legislators, coal companies, plant owners and trade unions halted implementation of the RGGI program, the signature climate initiative of outgoing Pennsylvania Gov. Tom Wolf, a Democrat.

In both states, whether utility carbon emissions will be capped under the RGGI, and for how long, is uncertain. On-again, off-again state energy policies make planning for the future difficult for power companies, said William Shobe, a professor of public policy and economics with the University of Virginia who helped to design RGGI's carbon allowance auctions ahead of the market's 2008 launch.

"There is risk in any market — what we don't need is the additional risk of big policy changes," Shobe said in an interview. "We would have to replace the [carbon] market with something that is less flexible, and it's going to cost firms to change their capital outlays over the next several years should policies change."

RGGI faces uphill battle in Pennsylvania

Under RGGI, power companies that own fossil fuel plants with a capacity of at least 25 MW are required to buy greenhouse gas emission allowances, or credits, for each short ton of carbon their plants emit. The companies purchase the allowances at quarterly auctions or from a secondary market to comply with their state's emissions cap, which is tightened over time.

The RGGI held its first auction in 2008. Greenhouse gas emissions in participating states have dropped by more than 50%, twice as fast as in the nation as a whole, since the program's inception, according to an RGGI fact sheet published in September 2021.

The RGGI market mechanism financially rewards power producers with cleaner plants while placing a growing economic burden on those that do not transition away from fossil fuels, pushing down emissions. That message has not gone over so well in Pennsylvania, which is the nation's second-largest producer of natural gas and third-largest producer of coal, according to the U.S. Energy Information Administration.

Neither candidate in Pennsylvania's high-profile race for governor has embraced membership in RGGI, now in limbo. Josh Shapiro, the state's attorney general, is running as a Democrat. Shapiro has suggested that his

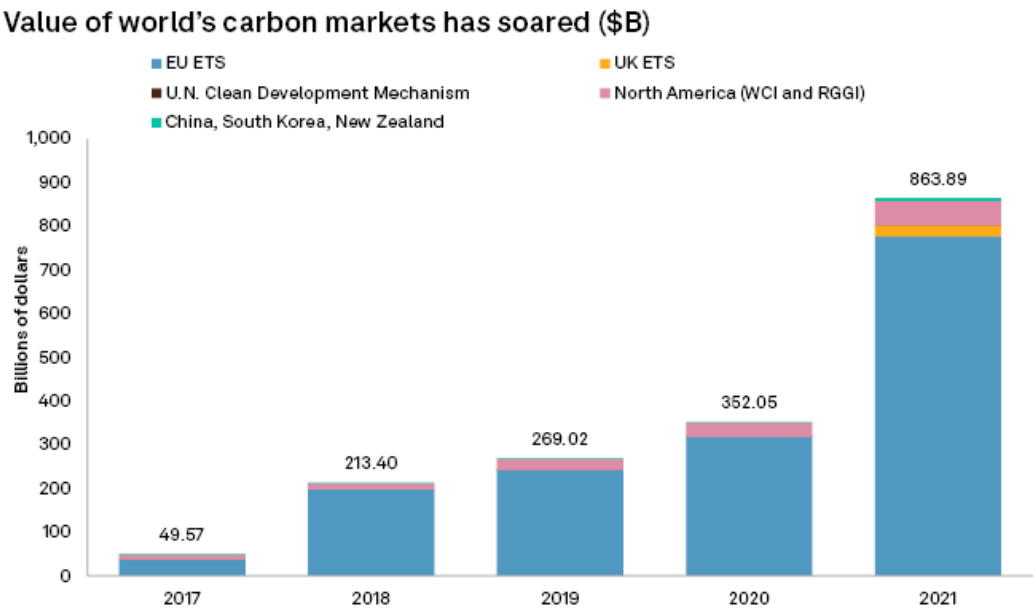
energy plan might not have room for RGGI, should he be elected.

Polling this summer by Muhlenberg College found that while Pennsylvanians expressed concern over climate change, 86% of state residents think that drilling for natural gas is either very or somewhat important to the state's economy.

The state officially entered the carbon market in July but had to withdraw from its first auction after a state court issued an injunction stalling the plan. The Pennsylvania Supreme Court in August declined to overrule that decision until the lower-court trial scheduled for mid-November has concluded.

That means Pennsylvania will probably also miss its second auction in December, along with millions in revenue, said Rob Altenburg, energy center director with environmental advocacy group PennFuture.

"Assuming the [state Department of Environmental Protection] prevails in the legal challenges, we expect continued legislative attempts to derail the program in the new session," Altenburg wrote in an email. "So a lot will depend on the political landscape after the election."



Data as of May 17, 2022.
Value of compliance cap-and-trade markets. Voluntary carbon offset market not included here.
WCI stands for Western Climate Initiative, RGGI for Regional Greenhouse Gas Initiative and ETS for Emission Trading System.
Values originally reported in euros were converted to U.S. dollars as of the last trading day of each year.

Virginia gearing up for a fight

In addition to private citizens, a number of Virginia cities, faith leaders and environmental groups such as the Southern Environmental Law Center, the National Parks Conservation Association, and the Sierra Club weighed in with comments to defend the RGGI cap-and-trade program.

"Communities across Virginia need to plan for, mitigate, and build resilience to the climate change impacts being felt today," wrote Justin Wilson, mayor of Alexandria, Va. "The dedicated source of funding for the Community Flood Preparedness Fund provided by Virginia's participation in the Regional Greenhouse Gas Initiative is critical to our ability to do the work of flood mitigation and resilience planning in our communities."

Supporters of the governor's plan said RGGI amounts to a tax on consumers when utilities pass on compliance costs to ratepayers, an argument Youngkin has also used. Others called it "government overreach" or questioned the RGGI's impact.

"Having power companies buy credits to meet greenhouse initiatives misses the point of reducing emissions," one commenter wrote. "I'd love to see the number of [kilowatt-hours] used each month by all these people who support keeping this initiative. These are probably the same people driving big SUVs while protesting for clean air."

Ultimately, it is not the share of comments filed against the governor's plan but the quality of comments that the state takes into consideration, said Mike Dowd, director of air and renewable energy for the Virginia Department of Environmental Quality.

"We take comments very seriously, especially if they bring up issues we may not have thought about," Dowd said in an interview. "We look for substance, not for a percentage."

The agency expected a large number of comments knowing that RGGI has public support, said the state's air quality chief, who has been with the agency since 2008. "A lot of people feel passionate about this, obviously," Dowd said.

Should the rulemaking make it through another comment period and be finalized in late 2023, as the Youngkin administration hopes, a court battle will likely ensue in Virginia, Jaffe predicted. Legal experts have argued that Youngkin cannot use executive orders or rulemakings to undo state law.

Acknowledgements

This report is an independent, retrospective study of the public health impacts of the Regional Greenhouse Gas Initiative (RGGI) over its first six years of implementation (2009-2014). Abt Associates relied on modeling results from two Analysis Group reports, *The Economic Impacts of the Regional Greenhouse Gas Initiative on Northeast and Mid-Atlantic States*, covering the 2009-2011 and 2012-2014 periods. Abt is grateful to Analysis Group for providing access to results of their dispatch modeling, which served as a foundation of our analysis of the impacts of RGGI on air emissions, air quality, and public health.

Abt would like to thank the Barr Foundation, Energy Foundation and the Merck Family Fund, with additional support from the Betterment Fund, Alexander Buck, Jr., The Devonshire Foundation, Thomas Haas at the New Hampshire Charitable Foundation and Daniel Hildreth, for their generous funding of this independent study as part of the RGGI Project Series. The authors give special thanks to Laurie Burt (Laurie Burt, LLC), Project Coordinator of the RGGI Project Series, for serving as the project coordinator of this independently conducted report and providing key support.

In addition, Abt formed a Technical Advisory Group (TAG) to obtain feedback on our approach, methods, and interpretation of analytic results. We would like to thank the TAG members for sharing their time and expertise:

- **George (Tad) Aburn,** Air Director, Maryland Department of the Environment
- **Paul Hibbard,** Principal, Analysis Group
- **Dr. Patrick Kinney,** Professor of Environmental Health, Boston University
- **Dr. Paul Miller,** Deputy Director, Northeast States for Coordinated Air Use Management (NESCAUM)
- Additional anonymous contributors also provided informal input and review.

Michelle Manion of Abt Associates was the lead author of this report. Claire Zarakas, Stefanie Wnuck, Jacqueline Haskell, Anna Belova, David Cooley, Jonathan Dorn, Marissa Hoer, and Lisa Mayo of Abt Associates all made important contributions to this report.

The findings of this independent study are based solely on the analysis and judgment of Abt Associates and do not necessarily reflect the views of the TAG members, Laurie Burt, or our funders.

About Abt Associates

Abt Associates is a mission-driven, global leader in research, evaluation, and program implementation in the fields of health, social and environmental policy, and international development. Known for its rigorous approach to solving complex challenges, Abt is regularly ranked as one of the top 20 global research firms and one of the top 40 international development innovators. The company has multiple offices in the United States and program offices in more than 40 countries.

Abt's experts in climate change, clean energy, and public health include economists, public health experts, epidemiologists, natural scientists, data scientists, attorneys, and others. In addition, Abt economists and public health experts support the U.S. Environmental Protection Agency's (EPA's) efforts to develop, maintain, and update the Benefits Mapping and Analysis Program (BenMAP) and the Co-Benefits Risk Assessment (COBRA) tools, both of which are utilized in this analysis.

Executive Summary

Purpose of this Study

This independent study provides an analysis of the public health impacts of the Regional Greenhouse Gas Initiative (RGGI) over its first six years of implementation (2009 to 2014). RGGI is the nation's first regional regulatory program designed to reduce greenhouse gas (GHG) emissions from large electric power plants, and builds from a long and successful tradition in the Northeast states of using market-based programs to cost-effectively reduce air pollution. Since RGGI started in 2009, the program has raised nearly $3 billion to support the RGGI states' investments in energy efficiency, renewable generation, and other public benefit programs, and these states are on track to achieve reductions of GHG emissions of 45 percent below 2005 levels by 2020.

Because "criteria" air pollutants[1] are co-produced along with GHG emissions from fossil-fuel power plants, RGGI is also expected to drive reductions in these air pollutants and their adverse effects on human health. The objective of this independent study is to provide a *retrospective* analysis of the impacts of an existing GHG reduction program—RGGI—on air quality and public health.

Using publicly available, peer-reviewed air quality and public health models and historical data characterizing RGGI's actual performance during the program's first two compliance periods (covering 2009 to 2014), we addressed the following questions in this analysis:

- Did RGGI result in measurable changes in emissions of criteria air pollutants and air quality?
- If so, how did changes in air quality resulting from RGGI affect public health and to what degree?
- What were the spatial and temporal patterns to changes in air quality and public health due to RGGI implementation?
- Will health benefits from RGGI's first two compliance periods be replicated in the future?

Key Results and Findings

The RGGI program improved air quality throughout the Northeast states and created major benefits to public health and productivity, including avoiding hundreds of premature deaths and tens of thousands of lost work days. RGGI's impact on electricity markets resulted in significant reductions in key air pollutants with adverse effects on human health. Over the first six years of the program, RGGI avoided hundreds of cases of premature deaths, heart attacks, hospitalizations, and emergency room (ER) visits; tens of thousands of lost work days, and hundreds of thousands of cases of restricted activity days due to poor air quality. Table 1 summarizes cumulative avoided health and productivity effects associated with RGGI's first two compliance periods.

[1] "Criteria air pollutants" refer to the six most common air pollutants in the United States: carbon monoxide (CO), lead, ground-level ozone (O_3), nitrogen oxides (NOx), particulate matter (PM), and sulfur dioxide (SO_2). The Clean Air Act requires EPA to set National Ambient Air Quality Standards (NAAQS), which are maximum allowable concentrations for these pollutants that are protective of public health.

Table 1. Summary of Cumulative RGGI Health Benefits, 2009 to 2014

Avoided Health Effects	**Avoided Mortality**		
	• 300–830 premature adult deaths		
	Avoided Morbidity		
	• 35–390 non-fatal heart attacks		
	• 420–510 cases of acute bronchitis		
	• 8,200–9,900 asthma exacerbations		
	• 13,000–16,000 respiratory symptoms		
	Other		
	• 180–220 hospital admissions		
	• 200–230 asthma ER visits		
	• 39,000–47,000 lost work days		
	• 240,000–280,000 days of minor restricted activity		
Value of Avoided Health Effects	**Low**	**Central**	**High**
	$3.0 billion	$5.7 billion	$8.3 billion

Source: Abt Associates analysis (2017).

Notes: The total value of avoided health effects is the sum of health benefits in states participating in RGGI and in neighboring northeastern states, based on a 3 percent rate of discount. Values are in 2015 dollars.

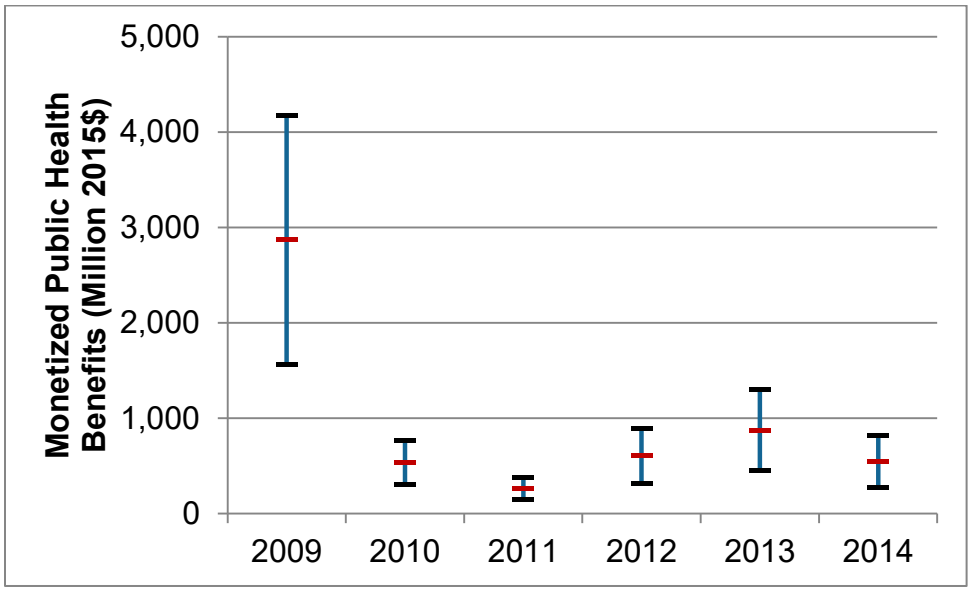
The economic value of RGGI's health and productivity benefits is estimated at a cumulative $5.7 billion ($3.0 billion low-end, $8.3 billion high-end). Avoided cases of premature deaths due to reduced levels of fine particulate matter $PM_{2.5}$ account for the majority of RGGI's monetized health benefits. However, other important benefits to the region's economic productivity and quality-of-life include more than 39,000 avoided lost work days and at least 240,000 avoided days with restricted activities (e.g., exercising outdoors) due to poor air quality.

Estimated benefits to health are positive in every state in the Northeast region (including RGGI and certain neighboring states)), and in almost every year of the study period. States with the highest total monetized health benefits over RGGI's first six years include: Delaware, Maryland, New Jersey, New York, and Pennsylvania. Sizeable benefits also occur in Massachusetts, Connecticut, and New Hampshire. Benefits in Rhode Island, Vermont, and Maine are smaller in magnitude compared to those in states with larger populations, but are relatively consistent over the study period. Overall, health benefits estimated for the first compliance period are higher than for the second period.

The largest annual improvements in air quality and health benefits from RGGI are in 2009 and 2013. The largest single-year benefits in health due to RGGI occur in 2009 (shown in Figure 1). This result is consistent with RGGI's two observed effects on wholesale power markets: 1) changes in power prices to absorb CO_2 allowance costs, which results in shifting electricity dispatch from higher- to lower-carbon sources, and 2) investments in energy efficiency that reduce electricity demand, fossil fuel-based generation, and emissions. There is also some evidence that power plant owners, anticipating the requirements of the program, may have taken early action to reduce CO_2 emissions immediately before and after the start of the program in 2009. Energy efficiency investments were comparatively high in this year as well. The combination of higher prices and energy efficiency investments, together with early action, likely account for the largest single-year emission reductions and health benefits across the six year period. Similarly, higher benefits in 2013 most likely correspond to higher relative investments in

energy efficiency and renewable energy in that year, and also reflect energy savings accruing from efficiency investments made in prior years.

Figure 1. Annual Health Benefits due to RGGI, 2009 to 2014

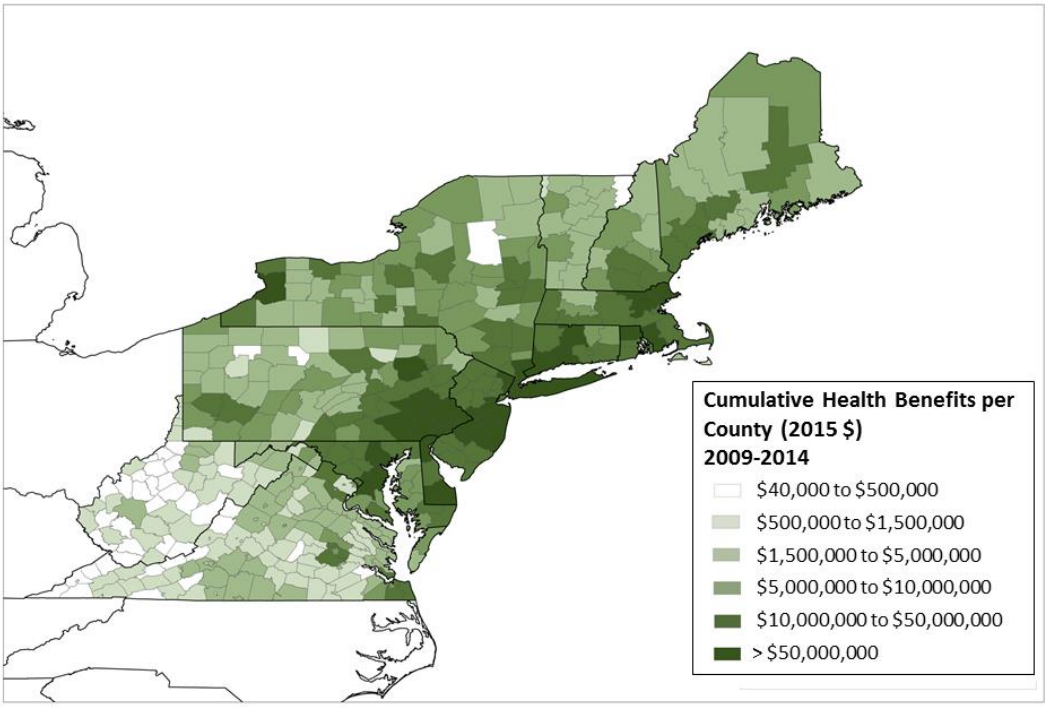


Source: Abt Associates analysis (2017).

Note: Value of annual health benefits is the sum of health benefits to RGGI states and neighboring northeastern states, based on a 3 percent rate of discount.

Multiple states in the mid-Atlantic and New England regions experienced significant health benefits from RGGI-induced changes to air quality which originate in the RGGI states. Due to regional transport of air pollutants, our modeling shows that states with densely populated areas located directly downwind of key coal-fired power plants experienced substantial health benefits, regardless of whether they participate in RGGI. As shown in Figure 2, Pennsylvania experienced the most significant benefits overall from RGGI due to reductions in emissions from Maryland's (and to a lesser extent Delaware's) large coal plants. The District of Columbia, Virginia and West Virginia also experienced modest health benefits from emissions reductions occurring in RGGI states. Similarly, emissions reductions due to RGGI from coal plants in western New York, Massachusetts, and New Hampshire create health benefits not only in those states, but also in Rhode Island, Vermont, and Maine.

Figure 2. Cumulative Health Effects of RGGI, 2009 to 2014



Source: Abt Associates analysis (2017).

A small number of legacy coal plants, particularly in the mid-Atlantic RGGI states, account for the majority of RGGI's health benefits. Coal-fired power plants have the highest emission rates of SO_2, which is the primary contributor to ambient $PM_{2.5}$ levels and risks to health. So, reductions in SO_2 emissions by coal plants account for the majority of health benefits. Of the RGGI states, Maryland has the most significant footprint of older coal-fired power plants and the largest inventory of SO_2 emissions. RGGI-induced changes in generation and emissions from five of Maryland's coal plants alone account for roughly 62 percent of SO_2 reductions in 2009, and 55 percent of cumulative SO_2 reductions from RGGI's first two compliance periods (2009 to 2014).

If coal plants in RGGI states retire as planned in the near future, reductions of air pollutants and annual health benefits resulting from the RGGI program will likely level off. However, additional health benefits will occur as energy demand from other sectors—transportation and buildings—shifts onto a cleaner grid in RGGI and neighboring states. As noted above, RGGI-induced changes at a relatively small number of coal plants drive a high proportion of RGGI's total reductions in key air pollutants and health benefits. However, a number of older coal-fired power plants in RGGI states driving many of the health benefits presented in this analysis are scheduled to retire within the next five years (e.g., Chalk Point in Maryland, Brayton Point in Massachusetts). As such, the fleet of power plants in RGGI states will on average be cleaner in the near future than the current fleet, so that future RGGI-induced reductions in generation are likely to result in less average annual health benefits going forward. However, states will be able to move energy use from other sectors, such as transportation and heating, to this cleaner grid. This process, known as "electrification," can further reduce air pollutants resulting in significant health benefits. For example, transitioning the light-duty vehicle fleet to about 65 percent zero-emission vehicles (ZEVs) by 2050 in eight northeastern states could result in emission reductions that generate nearly $12 billion in health benefits (American Lung Association of California 2016).

RGGI-funded investments in energy efficiency strategically targeted to address daily air quality goals during high-electricity demand periods can generate additional health benefits. The scope of this analysis addressed only annual changes in average $PM_{2.5}$ concentrations. However, air quality in a given location can be highly variable over the course of a year, and a single short-term exposure to high $PM_{2.5}$ concentrations can lead to more severe health outcomes than multiple exposures to low $PM_{2.5}$ concentrations. To the extent that RGGI states' future investments in energy efficiency programs can effectively target peak load on days with high electricity demand, RGGI can further reduce the number of low air quality days and thereby generate additional health benefits in the future.

Estimates of RGGI's health benefits presented in this study are likely conservative, and also do not include the value of other co-benefits associated with reductions in air pollution, such as improved ecosystem services. Health benefits resulting from energy savings associated with RGGI states' efficiency investments that persist beyond 2014 and from reductions in ozone were beyond the scope of this study, but could be significant. In addition, additional benefits to terrestrial and aquatic ecosystems resulting from reductions in sulfur and nitrogen deposition are not included in this analysis.

Approach

The analytic approach used in this study for estimating RGGI's impact on emissions, air quality, and public health consisted of three sequential steps described below:

1. **Estimate annual changes in electric generation and emissions of air pollutants at power plants as a result of RGGI implementation from 2009 to 2014.**

   The RGGI program created changes to annual electricity generation, the mix of power plants (and fuels) dispatched to meet electric demand, and associated changes in emission profiles through its two direct effects on the electricity market: 1) Owners of large fossil-fuel power plants purchase CO_2 allowances to meet RGGI's emissions cap, and then build the costs of these purchases into wholesale power prices. In this way, purchases of CO_2 allowances result in shifts in power production from higher- to lower-carbon generation sources; and 2) Participating RGGI states' investments of proceeds from allowance auctions into energy efficiency measures and renewable generation result in reductions in overall electricity demand and increase the capacity for low- or zero-carbon electricity, respectively.

   We used results from electricity dispatch modeling to determine annual changes in generation (in megawatt-hours (MWh), at the plant level) due to the RGGI program and also for a counterfactual scenario representing the world without RGGI. Using EPA historical data on actual power plant-level emissions (and emissions rates), we then used the incremental difference in plant-level output due to RGGI, calculated associated changes in SO_2 and NOx emissions, and aggregated these emission changes at the county level. These results became the inputs to the air quality modeling conducted in the second step of this analysis.

2. **Estimate annual changes in air quality at the county level associated with changes in sulfur dioxide (SO_2) and NO_x emissions from power plants, by year.**

   To estimate the air quality impacts of RGGI using annual county-level emission changes calculated under the first analytic step, we used EPA's Co-Benefits Risk Assessment (COBRA) model. COBRA is a free, screening-level tool that assists government agencies and others in assessing the benefits of clean energy and climate mitigation policies by estimating the effects of changes in air pollutant

emissions on ambient air concentrations of fine particulate matter ($PM_{2.5}$). Using the estimated incremental change in county-level emissions of NO_x and SO_2 due to RGGI that we calculated under Step 1, we performed a COBRA modeling run for each individual year from 2009 to 2014. Outputs from the COBRA modeling step consist of annual changes in ambient $PM_{2.5}$ levels in each county in RGGI and adjacent non-RGGI states, and become the inputs to the modeling of associated health impacts under Step 3.

3. **Assess public health impacts associated with changes in air quality due to RGGI implementation from 2009 to 2014.**

   To quantify and value the public health impacts associated with RGGI's first six years, we used EPA's BenMAP. The BenMAP model uses data describing population, background levels of health outcomes in populations, and economic values for health effects from literature to estimate the number and economic value of health impacts resulting from changes in air quality. We used the county-level changes in ambient $PM_{2.5}$ levels generated by COBRA as inputs to BenMAP. BenMAP then calculated annual health benefits from RGGI's relative effect on ambient $PM_{2.5}$ for 2009 to 2014.

In addition, we conducted sensitivity analysis to address uncertainties surrounding data, assumptions, and key modeling relationships. Specifically, we applied a sensitivity factor of 50 percent to discount estimates of health benefits for states not participating in the RGGI program, to account for a gap in information about changes in air emissions that may have occurred in these states as a result of RGGI. In addition, outputs from the BenMAP model also reflect uncertainties in the assumed relationship between reductions in exposures of human populations to key air pollutants and health outcomes, especially premature mortality. Finally, we did not quantify other benefits outside the scope of this analysis, such as health benefits associated with reductions in ozone and RGGI-induced energy savings occurring after 2014, or improved ecosystem health. As such, the benefits presented here can be considered a conservative representation of the co-benefits of the RGGI program to human health and ecosystems.

Overview of Analysis

The northeastern U.S. states have a long track record of implementing market-based environmental programs to improve air and water quality. The first of these programs—the Acid Rain Program[2]—was established under Title IV of the 1990 Clean Air Act Amendments (CAA) and required power plants to reduce emissions of sulfur dioxide (SO_2) and nitrogen oxides (NO_x), the primary contributors to acid rain formation. The Acid Rain Program also established a trading system that enabled regulated firms to exchange allowances or permits to meet emissions goals at the lowest possible total cost. The Acid Rain Program was an environmental success story: SO_2 emissions from electric power plants declined by more than one-third—from 15.9 million to 10.2 million tons—between 1990 and 2004 (U.S. EPA, 2016c), despite a 25 percent increase in electricity generation from coal-fired power plants over the same period (Schmalensee and Stavins, 2013). The program's cap of nearly 9 million tons of SO_2 emissions from the power sector was achieved by 2007, and declined further to 5 million tons by 2010.

Another important hallmark of the Acid Rain Program was that its environmental goals were achieved with low costs of implementation relative to net benefits. Electric utilities regulated under this program achieved the goals for emissions reductions at a significantly lower cost than was projected at the outset of the program. Costs projected before implementation of the Acid Rain Program were over $2.7 to $6.2 billion (U.S. EPA, 2011b). However, retrospective studies found that actual annual costs ranged from $0.5 billion to $2 billion, and total annual benefits ranged from $59 billion to $116 billion (Schmalensee and Stavins, 2013).

The Northeast region's second experience with implementing market-based trading to address air pollution from large power plants was the NO_x Budget Program, which was initiated by 12 states in order to attain compliance with National Ambient Air Quality Standards (NAAQS) for ozone. The NO_x Budget Program incorporated key "lessons learned" by regulators in state environmental agencies and utilities from implementing the Acid Rain Program and similar environmental trading programs. In particular, this program was the first time that a group of states worked together to establish their own multi-state program, in lieu of the U.S. Environmental Protection Agency (EPA) promulgating regulations to address summertime ozone exceedances in the region (Pew Center, 2003).[3] Another key feature of the NO_x Budget Program was that the states developed a "model rule," a set of core requirements that each state needed to adopt to ensure a well-functioning program.[4]

The Regional Greenhouse Gas Initiative (RGGI) built from and further leveraged the northeastern states' hands-on experience with implementing multi-state, market-based programs. RGGI is the nation's first regional market-based regulatory program designed to reduce greenhouse gas (GHG) emissions from the electric sector. Beginning in 2003, Governor Pataki of New York invited environmental and public utility

---

2 40 CFR Parts 72 through 78.

3 The first example of a local regulator establishing a cap-and-trade program for meeting air quality goals was the RECLAIM program established by South Coast Air Quality Management District to reduce emissions of criteria air pollutants in the Los Angeles County basin.

4 The "model rule" was created by a task force that included representatives from all states in the Ozone Transport Commission and EPA.

staff from 10 northeastern states[5] to begin working together on the scope and design of a regional system to reduce carbon dioxide (CO_2) emissions from power plants. The program's scope includes new and existing fossil-fuel electric generating units (EGUs) with capacity of 25 megawatts (MW) or more.[6] In late 2008, the 10 RGGI states held the first allowance auctions in preparation for RGGI's January 2009 start date. As of this writing, the RGGI program has an eight-year track record (i.e., January 2009–December 2016) and the following achievements:

- Raised nearly $3 billion in auction proceeds for participating state investments in energy efficiency (EE), renewable energy (RE), and other public benefit programs;
- Is on track for reducing GHG emissions 45 percent below 2005 levels by 2020;[7]
- Generated net savings in consumers' electricity and energy bills through substantial investments in demand-side efficiency;
- Performed over 30 quarterly allowance auctions in a well-functioning marketplace.

For these reasons, RGGI has been held up as a blueprint for other programs and certainly helped to inform the EPA's proposal for the Clean Power Plan, a national-level GHG program for the electric power sector. However, the direct results of the RGGI program are only a part of the story—its influence in the northeastern United States extends beyond reductions in GHG emissions.

1.1 Objectives of Analysis

While the RGGI states' objectives for the program were primarily focused on reducing GHG emissions, increasing the role of renewable energy, and reducing imports of fossil fuels, RGGI and similar clean energy programs also have other, less direct effects on the economy, the environment, and public health. A broader evaluation of the full suite of RGGI's impacts will provide policymakers and the public with a more complete picture of the program's effectiveness.

Analysis Group conducted the first set of studies that analyzed other impacts of RGGI beyond its primary goal of reducing GHG emissions from large power plants. In 2011 and 2015, after RGGI's first three-year compliance periods ended, Analysis Group performed retrospective analysis of RGGI's impact on electricity markets, costs to power producers, impacts on electricity bills of consumers and businesses, and impacts on economic output of the RGGI states. Both of these studies demonstrated that RGGI implementation created positive and substantial benefits to the regional economy over the six years since its inception. This positive economic story resulted in part because the RGGI states opted to invest nearly all of the proceeds received from RGGI allowance auctions back into the economy. The RGGI states did

---

5 At the outset of the program, Connecticut, Delaware, Massachusetts, Maryland, Maine, New Hampshire, New Jersey, New York, Rhode Island, and Vermont all participated in RGGI. New Jersey left the RGGI program in 2011; nine states currently participate in the RGGI program.

6 Owners of new and existing power plants regulated under RGGI must acquire a tradeable allowance for each short ton of CO_2 emitted. Owners of EGUs retire their allowances at the end of a three-year "control period" (also "compliance period").

7 New Jersey left the RGGI program in late 2011, and the emissions cap and goals were readjusted accordingly.

this through expansion of energy efficiency programs, new renewable power projects, assistance to low-income consumers of energy bills, and other programs designed to reduce GHG emissions.

Because Analysis Group's studies of RGGI economic impacts were retrospective, they used historical, real-world data on actual program performance and market outcomes to generate insights into net economic benefits of the program. Retrospective studies like these can provide especially useful inputs to RGGI's regular three-year program review process, during which policymakers in the RGGI states consider adjustments to fine-tune the program's effectiveness and net benefits.

The relationship between programs that improve air quality and public health is well-established: in numerous studies of the costs and benefits of CAA, EPA estimated that improved air quality results in public health benefits that exceed the costs of achieving air quality targets by a 30:1 ratio (U.S. EPA 2011c). Most of the economic value of CAA benefits (about 85 percent) are attributable to health benefits; specifically, reductions in premature deaths associated with reductions in ambient particulate matter (U.S. EPA 2011c). In 2020 alone, EPA estimates that the CAA will prevent over 230,000 early deaths.

Because air pollutants with adverse effects on human health are often co-produced with CO_2 when electric power is generated from fossil-fuel power plants, RGGI and similar GHG programs for the power sector are expected to drive some reductions in levels of these air pollutants. Numerous studies have explored the impact of *future* policies and programs aimed at reducing GHG emissions on air pollution and public health. To date, however, few studies have investigated public health impacts of *existing* GHG reduction programs such as RGGI.

To better understand the impacts of RGGI on public health, Abt Associates conducted an independent study of the program's effect on emissions and air quality during the first two compliance periods—2009 to 2014. The objective of our study is to apply credible, widely accepted tools, methods, and publicly available data to answer the following questions:

- Did the first six years of RGGI's implementation result in measurable changes in emissions of criteria air pollutants and air quality?
- If so, how did changes in air quality resulting from RGGI's implementation affect public health and to what degree?
- What spatial and temporal patterns are evident in changes in air quality and health outcomes resulting from RGGI?
- Will health benefits from RGGI's first two compliance periods be replicated in the future?

1.2 Scope of Analysis

Retrospective analysis. Many policy analyses are *prospective*, that is, they project incremental impacts that are anticipated to occur in the future as a result of policy, relative to a baseline or counterfactual case representing the world without the policy. However, our analysis is *retrospective*, i.e., it looks backward at incremental outcomes and impacts that occurred from 2009 to 2014 as a result of RGGI. Our analysis benefits from having actual historical data for many variables used in the analysis. Specifically, we used EPA datasets to describe actual annual NO_x and SO_2 emissions, annual generation levels, and emission rates at the individual plant level for all power plants located in the RGGI states. In addition, we rely upon

results from electricity market dispatch modeling runs conducted by Analysis Group in 2011 and 2015; these modeling runs also incorporated actual historical data for fuel prices, costs of emissions allowances, power plant retirements and additions, and other electricity market factors (e.g., transmission constraints).[8]

Scope. Below we provide additional detail on the scope of this analysis and how the analytic scope may influence results.

Timeframe: The timeframe addressed by this analysis encompasses the entirety of RGGI's first two compliance periods, i.e., 2009 to 2011, and 2012 to 2014, respectively. This is a somewhat limited picture of the incremental impacts of RGGI in one respect: proceeds invested by the states into energy efficiency programs during the 2009 to 2014 timeframe will continue to generate energy savings *after* 2014, because the incremental energy savings from high-efficiency devices funded through these programs typically persist for 10 to 15 years after installation. Our omission of these additional energy savings in this analysis was due to data and modeling limitations.[9] As such, our estimates likely *underestimate* reduced emissions associated with avoided electricity generation due to RGGI, and thus underestimate health benefits.

Air quality modeling: To estimate changes in air quality associated with RGGI implementation, we use EPA's Co–Benefits Risk Assessment model (COBRA) (U.S. EPA, 2015c). COBRA includes a reduced-form air quality model that estimates the effect of emission changes on formation of fine particulate matter (referred to as $PM_{2.5}$).[10] COBRA does not estimate changes in ozone, another air pollutant with adverse health effects. Thus, this analysis does not estimate benefits associated with ozone reductions, although they are expected to occur. Changes in levels of ambient particulate matter, however, are typically the largest factor driving human health benefits.[11] Therefore, we expect COBRA to capture a large share of RGGI's impacts on health in the region, although our estimates will be conservative.

Geographic scope: The geographic scope of this analysis includes changes in electricity market outcomes and associated emissions changes occurring in states participating in the RGGI program. Because changes in emissions that take place within RGGI states will affect air quality and public health in "downwind" states, we also report results for states within the region affected by the program but not currently participating in RGGI.

Other benefit categories: There are additional benefits associated with reducing emissions of CO_2 and other air pollutants that are outside of the scope of this study. First, this study does not cover the potential health benefits of mitigating climate change, such as fewer heat-related illnesses or cases of vector-borne disease.

The scope of this study also excludes reductions in regional haze, largely caused by $PM_{2.5}$ pollutants scattering the sunlight, which impairs visibility and also contributes to harmful respiratory impacts. EPA

---

8 Descriptions of these dispatch models and results from Analysis Group's use of them in their analyses of RGGI's regional economic impacts can be found in Analysis Group (2011, 2015).

9 Additional detail on tools and methods used for air quality modeling is provided in Section 2.

10 Fine particulate matter is less than 2.5 micrometers in diameter.

11 Anenberg et al. (2010) estimated that in North America annual mortalities due to anthropogenic $PM_{2.5}$ are approximately three to four times greater than annual mortalities due to anthropogenic ozone.

requires reductions in haze through the Regional Haze Rule to improve visibility in federally protected national parks and wilderness areas (U.S. EPA, 1999).

Benefits to ecosystems and natural resources represent a final category of benefits not captured in this analysis. RGGI-related reductions in the deposition of sulfur and nitrogen compounds in the environment, which have adverse effects on terrestrial and aquatic ecosystems, would improve the health of these ecosystems (Miller, 2011). These environmental impacts can also affect human livelihoods and public health.

This remainder of this report is organized as follows:

- **Section 2:** This section provides additional context for changes in air quality and public health as co-benefits of climate mitigation and clean energy policies.
- **Section 3:** This section describes the analytic approach, data, and methods used to estimate changes in emissions, air quality, and public health associated with RGGI implementation from 2009 to 2014.
- **Section 4:** This section provides results of the analysis and discussion of key findings, policy implications, and uncertainties.
- **Appendices:** The appendices include additional background and technical detail describing the air quality and public health modeling tools used in this analysis. Detailed state-level results are available in Appendix E, which is available for download as a separate document. .

2. Co-Benefits of Climate Mitigation and Clean Energy Programs

In addition to reducing GHG emissions, climate mitigation and clean energy programs such as RGGI can create an array of other public benefits—often referred to as "co-benefits"—in the energy system, the environment, and the economy.[12] These co-benefits can figure importantly in the analysis of total benefits and overall policy effectiveness. For example, the Intergovernmental Panel on Climate Change (IPCC) finds that the near-term public health co-benefits from climate mitigation may offset a significant portion of total mitigation costs (IPCC, 2013).

Table 2 lists key categories of co-benefits resulting from climate and clean energy policies, which are described below:

- **Energy system co-benefits** result from investments that improve the overall performance and efficiency of electricity grid operations. Energy system co-benefits include reduction in electricity losses over transmission lines (typically up to 10 percent), and alleviating load at times of peak demand. In addition, a more efficient system featuring a higher level of distributed generation resources (in contrast to large centralized power plants connected by long-distance transmission lines) can increase the resilience of the grid to severe storms while also enhancing reliability.
- **Economic co-benefits** associated with a more efficient and decentralized electricity grid include: direct savings on energy bills by consumers and businesses; reductions in high costs of serving peak load; and reducing imports of fossil fuels and thereby retaining more capital in the region. Regional employment and economic development can benefit directly from the growth of clean energy industries. In 2016, the 9 RGGI states plus New Jersey ranked in the top 20 states in the United States for total capital investments in energy efficiency, renewables, clean technology ventures, and policies supporting energy efficiency and clean technology (Clean Edge 2016). In Massachusetts for example, clean energy employment grew more than eight times faster than the overall growth rate across all Massachusetts industries from 2011 to 2013 (Massachusetts Clean Energy Center, 2013).
- **Public health co-benefits** result from improvements to environmental endpoints—airsheds and watersheds—as pollutant loadings to air and water are reduced via lower energy demand and shifting of energy generation to cleaner sources. Emissions of fine particulate matter, which can be emitted directly from sources or formed secondarily through atmospheric chemical processes, can cause premature death, heart attacks, and strokes, as well as harmful effects on the respiratory system, including asthma attacks. This category of co-benefit is the primary focus of this report; however, as noted below, reductions in emissions of mercury (Hg) and ozone-forming NO_x can also result from policies targeting GHGs and are also beneficial to human health.
- **Environmental co-benefits** of climate and clean energy programs arise from reducing total energy demand and shifting generation to cleaner, more efficient sources of generation. Key environmental benefits from clean energy include reductions in emissions of air pollutants and their precursors (e.g.,

[12] These positive outcomes are often referred to as "co-benefits" because they are additional to the direct program objective of reducing carbon emissions and increasing efficiency and renewable energy. While this list of co-benefits associated with climate mitigation and clean energy programs is fairly comprehensive, more in-depth information can be found in the following sources: U.S. EPA (2011a) and Regulatory Assistance Project (2014).

particulate matter (PM), NO_x, SO_2, ozone, air toxics, and Hg), which results in reduced formation and deposition of these pollutants.

Ozone is formed by emissions of nitrogen oxides reacting in the presence of sunlight with volatile organic compounds in the air. Ozone's effects on human health include increased frequency of asthma attacks, shortness of breath, aggravated lung disease, damage to lungs through long-term exposure, additional hospitalizations and emergency room (ER) visits, and premature deaths. Coal-fired power plants and other stationary sources (e.g., incinerators) can also release mercury into the air. Airborne mercury emissions then settle into terrestrial and aquatic ecosystems and can be converted to methylmercury, a harmful neurotoxin. Methylmercury enters into the food chain, where it builds up ("bio-accumulates") in fish through their diet. As a result, the most common source of human exposure to methylmercury occurs through fish consumption.

Table 2. Benefits of Climate Mitigation and Clean Energy Policies

	Energy System	Economic	Public Health	Environmental
Direct benefits	Reduced electricity load and peak demand Increase in distributed generation Reductions in imports of fossil fuels	Energy savings from energy efficiency investments Increased economic activity for energy efficiency and renewable energy sectors	**Improved air quality from co-reductions in emissions of criteria air pollutants**	Reductions in CO_2 emissions and impacts of climate change Reductions of nitrogen, sulfur, mercury, and other air toxics in air and watersheds
Indirect benefits	Fuel diversification Increased energy security Improved grid resilience and reliability	Job creation in clean energy and energy efficiency sectors	Fewer incidences of respiratory and cardiovascular diseases and premature deaths from improved air quality Improved water quality	Improved terrestrial and aquatic ecosystem health Improved visibility Potential reductions in water intake by power plants

2.1 Regional Economic Impacts of RGGI

The RGGI program had a net positive impact on the regional economy of the Northeast over the initial six years of program implementation. This outcome reflects key policy decisions made regarding the sale of nearly $2 billion of CO_2 allowances to owners of fossil-fuel power plants. The decision by RGGI states to auction nearly all emission allowances, rather than distributing allowances directly to regulated entities for free, is a unique and defining feature of the RGGI program.[13] As a result of this key design feature, the states were able to use proceeds collected from allowance auctions during the 2009 to 2014 period for

[13] Emission allowances were allocated freely to regulated utilities under both the Acid Rain and NO_x Budget Programs.

public benefit purposes. Each state determined how to deploy its share of RGGI proceeds based on its own legislative and public policy priorities.[14] During the first two compliance periods of RGGI, states participating in the program invested a substantial portion of auction proceeds into energy efficiency programs, renewable energy generation, and other GHG reduction programs. By investing proceeds into programs that themselves generate additional reductions in GHG emissions and energy demand, the RGGI states essentially leveraged revenues from proceeds to amplify the magnitude of GHG emissions reductions achieved, beyond those that would have been achieved solely from placing a cost on the right to emit CO_2.

Analysis Group's empirical review of the RGGI states' strategic investments of proceeds from RGGI auctions into efficiency and clean energy programs showed that these programs generated economic benefits to consumers and business, and an increase in output and employment in the region. Using six years of actual data gathered from RGGI's first two compliance periods, Analysis Group conducted consecutive analyses (in 2011 and 2015, respectively) that tracked individual RGGI states' investments of proceeds on an annual basis, and then estimated direct and indirect impacts of the program on the regional economy. In its calculations, Analysis Group accounted for the effects of the RGGI program on power system dispatch, net energy costs to consumers, revenues to electric generators, and overall state economic performance (Analysis Group, 2011, 2015).

Both the 2011 and 2015 Analysis Group studies arrived at similar conclusions: RGGI states' investments of auction proceeds into energy efficiency, renewable energy, climate mitigation activities, and direct rebates resulted in positive impacts on the region's economic value-added and employment. Analysis Group found that in the period 2009–2011, economic value-added in the RGGI states totaled $1.6 billion, and found similarly that economic value added in the period 2012–2014 was $1.3 billion. These benefits were found to be due in part to the states' combined investments in energy efficiency and clean energy in both compliance periods (Analysis Group, 2011, 2015). Additional economic value-added translated to an average of $31 per capita in the region for the 2012 to 2014 compliance period alone (Analysis Group, 2015). In addition, employment in the RGGI states increased by more than 16,000 job-years in the period 2009–2011, and 14,000 job-years from 2012 to 2014. Table 3 summarizes these key findings from Analysis Group's studies.

Table 3. Summary of RGGI Economic Benefits, 2009 to 2014

Type of Economic Impact	First Compliance Period (2009-2011)[1]	Second Compliance Period (2012-2014)[2]
Total value-added to RGGI states	$1.6 billion	$1.3 billion
Net job creation[3]	16,000 job-years	14,200 job-years

Source: Analysis Group (2011, 2015).

1. Reported in 2011 dollars, on a net present value basis using a discount rate of 3 percent.

[14] The 2005 Memorandum of Understanding and the 2008 revised Model Rule designate a minimum of 25 percent of each state's allowance proceeds to go to a "consumer benefit or strategic energy purpose." In practice, states are vastly exceeding the required minimums for public benefit or energy purposes. Allowances are apportioned through state allowance budgets, which are largely based on historical power plant emissions in each state and an agreed-upon formula. The allotment of allowances then determines the magnitude of each state's proceeds from the allowance auction.

2. Reported in 2015 dollars, on a net present value basis using a discount rate of 3 percent and reflects adjustments for inflation.
3. A job-year is defined as providing full-time job for one year.

Analysis Group's studies confirm that investments in energy efficiency acted as an important economic multiplier. Adopting energy efficiency measures reduces the total demand for electricity generation, and reduces wholesale electricity prices through impacts on system dispatch. Consumers who reduce their electricity use by becoming more efficient save on monthly energy bills. On a macroeconomic scale, reduced demand through energy efficiency and expansion of renewables lowers the total amount paid to fossil-fuel generators located outside of the RGGI region. Overall, higher per-kilowatt costs passed on to electricity consumers to cover the costs of CO_2 allowance purchases in the short term are offset by energy bill savings resulting from RGGI proceeds investments within the region (Analysis Group, 2015).

In the next section, we provide additional context for this evaluation of RGGI's impact on air quality and public health.

2.2 Impacts of Climate and Clean Energy Programs on Air Quality and Public Health

Policies and programs that reduce GHG emissions from electric power plants and other fossil-fuel stationary sources (e.g., industrial boilers) can also achieve important public health benefits. Fossil-fuel power plants emit not only CO_2 but also other air pollutants with proven adverse effects on human health, including fine particulate matter ($PM_{2.5}$), NO_x, SO_2, Hg, and air toxics.

Power plant emissions of NO_x, SO_2, and other pollutants impact air quality at the local level to varying degrees, depending on characteristics of the source,[15] spatial distribution of emissions, and local meteorological conditions that dictate the formation of pollutants with adverse health effects. The burning of fossil fuels releases SO_2, which contributes to the formation of acid rain and $PM_{2.5}$ and can cause impact human respiratory and cardiovascular systems. NO_x emissions also form $PM_{2.5}$ and ground-level ozone, thereby exacerbating negative impacts of this air pollutant. Fine particulate matter composed of airborne solid particles and liquid droplets carries a mixture of soot, smoke, toxic metals, and many other harmful chemical pollutants; inhaling the fine particulate matter can lead to severe health effects. By entering the lungs and even the bloodstream, these air pollutants can cause or aggravate respiratory conditions and cardiovascular diseases and can lead to premature death.

Below we describe results of recent prospective analyses of the impacts of national- and regional-level climate mitigation and clean energy policies on air quality and public health.

Findings from Recent Studies

A number of recent studies have demonstrated the link between policies aimed at reducing GHG emissions, associated changes in levels of air pollutants, and resulting impacts on human health. Generally, these studies rely upon a multi-step analytic approach that is similar to the process employed

[15] For example, the height of the emissions stack affects dispersion and formation of air pollutants, particularly through wind patterns that contribute to interstate transport of air pollutants. While tall stacks may be designed to limit negative air quality impacts on the local community, the overall pollution does not diminish, it is only transported downwind.

in this analysis (described in Section 3). The first step is to estimate the impact of a proposed policy on emissions of criteria air pollutants. Then, air quality models are applied to estimate how changes in emissions of air pollutants resulting from the policy modify levels of air pollution in specific geographic locations. Finally, a public health model is used to estimate changes in public health outcomes associated with air quality changes to specific geographic locations and populations, and the associated economic value of health impacts.

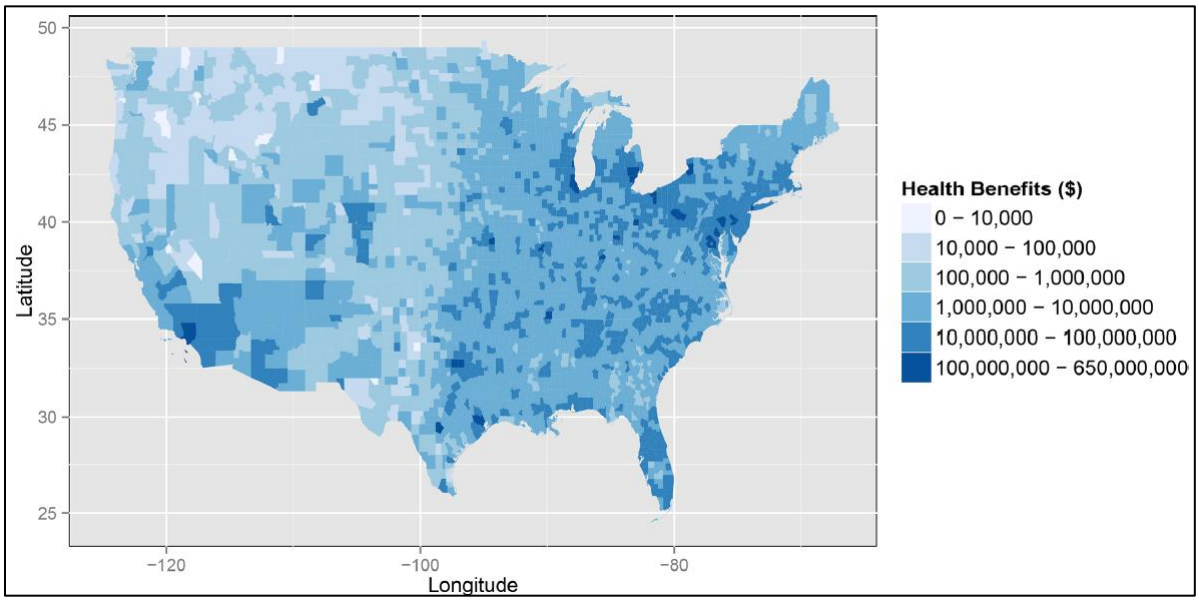
Based on an analysis of three national-level climate mitigation policies (for the electric sector, transportation sector, and an economy-wide trading system, respectively), a 2014 study by concluded that the health benefits associated with reduced $PM_{2.5}$ and ozone could offset some or all of the near-term costs of these policies (Thompson et al. 2014). Estimated public health benefits offset costs of mitigation by a range of 26 to 1,000 percent, with the economy-wide trading system offering the greatest flexibility and the largest potential net-benefits to health. Emission reductions occurring through a clean energy standard generated a median of nearly $40 billion in net benefits, accounting for nearly 120 percent of costs.

A 2015 study compared three national-level climate policies to determine which policy achieved the largest public health co-benefits, based on estimated changes in $PM_{2.5}$ and ozone (Driscoll et al., 2015). The authors found that limiting carbon emissions from power plants, while providing flexible compliance mechanisms and emphasizing energy efficiency investments, resulted in greater health co-benefits than a carbon tax of requiring heat-rate improvements at coal-fired plants. The energy efficiency investment scenario resulted in an estimated 3,500 premature deaths avoided nationally (with a range of 780 to 6,100) through changes in $PM_{2.5}$ and ozone. The study found that air quality improvements are maximized by shifting electric generation from coal plants to lower-carbon emitting sources and investing in demand-side efficiency measures.

A more recent study of a moderately stringent, highly flexible national policy scenario modeled after the final Clean Power Plan (EPA's proposed rule for power plants' GHG emissions nationally) estimates that public health benefits will exceed implementation costs by $12 billion per year in 2020 (Buonocore et al. 2016). The value of health benefits in RGGI states ranged from $10,000 to $100 million per county (see Figure 3). Under this scenario, the study estimates a total of $880 million in public health benefits in the New England states. Among New Jersey, Delaware, Maryland, and Virginia (a non-RGGI state[16]), the study estimates a total of $3 billion in public health benefits. For New York alone, the study estimates a total of $1.6 billion in health benefits.

[16] Throughout this report, we use the term "non-RGGI" to refer to states in the Northeast U.S. that are not participating in the RGGI program.

Figure 3. Total Annual Health Benefits in 2020 by County for Moderately Stringent, Highly Flexible Carbon Standards



Source: Buonocore et al. (2016).

Notably, the authors modeled investments in energy efficiency measures beginning in 2013 and increasing until 2025. Associated benefits from energy efficiency accrue years after initial investments are made; therefore, a comparison of costs in 2020 to benefits in 2020 does not take into account total benefits expected when the modeled regulation reaches its full effect in 2030. The authors conclude that not only are health benefits realized in the near term, they are also expected to extend past 2020 (Buonocore et al. 2016).

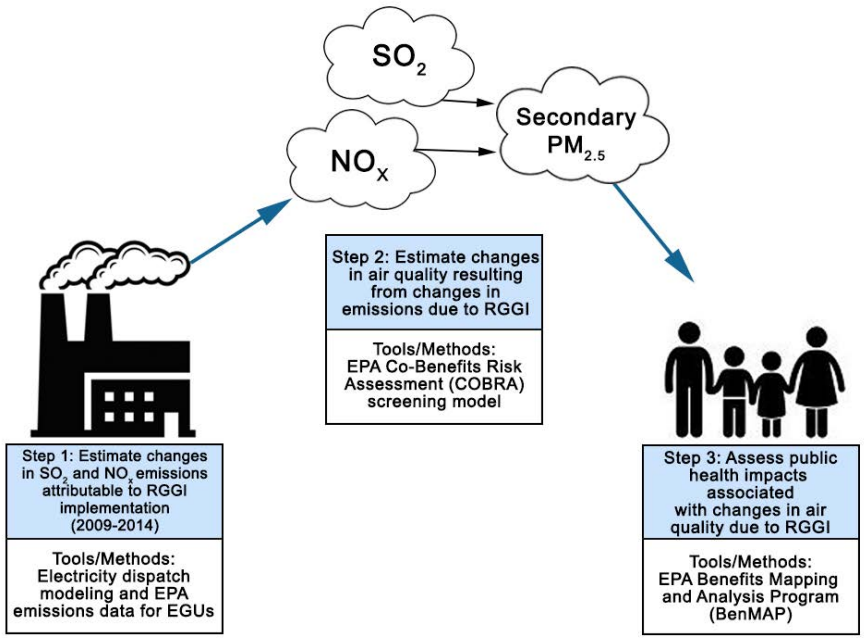
Despite the diversity and complexity of climate and energy scenarios modeled in these studies, they point to a consistent conclusion: there is potential for public health benefits to meet or exceed costs of mitigating GHG emissions by a significant degree. As Thompson et al. (2014) and Buonocore et al. (2016) both observe, estimates of overall net benefits are more sensitive to estimates of mitigation costs than to public health and other benefits.

3. Analytic Approach

We used a three-step analytic process to estimate the impacts on air quality and public health resulting from implementation of the RGGI program from 2009 to 2014. As shown in Figure 4, each of these steps relies upon a specific modeling tool (or tools) and datasets to estimate the incremental impacts of RGGI on the following variables: generation (in megawatt-hours (MWh)) by power plants, air pollution emissions, air quality, and public health.

This analysis was highly sequential—results from each analytic step were inputs to the next modeling tool in this process. At each stage of the analysis, we reviewed draft results at a highly disaggregated level and performed quality control before using results as an input to the next analytic step. In many cases, draft results were benchmarked to results from similar analyses and studies as another cross-check.

Figure 4. Overview of Analytic Steps and Tools



Source: Abt Associates analysis (2017).

Step 1: Estimate annual changes in electric generation and emissions of air pollutants at power plants as a result of RGGI implementation from 2009 to 2014.

To determine annual changes in emissions of air pollutants from electric power plants associated with RGGI implementation, we first estimated changes in electricity generation in participating RGGI states. For this step, we relied upon results from electricity dispatch modeling performed by Analysis Group in support of their studies of RGGI's regional economic impacts. These dispatch modeling runs were used to calculate incremental differences in electricity market outcomes between an "RGGI" scenario, and a counterfactual "No RGGI" scenario. Specifically, the difference in results of these two scenarios is the

incremental change in annual generation levels (in MWh) for power plants located in the RGGI states (including plants not regulated under RGGI).[17]

We then used actual, annual plant-level emissions and pollution control data from EPA to calculate changes in NO_x and SO_2 emissions associated with changes in generation at the power plant level due to RGGI.[18] Changes in plant-level NO_x and SO_2 emissions were aggregated at the county level for each year from 2009 to 2014, and then became the key inputs to the air quality modeling conducted in Step 2.

Step 2: Estimate annual changes in air quality at the county level associated with changes in SO_2 and NO_x emissions from power plants, by year.

For this step in the analysis, we used the COBRA model, developed by EPA to conduct screening-level analyses of the effect of changes in emissions on air quality. We ran COBRA using inputs of annual changes in SO_2 and NO_x emissions aggregated for each county in all RGGI participating states derived under Step 1 of the analysis.

COBRA's air quality model simulates chemical reactions in the atmosphere that transform NO_x and SO_2 into components of particulate matter. In the northeastern United States, these components constitute the majority of $PM_{2.5}$ resultant from power plant emissions and make up more than half of all ambient $PM_{2.5}$ (NARSTO, 2004). As noted earlier, as a simplified air quality model, COBRA does not model formation of ozone, although this is a major pollutant in the Northeast.

COBRA's outputs are changes in annual ambient $PM_{2.5}$ at the county level, which are the inputs to public health modeling conducted under Step 3.

Step 3: Assess public health impacts associated with changes in air quality due to RGGI implementation from 2009 to 2014.

We used the Benefits Mapping and Analysis Program (BenMAP) to translate county-level changes in annual ambient $PM_{2.5}$ from Step 2 into county-level changes in the frequency of various adverse health events among a population, referred to as incidences. BenMAP uses inputs of air quality changes, population, and baseline health incidences (i.e., the background frequency of a health impact in a population) to estimate the public health changes resulting from changes in air quality. BenMAP then estimates the economic value of health incidences avoided based on a synthesis of multiple economic valuation studies.

3.1 Estimating Changes in Emissions due to RGGI

Estimating changes in emissions due to RGGI requires isolating RGGI's incremental effect on the electricity market from that of the many other factors affecting the complex electric power system. Variations in weather and economic growth can influence electricity demand. And before RGGI's

[17] The scope of results from the dispatch modeling runs used in this analysis reflected changes in generation by power plants located in RGGI states, but did not include changes in other states and provinces adjacent to or with interconnection to RGGI. Results from dispatch modeling were also available for Pennsylvania but were not validated for plant additions, retirements, and other changes that occurred during the timeframe of this analysis.

[18] While power plants also emit other pollutants that affect air quality and health (such as mercury and air toxics), these pollutants' effects on air quality are not captured in the air quality modeling tool applied in this analysis.

inception in January 2009, major transformations in the market for natural gas, which is a key fuel used in electricity production, were underway. Advancements in shale gas extraction methods significantly increased the supply of domestic natural gas and resulted in substantial decreases in natural gas prices beginning in 2008.[19] Also in this timeframe, effects of the 2009 recession dampened demand for electricity.

In 2010, RGGI Inc. commissioned a study[20] to examine the role of factors that contributed to a 33 percent decrease in CO_2 emissions from the electric power sector across RGGI states, from 2005 to 2009 (RGGI Inc., 2010).[21] As shown in Figure 5, the study found that fuel-switching from oil and coal to lower-cost natural gas accounted for nearly one-third of the decline in CO_2 emissions from 2005 to 2009. An additional 25 percent of emissions reductions were due to weather, whereas the economic recession was responsible for a small fraction (about 4 percent) of emission reductions. Changes in available generation capacity (i.e., reduced coal capacity and increased nuclear, wind, and hydropower capacity) together accounted for nearly 21 percent of the reduction in emissions.

Finally, energy efficiency and customer-sited renewable generation accounted for approximately 12 percent of emissions reductions over this timeframe. While the study was not an analysis of the effect of the RGGI program, it showed that fuel-switching to natural gas and weather variations were more significant factors in the rapid decline of CO_2 emissions over the 2005 to 2009 timeframe than economic conditions or changes in the mix of available generation capacity.

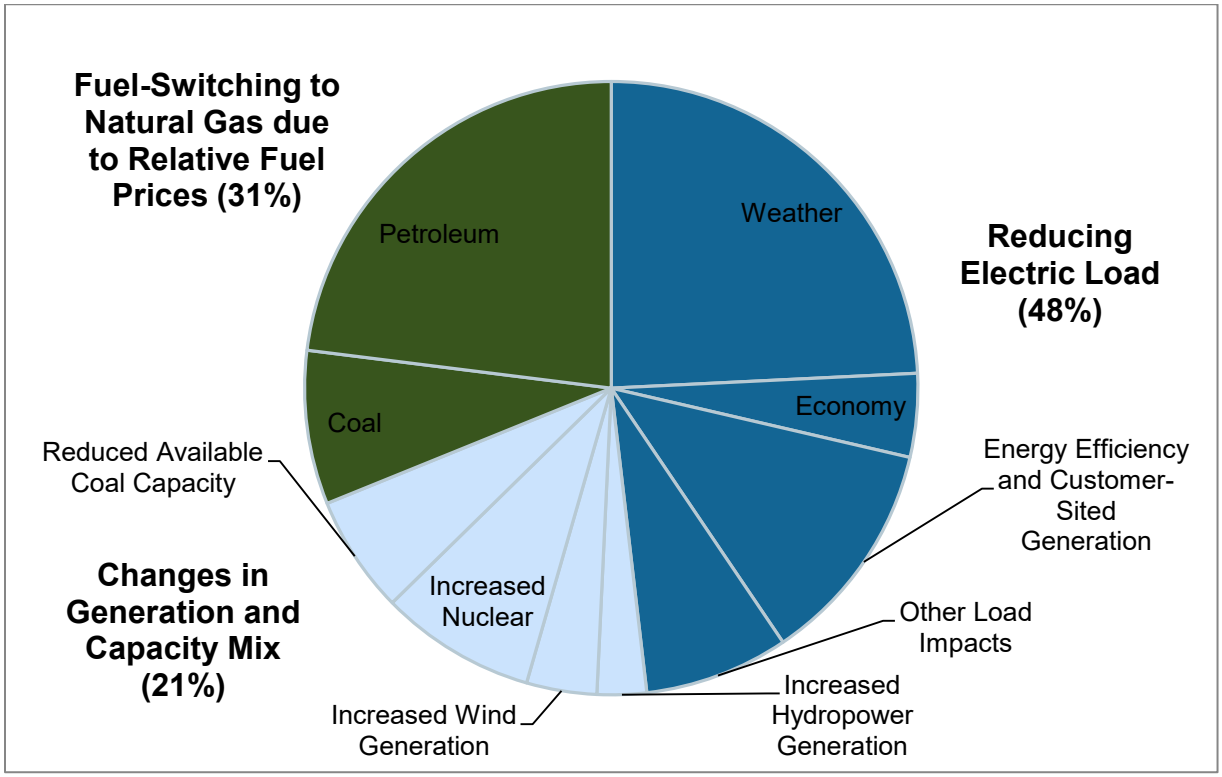
---

[19] The Henry Hub price for natural gas fell by nearly 70 percent between 2008 and 2015 (EIA, 2016).

[20] This study was conducted for RGGI Inc. in 2010 by the New York State Energy Research and Development Authority.

[21] Note that the timeframe of the RGGI Inc. study preceded RGGI program implementation and was focused on changes in emissions that pre-dated RGGI.

Figure 5. Factors Influencing CO_2 Emission Reductions in RGGI States, 2005-2009



Source: RGGI Inc. (2010).

Note: Connecticut, Delaware, Maryland, Massachusetts, Maine, New Hampshire, New Jersey, New York, Rhode Island, and Vermont are included in this analysis.

A more recent study focused specifically on RGGI's role in reducing regional CO_2 emissions during the first compliance period (2009 to 2011) (Murray and Maniloff 2015). Using econometric modeling, the study isolated the incremental effect of RGGI on emissions from that of other factors, including lower natural gas prices, the 2009 economic recession, and other environmental and energy programs, including states' minimum requirements for renewable energy generation (known as Renewable Portfolio Standards). Accounting for these factors, the study found that CO_2 emissions would have been 24 percent higher in the region over the first compliance period if the RGGI program did not exist (Murray and Maniloff 2015).[22]

[22] The study compared changes in CO_2 emissions from the electric sector from 1990-2008 to the 2009-2012 period and found that without low natural gas prices, the RGGI program, the recession, or state renewable goals, CO_2 emissions would have been 52 percent higher across the region. The same counterfactual scenario applied nationally found total CO_2 emissions would have only been 11 percent higher from 2009 to 2012. As such, the study concluded that nearly half of the actual CO_2 emissions reductions in RGGI states during this time period can be attributed to RGGI program implementation. The Murray and Maniloff study did not distinguish between the impact of RGGI's CO_2 allowance price from the effects of RGGI states' investments in energy efficiency and renewable energy on emissions, but noted that both are key aspects of RGGI's effect on generation and emissions.

For this analysis, we relied upon results from dispatch modeling of RGGI's first two compliance periods conducted by Analysis Group. These modeling runs estimated RGGI's incremental effect on overall electricity demand, the mix of generation sources and dispatch from power plants in the RGGI states, independent of changes in other variables over the 2009 to 2014 timeframe. These modeling runs provide an estimate of RGGI's incremental effect on the electricity market by simulating a "RGGI" scenario and a "No RGGI" counterfactual scenario. Modeling of the RGGI scenario depicted the two primary direct effects of the program on the wholesale power market, as described below:

- **Costs of CO_2 allowance purchases:** Owners of large fossil-fuel power plants purchase CO_2 allowances to meet RGGI's cap on emissions, and then build the costs of these purchases into the price at which they are willing to supply power to the wholesale market.[23] In this way, the cost of CO_2 allowances affects prices for power in many hours, which in turn can alter marginal generation (i.e., the last generator dispatched to meet hourly demand) from higher- to lower-carbon generation sources.
- **Investments of RGGI proceeds into energy efficiency (EE) and additional renewable generation (RE):** States' investments of RGGI proceeds into energy efficiency measures result in reductions in overall electricity demand and changes in the shape of annual electricity demand profiles.[24] Although much smaller than states' investments in energy efficiency, investments of RGGI proceeds in customer-sited renewables increase the capacity for low- or zero-carbon electricity. Demand-side efficiency investments and an increase in renewable capacity together shift demand for fossil-based electricity downward, resulting in changes to the mix of generation sources dispatched and associated emissions.

The No RGGI scenario is a counterfactual case of power market outcomes absent these two effects of RGGI. In this counterfactual scenario, all other variables affecting power markets except for RGGI (i.e., fuel prices, transmission constraints, NO_x and SO_2 allowance prices, state renewable energy requirements, plant retirements and additions) were held constant to the RGGI scenario. The difference between these two scenarios (i.e., RGGI and No RGGI) represents RGGI's incremental effect on the power system; specifically, changes in hourly generation by power plants located in RGGI states.

Because this analysis is retrospective, we had access to actual historical data depicting annual generation and emissions at individual power plants under RGGI. However, our retrospective approach also presented some analytical challenges in cases where results for the modeled RGGI scenario differ from

---

[23] New England and many mid-Atlantic states have competitive markets for electric power, which means that prices bid into the market by power plant owners should be close to the marginal costs of producing the last unit needed to meet hourly electricity demand.

[24] Different energy efficiency programs tend to reduce hourly electricity demand in different ways, and thus affect the "shape" of customer demand over the course of the year in addition to reducing the total aggregate demand across the year. For example, energy efficiency programs that focus on replacing older, inefficient air conditioning units with newer, more efficient models generate reductions in electricity demand almost exclusively in summer daytime hours, when electricity demand peaks across the Northeast region. An air conditioning energy efficiency program thus alters the "shape" of electricity demand by generating reductions only in summer daytime hours. This, in turn, disproportionately reduces generation from the most expensive, least efficient, and most polluting generating resources during the highest-load hours of the year.

actual RGGI data. Such differences are typical because dispatch models simulate economically optimized outcomes that do not perfectly align with power producers' actual, real-world decisions.

To calibrate dispatch modeling results to actual, "real-world" outcomes, we based our analysis on the *relative* incremental effect of RGGI simulated by the dispatch modeling. Using actual data for RGGI, we constructed a new No RGGI scenario by applying the *percent difference* between emissions levels from the modeled results for the RGGI and No RGGI scenarios to actual emissions levels under RGGI. The difference between the RGGI emissions inventory and the No RGGI emissions estimate is the incremental change in emissions due to RGGI. These emissions changes then become the inputs to Step 2 of the analysis described below.

Appendix A includes descriptions of specific calculations and datasets used in our analysis of incremental emissions changes due to RGGI.

3.2 Air Quality Modeling

EPA developed the COBRA model to conduct screening-level analyses of the effect of emissions changes on air quality. COBRA models the ambient air quality changes that result from criteria pollutant emissions using a simplified air dispersion model, which quantifies the relationships between emissions from each source and air quality (average annual $PM_{2.5}$) in each county. As described earlier, the choice to apply the COBRA air quality modeling tool for this analysis results in a somewhat more limited picture of actual changes in air quality than could be developed with a more detailed air quality modeling tool.[25] To reiterate, COBRA estimates how changes in emissions of primary $PM_{2.5}$, SO_2, and NO_x result in changes in ambient levels of $PM_{2.5}$, but COBRA does not model changes in ozone formation.

We used the COBRA model in order to estimate changes in air quality due to RGGI implementation. To run the COBRA model, we input estimated annual changes in SO_2 and NO_x emissions derived under Step 1 of the analysis, aggregated at the county level, for all counties in RGGI participating states. We input these into COBRA for each modeling year 2009 through 2014 and then performed a COBRA run for each of these years. Outputs from each of these COBRA runs are changes in annual levels of ambient $PM_{2.5}$ for each county, and are expressed in micrograms per cubic meter ($\mu g/m^3$). Annual county-level changes in ambient $PM_{2.5}$ then became the inputs to Step 3, modeling of public health impacts.

The scope of our analysis of air quality excludes the effect of energy savings associated with RGGI states' investments in energy efficiency made in the 2009 to 2014 timeframe that persist past 2014. To include the effect of these energy savings on air quality and health would require a projection of emissions inventories for all sectors to support additional COBRA modeling runs for each year subsequent to 2014. Because projections for future baseline emissions are currently unavailable for this timeframe, however, the impact of these energy savings was excluded from this analysis.[26]

---

[25] For example, the Community Multiscale Air Quality and CAMx models are often used to conduct cost-benefit studies of major proposed regulations—these models are capable of very detailed atmospheric modeling to estimate how emissions form ambient levels of ozone and ambient fine particles at very granular geographic levels.

[26] Specifically, the only annual emissions projection currently available from EPA is for the year 2025.

COBRA and underlying assumptions and data sources used for this step are described in more detail in Appendix B.

3.3 Public Health Modeling

To estimate the public health benefits resulting from RGGI, we used EPA's BenMAP, Version 4.0.67.[27] BenMAP uses data describing population, frequency of baseline health outcomes, and economic values to estimate the number and economic value of health impacts resulting from changes in air quality.

Abt Associates designed and implemented the original BenMAP model for EPA, which was the first publicly available model for valuing the health impacts of changes in air quality. EPA's current version of BenMAP[28] is being deployed around the world by government agencies and others for generating estimates of public health improvements resulting from reductions in air pollutants.

We used the county-level estimates of RGGI's effect on $PM_{2.5}$ relative to observed ambient $PM_{2.5}$, generated by COBRA under Step 2, as inputs to BenMAP. BenMAP used these estimated changes in ambient $PM_{2.5}$ to calculate the health benefits resulting from RGGI for 2009-2014.

BenMAP and underlying assumptions and data sources used for this step are described in more detail in Appendix C.

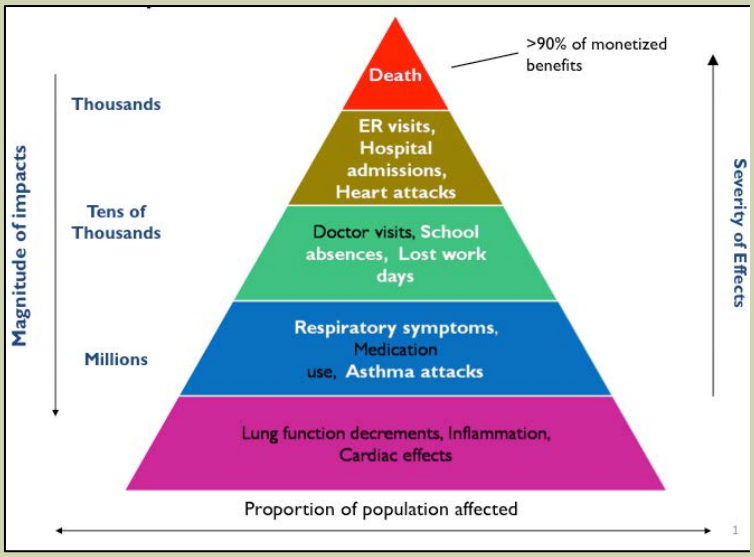
[27] COBRA also has functionality to estimate health benefits, but we selected BenMAP over COBRA for this step of the analysis because BenMAP allows us to capture changes in baseline population, incidence, and valuation over the entire study timeframe. While COBRA is an appropriate tool for estimating ambient air quality, the fact that its datasets are tied to a specific calendar year limits its representation of how air quality affects public health over time.

[28] This version is known as BenMAP-Community Edition.

How Does BenMAP Value Health Benefits?

As a society we value a clean, safe environment and a healthy population. Without an explicit value tied to a public good such as clean air,[1] it is challenging to evaluate the costs, benefits, and overall effectiveness of policies and programs that enhance or protect public goods. To estimate the value of public goods that are not traded in markets, economists rely upon a range of methods. One approach to quantifying the value of programs that benefit human health is to calculate the value of avoiding the "cost of illness," such as medical expenses and lost productivity. Another method is based on the value that individuals are willing to pay to avoid illness or reduce the risk of premature death.

Effects of Air Pollution on Health



Source: U.S. EPA (2016a).

To estimate a value for health benefits resulting from a reduction in air pollution, BenMAP estimates the value of total avoided health costs. BenMAP links air quality changes to public health outcomes by applying empirical relationships derived from epidemiological studies between air pollutants and 12 categories of human health effects (described in detail in U.S. EPA, 2015a). The economic value of improving air quality increases with the number of avoided premature deaths and illnesses, though the value of different avoided health effects can vary widely. For example, the economic, or "monetized" value for an avoided case of adult mortality is over $9 million, compared to the monetized value of an avoided case of respiratory symptoms ($22-$36); see Appendix C for a table of avoided health effects and their economic values.

As the "pyramid of effects" in the accompanying figure illustrates, the majority of monetized health benefits from reductions in air pollutants arise from a small number of avoided premature deaths (U.S. EPA, 2016a). The value of an avoided premature death is an estimate of how much people are willing to pay for small reductions in the risks of premature death (U.S. EPA, 2016b). This concept of avoided risk is commonly expressed as the "value per statistical life" (VSL), and is a commonly used value in economic and regulatory analysis of environmental and public health policies. It is important to note that the VSL concept represents the sum of many small risk reductions that are then aggregated, and does not represent the monetary value of an individual life.

4. Results and Discussion

In this section of the report, we discuss results from each analytic step used to determine RGGI's impact on public health. We then provide an overview of key findings, policy implications, and uncertainties for these results.

4.1 Changes in Generation due to RGGI

We calculated changes in electricity generation due to RGGI first on an absolute basis (in MWh per year), and then expressed them as a percentage relative to generation that would have occurred in the No RGGI scenario. These percentages are based on generation changes in RGGI-participating states only. Table 4 shows that the RGGI program resulted in a net reduction in electricity generation in every year of the first two compliance periods.[29]

Table 4. Annual Change in Generation due to RGGI

	2009	2010	2011	2012	2013	2014
Generation change in RGGI States	-5.8%	-2.9%	-2.0%	-3.4%	-7.0%	-6.9%

Source: Abt Associates analysis (2017).

Reductions in annual generation ranged from a low of 2.0 percent in 2011 to a high of 7.0 percent in 2013. Changes in generation as a result of RGGI were lowest overall in 2010 and 2011. The most significant RGGI-induced changes in generation occurred in 2009, 2013, and 2014.

In competitive electricity markets, changes in any number of variables, including fuel prices, weather, and plant and system operational changes, can cause variations in the level of electricity dispatched by a given power plant (or group of plants) from year to year. In this analysis, however, our modeling results account for all of these factors and thereby isolate the incremental effect of RGGI on electricity markets and dispatch. Thus, we interpret RGGI-induced changes in generation to be a result of the combination of (1) RGGI states' investments in energy efficiency and renewable energy and (2) the effect of CO_2 allowance prices on electricity dispatch. Our analysis does not quantify the individual contributions of these elements of the RGGI program to RGGI's overall net effect.

In addition to allowance prices and states' investments in EE and RE, the "announcement effect" is another factor that may have influenced the market response to RGGI. This effect describes the response by power plants owners to RGGI states' announcements of their intentions to join the RGGI system. If a plant owner believes an announcement to be credible, the prospect of future carbon prices can spur them to invest in lower-carbon generation options before the policy starts.[30] A 2015 study found that the

[29] Note that this analysis reflects modeling results only for those states that participated in RGGI at some point during the first two compliance periods. New Jersey participated in RGGI's first compliance period from 2009 to 2011, but did not participate in RGGI's second compliance period from 2012 to 2014. We modeled generation changes in New Jersey for 2009 to 2011, and assumed no generation changes from 2012 to 2014.

[30] Alternatively, if firm or plant owners do not view a policy announcement as credible, they might wait until a program takes effect to act. Murray and Maniloff (2015) noted literature which finds that the announcement effect was significant for policies addressing other air pollutants.

announcement of the RGGI program likely had a statistically significant effect on CO_2 emissions before and shortly after RGGI's start date (i.e., late 2008 and early 2009)—this suggests that owners of power plants in RGGI states did find states' policy announcements to be credible and took early actions to reduce CO_2 emissions (Murray and Maniloff 2015). The anticipation of pending CO_2 emissions limits may have affected plant owners' demand for CO_2 allowances and generation bids in 2009, the first year of the program.

Note that these results do not reflect changes in generation that may have occurred at power plants located in states or Canadian provinces (e.g., Quebec) adjacent (and with interconnection) to RGGI states, but not participating in RGGI. It is possible that changes in the marginal costs of electricity dispatch associated with pass-through of the cost of CO_2 allowance purchases by plant owners in RGGI states resulted in increases in electricity dispatch in non-RGGI states and provinces outside RGGI to some degree. Modeling by Resources for the Future (RFF) in 2004 projected that under RGGI, generation and CO_2 emissions in non-RGGI states would increase due to RGGI. Specifically, RFF estimated that that for every 100 tons of CO_2 reductions within the RGGI region, non-RGGI states and provinces adjacent to the RGGI region could emit an additional 37 tons of CO_2, a dynamic known as "leakage" (RFF, 2004).

RGGI Inc. (2013) examined patterns in generation in neighboring states over the first three years of RGGI implementation, and did not find conclusive evidence of substantial leakage to generators in non-RGGI states:[31] CO_2 emissions from non-RGGI electricity generators did not appreciably increase during 2009 to 2011 relative to a base period of 2006 to 2008, and total electric generation from all non-RGGI electric generation sources serving load in the RGGI region increased by only 1.2 percent, or 3.3 million MWh, over the same timeframe. A later RGGI Inc. study (2016) found that generation from all generators in non-RGGI states increased by nearly 12 percent in 2012 to 2014 compared to the 2006 to 2008 base period. However, neither RGGI Inc. study estimated RGGI's incremental effect on changes in generation in non-RGGI states and provinces relative to a counterfactual scenario, and thus are inconclusive with respect to the program's incremental impact on CO_2 emissions from these jurisdictions.

To account for the uncertainty in RGGI's effect on generation and emissions from fossil-fuel generators located in neighboring non-RGGI states and provinces, we applied a sensitivity factor that discounts benefits in non-RGGI states by 50 percent to represent a low-end estimate. Our high-end estimate of our range of estimates assumes 100 percent of benefits for non-RGGI states were realized.

4.2 Changes in Criteria Pollutant Emissions due to RGGI

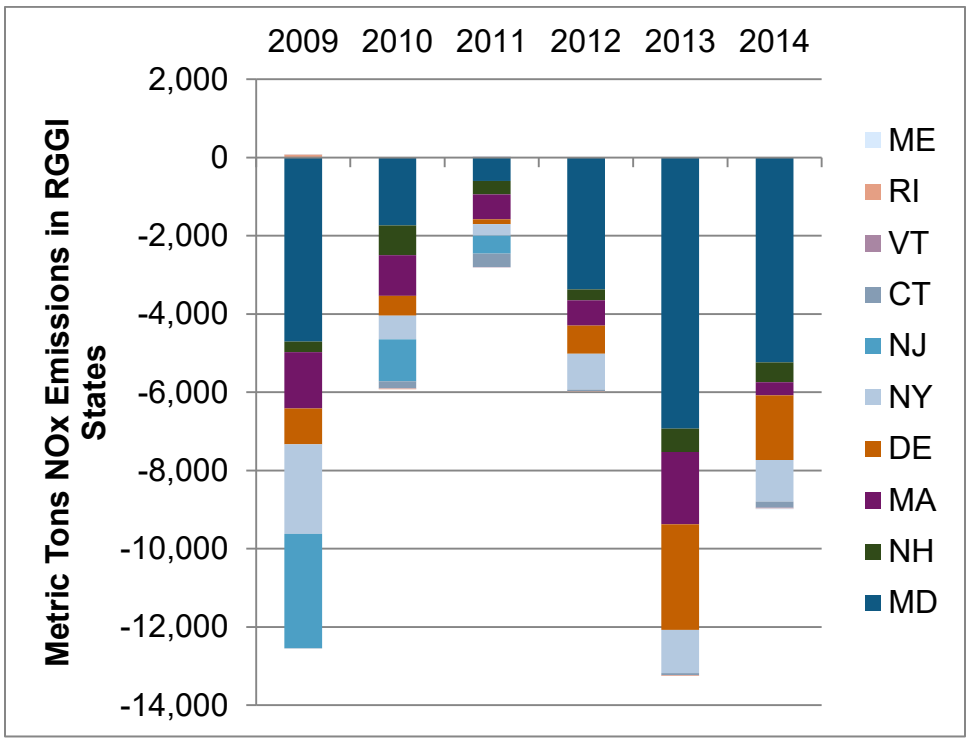
As described earlier, this analysis tracks changes in emissions of SO_2 and NO_x resulting from RGGI implementation. Annual changes in levels of these pollutants are the primary inputs to modeling of RGGI's impacts on air quality and public health.

Results of this analysis show that RGGI resulted in net reductions of both pollutants in each year of RGGI's first two compliance periods. Figure 6 shows that the largest reductions in NO_x emissions due to

[31] Note that RGGI Inc.'s monitoring reports are based only on comparisons of empirical data for generation and CO_2 emissions since RGGI's start in 2009 to similar data before the program began, and do not include modeling of a counterfactual No RGGI scenario. As such, RGGI Inc. notes that it cannot say conclusively what the likely magnitude of changes in generation and CO_2 emissions from neighboring non-RGGI states would have been in the absence of the RGGI program.

RGGI also coincide with years with the most significant declines in generation—2009, 2013, and 2014. In 2009, NO_x reductions from Maryland plants accounted for about one-third of total reductions, with plants in New York and New Jersey also accounting for significant NO_x reductions. In 2013 and 2014, reductions from plants located in Maryland and Delaware accounted for most of the reductions in total NO_x emissions. Decreases in NO_x emissions due to RGGI were at their lowest levels in 2010, 2011, and 2012.

Figure 6. Changes in NO_x Emissions due to RGGI

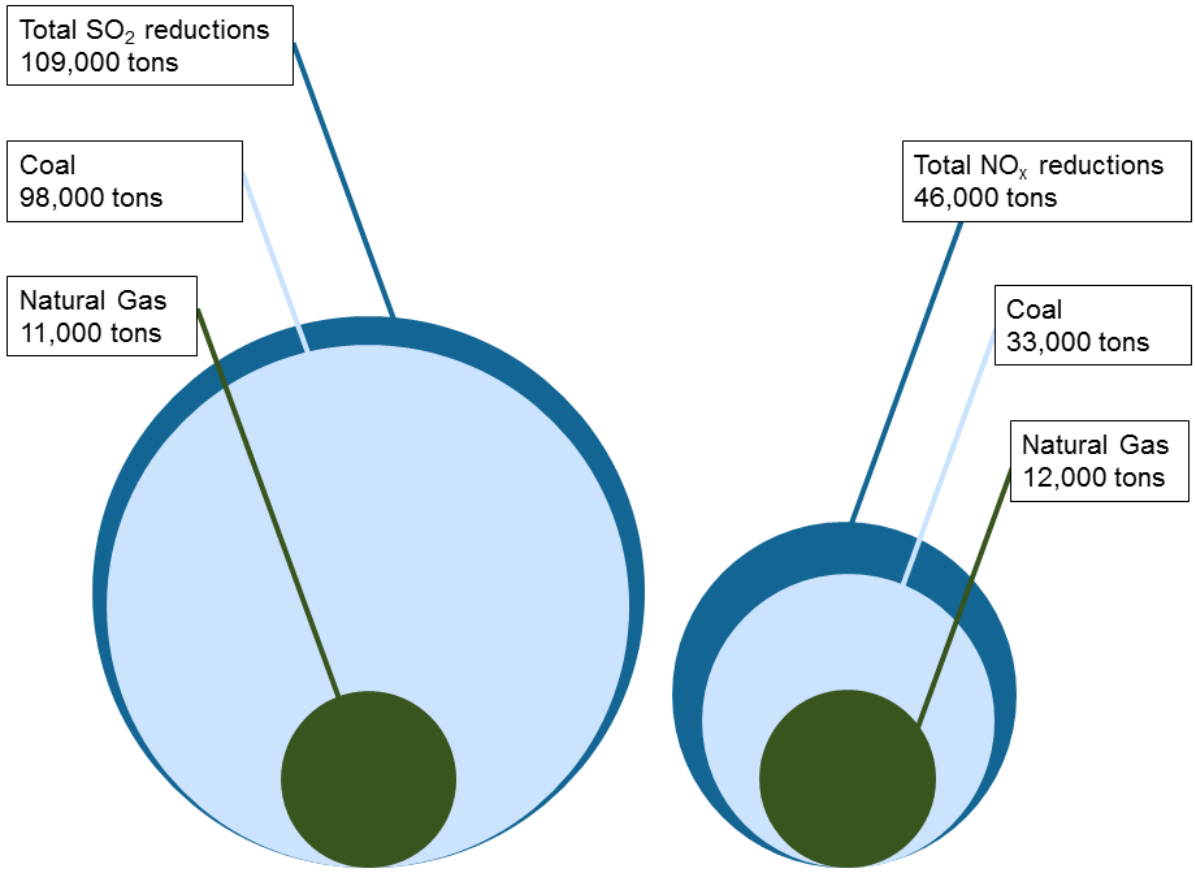


Source: Abt Associates analysis (2017).

Due to the high sulfur content of coal, emission rates of SO_2 are significantly higher for coal-fired power plants than for natural gas plants. Therefore, reductions in generation by coal-fired plants as a result of RGGI dominate total SO_2 reductions. As shown in Figure 7, coal plants account for 90 percent of reductions in SO_2 emissions resulting from RGGI. However, NO_x emission rates for coal- and natural-gas fired generation are much more comparable, especially when coal units are controlled for NO_x.[32] As such, RGGI-induced reductions in NO_x emissions can occur from a decline in generation by either coal-fired or natural gas-fired units. As shown in Figure 7, coal plants account for 73 percent of total RGGI-induced NO_x reductions from 2009 to 2014, while natural gas plants account for 26 percent of total NO_x reductions due to RGGI in the same timeframe.

[32] See Figure 18 in Appendix D for a comparison of NO_x and SO_2 emission rates across generation technologies and fuel types.

Figure 7. Changes in SO_2 and NO_x Emissions due to RGGI from 2009-2014, by Fuel Type



Source: Abt Associates analysis (2017).

Figure 8 shows that RGGI results in a decline in SO_2 emissions relative to the No RGGI baseline in every year of RGGI's first two compliance periods. RGGI had by far the greatest impact on SO_2 emissions in 2009, when SO_2 emissions fell by more than 76,000 metric tons. This single-year decline also accounts for nearly half of total reductions in SO_2 emission reductions over the full 2009 to 2014 timeframe. Moreover, the majority of SO_2 emission reductions in 2009 occurred in Maryland, which has the largest capacity of coal-fired power plants in all RGGI states. In response to Maryland's Healthy Air Act of 2006, SO_2 controls were installed at five of Maryland's coal plants in late 2009.[33] As a result of these controls, the SO_2 emissions rate (tons of SO_2 per MWh) declined by nearly an order of magnitude at some of these plants. This explains why absolute SO_2 reductions in Maryland are much smaller for all years after 2009, even in years such as 2013 and 2014 when RGGI resulted in meaningful decreases in generation from these plants.

[33] Controls for SO_2 were installed in the last two months of 2009 on the following Maryland coal plants (units): Brandon Shores (1 unit); AES Warrior Run (1 unit); Morgantown (2 units); Dickerson (3 units); and Chalk Point (2 units).

Figure 8. Changes in SO_2 Emissions due to RGGI

Accounting for State Power Plant Regulations: Maryland's Healthy Air Act

With seven large power plants and more than 4,600 MW of capacity fired by coal, at the time of RGGI's start in 2009, Maryland had the largest inventory of criteria pollutant emissions from power plants of all states in the RGGI region. In 2006, Maryland passed the Healthy Air Act (HAA) in 2006 to achieve Clean Air Act goals for NO_x, SO_2, and Hg emissions from large power plants. Owners of Maryland coal-fired power plants installed a significant number of controls for these pollutants shortly after HAA took effect. Most of these controls, which included flue gas desulfurizers, baghouses, injection systems, and scrubbers, were installed on MD coal units within four years after HAA took effect. These controls were highly effective—between 2009 and 2010, SO_2 emissions fell by more than 80 percent, and NO_x emissions declined by more than 60 percent from 2007 to 2009 (Maryland Department of the Environment, 2015).

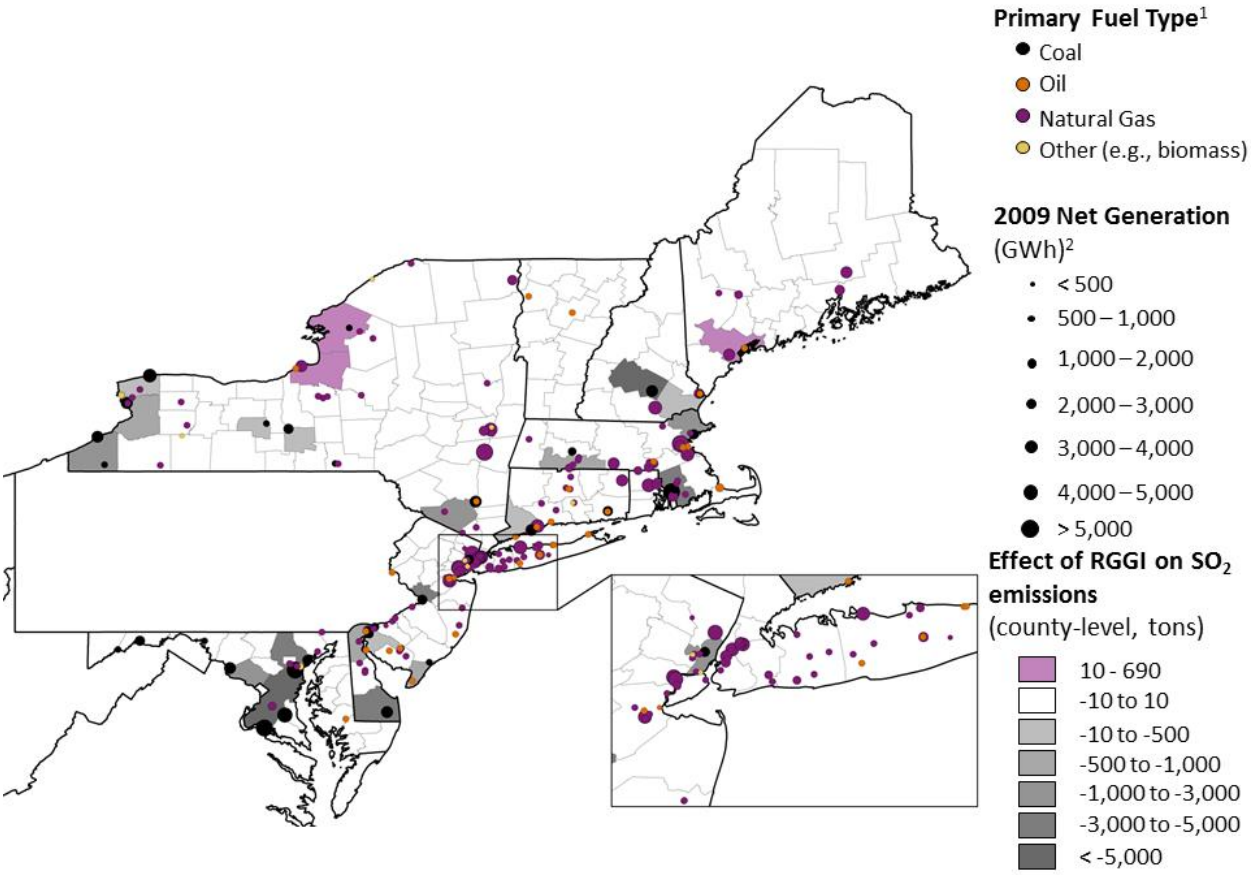
Given the importance of SO_2 emissions from Maryland's coal-fired power plants to this analysis, we sought additional input from Maryland Department of Environment staff to make sure that our emissions inventories for 2009 and 2010 accurately reflected total emissions for Maryland's power plants. We also pulled plant-specific data on control installations from EPA to ensure that our plant-specific emission factors for SO_2 and NO_x reflected changes made in response to the HAA. As a result, we are confident that results from this analysis reflect incremental emissions reductions in Maryland that are attributed to RGGI rather than to Maryland's HAA. We also confirmed that annual emission factors for other coal plants outside Maryland accounted for installations of pollution controls.

In addition to reductions from Maryland, RGGI has also resulted in SO_2 reductions from individual legacy coal plants[34] located in Delaware, New England, and New York, as shown in Figure 9. However, because these coal plants are generally more geographically isolated than Maryland's coal plants,[35] the impacts of SO_2 emissions reductions from these individual plants on air quality in surrounding downwind counties is more easily observable in air quality results. For the most part, the single largest county-level reductions in SO_2 emissions in 2009 occurred in or immediately adjacent to a county with a large coal-fired plant; however, a few oil-fired plants also played a role in changes in SO_2 emissions. In a few counties, SO_2 emissions actually increased to a small degree due to an increase in generation by a local oil- or coal-fired plant. However, each of these counties still experienced net improvements in air quality.

[34] Legacy in this context refers to older coal plants, built in the 1950s to 1970s to serve baseload power needs and whose original capital costs are fully amortized.

[35] Five of Maryland's coal plants are clustered relatively close together in Anne Arundel, Charles, and Prince Georges counties.

Figure 9. RGGI-Regulated Plants and 2009 SO_2 Reductions



Source: Abt Associates analysis (2017).

1. Primary fuel type identified from the Emissions and Generation Resource Integrated Database (eGRID) (U.S. EPA 2009).

2. Net generation data from the EIA Form 923 (U.S. EIA, 2009b). Net generation includes generation from all fuel types, not just the primary fuel type. Excludes generation from nuclear units.

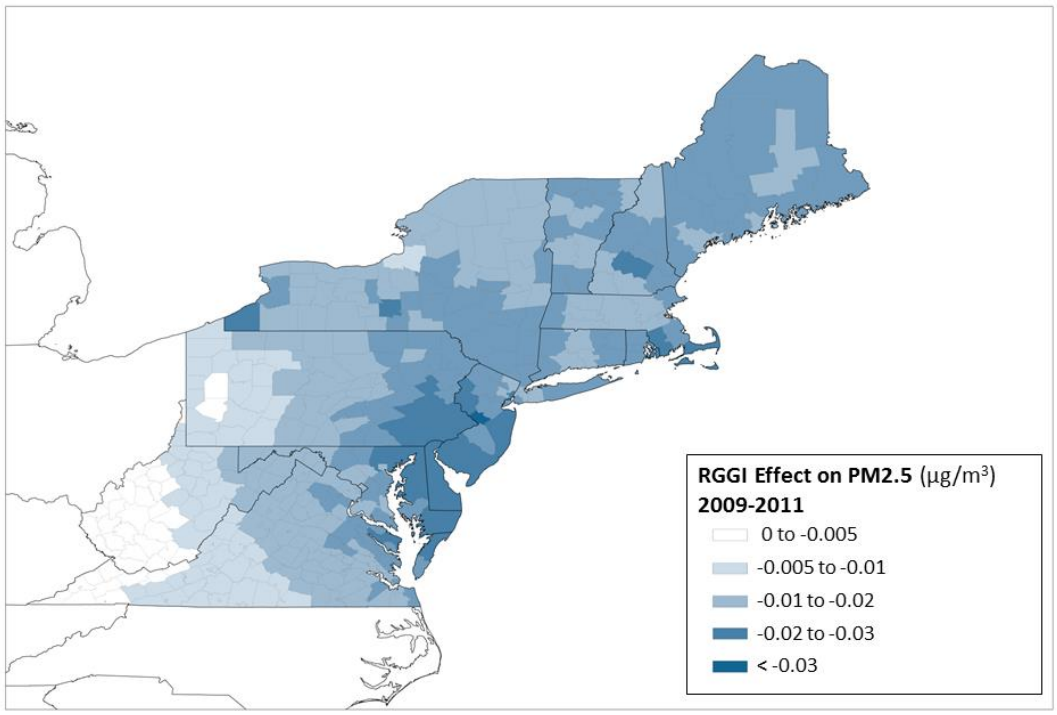
4.3 Impacts on Air Quality due to RGGI

RGGI resulted in incremental improvements to air quality in every year of the program's first six years. However, because air pollutants can be transported long distances from where they are first emitted, the spatial distribution of air quality improvements resulting from RGGI differs from the locations of plants where emission reductions originated.

Figure 10 and Figure 11 illustrate the spatial distribution of county-level changes in air quality due to RGGI for the first and second compliance periods, respectively. Generally, the most significant air quality improvements occurred in states and counties adjacent to or downwind of Maryland's power plants regulated under RGGI, although certain counties in New York (i.e., Chautauqua County and Tompkins County), and New England (Merrimack County, NH and Bristol County, MA) with or downwind of large coal plants also experienced notable air quality improvements due to RGGI. Counties in Delaware

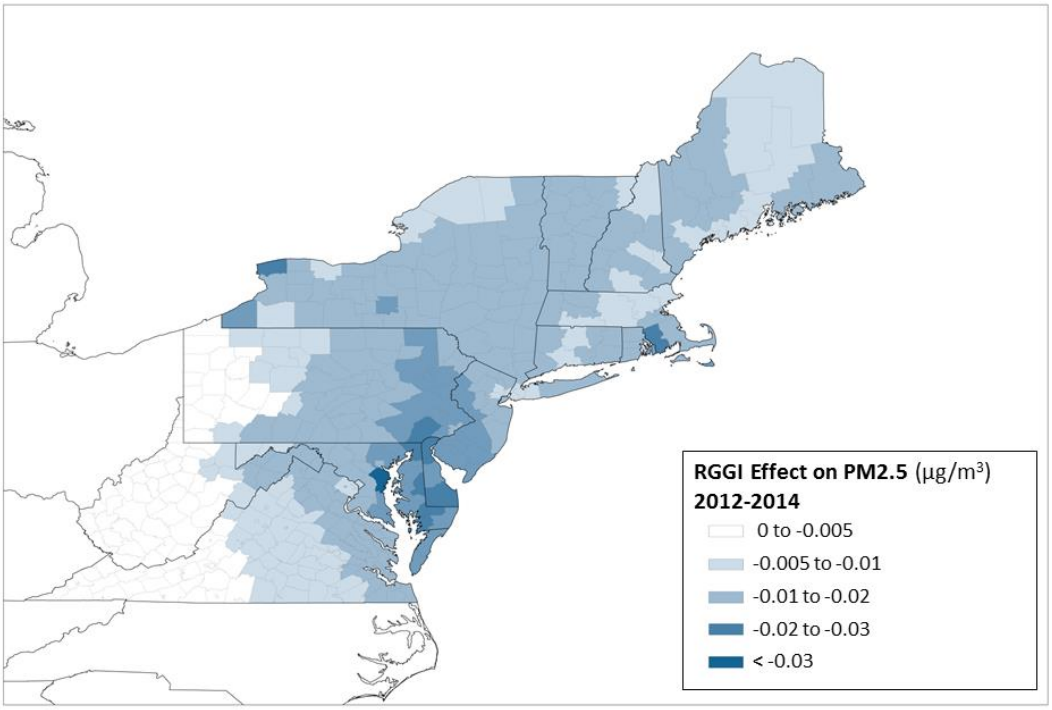
experienced the largest absolute declines in ambient $PM_{2.5}$ under RGGI because of their location immediately downwind of Maryland's coal plants, which account for the largest absolute reductions in SO_2 emissions as a result of RGGI.

Figure 10. RGGI Effect on Annual Average $PM_{2.5}$, 2009 to 2011



Source: Abt Associates analysis (2017).

Figure 11. RGGI Effect on Annual Average $PM_{2.5}$, 2012 to 2014



Source: Abt Associates analysis (2017).

Regional transport of pollution means that changes in emissions from plants located in RGGI states also impact air quality in non-RGGI states. Our modeling results show substantial air quality benefits in the non-RGGI states of Pennsylvania and New Jersey[36] due to emission reductions from plants located in RGGI states. However, as noted earlier, this analysis did not estimate possible shifts in generation and emissions that may have occurred in non-RGGI states in response to RGGI, so these changes cannot be considered net of those changes in emissions and air quality.

All counties in RGGI states met EPA's annual average $PM_{2.5}$ standard during the 2009 to 2014 timeframe and still met this standard when we modeled air quality without RGGI. EPA, however, does not set NAAQS at "zero-risk" levels,[37] which means that incremental benefits to health occur even when air quality improvements exceed EPA standards.

It is important to note that our analysis only addressed changes in annual average $PM_{2.5}$ concentrations, and that $PM_{2.5}$ concentrations are highly variable over the course of a year. A single short-term exposure to high $PM_{2.5}$ concentrations can lead to more severe human health outcomes than multiple exposures to low $PM_{2.5}$ concentrations, which is why EPA sets a 24-hour $PM_{2.5}$ standard as well as an annual average $PM_{2.5}$ standard. To the degree that RGGI states' investments in energy efficiency programs aimed

[36] Note that New Jersey was a participant in the RGGI program in the first compliance program (2009 to 2011) but not in the second (2012 to 2014).

[37] The Clean Air Act does not require EPA to establish air quality standards at a zero-risk level or at background concentrations, but rather at a level that reduces risk sufficiently to be protective of public health "…with an adequate margin of safety." (U.S. EPA, 2010).

specifically at reducing peak load, it is possible that RGGI had an amplified impact on low air quality days. However, the scope of this analysis did not include RGGI's effects on daily air quality changes.

Table 5 and Table 6 show RGGI's effect on air quality, as measured by changes in annual average levels of ambient $PM_{2.5}$, in RGGI states and non-RGGI states, respectively. RGGI's effect on air quality over time was largely consistent with its effect on emissions over time. Changes in air quality due to reductions in average $PM_{2.5}$ levels were the most significant in every state in 2009, and by a fairly significant margin over air quality improvements in other years. The next largest impact on average annual $PM_{2.5}$ occurred in 2012 to 2014, and RGGI's effect on average annual $PM_{2.5}$ was lowest in 2010 and 2011. Overall, air quality improvements in RGGI's first compliance period were larger than those in the second compliance period.

Delaware, Maryland, Pennsylvania, and New Jersey experienced the largest changes in $PM_{2.5}$ in 2009, and Delaware experienced the highest average reduction in annual $PM_{2.5}$ among all RGGI and non-RGGI states over the full time period. Pennsylvania experienced the largest average improvement among non-RGGI states. Improvements in air quality were the lowest in all states in 2011.

4.4 Impacts on Public Health due to RGGI

Our estimates show that RGGI's impact on air quality in the region resulted in substantial improvements to public health throughout the Northeast, in both RGGI and non-RGGI states. Results for avoided adverse health effects and their total estimated value across all RGGI states are presented in Table 7. The number of health effects avoided in RGGI states include 240 to 540 adult mortalities, 27 to 260 non-fatal heart attacks, 145 hospitalizations (respiratory or cardiovascular), and cases of asthma ER visits, asthma exacerbations, and minor respiratory illnesses. Overall, the main driver of the value of health benefits is avoided premature mortality among adults, which constitutes over 98 percent of the total health benefits across the 2009 to 2014 study timeframe. Health benefits due to RGGI also include improvements to productivity and quality-of-life, totaling 31,000 avoided lost work days and nearly 200,000 fewer days with lower levels of activity (e.g., walking, exercising).

To express the value of benefits which occur over multiple years in present value terms, we apply 3 and 7 percent rates of discount to the flow of estimated annual benefits from 2009 to 2014.[38] Results presented in this section are based on 3 percent rate of discount; similar results based on a 7 percent rate can be found in the Appendices.

Table 7. Health Benefits due to RGGI in RGGI States[39]

Health Effect	Incidences avoided due to RGGI. 2009-2014	Monetized health benefit due to RGGI, 2009-2014 (Million 2015 dollars), 3% discount rate
Acute Bronchitis	340	$0.20
Adult Mortality	240–540	$2,400–$5,300
Asthma ER Visits	160	$0.09
Asthma Exacerbations	6,500	$0.45

[38] These rates are based on EPA's guidelines on the use of a social rate of discount in economic analyses of public environmental and health policies and programs.

[39] Public health benefits in New Jersey from 2009-2011 are included in the total public health benefits due to RGGI in RGGI States

Cardiovascular Disease Hospital Admissions	80	$4.1
Infant Mortality	0.4	$4.5
Lower Respiratory Symptoms	4,300	$0.11
Minor Restricted Activity Days	190,000	$15
Non-fatal Heart Attacks	27–260	$4.4–$44
Respiratory Hospital Admissions	65	$2.3
Upper Respiratory Symptoms	6,100	$0.25
Work Loss Days	31,000	$7.5
Total		**$2,400–$5,400**

Source: Abt Associates analysis (2017).

For health impacts outside the RGGI states, our analysis included results for Pennsylvania, the District of Columbia, Virginia, and West Virginia (Table 8). Although these jurisdictions are not part of the RGGI program, they also accrue health benefits as a result of their location downwind of a RGGI state(s) where emissions reductions occurred as a result of the program. Pennsylvania's low-end benefits estimate of $823 million is greater than the total benefits for any single RGGI state, while Virginia's benefits ($244 million) exceed the estimates for several RGGI states. In addition, the District of Columbia's total benefits are over $18 million.

Table 8. Health Benefits due to RGGI in Non-RGGI States (PA, DC, VA, WV)[40]

Health Effect	Incidences avoided due to RGGI, 2009-2014	Monetized health benefit due to RGGI, 2009-2014 (Million 2015 dollars) 3% discount rate
Acute Bronchitis	180	$0.10
Adult Mortality	130–290	$1,300 - $2,900
Asthma ER Visits	73	$0.04
Asthma Exacerbations	3,400	$0.23
Cardiovascular Disease Hospital Admissions	44	$2.2
Infant Mortality	0.25	$2.8
Lower Respiratory Symptoms	2,200	$0.06
Minor Restricted Activity Days	95,000	$7.7
Non-Fatal Heart Attacks	14–130	$2.3–$21
Respiratory Hospital Admissions	32	$1.1
Upper Respiratory Symptoms	3,200	$0.13
Work Loss Days	16,000	$3.6
Total		**$1,300–$2,900**

[40] Public health benefits in New Jersey from 2012 to 2014 are included in the total public health benefits due to RGGI in non-RGGI states.

Source: Abt Associates analysis (2017).

Because of uncertainties regarding RGGI's effect on generation and emissions in non-RGGI states, we discount the low-end range of benefits estimated by BenMAP for non-RGGI states by 50 percent to create a new low-end, before adding these to benefits for RGGI states for a cumulative estimate. The high-end benefits for non-RGGI states are not adjusted, and are equal to 100 percent of BenMAP's high-end estimate. The range of cumulative health benefits due to RGGI are shown in Table 9. The total estimated value of health benefits associated with the RGGI program range from $3.0 to $8.3 billion (2015 dollars) in the region, with a central estimate of $5.7 billion (3 percent discount rate). The benefits estimates represent the value of reductions to affected populations in the health risks associated with $PM_{2.5}$.

Table 9. Cumulative Health Benefits due to RGGI[41]

Health Effect	Avoided Health Effects due to RGGI, 2009-2014		Value of Health Benefits due to RGGI, 2009-2014 (Million 2015 dollars)		
	Low	High	Low	Central	High
Acute Bronchitis	420	510	$0.25	$0.27	$0.3
Adult Mortality	300	830	$3,000	$5,600	$8,200
Asthma ER Visits	200	230	$0.11	$0.12	$0.13
Asthma Exacerbations	8,200	9,900	$0.57	$0.63	$0.69
Cardiovascular Disease Hospital Admissions	100	120	$5.2	$5.8	$6.3
Infant Mortality	<1	<1	$5.9	$6.6	$7.3
Lower Respiratory Symptoms	5,400	6,500	$0.14	$0.15	$0.17
Minor Restricted Activity Days	240,000	280,000	$19	$21	$23
Non-Fatal Heart Attacks	35	390	$5.5	$33.5	$61.6
Respiratory Hospital Admissions	82	98	$2.8	$3.1	$3.4
Upper Respiratory Symptoms	7,700	9,300	$0.31	$0.34	$0.37
Work Loss Days	39,000	47,000	$9.2	$10.1	$11
Total			**$3,000**	**$5,700**	**$8,300**

Source: Abt Associates analysis (2017).

Note: Value of avoided health effects is the sum of health benefits to states participating in RGGI and other northeastern states, based on a 3 percent rate of discount.

Figure 12 and Figure 13 show the geographic distribution of health benefits at the county level (central estimates, 3 percent discount rate). In each RGGI state, the most significant benefits were realized in 2009

[41] Public health benefits in New Jersey from 2009-2011 are included in the total public health benefits due to RGGI in RGGI States. Public health benefits in New Jersey from 2012-2014 are included in the total public health benefits due to RGGI in non-RGGI States.

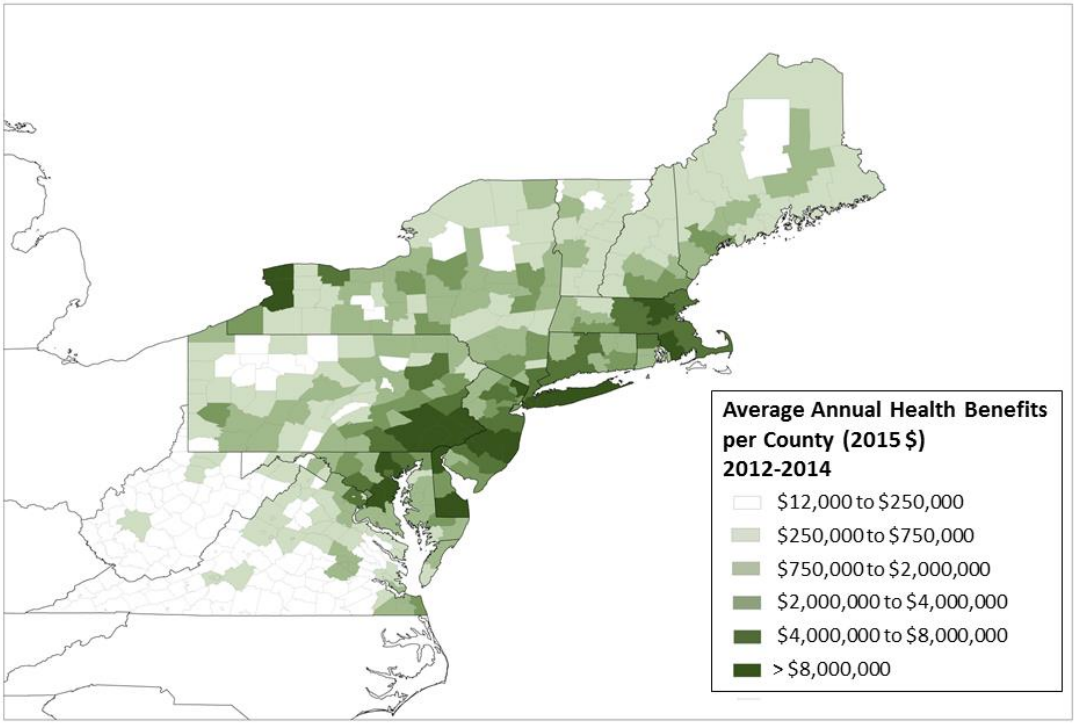
Figure 13. Annual Health Benefits of RGGI, 2012 to 2014 (Central Estimate, 3% Discount Rate)



Source: Abt Associates analysis (2017).

Figure 14 and Figure 15), the year with the largest estimated reductions in SO_2 emissions. State-level benefits were lower in 2010 and 2011, increased in 2012 and 2013, and decreased in 2014. Among the RGGI states, the largest health benefits by value are in New York, followed by New Jersey and Massachusetts. This is in contrast to the air quality results, which indicated the largest changes in air quality in Delaware, due to differences in population size across counties in the RGGI states. The same air quality change will result in different numbers of avoided cases (and therefore different monetized benefits) based on the affected population. For example, in 2010, $PM_{2.5}$ emissions in New York County decreased by 0.008 $\mu g/m^3$, resulting in a range of total health benefits of $4.8 to $10.8 million (2015 dollars). In the same year, the air quality change in New Castle County, DE was larger (0.014 $\mu g/m^3$), but resulted in lower benefits of $3.5 to $7.9 million (2015 dollars) (see sidebar for more information of the role of population on health benefits).

The Role of Population in Public Health Benefits in Two Maryland Counties

The benefits of RGGI to public health for a given county are a function of the county's population, baseline level of health, and changes to the level of ambient $PM_{2.5}$ attributable to RGGI. Because of differences in population and baseline health, counties with similar RGGI-driven $PM_{2.5}$ reductions can experience very different public health outcomes. The table shows avoided health outcomes for two counties in Maryland with different population sizes. Although RGGI results in a comparable $PM_{2.5}$ reduction in both counties (i.e., 0.022 to 0.023 $\mu g/m^3$), Baltimore County's population is about 810,000, while St. Mary's population is only 110,000. Because of these population differences, health benefits of RGGI are much more significant for Baltimore County than for St. Mary's County.

Public Health Benefits of RGGI in Baltimore County, MD and St. Mary's County, MD, 2014

Health Effect	Incidences Avoided due to RGGI, 2014	
	Baltimore County, MD	St. Mary's County, MD
Acute Bronchitis	1.2	0.20
Adult Mortality	1.0–2.3	0.10–0.23
Asthma ER Visits	0.65	0.06
Asthma Exacerbations	23	3.7
Cardiovascular Disease Hospital Admissions	0.37	0.04
Infant Mortality	<0.01	<0.01
Lower Respiratory Symptoms	15	2.5
Minor Restricted Activity Days	690	94
Non-Fatal Heart Attacks	0.12–1.1	0.01–0.08

4.5 Key Findings and Implications

During the first six years of RGGI implementation, the program resulted in sizable reductions in key criteria air pollutants, especially SO_2 emissions, which contribute to the formation of $PM_{2.5}$. RGGI-induced reductions in ambient $PM_{2.5}$ occurred throughout densely populated areas of the northeastern corridor all the way to western New York and into New England, and resulted in significant benefits to human health. These benefits include hundreds of avoided cases of premature deaths, heart attacks, asthma attacks, and hospital admissions, and tens of thousands of avoided cases of other health symptoms, lost work days, and restricted activities. The estimated value of the health, productivity, and quality-of- life benefits associated with RGGI ranges from $3.0 billion to $8.3 billion, with a central estimate of $5.7 billion (2015 dollars, 3 percent discount rate).

RGGI's effect on annual air quality and public health are most significant in 2009 and 2013. This pattern is consistent with RGGI's two effects on wholesale power markets: 1) changes in power prices to absorb CO_2 allowance costs, which results in a shift of dispatch to lower-carbon sources, and 2) investments in energy efficiency, which reduce electricity demand and emissions. In addition, there is evidence that plant owners took early action to reduce CO_2 emissions in anticipation of RGGI.

As noted above, RGGI-induced changes at a relatively small number of legacy coal plants drive a high proportion of RGGI's total reductions in key air pollutants and health benefits. The fleet of power plants in RGGI states will be, on average, cleaner in the near future than the current fleet,[42] so future RGGI-induced reductions in generation are likely to result in lower total health benefits going forward.

However, the cleaner electricity grid does create opportunities for additional health benefits if energy demand from other sectors—transportation and buildings—shifts onto to a cleaner grid in RGGI (and neighboring) states, a process known as "electrification." Reductions of air pollutants and health benefits from decarbonizing other energy demand could be significant. For example, a 2016 study assessed future health and climate benefits that would occur if the eight northeastern states participating in the Zero Emission Vehicle (ZEV) program[43] transitioned to a vehicle fleet of about 65 percent ZEVs by 2050 (American Lung Association in California, 2016). According to the study, this would result in about $12 billion in annual health benefits. [44] Many RGGI states (e.g., Massachusetts, Rhode Island) are currently implementing or developing GHG mitigation plans to achieve 80 percent reductions in GHG emissions

[42] A number of states in the region are implementing GHG mitigation plans that require 80 percent reductions in GHG emissions by 2050, relative to 1990 levels.

[43] The ZEV program requires that automakers meet a threshold of electric vehicle sales in participating states. The exact number of electric vehicles required is linked to each automaker's total sales within the state. The eight northeastern states participating in the ZEV program, along with California and Oregon, include: Connecticut, Maine, Maryland, Massachusetts, New Jersey, New York, Rhode Island, and Vermont.

[44] The study reports state-level combined health and climate benefits, and we assume that health benefits constitute 62 percent of combined benefits. This assumption is based on the fact that health benefits across all states constitute 62 percent of combined health and climate benefits across all states.

by 2050,[45] and these plans include strategies for electrification of energy used in light-duty vehicles and building heating and cooling.

As in any analysis, there were certain uncertainties in data, assumptions, and models used in this study which influenced estimates. Table 10 below describes these sources of uncertainty and their potential impact on estimated changes in emissions, air quality, and health benefits due to RGGI, as well as our approach to addressing individual uncertainties within models or through quantified sensitivity cases. The fact that quantitative estimates of energy savings from RGGI investments in efficiency which persist after 2014 and reductions in ozone due to RGGI are excluded from this analysis implies a likely underestimation of benefits. We also applied a sensitivity factor of 50 percent to health benefits estimated for non-RGGI states to account for the lack of conclusive information describing RGGI's incremental effect on generation and emissions in these states. As such, our estimates of total health benefits due to RGGI are probably conservative.

Table 10. Key Uncertainties in the Analysis

Source of Uncertainty in the Analysis	Impact on Estimates	Likely Significance on Estimates of Health Benefits
Analysis excludes avoided emissions, air quality, and health benefits that occur after 2014 resulting from states' investments in energy efficiency from 2009 to 2014.	**Underestimation.** The magnitude of these excluded benefits is not known, but could be significant given the magnitude of EE investments particularly in 2013 and 2014.	Possibly significant.
Analysis excludes health benefits associated with reductions in ozone.	**Underestimation.** The effect of ozone reductions on health benefits is known to be smaller in magnitude than that of reductions in ambient $PM_{2.5}$.	Probably minor.
Analysis excludes changes in emissions in non-RGGI states as a result of RGGI.	**Overestimation**. Unable to determine magnitude based on current information, but the potential for lower benefits is addressed through a sensitivity factor that discounts benefits in non-RGGI states by 50 percent.	Possibly significant.
Gaps in baseline emissions datasets.	**Indeterminate.** Gaps for missing years in EPA emissions databases were addressed by adjustments to data describing adjacent years.	Probably minor.

[45] The base year against which each of these states calculates their 2050 emissions reduction goal in their GHG mitigation plans varies—some states use a base year of 1990, while others use 2001.

Source of Uncertainty in the Analysis	Impact on Estimates	Likely Significance on Estimates of Health Benefits
Uncertainties in assumptions and inputs used in dispatch, air quality, and health benefits modeling.	**Indeterminate.** Low- and high-end estimates from the BenMAP model account for uncertainties in the relationship between population exposures and health effects. Historical actual data were used in dispatch and air quality models, thereby reducing some sources of error.	Possibly significant.

Appendix A – Emissions Data Sources and Analysis

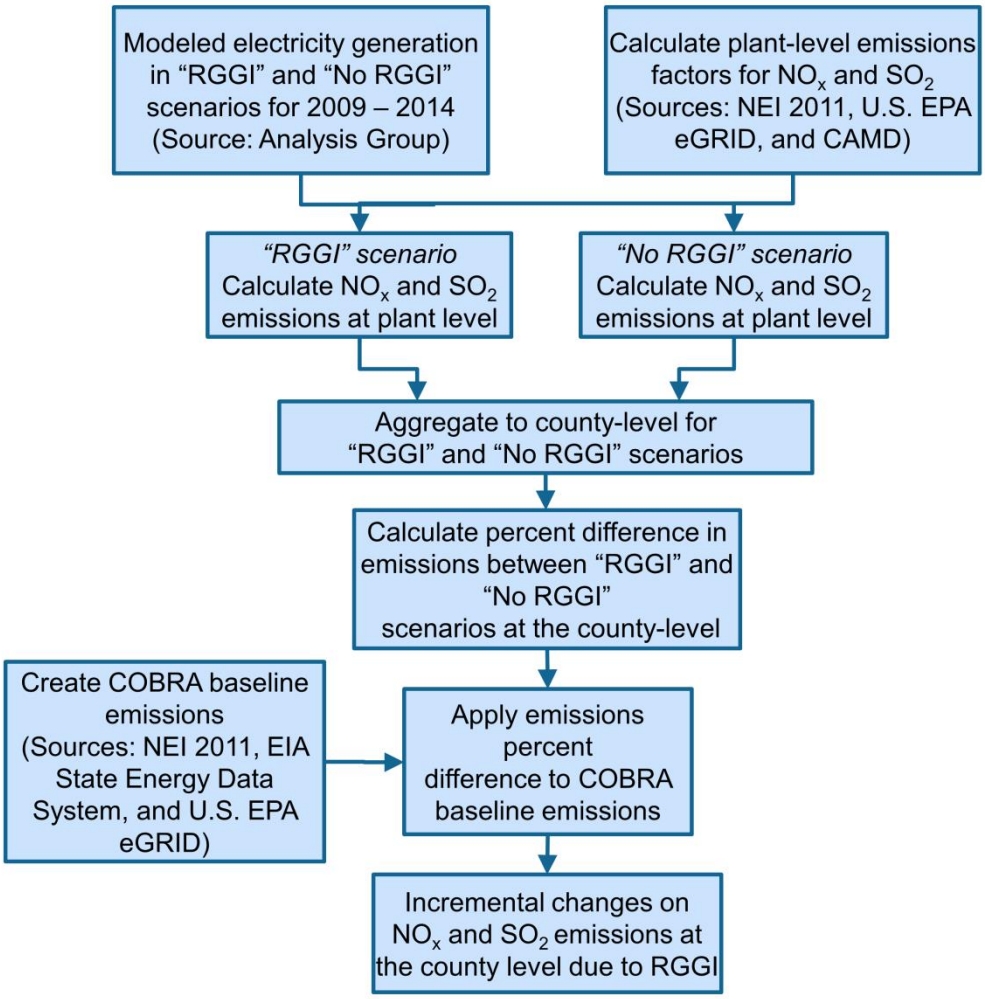
Detailed Analytic Approach

We developed a baseline of emissions for the RGGI scenario from actual emissions in the EPA's 2011 National Emissions Inventory (NEI) data. We chose the NEI dataset because it enabled us to represent emissions inventories from all sectors in the economy. This is necessary for Step 2 of our analysis because COBRA models changes in air quality based on a complete inventory of criteria pollutant emissions from all sectors (e.g., power plants, transportation, industrial processes.

We calculated emissions for the modeled electricity generation levels under the RGGI and No RGGI scenarios by (1) calculating plant-level emission factors and (2) applying plant-level emissions factors to modeled generation levels. We calculated plant-level SO_2 and NO_x emissions factors (tons pollutant/MWh generated) by dividing NEI-derived baseline emissions by actual generation. We created unique emissions factors for each year, which enabled us to reflect the effects of pollution control installations, operational characteristics, and changes in fuel mix for each plant. We applied these emissions factors to the modeled generation levels under RGGI and No RGGI to determine emissions under RGGI and No RGGI, respectively. Our workflow to calculate incremental changes in NO_x and SO_2 emissions at the county level is illustrated in Figure 16.

We then aggregated the modeled RGGI and No RGGI emissions to the county level and calculated the ratio of emissions between the RGGI and No RGGI scenarios. We applied this ratio to the actual RGGI emissions baseline to construct the counterfactual emissions inventory for No RGGI. The difference between the RGGI emissions inventory and the RGGI emissions baseline is the incremental change in emissions due to RGGI, which we input into COBRA under Step 2.

Figure 16. Approach to Estimating County-Level Changes in Emissions due to RGGI



Source: Abt Associates analysis (2017).

Description of Datasets Used

Analysis Group Datasets

We used results of modeling runs conducted by Analysis Group as part of their 2011 and 2015 retrospective studies of RGGI's economic impacts. These datasets provided estimates of annual plant-level electricity generation for all power plants located in RGGI states, for the RGGI and No RGGI scenarios (Analysis Group, 2011, 2015).

Analysis Group modeled electricity generation per unit with power system dispatch models, which simulate the optimal distribution of the electric power system load among generation facilities. Analysis Group used GE Energy's Multi-Area Production Simulation (MAPS) model for the first compliance period (see Analysis Group, 2011) and the PROMOD model for the second compliance period (see Analysis Group, 2015).

These dispatch models are useful for this retrospective analysis of RGGI because they compute optimal dispatch based on observed fuel prices, transmission system constraints, and operational constraints at a high geographic and temporal resolution. However, dispatch models cannot perfectly simulate power producers' actual, real-world decisions. For example, dispatch models tend to show that very small changes in marginal costs lead to significant changes in dispatch patterns, which is not always the case.

The modeled "RGGI" scenario reflects actual "RGGI" data accurately when aggregated to the regional scale. However, differences between the modeled "RGGI" scenario and actual "RGGI" data emerge at the county or plant level. Accuracy at the plant level is necessary to model public health benefits, because the estimated effect of changes in generation on emissions is highly dependent on the age, fuel use, and emissions controls of a given plant, and the effect of changes in emissions on public health are highly dependent on the emissions' location. We adopt a percent difference approach to deal with differences between the modeled RGGI scenario and actual RGGI data, as described in the main text.

National Emissions Inventory

The NEI is a comprehensive estimate of air emissions that EPA develops from data reported primarily from state, local, and tribal air agencies. The NEI includes emissions from multiple sources, including point sources (e.g., power plants), non-point sources (e.g., residential heating), on-road sources (e.g., light-duty vehicles), and non-road sources (e.g., boats, lawn and garden equipment). NEI datasets are available from 2008, 2011, and 2014. For our analysis, we used the 2011 NEI dataset. We estimated annual power plant emissions for each year in the 2009 to 2014 period by modifying the NEI 2011 baseline. We estimated plant-level emissions changes relative to 2011 based on fuel use ratios from the State Energy Data System and annual emissions factor ratios from the EPA Emissions and Generation Resources Integrated Database (eGRID). We also cross-checked our annual plant-level emissions estimates with other data sources, such as EPA's Clean Air Markets Division (CAMD), and spot-corrected our baseline as necessary.

EPA Emissions and Generation Resource Integrated Database

EPA's eGRID contains environmental data from all U.S. plants that supply power to the electric grid and provide data to the federal government. The database was developed by Abt Associates and CAMD. We use eGRID's plant-level SO_2 and NO_x emissions rates to adjust our annual emissions inventories to account for installation of emissions controls. Plant-level SO_2 and NO_x emissions rates are available for 2009, 2010, 2012, and 2014. For years of interest without a corresponding eGRID dataset, we calculate average emissions rates from adjacent years for which data are available.

U.S. Energy Information Administration (EIA) Annual Electric Generator Capacity Data (Form EIA-860)

The Annual Electric Generator Data is compiled from submissions of survey Form EIA-860. Form EIA-860 gathers generator-level data from all U.S. power plants with total nameplate capacity of one megawatt or greater. We used plant-level data for generators surveyed in 2009-2014. We used Form EIA-860 to identify the county in which plants are located.

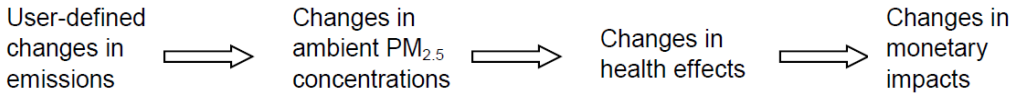
Appendix B – Estimating Air Quality Changes: Co-Benefits Risk Assessment (COBRA) Model

To estimate the air quality impacts of RGGI in 2009-2014, we used EPA's COBRA model. COBRA is a free screening tool that helps state and local governments evaluate the costs and benefits of clean energy and climate mitigation policies. COBRA provides preliminary estimates of the effects of air pollutant emission changes (e.g., NO_x, SO_2, and $PM_{2.5}$) on ambient air concentrations of $PM_{2.5}$, translates the estimated changes in ambient $PM_{2.5}$ concentrations into the number of avoided adverse health effects, and then provides a monetary value of the avoided health effects. COBRA enables policymakers and planners to identify and highlight air quality and public health co-benefits achieved through energy efficiency or renewable energy policies.

COBRA Model Components

Abt Associates originally developed COBRA in 2002 for EPA and continues to support updates of the screening tool. The model consists of four components, shown in Figure 17.

Figure 17. Components of the COBRA Model



Source: *COBRA User Manual* (U.S. EPA, 2015c).

A brief explanation of the two of the four components of the model that were used in this analysis is included below.[46] In lieu of COBRA's health valuation functions, we used the BenMAP model described in the next section.

User Inputs of Emissions Changes

COBRA contains baseline emissions estimates based on the National Emissions Inventory. Note that we prepared customized versions of the COBRA model that contain baseline emissions estimates for each modeling year 2009-2014 (see Section 3.2). We then created COBRA scenarios by entering increases or decreases to the baseline emissions estimates.

Changes in Air Quality (i.e., ambient $PM_{2.5}$ concentrations)

Based on changes in emissions levels, the COBRA model then calculates changes in particulate matter, which reflect changes in air quality. Specifically, COBRA estimates $PM_{2.5}$ concentrations using a simple air quality model known as the Phase II Source-Receptor (S-R) Matrix. The S-R Matrix consists of fixed transfer coefficients that reflect the relationship between annual average $PM_{2.5}$ concentration values at a single receptor in each county (a hypothetical monitor located at the county centroid) and the contribution by $PM_{2.5}$ species to this concentration from each emission source (E.H. Pechan & Associates Inc., 1994). COBRA models the formation of secondary $PM_{2.5}$ from NO_x and SO_2 by (1) assuming up to 25 percent of NO_x and 100 percent of SO_2 transform into ammonium nitrate and ammonium sulfate, respectively,

[46] For more detailed information, see the *COBRA User Manual* (U.S. EPA, 2015c).

depending on the limiting concentration of ammonia, (2) modeling secondary reactions among gaseous and particulate species, and (3) calibrating COBRA modeling results to measured $PM_{2.5}$ values.

Benefits of COBRA

The COBRA model allows us to quickly estimate air quality impacts based on a simplified air quality model. COBRA displays county-level results in both tabular and geographic formats. The mapping feature allows users to see changes in ambient $PM_{2.5}$ levels at the county level.

Limitations of COBRA

More sophisticated (and resource-intensive) air quality modeling approaches are available and would provide more refined estimates of the benefits of emissions reductions. Importantly, COBRA does not account for all air pollutants, such as ozone, carbon dioxide, and mercury. Therefore, the health benefits based on COBRA air quality results are likely a conservative estimate because many health impacts are exacerbated by other harmful air pollutants but are not included in the scope of the COBRA model.

Another key limitation of COBRA is that the health effects inputs cannot be easily customized. COBRA relies on population, incidence (i.e., the baseline probability of a health effect), and income data for a specific modeling year. Therefore, we did not use the health impact and valuation components of COBRA in our analysis of RGGI, and instead relied upon the BenMAP model.

Appendix C – Estimating Changes in Public Health: Benefits Mapping and Analysis (BenMAP) Model

Abt Associates designed and implemented the original BenMAP model for EPA, which was the first publicly available model for estimating the number and economic value of health impacts resulting from changes in air quality. EPA's current version of BenMAP (known as BenMAP-Community Edition) is being deployed around the world by governments, researchers, and policy analysts for generating monetized estimates of public health improvements resulting from reductions in air pollutants. For example, BenMAP has been used for local- and regional-scale analyses (e.g., Cohan et al., 2007; Nowak et al., 2013) and climate assessments (e.g., Hill et al., 2009; Tagaris et al., 2009).

We estimated the public health impacts of RGGI in 2009-2014 using the BenMAP model, Version 4.0.67. This is a legacy version of BenMAP that allows us to use configuration files EPA used for the 2012 PM National Ambient Air Quality Standards (NAAQS) Regulatory Impact Analysis (referred to below as the "2012 PM RIA configuration").[47]

We input COBRA-generated county ambient $PM_{2.5}$ estimates into BenMAP, which BenMAP used to calculate RGGI's effect on $PM_{2.5}$ relative to observed ambient $PM_{2.5}$ for 2009-2014. We selected BenMAP over COBRA for this step of the analysis because BenMAP allows us to capture changes in baseline population, incidence, and valuation over the study period. While COBRA is an appropriate tool for estimating ambient air quality, the fact that its datasets are tied to a specific calendar year limits its representation of how air quality affects public health over time.

BenMAP linked air quality changes to public health metrics by applying empirical relationships between $PM_{2.5}$ and multiple health effects.[48] BenMAP applied these statistical relationships to population datasets for 2009-2014. BenMAP uses county-level population projections based on the 2010 U.S. Census of Population and Housing and forecasting models developed by Woods and Poole (2011).

Based on the 2012 PM RIA configuration, BenMAP monetized the health impacts using "unit values" for each health endpoint (presented in Table 11). The unit values are based on published estimates of the costs of treating the illness (which can include both direct medical costs and costs of lost productivity), or the willingness to pay (WTP) to avoid the illness or to reduce the risk of premature death (i.e., value per statistical life, VSL). The unit values based on WTP estimates reflect expected growth in real income over time. This is consistent with economic theory, which argues that WTP for most goods (such as health risk reductions) will increase if real incomes increase.

In BenMAP, we estimated economic values in 2015 dollars and using income levels for each year of the analysis (e.g., 2009 income levels for valuing health impacts for 2009). In Table 11, we present the unit values at 2014 income level. Because some of the health benefits from emissions reductions in a particular year are expected to occur over several years, BenMAP discounts the estimated stream of

---

[47] In BenMAP, configuration files specify the health impact and valuation functions, as well as settings for aggregation and pooling across the incidence and valuation results.

[48] The health impact functions are described in detail in Appendix E of the *BenMAP User's Manual* (U.S. EPA, 2012).

economic benefits to the analysis year using either a 3 percent or a 7 percent discount rate. We further adjusted all results to 2015 present values.

Table 11. Health Effects and Their Economic Values (2015 dollars/case)

Avoided Health Effect	Economic Value (2015 dollars, 2014 Income Level)[1]
Time-varying costs[2]	
Adult Mortality[1] (3% discount rate)	$8,937,339
Adult Mortality[1] (7% discount rate)	$7,960,346
Non-Fatal Heart Attacks (3% discount rate)	$38,253–$298,337
Non-Fatal Heart Attacks (7% discount rate)	$36,167–$286,735
Costs incurred in the year of exposure	
Infant Mortality[3]	$9,961,679
Hospital Admissions (Respiratory, Cardiovascular-related)[4]	$17,135–$46,318
Asthma Emergency Room Visits	$447–$534
Acute Bronchitis	$513
Respiratory Symptoms (Upper, Lower)	$22–$36
Asthma Exacerbations (attacks, shortness of breath, and wheezing)	$62
Minor Restricted Activity Days	$73
Work Loss Days[4]	$160

Source: U.S. EPA (2012d and 2012e).

1. The unit values based on WTP estimates reflect expected growth in real income over time. When estimating health benefits, we used the income level specific to each analysis year. In this table, we present the values at 2014 income level.

2. Most health effects and their economic values are expected to occur in the year of analysis. However, not all avoided cases of adult mortality are expected to occur in the year of analysis. In addition, while avoided cases of non-fatal heart attacks are expected to occur in the same year as the emissions change, the costs associated with this health effect would occur over multiple years. Thus, BenMAP uses discount rates of 3 percent and 7 percent to calculate the value of these health effects in present terms.

3. Following U.S. EPA (2012a), we assume that some of the incidences of premature adult mortality related to $PM_{2.5}$ exposures occur in a distributed fashion over the 20 years following exposure. This lag adjustment does not apply to infant mortality because Woodruff et al. (1997) estimated the number of infant deaths occurring in the same year as the emissions change. We applied the lag adjustments to the BenMAP output.

4. BenMAP uses county-specific median daily wages to value work loss days and opportunity costs for hospital admissions. In this table, we report unit values based on the national median daily wage.

The resulting health impact results do not capture all uncertainty surrounding BenMAP's inputs. This analytic step introduces several uncertainties, including population forecasts and the VSL. Another source of uncertainty introduced in this analytic step relates to whether there is regional variability in some inputs. Because BenMAP's health impact and valuation functions represent national-level relationships,

the accuracy of regional-level analyses may be improved by identifying region-specific relationships from the literature.[49]

[49] Further details on uncertainty in BenMAP inputs are provided in the appendices of the *BenMAP User's Manual* (U.S. EPA, 2015a).

Background: While various policies have been implemented globally to mitigate climate change and reduce exposure to toxic air pollutants, policy assessments have considered few if any of the benefits to children.

Objective: To comprehensively assess the co-benefits of climate change mitigation to children, we expanded the suite of adverse health outcomes in the U.S. Environmental Protection Agency's Benefits Mapping and Analysis Program (BenMAP) to include additional outcomes associated with prenatal and childhood exposure to ambient fine particulate matter ($PM_{2.5}$). We applied this newly expanded program to an assessment of the U.S. Regional Greenhouse Gas Initiative (RGGI), the United States' first regional market-based regulatory program designed to reduce greenhouse gas emissions from the electric power sector within the Northeast.

Methods: We used calculated changes in ambient $PM_{2.5}$ concentrations for the period 2009–2014, with newly incorporated concentration–response (C-R) functions to quantify changes in the incidence of preterm birth (PTB), term low birth weight (TLBW), autism spectrum disorder (ASD), and asthma. These outcomes are causally or likely to be causally related to $PM_{2.5}$ exposure. Cost per case estimates were incorporated to monetize those changes in incidence.

Results: The estimated avoided cases of adverse child health outcomes included 537 asthma cases, 112 preterm births, 98 cases of ASD, and 56 cases of TLBW, with an associated avoided cost estimate ranging from $191 to $350 million. In a previous analysis of health benefits of RGGI, the only benefits accruing to children were limited to prevented cases of infant mortality and respiratory illnesses, with a monetized impact of $8.1 million—only 2–4% of the new results attributable to RGGI.

Conclusion: The results of this innovative analysis indicate that RGGI has provided substantial child health benefits beyond those initially considered. Moreover, those health benefits had significant estimated economic value. https://doi.org/10.1289/EHP6706

Introduction

Toxic air pollutants such as ambient fine particulate matter [PM ≤2.5 μm in aerodynamic diameter ($PM_{2.5}$)] and the major climate-altering gas, carbon dioxide (CO_2) emitted by fossil fuel combustion, are taking a significant toll on children's health and jeopardizing their future well-being. They are also major contributors to inequality worldwide (Perera 2017). Because of their biological vulnerability and rapid development, the developing fetus and young child are disproportionately affected by air pollution and climate change (Perera 2017). This is especially true in populations where poverty and environmental injustice compound the effects. A number of climate change mitigation policies and air pollution regulations have been implemented around the world to reduce fossil fuel combustion emissions, with sizeable health and economic benefits documented or projected. However, assessments of the public health benefits of such policies have considered few, if any, benefits to children; and their lifelong consequences have generally not been factored into the assessments of avoided costs. These include the U.S. Clean Air Act Amendments (U.S. EPA 2011), the Clean Power Plan (Driscoll et al. 2015), California's cap and trade program and low-cost fuel standards (O'Connor et al. 2014), the City of London Air Quality Strategy (City Of London Corporation 2019), and the Paris Climate Accord (Markandya et al. 2018). This omission has resulted in a serious undercounting of potential health benefits for this vulnerable population.

The Regional Greenhouse Gas Initiative (RGGI) is the United States' first regional market-based regulatory program designed to reduce greenhouse gas emissions from the electric power sector (RGGI Inc. 2019a). RGGI was established in the northeastern region in 2005 through a Memorandum of Understanding between the governors of Connecticut, Delaware, Maine, New Hampshire, New Jersey, New York, and Vermont. In 2007, the program was expanded to include Maryland, Massachusetts, and Rhode Island, and in 2008 it held an initial auction for emissions allowances (Center for Climate and Energy Solutions 2019). Under RGGI program, participating states are expected to reduce their annual CO_2 emissions from the power sector by 45% below 2005 levels by 2020, and by an additional 30% by 2030 (Center for Climate and Energy Solutions 2019). RGGI included 10 states during its initial compliance period starting in 2009. The program is still currently operating with 9 of the original states, with New Jersey having withdrawn in 2012 but planning to rejoin in 2020 (Center for Climate and Energy Solutions 2019).

RGGI places limits on CO_2 emissions from new and existing fossil-fuel-fired electric generating units (EGUs) in the program area with a minimum capacity of 25 MW. Regulated EGUs must obtain allowances for each short ton of emitted CO_2. Allowances are auctioned quarterly and may be sold or traded between EGUs. Auction revenues have been reinvested to accelerate renewable energy use, improve energy efficiency, and support other public benefit programs (RGGI Inc. 2019a).

Although RGGI is focused on reducing greenhouse gas emissions, it also reduces emissions of other pollutants, such as $PM_{2.5}$, nitrogen oxides (NO_x), and sulfur dioxide (SO_2) (Manion et al. 2017). NO_x and SO_2 react in the atmosphere to form $PM_{2.5}$, which has a well-documented relationship with multiple adverse health outcomes, including respiratory and cardiovascular effects, premature mortality, and, more recently, adverse birth outcomes,

respiratory illness, and neurodevelopmental problems in children (Perera et al. 2019).

Abt Associates previously analyzed health impacts of the first two compliance periods of RGGI (2009–2014) (Manion et al. 2017). The analysis estimated the reduction in NO_x and SO_2 emissions from RGGI-influenced EGUs based on modeling of the electricity sector and used the U.S. Environmental Protection Agency's (EPA's) Co-Benefits Risk Assessment (COBRA) to estimate changes in ambient levels of secondarily formed $PM_{2.5}$. The Environmental Benefits Mapping and Analysis Program (BenMAP) tool was used to estimate associated changes in health benefits due to changes in the ambient concentration of $PM_{2.5}$ in the nine then current RGGI states and in the adjacent states of New Jersey, Pennsylvania, Virginia, and West Virginia. BenMAP is a publicly available computer program supported by the U.S. EPA that can be used to estimate the number of air pollution-related illnesses and deaths and quantifies their economic value (U.S. EPA 2019). The program draws from a database that includes concentration–response (C-R) functions for a number of health outcomes attributable to different pollutants, population data, baseline health data, and cost of illness functions needed to quantify impacts (U.S. EPA 2019). The C-R functions included by default in the open-source program are focused largely on health outcomes for adults and do not currently include C-R functions or data for the children's health outcomes newly considered here.

Abt's 2017 assessment focused on avoided cases of premature adult deaths, heart attacks, acute bronchitis, asthma exacerbations, respiratory symptoms, hospitalizations, asthma emergency department visits, as well as productivity effects such as lost work days and days of minor restricted activity (Manion et al. 2017). These end points have traditionally been included in the U.S. EPA's regulatory analyses such as the *Regulatory Impact Analysis for the Final Revisions to the National Ambient Air Quality Standards for Particulate Matter* (U.S. EPA 2012). The 2017 assessment found that between 2009 and 2014, emissions reductions from RGGI resulted in avoided health outcomes having an estimated value of between $3 billion and $8.3 billion (2015$).

Since Abt's original analysis, the evidence base has strengthened the relationship between $PM_{2.5}$ and additional health end points, particularly end points that affect children. Specifically, Perera et al. (2019) conducted a systematic review of epidemiological studies quantifying the impacts of changes in ambient $PM_{2.5}$ concentrations on health end points identified as having a causal or likely causal relationship with $PM_{2.5}$: preterm birth (PTB), term low birth weight (TLBW), autism spectrum disorder (ASD), and incidence of asthma. Based on this review, the authors selected odds ratios that could be used to develop C-R functions for each outcome in estimating the benefits of reducing $PM_{2.5}$ exposure.

The present analysis provides a more comprehensive evaluation of children's health benefits under RGGI by including these additional health end points. This involved incorporating C-R functions for the new health end points and data on baseline incidence of these end points into BenMAP. These inputs were used with emissions reductions and air quality modeling results from the 2017 RGGI analysis to estimate the impacts of RGGI on PTB, TLBW, ASD, and asthma between 2009 and 2014 in RGGI states (Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont) and adjacent non-RGGI states (Pennsylvania, the District of Columbia, New Jersey, Virginia, and West Virginia). Per-case monetary estimates (unit values) were incorporated into the expanded BenMAP based on a systematic review of the published literature on the cost of illness (Shea et al. 2020).

In addition, in order to more fully present the impacts/benefits in children, this report highlights the change in incidence of infant mortality, acute bronchitis, and respiratory symptoms in children included in the results of the 2017 analysis. However, these were not explicitly reported as occurring in children.

Methods

This section describes in detail the methods and data sources used to quantify and monetize the change in incidences of PTB, TLBW, ASD, and childhood asthma. Both RGGI states and adjacent non-RGGI states were included in the analysis.

Figure 1 summarizes the general analytic approach used in Abt's 2017 RGGI analysis (Manion et al. 2017). Step 1 involved estimating the change in NO_x and SO_2 emissions at the county-level based on electricity dispatch modeling conducted by the Analysis Group, an economics consulting firm, which included the change in electricity generation by EGUs under two scenarios: with RGGI and without RGGI. Abt then estimated the change in emissions due to the change in generation based on facility-specific emissions rates from U.S. EPA data. In Step 2, Abt used COBRA, a screening-level tool, which includes a reduced-form air quality model to estimate how changes in NO_x and SO_2 emissions would impact ambient concentrations of $PM_{2.5}$ in RGGI and neighboring states. The estimated incremental changes in NO_x and SO_2 emissions calculated in Step 1 were used to model changes in concentrations during individual years (2009–2014). Outputs from this model included annual changes in levels of ambient $PM_{2.5}$ in each county in RGGI and neighboring states and were the inputs for modeling the associated health impacts. Finally, in Step 3, Abt used the expanded BenMAP to estimate how changes in ambient $PM_{2.5}$ concentrations resulted in changes in health impacts in children.

The present analysis made no changes to Steps 1 and 2 from the 2017 analysis—we obtained annual average $PM_{2.5}$ concentration data from Abt Associates for the years 2009–2014. Rather, the present analysis added additional health end points to BenMAP and estimated how the modeled changes in $PM_{2.5}$ concentrations under RGGI (2009–2014) affected those additional end points. The remainder of this section discusses the specific inputs and steps taken in this analysis.

C-R Functions

C-R functions are estimates of the relationship between changes in ambient pollutant concentrations and incidences of specific health end points. These functions are derived from epidemiological studies that compare the change in incidences of specific health outcomes to, in this case, changes in ambient $PM_{2.5}$ concentrations.

Perera et al. (2019) conducted a systematic review of epidemiological studies, meta-analyses, and review articles to determine the current state of the science on the associations of ambient air pollutants, including $PM_{2.5}$, and children's health outcomes. Through this comprehensive review the authors identified four key meta-analyses that estimated the relationship between changes in $PM_{2.5}$ concentrations and changes in the incidence of each health end point (Table 1).

We used the results of Perera et al. (2019) to incorporate C-R functions for each end point into BenMAP. The C-R functions include a beta coefficient, which quantifies the impact on each health outcome per 1-unit change in $PM_{2.5}$ concentrations. We developed the beta coefficients shown in Table 1, based on the natural log of the odds ratio reported by the meta-analysis, divided by the reported exposure change (in micrograms per cubic meter), as is consistent with U.S. EPA practice (U.S. EPA 2012). The beta coefficients were combined with county-level data on

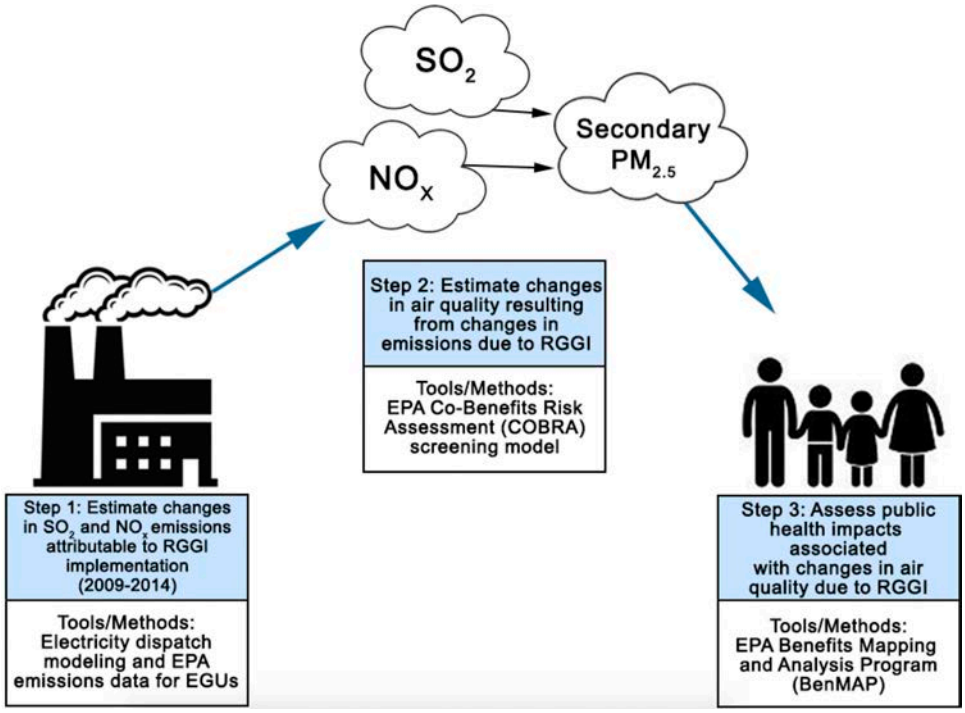

Figure 1. Overview of the analytic steps and tools. Source: Manion et al. 2017. Note: EGU, electric generating unit; EPA, Environmental Protection Agency; NO_x, nitrogen oxides; $PM_{2.5}$, particulate matter ≤2.5 μm in aerodynamic diameter; RGGI, U.S. Regional Greenhouse Gas Initiative; SO_2, sulfur dioxide.

population, baseline incidence, and the modeled change in county-level $PM_{2.5}$ concentrations to estimate the change in incidence of each health outcome in each county.

Population

The impact assessments require data on the affected age groups in the population. For this analysis, we used the county-level population by age group data loaded in BenMAP for each year of the analysis (2009–2014). These data were taken from the 2010 U.S. Census of Population and Housing models (developed by Woods and Poole 2011).

The C-R functions for PTB, low birth weight (LBW), and ASD reported in Perera et al. (2019) are based on maternal exposure during pregnancy. We applied the C-R functions to the population in Age Group 0 in BenMAP, which was used as a proxy for pregnant mothers. The C-R function for asthma incidence is based on the exposure of children under the age of 18 y. Accordingly, we applied this C-R function to populations in Age Groups 0–18.

Table 1. Meta-analyses for additional health end points associated with $PM_{2.5}$ identified by Perera et al. (2019).

Health end point	Study	Odds ratio	Exposure metric	Beta coefficient
PTB	Sun et al. 2015	1.13	Per 10-μg/m^3 increase	0.012
LBW	Sun et al. 2016	1.09	Per 10-μg/m^3 increase	0.009
ASD	Lam et al. 2016	2.32	Per 10-μg/m^3 increase	0.084
Asthma incidence	Khreis et al. 2017	1.03	Per 1-μg/m^3 increase	0.030

Note: Perera et al. (2019) conducted a systematic review to determine the current state of the science on the associations of ambient air pollutants, including $PM_{2.5}$, and children's health outcomes. The authors identified four key meta-analyses that estimated the relationship between $PM_{2.5}$ concentrations and the incidence of each health end point: PTB, LBW, ASD, and asthma. ASD, autism spectrum disorder; LBW, low birthweight; $PM_{2.5}$, particulate matter ≤2.5 μm in aerodynamic diameter; PTB, preterm birth.

Baseline Incidence

Baseline incidence rates for each end point were drawn from public data sources and the academic literature. County-level incidence rates of PTB and LBW were taken from the Centers for Disease Control and Prevention (CDC) WONDER database (CDC 2019), which contains extensive data on births, including gestational age and infant birth weight.

PTB is defined as a birth that occurs before the 37th week of pregnancy. The incidence of PTB was developed by dividing the number of births in each county occurring before the 37th week of pregnancy by the total number of births in each county. The county-level average incidence rate of PTB in RGGI and neighboring states was 13.4%. For comparison, the national average rate was 11.6%.

TLBW is defined in this analysis as a weight <2,500 g at birth when the infant was delivered on or after the 37th week of pregnancy (i.e., early to late term). This analysis does not include LBW in infants born before the 37th week of pregnancy to avoid double-counting the effects of PTB. The incidence of TLBW was calculated by dividing the number of full-term births in each county where the weight of the infant was <2,500 g by the total number of full-term births in each county. The county-level TLBW rate average was 3.2%. For comparison, the national TLBW rate average was 3.3%.

In the absence of county-level and complete state-level data, the asthma incidence rate for this analysis was taken from Winer et al. (2012), who estimated a national rate of 11.1 per 1,000 children ages 5–11 y from 2006–2008. This estimate was based on the Asthma Call-Back Survey, which was first implemented in 2006. Incident cases of asthma were defined as children diagnosed with asthma by a health care provider within 12 months prior to survey participation.

Because incidence rates were not directly available for ASD, we used prevalence as a proxy. In the absence of county-level and complete state-level data for prevalence, we selected the national prevalence rate of ASD for 2014 based on a CDC report (Zablotsky et al. 2015). We note that incidence is difficult to measure with rarer

chronic diseases such as autism. In addition, the disorder starts long before it is diagnosed, and the gap between initiation and diagnosis is influenced by many factors unrelated to risk (Hertz-Picciotto and Delwiche 2009). The rate used in this analysis was 14.7 per 1,000 children (Zablotsky et al. 2015).

Economic Valuation

The economic value of the change in incidences of each health end point was estimated using unit cost values from the literature (Shea et al. 2020). As described, those values were adjusted to 2015$ using a discount rate of 3% (Shea et al. 2020). Table 2 lists the values used in this analysis and the studies from which they were taken. The economic costs of each health end point were estimated by multiplying the change in incidences, as estimated by BenMAP, by the values in Table 2.

The values for asthma and ASD in Table 2 include high and low values. For asthma this is related to whether or not there is a persistence of the disorder into adulthood. For ASD this is related to whether there is an intellectual disability or not. For these end points, both the high and low values were used, and the results are reported as a range.

Results

This section describes the results of the analysis, including the estimated change in incidences of each health end point (the number of avoided cases) due to the emissions reductions associated with RGGI, as well as the economic valuation of those changes in incidences. Both the change in incidences and the economic valuation are summarized as the cumulative change between the year 2009 and the year 2014 (for both RGGI and neighboring states). The results are summarized separately for RGGI and neighboring states, and then totaled.

The results of this analysis are also compared with the results of the previous RGGI analysis (Manion et al. 2017), specifically the other health end points in children that were included in the previous analysis but not all explicitly labeled as occurring in children.

Change in Incidences

Table 3 shows the estimated change in incidence—the estimated number of avoided cases—of each health end point in RGGI and neighboring states between 2009 and 2014. Asthma had the largest change in incidence, at 537 cases avoided in the study area between the year 2009 and the year 2014. TLBW had the lowest change in incidence, at a total of 56 incidences avoided. This largely reflected that LBW had the smallest beta coefficient of the four end points (Table 1).

Table 3. Number of estimated avoided cases by health end point in RGGI and neighboring states (2009–2014).

Health end point	RGGI states	Neighboring states	Total
PTB	58	54	112
TLBW	29	27	56
ASD	50	48	98
Asthma	274	263	537

Note: RGGI states include Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont. Adjacent non-RGGI states include Pennsylvania, the District of Columbia, New Jersey, Virginia, and West Virginia. ASD, autism spectrum disorder; PTB, preterm birth; RGGI, U.S. Regional Greenhouse Gas Initiative; TLBW, term low birth weight.

Economic Valuation

Table 4 shows the results of the economic valuation of the change in incidences in RGGI and neighboring states between 2009 and 2014 for the newly incorporated health end points: ASD, asthma, TLBW, and PTB. As discussed above, both ASD and asthma have high and low estimates for the economic values of each end point. Results using both the high- and low-end estimates are shown here.

Although ASD was estimated to have the second-lowest number of avoided incidences compared with other health end points, it had by far the highest valuation per case, estimated at $1.8–3.1 million (Table 2). As a result, the economic valuation of the reduction in ASD incidences accounted for 84–89% of the total health benefits of the four health end points. Although asthma had a lower valuation per end point, it had the highest estimated change in incidence, leading it to have the second-highest value of the four health end points, at 6–13% of the total health benefits of those four end points. PTB and TLBW both had relatively lower per-unit economic values and lower estimated change in incidences. Therefore, the estimated economic valuation for those end points was comparatively smaller: 2–4% of the total benefits for PTB and <1% for TLBW.

Table 2. Per-case monetary estimates of each health end point (Shea et al. 2020).

Study basis	Health end point	Cost of illness definition	Unit value (2015$)
PTB			
Institute of Medicine Committee on Understanding Premature Birth and Assuring Healthy Outcomes 2007	Any PTB	Medical costs + special education costs + lost productivity costs, 3% discount rate (DR)	70,101
LBW			
Russell et al. 2007	LBW among those with slow growth/malnutrition	Initial hospital costs	15,560
ASD			
Buescher et al. 2014	ASDs with intellectual disability	Medical costs + non-medical expenditures + special education costs + lost productivity costs, 3% DR	3,109,096
	ASDs without intellectual disability	Medical costs + non-medical expenditures + special education costs + lost productivity costs, 3% DR	1,805,941
Asthma			
Nurmagambetov et al. 2018	Age 3 y onset, no persistence into adulthood	Medical costs + absentee costs, 3% DR	23,573
	Age 3 y onset, persistence into adulthood	Medical costs + absentee costs, 3% DR	91,954

Note: The values for asthma and ASD include high and low values. For asthma this is related to whether or not there is a persistence of the disorder into adulthood. For ASD this is related to whether there is an intellectual disability or not. For these end points, both the high and low per-case monetary estimate values were used, and the results are reported as a range. ASD, autism spectrum disorder; LBW, low birth weight; PTB, preterm birth.

Table 4. Estimated economic valuation (million 2015$) of change in incidence by health end point in RGGI and neighboring states (2009–2014).

	Low value			High value		
Health end point	RGGI states	Neighboring states	Total	RGGI states	Neighboring states	Total
ASD	87.3	83.7	171.0	150.2	144.1	294.4
Asthma	6.2	5.9	12.1	24.2	23.1	47.4
TLBW	0.4	0.4	0.8	0.4	0.4	0.8
PTB	3.9	3.6	7.5	3.9	3.6	7.5
Total	97.8	93.7	191.5	178.8	171.3	350.1

Note: The values for asthma and ASD include high and low values. For asthma this is related to whether or not there is a persistence of the disorder into adulthood. For ASD this is related to whether there is an intellectual disability or not. For these end points, both the high and low per-case monetary estimate values are used, and the results are reported as a range. ASD, autism spectrum disorder; PTB, preterm birth; RGGI, U.S. Regional Greenhouse Gas Initiative; TLBW, term low birth weight.

Comparison of Current Results to Estimates from the Previous (2017) Analysis

The 2017 Abt analysis of the health benefits of RGGI estimated total health benefits of between $3.0 billion and $8.3 billion between 2009 and 2014, using a 3% discount rate (Manion et al. 2017). This included an estimated 300–830 avoided premature adult mortalities, which accounted for the great majority of the monetized benefit.

The economic value of the health benefits of the four health end points in the present analysis were estimated at between $191 million and $350 million, or approximately 4–6% of the total benefits of the 2017 analysis, but considerably larger than the originally estimated impact from health outcomes excluding premature mortality.

Although the 2017 analysis did not specifically report benefits that accrue to adults and children separately, some of the health end points included in that analysis were focused on children. Specifically, the child-focused health end points included infant mortality, acute bronchitis, and respiratory symptoms. The numbers of estimated avoided incidences and economic valuation of those incidences are shown in Table 5. Note that the 2017 analysis included some health effects that applied to both children and adults, such as asthma emergency department visits and respiratory hospital admissions. Because it was not possible to separate out the impacts in children, those results are not discussed here.

As shown in Table 5, the economic value of the estimated health benefits to children from the 2017 analysis is dominated by avoided infant mortality. Although the estimated incidence was <1, the economic value per incidence is so high (approximately $11 million per incidence) that it vastly outweighs the economic value of the other health end points, which have per-incidence economic values of <$1,000 each.

The four health end points for children included in the 2017 analysis (Table 5) have a much lower total economic value than the four health end points in the present analysis (Table 4). The economic value of the benefits to children included in the 2017 analysis are approximately 2–4% the size of the value of the benefits to children newly included in the present analysis.

The total health benefits to children from RGGI between 2009 and 2014, including all eight health end points (both those in the 2017 analysis and the present analysis), were estimated at $199.6–358.2 million.

Table 5. Estimated health benefits for children due to RGGI (2009–2014) from the previous Abt Associates analysis [RGGI and neighboring states (Manion et al. 2017)].

Health end point	Avoided incidences	Economic value (million 2015$)
Acute bronchitis	510	0.30
Infant mortality[a]	<1	7.30
Lower respiratory symptoms	6,500	0.17
Upper respiratory symptoms	9,300	0.37
Total[b]	16,310	8.10

Note: BenMAP, Benefits Mapping and Analysis Program; RGGI, U.S. Regional Greenhouse Gas Initiative.
[a]The 2017 analysis estimated <1 avoided infant mortality due to RGGI. It is important to note that the C-R functions in BenMAP estimate actual health outcomes based on the change in risk of an outcome. Therefore, estimating <1 avoided infant mortality means that RGGI reduced the risk to infants by a relatively small, although not negligible, amount. Nevertheless, this reduced risk still has a very high economic value relative to the other health outcomes.
[b]Totals may not sum due to rounding.

Distributional Analysis of Benefits across Counties

The map in Figure 2 shows considerable variation across RGGI and neighboring counties in the distribution of economic benefits from the cumulative avoided child health outcomes: PTB, TLBW, ASD, asthma, infant mortality, acute bronchitis, lower respiratory symptoms, and upper respiratory symptoms.

Figure 3 maps the spatial distribution of reductions in average annual $PM_{2.5}$ concentrations between 2009 and 2014 at the county level attributable to RGGI during its first and second compliance periods. These results show substantial air quality benefits, particularly in counties downwind of Maryland's power plants regulated under RGGI. In addition, counties in New Jersey and Pennsylvania, both currently non-RGGI states, experienced significant air quality improvements attributable to emission reductions in neighboring RGGI states.

It is important to note that estimates of reductions in $PM_{2.5}$ concentration represented in Figure 3 account only for secondary $PM_{2.5}$ formed by chemical reactions of NO_x and SO_2. This analysis does not account for impacts of directly emitted $PM_{2.5}$. Nor does it account for the health effects from other pollutants such as ozone (O_3) or nitrogen dioxide (NO_2), thereby underestimating the health benefits under RGGI.

Discussion

Over the past decade, RGGI has driven significant emission reductions from the electric power sector. The program's initial goal was to reduce annual power sector CO_2 emissions by 45% below 2005 levels by 2020. Their 2030 goal was to reduce emissions by an additional 30% (Center for Climate and Energy Solutions 2019). According to a recent report by RGGI, by 2017, participating states had reduced CO_2 emissions from the power sector by more than 50% since 2005 while maintaining steady regional gross domestic product growth (RGGI Inc. 2019b), suggesting that RGGI states have exceeded their initial goal and are on track to meet their 2030 goal. Additional findings from a 2019 assessment (Acadia Center 2019) indicate that since 2008 (1 y prior to the program's launch), RGGI states' emissions from the electric power sector decreased from 133 million short tons of CO_2 to 70 million; these reductions exceeded those of the rest of the country by 90% (Acadia Center 2019). Although RGGI has not been the single driver behind the northeastern region's decarbonization in the electric power sector, a previous analysis (Murray and Maniloff 2015) has suggested that the program has

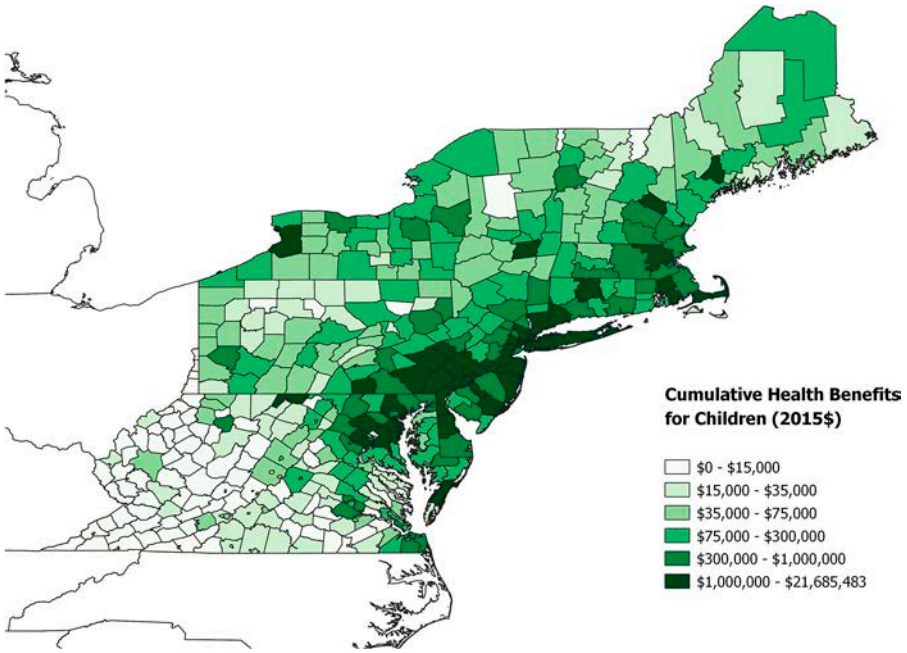

Figure 2. Economic benefits of avoided cases of child health outcomes attributable to RGGI by county, 2009 to 2014 (low value, 2015$). Note: RGGI, U.S. Regional Greenhouse Gas Initiative.

been a significant factor in the reduction of power plant emissions. Simulations from that analysis also suggested that emissions would have been approximately 24% higher in the region and 1.4% higher in the United States in 2012 without the program's implementation in 2009 (Murray and Maniloff 2015).

The results of our analysis of RGGI's co-benefits from the reduction in air pollution indicate that RGGI has provided substantial child health benefits beyond those considered in the 2017 analysis. Moreover, those health benefits have significant estimated economic value. The previous analysis found large total health benefits with a total economic value of $3.0–8.3 billion; nearly all of those benefits were due to avoided adult mortality (Manion et al. 2017). The benefits from health end points specific to children included in the 2017 analysis (infant mortality, acute bronchitis, and other respiratory symptoms) were estimated at $8.1 million, accounting for a very small fraction (0.09–0.27%) of the total estimated health benefits. The four additional health end points considered here—PTB, TLBW, ASD, and asthma—have a much larger combined economic value ($191–350 million) than those previously considered and amount to 4–6% of the total adult and child benefits from the 2017 analysis. This is likely to be an underestimate, as discussed below. Of the four additional health end points, asthma had the most significant change in incidence (number of avoided cases) between 2009 and 2014. This is expected, given that the C-R function used to estimate the incidence of asthma was applicable to all children ages 0–18 y, while the C-R functions for the other health end points were applied only to infants (age 0 y). As a result, there is a larger population of children for whom the analysis estimated impacts on the incidence of asthma.

Although a modest contribution to the total avoided costs, estimates from the present study are 20–40 times greater than the value of the avoided child outcomes in the 2017 analysis (Manion et al. 2017). The estimated total economic benefit from these avoided cases attributed to RGGI between 2009 and 2014, including the combined eight health end points considered in the 2017 analysis and the present analysis, was $199.6–358.2 million.

Not only is this a substantial economic benefit, but it is likely an underestimate of the true benefit because the adverse outcomes in children associated with $PM_{2.5}$ not only have immediate heath impacts but can also have serious consequences for their future health, well-being, and ability to contribute to society. These long-term health or lifelong consequences are not adequately considered in most of the outcome valuations used in this analysis.

In addition, it is important to note that the per-case estimates used in our calculations of avoided costs are likely underestimates for a few reasons, including the reliance on the cost of illness (COI) (Shea et al. 2020). For instance, as the U.S. EPA *Guidelines for Preparing Economic Analyses* notes, the COI method for developing per-case estimates typically does not attempt to quantify a loss in utility from pain and suffering (U.S. EPA 2010). Given that these costs are often omitted from COI estimates, the value of an individual's willingness to pay to avoid a lifetime of an illness like asthma may be significantly larger than the COI value. Furthermore, potential long-term costs to children or parents were not generally considered in the per-case monetary estimates used in this study (Shea et al. 2020). Examples are a child's cognitive disability associated with PTB and the impact on parents' employment behaviors, affecting their household income (Petrou et al. 2001).

A further factor in potentially significant underestimation of benefits is that both the 2017 and the present analyses include only emission reductions of NO_x and SO_2. Although secondary $PM_{2.5}$ accounts for the majority of $PM_{2.5}$ resulting from power plant emissions (NARSTO 2004), the analysis did not consider impacts from directly emitted $PM_{2.5}$. Nor were the health benefits of reductions in O_3 precursors, NO_2, and climate-altering greenhouse gases factored into this analysis. For these reasons, the results are conservative.

The health benefits from RGGI are not likely to be evenly distributed geographically, with some populations receiving higher health benefits than others. This analysis (like Manion et al. 2017) estimated the geographic distribution of health benefits by county but did not attempt to estimate disparities in health benefits by differences in socioeconomic status or ethnicity/race. This is because air quality results used in this analysis (and the previous 2017 analysis) are at the county level, and socioeconomic

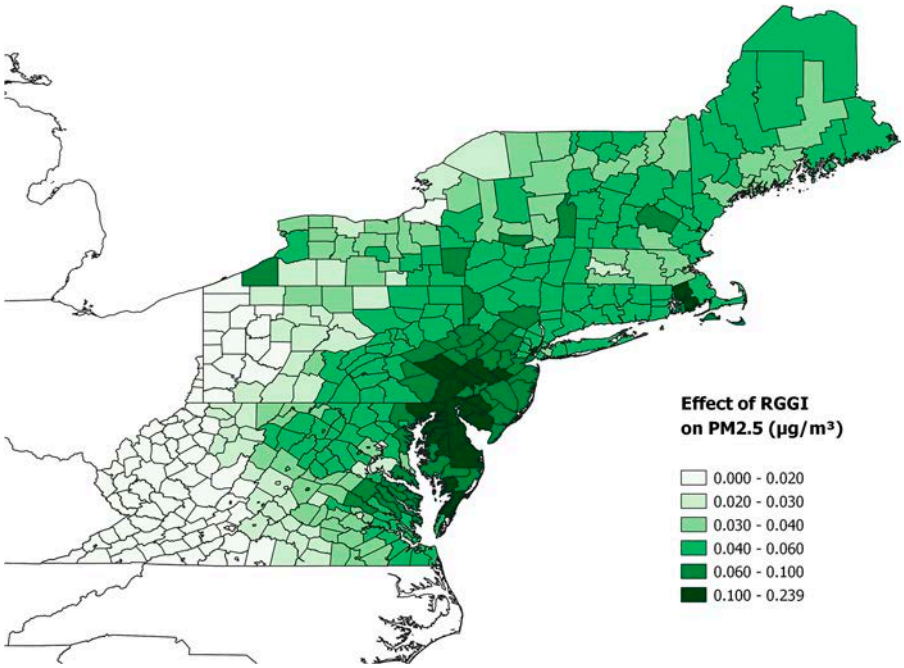

Figure 3. Reductions in average annual $PM_{2.5}$ concentrations by county attributable to RGGI (2009–2014) Source: Abt Associates 2017. Estimates of reductions in $PM_{2.5}$ concentration account only for secondary $PM_{2.5}$ formed by chemical reactions of NO_x and SO_2. This analysis does not account for impacts of directly emitted $PM_{2.5}$. Nor does it account for the health effects from other pollutants such as O_3 or NO_2, thereby underestimating health benefits under RGGI. Note: NO_x, nitrogen oxides; NO_2, nitrogen dioxide; O_3, ozone; $PM_{2.5}$, particulate matter ≤2.5 µm in aerodynamic diameter; RGGI, U.S. Regional Greenhouse Gas Initiative; SO_2, sulfur dioxide.

status and distribution of population by ethnicity/race can vary widely within counties (Sommeiller et al. 2016).

Exploratory assessment of the distributional impacts of the health benefits and associated economic benefits at the county level showed significant variation in benefits across counties, as demonstrated in Figure 2. The monetized benefits are a function of the change in air quality and the total population affected. As a result, more densely populated areas would be expected to have higher benefits because there is a larger at-risk population (more pregnant women and children) breathing cleaner air. This is likely occurring in densely populated counties across New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, and New Jersey. Reductions in average annual $PM_{2.5}$ concentrations between 2009 and 2014 under RGGI, as shown in Figure 3, suggest substantial air quality benefits.

A comparison of the two maps (Figures 2 and 3) gives a sense of the magnitude of the air quality changes experienced in each county relative to their corresponding health benefits. Similar to the economic benefits map (Figure 2), the map of reductions in $PM_{2.5}$ concentrations (Figure 3) shows considerable variation across counties. In most counties, the distribution of economic benefits corresponds with reductions in levels of $PM_{2.5}$; highlighting the direct benefit from emission reductions. On the other hand, as shown in Figure 3, some counties—for example, in Massachusetts, Connecticut, and Rhode Island—experienced disproportionately high estimated health and economic benefits in relation to their low level emission reductions; indicating that even slight reductions in $PM_{2.5}$ emissions resulted in considerable benefit.

Because of the scale of analysis, we were not able to meaningfully examine whether benefits were shared equitably across socioeconomic strata and different racial/ethnic populations. This is a major concern with respect to environmental justice given that it is the less affluent communities and communities of color that have borne the brunt of fossil fuel–related pollution and climate change impacts (Morello-Frosch et al. 2011). Although regional cap and trade policies like RGGI may be effective in reducing greenhouse gases and their co-pollutants on a regional scale, they may not maximize public health benefits or adequately address existing environmental justice issues. A more granular analysis (e.g., at the census tract or neighborhood level) is necessary to better understand finer-grained changes in air quality and the true distribution of health benefits by population density, socioeconomic status, and ethnicity/race. Such a comprehensive assessment could provide an opportunity to evaluate whether alternative programs could achieve the same greenhouse gas mitigation goals while also redressing environmental injustice.

As noted by Manion et al. (2017), the benefits associated with reducing emissions of the major greenhouse gas, CO_2, are outside of the scope of this study. Thus, the analysis does not cover the many health benefits of mitigating climate change, such as fewer heat-related illnesses or cases of vector-borne disease to which children are especially vulnerable. In addition, benefits to ecosystems and natural resources that support human livelihood are not captured in this analysis.

Because the epidemiologic evidence on the association between $PM_{2.5}$ and child intelligence quotient (IQ) is suggestive only (Chiu et al. 2016; Harris et al. 2015), we were not able to consider the potentially large benefit of RGGI in terms of improvement in child IQ. Decreased IQ in boys has been associated with gestational exposure to higher $PM_{2.5}$ levels (Chiu et al. 2016). Prenatal exposure to polycyclic aromatic hydrocarbons, a component of $PM_{2.5}$, has also been associated with lower child IQ (Perera et al. 2009). In addition, the association between PTB and IQ reduction, previously identified in the literature (for review, see Allotey et al. 2018; Bhutta et al. 2002; Kerr-Wilson et al. 2012), is not accounted for—thereby underestimating the impacts of PTB. A meta-analysis by Kerr-Wilson et al. (2012) estimated a decrement of 11.94 (95% confidence interval: 10.47, 13.42) IQ points among preterm children compared with children born at term. The loss of 1 IQ point has been estimated to result

in a $17,815 loss of lifetime earnings per child (Gould 2009). Therefore, preventing the contribution of $PM_{2.5}$ exposure to PTB could have substantial economic benefits.

We note that the evidence with respect to $PM_{2.5}$ and ASD support a likely causal association. A highly cited systematic review and meta-analysis by Lam et al. (2016) has identified a number of studies on air pollution exposure during developmental periods that have found associations with ASD. The analysis by Lam et al. (2016) included 23 human studies published between 2006 and 2015, 9 of which assessed particulate matter (including PM_{10} and $PM_{2.5}$). The review found evidence for associations between prenatal exposure to $PM_{2.5}$ and ASD (Lam et al. 2016). Additional studies have been published since this review that have found positive associations between prenatal and/or early life $PM_{2.5}$ exposure and ASD (Kaufman et al. 2019; Jo et al. 2019; McGuinn et al. 2020).

Despite its limitations, the present analysis provides evidence of the importance of comprehensive assessments of child health benefits in analyses of the benefits of climate mitigation and air pollution emissions reduction policies. With respect to the distributional impacts, additional research is needed to refine and extend the overall benefits estimates provided here. Nevertheless, this analysis has estimated substantial benefits of RGGI for children's health.

Conclusion

Findings from the present assessment indicate that RGGI has provided considerable child health benefits to participating and neighboring states beyond those conventionally considered. Moreover, those health benefits are estimated to have significant economic value. Our assessment of the projected health co-benefits to children under RGGI can provide valuable support for the design and implementation of future programs to mitigate climate change targeting other sectors, including the transportation sector. Findings from this assessment also should encourage other states to join the program or initiate similar strategies of their own. In addition, our newly incorporated C-R functions and economic values for children's health end points into BenMAP are important additions to the existing program, which can be used widely. In this sense, the present study is generalizable and the methods can be used to quantify children's health and economic benefits under other climate change mitigation, air pollution control, and environmental programs.

Attachment 50

Regional Greenhouse Gas Initiative, Inc.

Scope of Work in Support of Virginia Department of Environmental Quality Implementation of the Virginia Carbon Dioxide (CO_2) Budget Trading Program

Regional Greenhouse Gas Initiative, Inc. ("RGGI, Inc.") will provide program implementation, administration and development services, as outlined in this Scope of Work, to the Virginia Department of Environmental Quality ("Department") to support the Commonwealth of Virginia's ("Commonwealth") participation in the Regional Greenhouse Gas Initiative ("RGGI") and the implementation of regulations for the Virginia CO_2 Budget Trading Program ("Program"). RGGI, Inc., a non-profit organization incorporated in the State of Delaware, was formed expressly to provide technical implementation and program development support services to the states participating in RGGI ("participating states").

Overview

As described more fully herein, RGGI, Inc. will provide services to support implementation of the Program in the following seven areas:

I. Operation of the RGGI CO2 Allowance Tracking System (RGGI COATS), for use by the Department in administering the Program in coordination with counterpart programs in other participating states.

II. Operation of a regional allowance auction platform, for use by the Department in administering the Program in coordination with counterpart programs in other participating states.

III. Development of model offset consistency applications and model offset monitoring and verification submittal forms, suitable for customization by the Department for use in administering the offset components of the Program.

IV. Development of generic and category-specific guidance documents detailing the requirements for offset projects under the RGGI Model Rule, suitable for customization by the Department for use in administering the offset components of the Program.

V. Maintenance and operation of an accreditation process and provide materials for the accreditation of independent verifiers of offset projects, suitable for customization by the Department for use in accrediting independent offset verifiers.

VI. Market monitoring services for the monitoring of both allowance auction conduct and outcomes and the secondary allowance market.

VII. Provision of program development support services on an as-requested basis, including, but not limited to, evaluation of additional offset categories and the development of technical and policy recommendations related to specific Program elements for evaluation and consideration by the Department.

I. No Policy Role or Regulatory Authority

RGGI, Inc.'s activities under this Agreement shall not include any policy role or decision-making authority regarding policy matters of the Commonwealth, including, without limitation, the Commonwealth's positions in response to federal policies, the Commonwealth's decisions regarding any future changes to the Program, and the Commonwealth's interaction with participating states or other states that may be considering becoming a participant in RGGI. RGGI, Inc. shall also have no regulatory authority under this Agreement, including, without limitation, authority to enforce the Program and authority to interpret any provisions of the Program. All such policy roles, decision-making authority, and regulatory authority shall remain with the Commonwealth under this Agreement.

I. RGGI CO2 Allowance Tracking System (RGGI COATS)

RGGI, Inc. shall provide services to support allowance tracking for the Program through RGGI COATS. Such services shall include annual program implementation and support. RGGI COATS facilitates market participation by supporting:

- The origination, allocation, award, and transfer of CO_2 allowances.
- The certification and providing of CO2 allowances for compliance-related tasks; and,
- The registration and submittal of applications and reports for offset projects.

II. RGGI, Inc. shall provide on-going implementation and operational support for RGGI COATS, including the tasks outlined below.

II-A. Allowance Program Management

RGGI, Inc. shall provide implementation support to the Department for all Program activities relating to CO2 budget source account management, allowance allocations to compliance and general accounts, and allowance transfers for both general and compliance accounts. This shall include all activities necessary to support the assignment of allowances to appropriate accounts following the successful completion and Department approval of all allowance auctions, as well as the population of user accounts after Department award of offset allowances.

II-B. Emissions Data Management and Analysis

RGGI, Inc. shall perform all data management and quality assurance tasks necessary to ensure the availability of annual CO2 emissions data from all affected units. RGGI, Inc. shall prepare and send communications to the authorized account representatives for budget sources relating to emissions values. RGGI, Inc. shall work with the Department to identify and resolve any issues relating to the submission of emissions data, and the accuracy and

completeness of the data. To the extent requested by the Department, RGGI, Inc. shall contact authorized account representatives directly to resolve any outstanding issues. RGGI, Inc. shall document all issues, their resolution, and all contacts with authorized account representatives.

II-C. Allowance Reconciliation (True-up)

RGGI, Inc. shall assist the Department with compliance assessments for the Program. RGGI COATS shall support the entry of compliance certifications required by the Program and the identification of allowances to be deducted during the compliance process. Assessments shall also factor in appropriate offset limits as a function of a source's reported emissions. RGGI, Inc. shall prepare draft and final compliance reports and will provide information to the Department regarding possible non-compliance.

II-D. User Technical Support

RGGI, Inc. shall provide technical support to industry, the Department, and public users for RGGI COATS. RGGI, Inc. shall record all technical support requests, inquiries, or other occurrences in a log that identifies the nature of the request or events, requestor, respondent, response provided, date(s) and time(s) of response, and amount of time expended on the request and response. Records shall be provided to the Department on a periodic basis, or on demand, as requested.

As necessary, RGGI, Inc. shall provide assessments and recommendations relating to performance of RGGI COATS based on the technical support levels and user feedback. RGGI, Inc. shall not be responsible for interpretation of the Department's regulations, and/or interpretation of actions taken by the Department in enforcement of those regulations.

II-E. System and Database Support

RGGI, Inc. shall be responsible for all aspects of RGGI COATS maintenance and database support and management. This shall include on-going database quality assurance activities, management of all user accounts and security, coordination and monitoring of the Application Service Provider support activities, database, security and application performance, and all other tasks designed to ensure high system availability and performance. RGGI, Inc. shall provide reports to the Department on all routine activities and on any events or technical issues that will affect the operation or performance of the system. RGGI, Inc. shall oversee all data backup and audit procedures to ensure the on-going integrity of the data.

III. Allowance Auction Platform

RGGI, Inc. shall implement and administer a process and platform for the auctioning of allowances under the Program. RGGI, Inc. shall provide auction services in three general areas: pre-auction, auction implementation, and post-auction.

Pre-auction Services

Consultation

RGGI, Inc. shall work with Department staff to maintain the draft standard allowance purchase and sales agreement that is comparable to those developed by other participating states. In addition, RGGI, Inc. may be asked to provide general consultation to the Department on auction design. This may include consultation on auction activity procedures and auction closing procedures.

Auction Notices

RGGI, Inc., in consultation with the Department and subject to its approval, shall create documents and associated information necessary to inform auction participants about details of each auction. Each notice of auction shall provide a specific description of the auction format that will be used, the quantities of allowances to be auctioned, and all applicable participation requirements, consistent with the participating states' rules. Such information shall be made available on the RGGI, Inc. auction website, which can be found through the RGGI, Inc. website, https://www.rggi.org. RGGI, Inc. shall prepare and host an auction participant training presentation for public viewing prior to each auction, as well as receive and respond to written questions submitted by conference participants.

Participant Qualification

RGGI, Inc., in consultation with the Department, shall ensure that all qualified participants have completed the applicable qualification application materials and documents prior to participation in any auction. RGGI, Inc. shall manage, under the direction of the Department, the application process, including receiving and reviewing each qualification application to determine completeness and accuracy of the information submitted. RGGI, Inc. shall be responsible for collecting and managing all auction financial security submissions and/or escrow accounts for the Department. RGGI, Inc., in consultation with the Department, shall be responsible for notifying bidders of their qualification status and maintaining a database of all qualified bidders.

Auction Documentation and Training

To prepare for each auction, RGGI, Inc. shall, subject to the Department's approval, create and distribute auction materials, such as participation instructions, final auction procedures and manuals, as well as the distribution of user codes and passwords to qualified auction participants. In addition, RGGI, Inc. shall be responsible for training auction participants in the use of the auction software platform.

III-B. Auction Implementation Services

Auction Platform

RGGI, Inc. shall maintain and administer an online auction platform for the auctioning of allowances under the Program capable of accommodating an auction in the following formats:

- A sealed bid, uniform price auction
- A sealed bid, discriminatory-price auction
- An ascending price, multiple-round auction
- A descending price, multiple-round auction

Furthermore, the online auction platform shall be capable of managing allowance purchase limits based on specifications provided by the Department. In addition, the auction platform shall be capable of tracking bidding activity and must provide for audit level documentation of such activity, in accordance with auction monitoring protocols that are established by RGGI, Inc. in consultation with the Department and subject to its approval.

IV-C. Post-auction Services

RGGI, Inc. shall arrange for and facilitate the transfer of funds from successful bidders to an account designated by the Department and arrange for the return of financial security to bidders. RGGI, Inc. shall also be responsible for coordinating the operation of RGGI COATS for the transfer of allowances, at the direction of the Department, to the compliance or general accounts of the winning bidders. RGGI, Inc. shall also be required to: (1) work with any independent third party hired by the Department to verify the results of the auction, including potential redress; (2) if directed by the Department, post appropriate information about auction results; and (3) work with the Department to use on-going auction experience to improve subsequent auctions.

RGGI, Inc. shall administer a bank account for holding financial security from bidders. RGGI, Inc. shall impose access security controls on such account to the satisfaction of the Department. RGGI, Inc. shall transfer the proceeds from the sale of allowances at auction to an account to be designated by the Department using an ACH transaction no later than one business day following the transfer of allowances to winning bidders.

IV. Model Offset Consistency Applications and Monitoring and Submittal Documents

RGGI, Inc. shall provide model offset consistency applications and model monitoring and verification report submittal forms for each eligible offset category in the RGGI Model Rule, suitable for customization by the Department. These model application and submission materials will facilitate monitoring of the Department's offset project approval process by market observers and other participating states. All materials developed by RGGI, Inc. shall be consistent with the Model Rule criteria.

V. Model Offset Guidance Documents

RGGI, Inc. shall provide model generic and category-specific offset project guidance documents suitable for customization by the Department. This model guidance shall be detailed and easily understandable by project sponsors (including small businesses or other parties that may lack experience in carbon offset markets) and by Department staff.

The model guidance documents developed by RGGI, Inc. shall cover submittal requirements and the evaluation of specific offset projects against the Model Rule requirements. The model guidance documents shall also explain the intent and letter of the offset project provisions in the RGGI Model Rule, address any ambiguities in the Model Rule provisions, and clarify how they apply to specific types of projects. Any interpretive material shall be consistent with the Model Rule criteria and shall be reviewed by the Department and the participating states.

RGGI, Inc. shall also identify project scenarios that address questions that are likely to arise in the course of the offset application and approval processes, based on the expertise of RGGI, Inc. staff, other offset program experience, and communications with the Department and the participating states.

VI. Accreditation Process and Training Program for Independent Verifiers of Offset Projects

RGGI, Inc. shall maintain a process for the accreditation of independent offset project verifiers and a related training program, consistent with the requirements of the Model Rule, which can be customized and used by the Department in accrediting independent offset verifiers.

RGGI, Inc. shall also provide supporting materials for independent verifiers, consistent with the requirements of the RGGI Model Rule, which can be customized and used by the Department, and which explain:

- The process for the accreditation of independent verifiers, including the review of candidate verifier qualifications.
- The process for evaluating candidate verifier conflicts-of-interest; and
- Application materials for accreditation.

RGGI, Inc. shall also provide materials that can be customized for use by the Department to support on-going Department review of an accredited verifier's potential conflicts-of-interest, including the following:

- Submittal forms for accredited verifier disclosure of potential conflicts-of-interest, to be reviewed by the Department prior to the verifier engaging in work with an offset project sponsor; and

- Guidance materials to support Department staff review of accredited verifier potential conflicts-of-interest.

These materials shall provide a review of existing greenhouse gas independent verifier accreditation standards and processes used by other voluntary and mandatory greenhouse gas management or regulatory programs, and incorporate, if appropriate, elements of these into the materials developed for the Department. RGGI, Inc. shall provide a brief evaluation of the standards and processes reviewed.

VII. Market Monitoring

RGGI, Inc. shall provide market monitoring services in three general areas: monitoring and auditing of allowance auctions, monitoring of relevant secondary allowance market activity, and provision of consultative services addressing market monitoring.

VII-A. Monitoring and Auditing of RGGI Allowance Auctions

RGGI, Inc. shall provide professional monitoring of all RGGI regional allowance auctions, some of which may involve a subset of the RGGI participating states and may or may not include allowances submitted for auction by the Department. RGGI, Inc. will use and develop, as appropriate, data collection methods, metrics, and analytic techniques for monitoring auction performance and thresholds for identifying any collusion, market power, and/or market manipulation that may impact the efficiency and performance of the RGGI auctions.

VII-B. Monitoring of Secondary Market Behavior

RGGI, Inc. shall monitor all relevant publicly available data and indicators of market behavior (available through both public and private sources) in the secondary allowance market that may be expected to significantly impact the performance of RGGI auctions and/or the secondary allowance market.

VII-C. Consultative Services

RGGI, Inc. shall provide expert advice to the Department regarding how any aspects of the auction process should be altered to improve the performance and efficiency of the RGGI auctions and shall ensure the functioning of fair and competitive auctions and a secondary allowance market.

VIII. Program Evaluation and Development Support

RGGI, Inc. shall provide program evaluation and development support to the Department, as requested, to facilitate Department consideration of potential modifications to and/or expansion of the Program.

IX. Effective Date, Project Term

The Effective Date of this Agreement shall be the date upon which it is signed by the Agency Director. The parties recognize and agree that the Commonwealth of Virginia will not be a Participating State as defined in the RGGI, Inc. By-Laws until January 1, 2021. Between the Effective Date and January 1, 2021, it is agreed that RGGI, Inc. staff will work with appropriate members of the Department to prepare for the Commonwealth's participation in RGGI beginning on January 1, 2021, as outlined in this Agreement.

The initial term of this Agreement shall be from February 1, 2021 to December 31, 2023.

The initial term of this Agreement may be extended for up to two (2) additional three (3) year terms, or any portion thereof, by mutual written agreement of the Department and RGGI, Inc. in accordance with the procedures set forth in this Agreement.

X. Budget/Payment

The Department shall pay to RGGI, Inc. an amount equal to the State's proportionate share of RGGI, Inc.'s annual operating budget, which shall be calculated based on the State's proportionate share of the regional CO2 allowance budget.

For services rendered for the initial term, based upon RGGI, Inc.'s projected annual operating budget for calendar year 2021, the Department shall pay RGGI, Inc. an amount not to exceed $592,920 ("2021 payment"), for the services set forth in the table below. The Department authorizes RGGI, Inc. to retain a quarter (25%) of this payment "off the top" of the Commonwealth's proceeds from the sale of allowances in each of the quarterly auctions in calendar year 2021.

General Service Category	Percentage of Funding	Approximate Amount
Allowance Tracking	20%	$118,584
Auctions	30%	$177,876
Market Monitoring	15%	$88,938
Technical Modeling	15%	$88,938
Program Management	20%	$118,584
TOTAL	**100%**	**$592,920**

For services rendered for any subsequent calendar year or portion thereof ("subject year") of this Agreement, RGGI, Inc. shall submit to the Department, by December 15 of the year preceding the subject year, a request for payment of its estimated operating costs for the subject year and the State's proportionate share (itemized as set forth above). Operating costs include staff and overhead costs, costs incurred in performance of the services and deliverables set forth in the Scope of Work and the Department's contribution to support services that may be provided jointly to the Department and agencies in other RGGI participating states.

XI. Reporting

RGGI, Inc. shall designate a Project Manager, who shall be the one point of contact with the Department. The Project Manager shall be responsible for monitoring and ensuring progress for all tasks and subtasks, and for ensuring timely delivery of all services and deliverables outlined in this Scope of Work. The RGGI, Inc. Project Manager shall be responsible for all project reporting to the Department.

The following reporting obligations shall begin February 1, 2021.

By the 15th day of January, April, July, and October of each year during the Project Term, RGGI, Inc. shall provide the Department with a detailed report of the activities undertaken by RGGI, Inc. and its subcontractors to meet its responsibilities under this Agreement during the preceding calendar quarter, including, without limitation, quarterly status reports on RGGI COATS; the auction program; offset program support; market monitoring findings; quarterly budget reports, including any audit reports; the status of progress in providing the deliverables specified in the Scope of Work, including identification of all completed/not completed work during the preceding three-month period; and description of any problems encountered by RGGI, Inc. and their actual or proposed resolution.

At least once in each calendar quarter, RGGI, Inc. shall also submit to the Department a report of its expenditures for operating costs covering each full month in the preceding completed quarter. Such report shall reconcile the actual expenses for operating costs against either the 2020 payment or estimates contained in a request for payment for a subject year, as applicable, and shall provide a net credit to be applied against subsequent requests for payment of operating costs to the extent that actual expenses were less than the estimates. For a subject year, if actual expenses are greater than the estimates contained in a request for payment, the balance shall be itemized as such and applied to subsequent requests for payment of operating costs. Any remaining credit at the end of the term of this Agreement shall be returned to the Department by RGGI, Inc. within 30 days of expiration of this Agreement. Any remaining costs at the end of the Project Term shall be paid by the Department to RGGI, Inc. within 60 days of receipt of a final request for payment in accordance with the Prompt Payment Act, N.J.S.A. 52:32-32, et seq., provided that the listed operating costs are in accordance with this Agreement.

Within 30 days after the end of the term of this Agreement, RGGI, Inc. shall prepare and submit a draft final report that provides a description and summary of all major work tasks and submitted deliverables. The draft final report shall be revised to address all Department comments within 60 days of receipt by RGGI, Inc., and RGGI, Inc. shall submit a final report addressing all such comments.

XII. Services, Deliverables

RGGI, Inc.'s performance shall include, and the Department shall cooperate in, all tasks necessary to set up or otherwise "onboard" the Department and its facilities. All services provided by RGGI Inc. in support of the Department's implementation of the Program shall be performed in accordance with and meet all applicable Program requirements.

In any area where services are requested or deliverables will be provided, all deliverables shall be presented to the Department in draft form for review and ultimate approval by the Department. All documents generated or accepted in performance of this Agreement shall be confidential and shall not be released to anyone without prior authorization by the Department, unless directed by a court of competent jurisdiction. This confidentiality provision shall govern this Agreement and shall survive the termination or expiration of this Agreement.

XIII. Notices

All notices, approvals and other communications which may or are required to be given by either party to the other shall be in writing and shall be transmitted, by certified or registered United States mail, return receipt requested, expedited delivery service, or email, return receipt requested, to the party's representatives identified below:

For the Department:

David K. Paylor, Director, Virginia Department of Environmental Quality
P.O. Box 1105
Richmond, VA 23218
Email: David.Paylor@deq.virginia.gov

For RGGI, Inc.:

Andrew J. McKeon, Executive Director
90 Church St.
New York, NY 10007-2919
Email: andrew.mckeon@rggi.org

The parties may, from time to time, specify any new or different address in the United States as their address for purpose of receiving notice by giving fifteen (15) days written notice to the other party. The parties may, from time to time, designate in writing new or different individuals as their respective representatives for the purpose of receiving notices under this Agreement. Additional individuals may be designated in writing by the parties for purposes of implementation, administration, and billing.

HOUSING INNOVATIONS IN ENERGY EFFICIENCY (HIEE)

CONTACT:

Daniel Farrell
daniel.farrell@dhcd.virginia.gov
Aaron Shoemaker
aaron.shoemaker@dhcd.virginia.gov

The Department of Housing and Community Development's (DHCD) Housing Innovations in Energy Efficiency (HIEE) funding makes energy efficiency upgrades to new and existing residential buildings to reduce energy bills for low-income Virginians. HIEE is funded through Regional Greenhouse Gas Initiative (RGGI) proceeds.

BACKGROUND

In 2020, the Commonwealth of Virginia became the first southern state to join RGGI, a regional cap and trade program designed to reduce climate pollution from fossil fuel power plants. Legislation passed by the Virginia General Assembly authorizes proceeds from these auctions to be used for community flood preparedness, coastal resilience and energy efficiency programs for affordable housing. DHCD will administer approximately 50% of the auction proceeds through HIEE, with technical assistance from the Virginia Department of Energy.

CURRENT STATUS

DHCD administers HIEE funds to enhance affordable housing programs benefiting low- to moderate-income (LMI) families in Virginia. For fiscal year 2021, HIEE funds are allocated to DHCD’s Affordable and Special Needs Housing (ASNH) program and the Weatherization Deferral Repair (WDR) Program . DHCD will continue to develop the HIEE program and other initiatives that will further benefit LMI families in fiscal year 2022 and beyond. ASNH and WDR information and program guidelines are posted under Resources.

For project administration questions

The Weatherization Deferral Repair (WDR) program funds repairs that have caused homes (or units in multifamily buildings) to be deferred from the Weatherization Assistance Program (WAP). Once the needed repairs are made using the WDR funds and the home is "weatherization-ready," clients can then receive energy efficiency and health and safety measures available through WAP (such as insulation, air sealing, energy efficient light bulbs, and carbon monoxide detectors). Clients are required to sign an agreement with the weatherization agency, agreeing to both the WDR repairs and the weatherization services. Households may not receive the initial repairs without agreeing to also receive the weatherization services.

PERSONS SEEKING ASSISTANCE:

Contact the local weatherization agency serving your area.

For the Weatherization Deferral Repair (WDR) program, clients must work with the local weatherization agency serving their area through the Weatherization Assistance Program (WAP). In order to qualify for WDR, clients must meet WAP eligibility requirements.

Read the press release.

The U.S. Department of Energy (DOE) Weatherization Assistance Program (WAP) reduces energy costs for low-income households by increasing the energy efficiency of their homes, while ensuring their health and safety. The program supports **8,500 jobs** and provides weatherization services to approximately **35,000 homes every year** using DOE funds.

Through weatherization improvements and upgrades, these households save on average **$372 or more every year** according to a national evaluation of the program. Since the program began in 1976, WAP has helped improve the lives of more than 7 million families through weatherization services.

I. INTRODUCTION

The Department of Housing and Community Development (DHCD) administers the Weatherization Assistance Program (WAP) for low-income persons in Virginia, in partnership with a network of local weatherization agencies ("agencies"). DHCD is making additional funding available to the agencies through the Housing Innovations of Energy Efficiency (HIEE) program to assist households in Virginia who have been deferred from receiving WAP services to their homes due to needed repairs to ensure the effective installation of the WAP measures. HIEE funds are derived from the auction proceeds that DHCD receives from Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI).

DHCD refers to the HIEE funds used for this purpose as **Weatherization Deferral Repair (WDR) funds**. WDR funds are provided to weatherization agencies by DHCD via separate agreements from WAP, however these repairs are intended specifically to enable making the home "weatherization ready," and for the income-eligible household to receive weatherization services. *WDR funds are to be utilized only for repairs identified by the agency as causing the deferral of the home or unit from WAP*.

- For more information on HIEE, access the DHCD HIEE webpage.
- For more information on WAP and household eligibility requirements, access the WAP webpage.

II. WDR OVERVIEW

WDR funds are allocated to weatherization agencies specifically for repairs of the most common and frequently-cited issues causing WAP deferrals in Virginia: leaking roofs, minor structural, biological contaminants (e.g. mold), non-operational or unsafe HVAC unit, moisture issues, electrical, and plumbing. Other measures needed to bring the home out of deferral status and enable the home to be weatherized may be considered on a case-by-case basis. DHCD will cap WDR repair costs at reasonable and regionally-specific limits, as shown in Table 1. If estimated repair costs exceed the caps, the agency must contact DHCD so that the request may be evaluated. DHCD has appropriated $13.0 million in HIEE funds to be made available to weatherization agencies for WDRs starting July 1, 2021. Additional allocations of HIEE funds will be determined based on need and funding availability. Allocations are subject to final approvals by the Office of the Governor and Secretary of Commerce and Trade.

WDR funds are to be used solely to make repairs on income-eligible occupied homes and address the specific issue(s) that caused, or are causing, the home to be deferred so that the homeowner/tenant may regain eligibility for WAP and are NOT intended for full housing rehabilitation. Gut rehabilitations, projects requiring full plumbing, electrical and HVAC replacements, and major structural repairs (such as foundation repairs or collapsed roofs) are beyond the scope of WDR and WAP. Derelict, abandoned, and/or condemned homes are not eligible. If, in consultation with DHCD, agencies determine repairs needed to address the issue(s) causing the deferral and make the home weatherization-ready are beyond the scope of the WDR program, DHCD may work with agencies to refer these homes to local or other state

housing rehabilitation programs. For more detailed information see the section on eligible repairs.

III. FUNDING ALLOCATION

A. AGENCY AGREEMENTS AND REPAIR COSTS

The WDR Program requires agencies to adhere to a WDR Program Agreement, separate from the WAP agreement, beginning July 1. Allocation of WDR funds through these agreements is based on the agency's identification of eligible existing deferrals in its service area and estimated cost of the associated repair(s).

DHCD intends to ensure that agencies have a sufficient allocation of funds to initiate the necessary work to address their current deferral lists. WDR funds will also be allocated to ensure that the weatherization network overall is able to address the maximum number of deferrals that currently exist.

B. ADMINISTRATIVE COSTS

For agencies requesting less than $1.0 million in HIEE funds, DHCD will include an additional twenty (20) percent of the identified WDR allocation amount for agencies' administrative overhead and equipment costs with each agreement; those agencies requesting over $1.0 million will receive an additional ten (10) percent for administrative costs. Administrative costs may include accounting for the use of WDR funds, preparing reports for submission to DHCD, project management (e.g. obtaining evaluations/estimates on needed repairs, inspections of completed work), similar costs related to administering the funding, vehicle purchases or leases, and associated staff salaries. **As with all billed expenditures, billing for administrative costs must be based on actual costs incurred during a particular billing period.**

C. DEFERRAL TRACKING

Participation in the WDR program will require that all WDR recipient agencies participate in deferral tracking procedures established by DHCD. DHCD will work with the agencies to establish a consistent tracking procedure for deferrals that protects client confidential information. DHCD will distribute specific guidance on identifying and tracking deferral-related issues and repairs. As WDR projects are completed, the agency must accurately track the addresses of the projects to ensure that they are now eligible for WAP services. Agencies may establish their own systems and processes for re-engaging with clients and prioritizing WDR projects, but participation in the deferral tracking system will be mandatory. Agencies must adhere to DOE regulations for addressing completed WDR projects through WAP: the client should be integrated into the established weatherization queue based on the original intake date and should not go to the bottom of the priority list.

D. SERVICE PROVIDER/CONTRACTOR ELIGIBILITY

For WDR projects that agencies do not perform with their own staff, agencies must utilize subcontractors appropriately licensed and insured to perform the work needed to repair the issue(s) causing the deferral. Staff or subcontractors performing the WDR repairs are not

required to have WAP-specific training. However, subcontractors must be appropriately trained and credentialed in accordance with all relevant regulations, guidelines, and agreements.

E. SERVICE AREA

WDR funds may only be used to assist households in the municipalities of the Commonwealth of Virginia. WDR service areas are established for each funded agency based on the WAP service area. With explicit permission from DHCD, agencies may serve households in municipalities outside of the established service area. Allowances to serve outside the service area are based on the need, capacity, and available funding.

F. REALLOCATION OF UNSPENT FUNDS AND PERFORMANCE POOL

DHCD will actively review the expenditures of WDR funds by agencies regularly to ensure that the agency is progressing satisfactorily towards addressing needed repairs of deferred homes in its service area. Agencies are not required to spend 100% of funds allocated per the WDR Program Agreement in the contract year, but must demonstrate reasonable and substantial progress toward addressing the projected number of deferrals. Unspent funds may be rolled over into the subsequent program year agreement with approval from DHCD. However DHCD reserves the right to adjust WDR funding allocations or recapture/reallocate funding.

If at any point the agency has been identified by DHCD to have production issues that may compromise the success of the WDR Program, DHCD will confer with the agency to understand barriers and identify a production improvement plan and process. The agency must agree in writing to implement steps identified for production improvement. If issues relating to lack of production are unable to be resolved, DHCD reserves the right to de-obligate and reallocate part or all remaining funds subject to this agreement.

In addition, DHCD may set aside HIEE funds in a performance pool, which may be quickly allocated by addendum to existing agreements to agencies that are able spend all allocated HIEE funds for WDRs before the end of the agreement period and need additional funding to maintain their WDR repair pipeline.

G. MATCHING FUNDS AND COST CAPS

Matching funds are not required for WDR, and the agency cannot require a client contribution. If a repair estimate exceeds the regional cost caps (see Table 1), the agency may request an exception to exceed the limit. However, the agency must receive DHCD approval before proceeding.

H. VEHICLE PURCHASES AND LEASES

Prior written approval from DHCD is required for agency purchase of any vehicle with WDR funds. The cost of vehicles or equipment to support the program must be charged to the administrative budget category. Agencies must use approved bidding and purchasing procedures to acquire vehicles, or through a fleet contract. Vehicles will be titled in the name of the agency and a first lien in the name of DHCD must be placed on the title. Agencies must submit the title to DHCD upon receipt. Insurance coverage is required for vehicles purchased with DHCD funds.

Agencies must request permission from DHCD to sell or dispose of vehicles with a value greater than $5,000.00 purchased with WDR funds. DHCD must approve all vehicle leases prior to lease execution

IV. PROGRAM GUIDELINES

A. CLIENT ELIGIBILITY AND INCOME VERIFICATION

All clients (homeowners and tenants) must be determined as WAP-eligible (meet income guidelines) consistent with the procedures in the WAP Operations Manual. Agencies must receive property owner approval in writing for rental properties. Homeowners or renters must sign a service agreement with the local weatherization agency committing to the needed deferral repairs and the subsequent weatherization work. DHCD notes that all WAP clients participate on a voluntary basis. If it is determined up front that a client intends to forgo WAP services and/or will not sign the service agreement, they are ineligible for use of the WDR funds.

If it has been more than a year since the initial client intake, income eligibility must be re-verified. Agencies must prioritize serving income eligible clients first, along with immediate health and safety issues (such as unsafe combustion appliances or no heat/no A/C). Consistent with WAP guidelines, agencies have no obligation to serve potential clients who are unresponsive or hostile, or to offer services where dangerous or illegal activity is taking place.

If a client's income exceeds WAP eligibility requirements, weatherization agencies may refer the client to utility weatherization programs, which typically serve clients up to 80 percent of area median income (AMI). WDR funds may be used for deferral repairs for households with up to 80 percent of AMI, subject to availability of funds and the customer's agreement to participate in a utility-sponsored (investor-owned utilities and electric cooperatives/municipal utilities) weatherization program where those income limits are applicable.

B. ELIGIBLE REPAIRS

WDR funds are to be used solely for addressing needed repair(s) causing the home or unit to be deferred from WAP. The following repairs are most commonly-identified as causing weatherization providers to defer weatherizing the home and are eligible for WDR funding. The list is non-exhaustive and is subject to change. DHCD reserves the right to determine the eligibility of repairs or any costs not listed. All repairs must be code compliant and permitted if required by the Authority Having Jurisdiction (AHJ). Repairs not listed must be pre-approved by DHCD.

Roofs and minor structural

- Roof repair or replacement (e.g. roof leaks and attic cannot be insulated)
- Wall repair- interior or exterior (e.g., walls cannot support insulation without repair)
- Ceiling repair - interior (e.g., ceiling cannot support insulation without repair)
- Floor repair

Electrical, plumbing and HVAC

- Plumbing repair (e.g. water leaks that would damage insulation)
- Electrical repair (safety hazard or exposed wiring; cannot insulate due to presence of knob and tube wiring)
- Non-working or unsafe HVAC unit repair or replacement
- Non-working or unsafe gas/propane hot water heater repair or replacement
- Non-working or unsafe gas/propane range/oven repair or replacement

Hazardous materials

- Mold identification and remediation
- Suspected Asbestos Containing Materials ("SACM" e.g. attic, walls, pipes etc.)

The following are other issues that may cause WAP deferrals and may be remedied with repairs (requires DHCD pre-approval):

- Removal of vegetation (e.g. tree, bush, shrub trimming) needed to provide safe access to make eligible repairs
- Pest infestation
- Clutter restricting access to necessary areas

C. INELIGIBLE REPAIRS

The following repairs are not eligible uses of WDR funds. DHCD reserves the right to determine the eligibility of repairs or any costs not listed. The list is non-exhaustive and subject to change:

- Gut rehabilitation or major structural repairs (e.g. foundation, collapsed floor/roof)
- Replacement of entire plumbing, electrical, or HVAC systems
- Replacement of windows or doors where existing ones are not broken, missing, or damaged beyond repair
- Repairs covered by homeowner's or flood insurance
- Repairs needed due to willful damage or negligence on the part of the owner/occupant
- Cosmetic improvements (e.g. interior or exterior painting)
- Repairs to detached garages, barns, sheds, or storage buildings

TABLE 1 - REPAIR COST CAPS (BY REGION)

Eligible Measures/Repair Needed*	Northern VA	Central and Hampton Roads	Eastern Shore, Southside, and SWVA
Roof repair/replacement** (per project)	$10,300	$9,700	$9,500
Structural (per project)	$6,660	$6,200	$6,100
Hazardous material removal (e.g. mold, asbestos) (per project)	$14,000	$13,200	$12,800
Electrical (per project)	$5,600	$5,300	$5,200
HVAC unit replacement (per system)	$14,000	$13,200	$12,800
Plumbing (per project)	$2,700	$2,600	$2,500

*Cost limits are developed by triangulating three data sources including: The National Residential Efficiency Measures Database, RS Means 2020 Assembly estimates (normalized by city, state), and data collected from projects by the Virginia Center for Housing Research (VCHR) at Virginia Tech.
**Multifamily roof repair/replacement: NOVA: $3.40/FT^2; Central, and Hampton Roads: $3.20/FT^2; Eastern Shore, Southside, and SWVA: $3.10/FT^2. Roof repair/replacement is based on typical asphalt shingles; flat roofs requiring a membrane system will be more expensive so agencies should contact DHCD for exemption to cost cap.

V. FINANCIAL AND REPORTING REQUIREMENTS

A. CLIENT REPORTING/REQUIRED DOCUMENTATION

For each household served by WDR funds, the agency must retain the following:

- Documentation of incurred costs (timesheets, contractor invoices, materials and equipment cut sheets, etc.) to support all invoices, consistent with procedures for WAP jobs.
- A quarterly report including number of homes repaired, amount of WDR funds invoiced, and the nature of repairs accomplished.

B. PROJECT MANAGEMENT – CAMS

Agencies must manage documentation of WDR projects (applications, invoices, and reports) through the DHCD Centralized Application & Management System (CAMS). All grantees must be registered in CAMS and have approved audits in order to manage their project and receive payment. CAMS login and profile registration page may be accessed via the following link: CAMS login portal.

Agencies are responsible for managing their own staff access and user roles assignments.

The CAMS User Guide contains project management instructions including but not limited to:

- managing staff access and user role assignment
- submitting the agency audit
- requesting budget revisions
- submitting remittances (a.k.a. invoices, drawdowns)
- fulfilling reporting requirements

C. PAYMENT REQUESTS - SUBMITTING REMITTANCES IN CAMS

Payment is established based on the agreed-to repair estimate for each project. Agencies are encouraged to request payment in CAMS upon full project completion to the extent feasible, especially for smaller jobs (less than $5,000). However, agencies have the option to request payment on a draw-down basis, based on completing pre-established milestones as follows: homeowner and subcontractor agreement signed 10%, materials and equipment delivery, 60%, installation and project completion, 30%.

Prior to beginning each job, the weatherization agency or local service provider must submit the WDR Application Form and Homeowner Agreement signed by agency representative, homeowner, or landlord and tenant and WDR Authorization and Release in CAMS for reservation of funds to DHCD for approval and funding. The application will include site address, homeowner/tenant name, and a description of the repairs needed. The issues to be repaired/replaced must be photographed and submitted accompanying the WDR Application Form and Homeowner Agreement.

Once DHCD has approved the WDR Application Form and Homeowner Agreement, WDR Authorization and Release WDR Application Form and accompanying documentation in CAMS, agencies may either fund each repair upfront and request reimbursed by DHCD once the WDR Certification of Completion, financial supporting documents (i.e. contractor invoices, receipts) and photos of completed repair(s) have been submitted in CAMS as the remittance supporting documentation. Agencies may pay for the repairs and seek reimbursement or request funds to pay the contractor invoices upon completion on a drawdown basis as noted above. DHCD will not reimburse for work outside of the approved scope of work, or if work is determined to be substandard.

To initiate the payment process, the agency must submit remittances in CAMS. For each remittance, the agency must submit the required documentation which consists of:

- DHCD-provided signed cover sheet(template available on
- Invoice documentation (e.g. paid contractor invoices)
- Certification of Completion form
- General Contractor Affidavit, Warranty, and Lien Waiver
- Photos clearly showing completed work

All forms are available in CAMS or on the HIEE webpage.

The average time from submission to DHCD approval is 30 days for remittances that are accurate, complete, and include all required documentation at time of submission. If there are discrepancies or issues with the remittance documentation, and changes or resubmittals are required, the process may extend beyond 30 days. DHCD will reach out to the submitting agency regarding incomplete remittances.

D. METHOD OF PAYMENT

DHCD requires that agencies receive funds via electronic transfer. Instructions on establishing an account with the Virginia Department of Accounts (DOA) is located on their website through the selection of Electronic Data Interchange (EDI) from the link on the DOA main webpage. The EDI guide can then be accessed through a link under the Trading Partner Information section. Any grantee with unresolved findings or compliance issues, including for other programs, may have payments suspended.

E. ACCOUNTING AND FINANCIAL CONTROLS

Agencies must have established standard accounting practices including internal fiscal controls, standard accounting procedures, and track agency and program budgets by revenue sources and expenses.

VI. ADDITIONAL AGENCY REQUIREMENTS

A. COMPLIANCE WITH FAIR HOUSING AND CIVIL RIGHTS LAWS

(1) WAP agencies must comply with all applicable state and federal fair housing and civil rights requirements (see 24 CFR 5.105(a)). This includes the Virginia Values Act (effective July 1, 2020) which expands the list of protected classes under the Virginia Fair Housing Act. As the Virginia Fair Housing Act prohibits discrimination based on race, color, national origin, sex, pregnancy, childbirth or other related conditions (including lactation), age (over 40), marital status, disability, sexual orientation, gender identity, or veteran status (collectively the "Protected Classes"). (2) If the WAP agency: (a) Has been charged with an ongoing systemic violation of the Fair Housing Act; or (b) Is a defendant in a Fair Housing Act lawsuit filed by the Department of Justice alleging an ongoing pattern or practice of discrimination; or (c) Has received a letter of findings identifying ongoing systemic noncompliance under Title VI of the Civil Rights Act of 1964, section 504 of the Rehabilitation Act of 1973, or section 109 of the Housing and Community Development Act of 1974, and the charge, lawsuit, or letter of findings referenced in subparagraphs (a), (b), or (c) above has not been resolved before the application deadline, then the subgrantee is ineligible to apply for funds.

Weatherization Client Roof in Disrepair Resulting in Client Being Deferred for Weatherization Services

Utilizing Virginia RGGI Revenue to Support Existing Low-Income Energy Efficiency Programs

Chase Counts, CEM
Reducing energy burdens with weatherization at CHP Energy Solutions
Published Dec 11, 2020

+ Follow

Energy efficiency and weatherization programs serving low-income, elderly, individuals with disabilities, and other energy burdened populations in Virginia have evolved dramatically since 2015. Federal resources through U.S. Department of Energy's Weatherization Assistance Program (WAP) and U.S. Department of Health & Human

have served as the foundational resource for weatherization services provider operations. In 2015, providers saw an increase in utility-sponsored energy efficiency programs which are designed to serve the same client base. In 2021, utility-sponsored programs will have increased by 19-times from their 2015 funding levels, exceeding the federal resources available for weatherization for the first time in Virginia's history.

Figure 1. Historic Funding Levels for Low-Income Energy Efficiency Programs in Virignia by Source, 2015-2021

While encouraging progress has been made to serve thousands more energy burdened households in Virginia, weatherization providers face challenges in service delivery to nearly 1 in 5 households that apply for their programs according to a 2020 survey by the Association of Energy Conservation Professionals (AECP) - the local trade association of weatherization providers in Virginia.

All 17 subgrantees in Virginia DHCD's weatherization program responded to the survey for the federal weatherization program year 2018 - the most recent program year uninterrupted by the COVID-19 pandemic. The survey revealed providers had to defer weatherization services to 525 households of the 2,901 applications received that year. Deferral issues vary in scope and scale, but the core is consistent: weatherization providers do not have the resources needed to address health and safety and other incidental repairs required prior to the installation of weatherization and energy saving measures.

Figure 2. AECP Weatherization Deferral Rate Survey Results for Program Year 2018-2019

moisture and other biological hazards, electrical issues, and more. These repairs are needed before weatherization providers can provide energy saving measures to these energy burdened households. Attic insulation, for example, cannot be installed if a leak in the roof may result in the insulation being compromised before the end of its expected useful life.

Access to home repair funds that could prevent these deferrals is sparse and inconsistent throughout the Commonwealth. Federal funds and utility-sponsored programs have limited health and safety and incidental repair funds available, averaging approximately 11-percent of the total funds available statewide, which have been further strained by additional personal protective equipment (PPE) needs resulting from the current pandemic. Those funds also come with many restrictions and are often insufficient to resurrect a weatherization applicant from deferral. Other funding sources include a handful of municipalities or private donations. Community Housing Partners (CHP), Virginia's largest non-profit weatherization provider, sets aside nearly $200,000 of internal funds each year to address health and safety issues and/or incidental repairs needed to unlock weatherization candidates' households to then deliver energy saving weatherization services. Even with the application of those extra funds, CHP still had to defer 197 jobs during the reporting period.

Figure 3. Weatherization Deferral Due to Roof Issues Resulting in Ceiling Damage

Based on the feedback in the survey responses, Virginia's weatherization providers estimate an average range of $5,000-$8,000 is often needed to bring a weatherization candidate back from deferral status. With the increase in funding available in 2021 and beyond, Virginia's weatherization provider network expects to complete an estimated 8,500 comprehensive weatherization retrofits per year for the foreseeable future. At current weatherization deferral rates, the weatherization providers can expect to defer

providers are not able to recover. At an average of $7,500 per household in health and safety and/or incidental repair funds serving 1,500 households per year, the weatherization network would like to leverage $11,500,000 of RGGI revenues each year in support of Virginia's most effective and shovel-ready energy efficiency program serving low-income, elderly, and individuals with disabilities to reduce their household energy burdens.

Considering new utility-sponsored programs beginning in 2021 will allow weatherization providers to braid federal resources to serve more multifamily properties, particularly in urban areas where gas heating and water heating are more prevalent and prone to health and safety issues, deferrals due to combustion safety hazards are expected to rise that were not captured on the AECP survey. Rough estimates anticipate an additional 20-percent of the projected $11,500,000 of RGGI revenues could be leveraged to address health and safety issues arising from gas appliances in disrepair at multifamily properties driving the leveraged funding request closer to $14,000,000 per year.

Figure 4. Commonly Reported Reasons for Deferral from AECP Survey

From historic records, the typical weatherized home in Virginia realizes approximately 28.54 MMBtu of energy savings annually, unlocking the energy efficiency potential of more than 1,500 households that would otherwise be weatherization deferrals could translate into an additional 43,000 MMBtu energy savings each year, offsetting greenhouse gas emissions while fulfilling the legislative intent of the 2020 House Bill 981 by supporting low-income energy efficiency programs. The weatherization network has demonstrated its ability to scale operations through the American Reinvestment and Recovery Act stimulus funding in 2009, and today amidst an increase in utility-sponsored programs that can be leveraged with federal resources.

weatherization clients' roofs will create additional opportunities to consider those households for distributed rooftop solar - complementing efforts like 2019 House Bill 2789's low-income solar and energy efficiency program and the work of the Virginia Clean Energy Advisory Board - to have a fair and equitable clean energy transition in Virginia.

The weatherization provider network requests the Virginia DHCD RGGI Stakeholder Advisory Group and all participating stakeholders consider the energy efficiency potential of this proposal while taking into account how RGGI revenues used for this purpose aligns with the intention of the legislation.

Sign up for updates and have your voice heard at the upcoming Virginia DHCD RGGI Stakeholder Advisory meeting on Tuesday, December 15, 2020 from 2-4 PM EST, by visiting Virginia DHCD's Housing Innovations in Energy Efficiency Program landing page here: https://dhcd.virginia.gov/hiee

Virginia weatherization program is changing lives, but Gov. Youngkin wants to cut off its funding source

A Virginia program that uses money from the Regional Greenhouse Gas Initiative to help low-income residents with deferred maintenance and energy efficiency overhauls has been hailed by advocates as a national model.

by **Elizabeth McGowan**
September 21, 2022

Paul Acker, program manager with Community Housing Partners energy solutions division, speaks with Dorothy Carter on her front porch about upcoming installations. Credit: Everett Brubaker / Community Housing Partners

Dorothy Carter pined to remain in her Elkton, Virginia, home, but that possibility seemed less and less likely as health and safety issues mounted.

Sewage from broken pipes leaked into the basement. Rain poured in through holes in the roof. And blown fuses were a constant headache when she bypassed a balky oil furnace to warm rooms with space heaters.

But where would the 61-year-old go? And how would she gather the resources to move?

Fortunately, relief from that anguish began arriving in mid-August when a crew spent several days scrubbing away the sewage. That deep cleaning laid the groundwork for a phalanx of other contractors that are part of a now-at-risk Virginia program dedicated to tackling deferred home repairs that stand in the way of energy efficiency improvements.

Carter was again beaming on Sept. 13 as an electrician and several other contractors darted in and out of her rural Rockingham County house replacing her water heater and breaker panel. Within the next few weeks, she will gain a new roof, heat pump and water pipes.

Dorothy Carter of Elkton, Va., on her front porch in Rockingham County. Credit: Everett Brubaker / Community Housing Partners

“It will be so much nicer here when I come home from work,” said Carter, who has a job at nearby Friendship Industries, which employs people with disabilities. “They’re putting in stuff I can’t afford to buy.”

Carter is relieved the electric heat pump will end the $700 payments to fill her oil furnace.

“Now I’m going to call and tell them I don’t need it no more,” she said. “I’ve been here for about 43 years. There have been challenges, but I’m going to keep on living here.”

Carter is far from the only Virginian to benefit
from the new statewide initiative for low- and moderate-income residents designed to pair out-of-reach repairs with energy efficiency overhauls.

However, she could be one of the last if Republican Gov. Glenn Youngkin succeeds in his quest to extract his state from an East Coast carbon cap-and-invest enterprise Virginia joined in 2020. Virginia targeted a share of its Regional Greenhouse Gas Initiative dollars to lift up Carter and other homeowners struggling to modernize basic infrastructure that keeps houses ticking.

Briefly, what's known as RGGI curbs the emissions of heat-trapping gases from fossil fuel power plants by auctioning carbon dioxide allowances. Facilities are assigned a cap on how much carbon dioxide they can emit, and they must purchase allowances for any pollution above that threshold. The 11 member states decide independently how to spend the revenue.

Virginia's General Assembly opted to direct roughly half of the annual auction proceeds to a range of energy efficiency programs for lower-income households. Programs are administered by the Department of Housing and Community Development.

Through June, records show the state agency has distributed $189 million in RGGI funds toward energy efficiency from its start date in March 2021.

Sara Hayes, a health and environment specialist with the research nonprofit American Council for an Energy-Efficient Economy, praised Virginia for directing a RGGI allotment toward big-ticket home repairs that aren't covered by traditional weatherization programs funded by utilities and the federal government.

"I have huge kudos for the people in Virginia who made that happen," Hayes said about a front where other states are lagging. "That kind of coordination rarely happens.

"Virginia created a program that outshines everybody. Why would you wake up one day and say you're going to get rid of a wildly successful framework?"

Everett Brubaker asks the same question.

As a Harrisonburg-based business development specialist with the energy solutions division of Community Housing Partners, he's been an eyewitness to the impact of the RGGI cash infusion. His

employer is the largest of 15 nonprofits statewide qualified to **perform weatherization services**. It's also coordinating the repairs at Carter's house.

In years past, these nonprofits couldn't undertake more run-of-the-mill weatherization until health and safety threats such as mold and leaky roofs were tackled. Cases placed on what's known as the deferred list lingered because local charities were often too strapped to step up.

"I don't think people realize that many of their neighbors are living in these conditions," said Brubaker, who visited Carter's house with work crews. "It's not like she's an exception."

Advocates: Legislators control RGGI's destiny

Youngkin's administration has targeted RGGI withdrawal as a priority since Virginians elected the Republican governor last November. In January, he issued an executive order calling for an exit.

Then, in late August, at a regular meeting of the Virginia Air Pollution Control Board, acting Natural Resources Secretary Travis Voyles announced the administration's intention to file the paperwork to extract the state from RGGI by the end of 2023.

Environmental advocates **have vowed** to beat back that repeal.

Conservation attorneys claim withdrawal is an act of overreach by the governor and regulators.

"The lawmakers who do have that authority in the General Assembly know RGGI is already delivering real resources to Virginians on the frontlines of climate change," said Nate Benforado, a senior attorney with the Southern Environmental Law Center. "It would be a colossal mistake to pull out of a program that is … helping Virginians solve real problems they often can't afford to tackle alone."

Sixty-one Democratic state legislators echoed that perspective in a **September letter**, stating that, "only a change in the law that passes both chambers of the General Assembly and is signed by the Governor can remove Virginia's participation. No proposed regulation, emergency regulation, regulatory act, or any subsequent administrative process can do so."

Virginia's journey to becoming the first southern state to RGGI has been circuitous and twisted. Democratic Gov. Ralph Northam, whose four-year term ended in January, backed membership.

After years of obstruction, the General Assembly finally voted to join the 2008 initiative in 2020. With **House Bill 981**, legislators tasked the Department of Environmental Quality with establishing parameters for the Clean Energy and Community Flood Preparedness Act. The RGGI money is split between flood mitigation projects and energy efficiency.

The state is **funding two other non-weatherization housing initiatives**. Both target low- and moderate-income Virginians. One "bucket" covers energy efficiency efforts for new construction, rehabilitation, and adaptive reuse of affordable and special needs housing. The other, not yet rolled out, is a grant program for housing innovation partnerships.

During this year's legislative session, the Republican-majority House of Delegates voted to halt RGGI participation. But the Senate, where Democrats have a slim lead, thwarted that effort by deep-

sixing a similar bill in its conservation committee.

Chelsea Harnish, executive director of the Virginia Energy Efficiency Council, is urging Virginians to voice support for RGGI by submitting comments to the state Department of Environmental Quality during the Sept. 26-Oct. 26 window.

“This money has been instrumental in moving homeowners in the most dire need of help off the deferral list,” Harnish said. “Before, providers were having to walk away from those in need. With RGGI funding, they don’t have to do that anymore.”

She emphasized that the pot of money RGGI provides is far greater than all other energy efficiency and weatherization programs combined at the federal and utility level.

Harnish pointed to how Project: HOMES deployed a portion of its $16 million from RGGI to fix up 12 Eastern Shore homes initially tagged for the deferral list. The nonprofit hired 30 local subcontractors to address roof, mold, insulation, and heat and cooling issues before engaging in more routine weatherization. Homeowners’ utility bills have dropped by about 20%.

The state Department of Housing and Community Development did not respond to requests for comment about RGGI funding potentially being in jeopardy. While the agency is the clearinghouse tracking how the 15 nonprofits are spending RGGI money, those collective figures are not available. However, each nonprofit is recording its individual statistics.

For instance, since July 2021, Community Housing Partners has spent $1.2 million serving 226 households in need of RGGI pre-weatherization repairs.

Another 325 households remain in the repair queue. Currently the nonprofit has $1.3 million on hand to address those needs.

While Virginia will certainly benefit from clean energy provisions in the Inflation Reduction Act, Harnish said that federal law is no substitute for RGGI money that provides weatherization deferral repairs.

“It’s comparing apples and oranges,” she said. “While IRA money coming to the states is historic, it isn’t going to help fix roof or mold problems.”

In a nutshell, the IRA offers multiple rebates and tax credits for electric appliances and overall energy savings.

For instance, states will administer the IRA rebate program "and we don't know what that will look like yet," Harnish said.

She was pleased that Hayes, with the American Council for an Energy-Efficient Economy, had lauded Virginia for acting boldly with its RGGI funding.

"It's wonderful to hear a national nonprofit referring to us as a model," Harnish said. "And now our governor wants to take away that money."

RGGI money gives Virginia a boost

Virginia ranked a respectable 19th in an overarching state energy efficiency scorecard that Hayes and three other ACEEE researchers released in mid-August. Overall, the authors discovered that no state is knocking it out of the park with efforts to support healthy, affordable and decarbonized homes.

Maryland, Virginia's neighbor to the north, was the top finisher with 54.5 out of a possible 100 points. Virginia tallied 29 points.

In the 119-page "Pathways to Healthy, Affordable, Decarbonized Housing," ACEEE evaluated each state across 33 possible actions that could reduce pollution and housing costs for residents through energy efficiency, electrification and renewable energy investments.

Detailed categories covered energy utilities, weatherization and bill assistance, affordable housing, healthy homes and communities, and cross-agency coordination.

While Virginia's list of shortcomings is lengthy, it earned points for funneling RGGI dollars into its unique weatherization repair deferral program that benefitted Carter and hundreds of others.

"Usually, these programs happen because they have champions who develop relationships with people in other agencies," Hayes said. "That takes time and effort.

"Virginia is reaching the neediest by building a mechanism where money can help people being harmed in their homes."

Hayes and her colleagues opted to undertake this first-of-its-kind report because people's homes are linked to their health and their economic circumstances. That became even more apparent during the pandemic.

"We wanted to come at it holistically and we didn't want to advocate policies that don't take people into account," said Hayes, a 20-year energy policy veteran. "As the climate changes, how do we make sure those hit the hardest can survive?"

Lower-income people not only have higher energy burdens because their inefficient homes consume more energy per square foot, Hayes said, but they also pay higher utility bills because of gaping problems with mold, roofs and windows.

Rhode Island, California and Vermont, which ranked two, three and four, were the only states with marks of 50 or higher. She also noted that five of the 10 bottom-ranking states lead the nation in poverty rates.

The report provides a potential roadmap for ambitious states.

"But they have to get into the weeds," Hayes said. "We've done the work of saying, 'Here is the body of things you need to address.' To take action, states have to look at what they do have and don't have."

A brighter Christmas

Carter is grateful her home, built in 1962, will be buttoned down before cool weather envelopes the Shenandoah Valley.

She began falling behind on upkeep when her husband, Chester, died 26 years ago. They had moved into the family home after marrying in 1979.

Carter is so enamored with the upgrades Community Housing Partners is coordinating that she is serving as an informal ambassador for the program. She's puzzled why Youngkin seems so intent on dismantling it.

"I've talked to family members, neighbors and coworkers about how it can help," she said. "I don't know why [the governor] can't just leave it alone and let it keep going. There are a lot of people out there who can't afford what it provides."

With some of her savings on utility bills, Carter plans to purchase a washer and dryer — and also splurge a bit during the holiday season.

“A friend asked me why I didn’t decorate at Christmas. I told her I ain’t got time to blow no fuses.”

Later this year, the two women will string dazzling arrays of lights.

With my new electrical box,” Carter said, “I can put out a lot of Christmas stuff.”

Program Overview

Background

The Affordable and Special Needs Housing (ASNH) Program is a consolidated, competitive application used by the Virginia Department of Housing and Community Development (DHCD) to award National Housing Trust Fund (NHTF), HOME Investment Partnerships (HOME), Virginia Housing Trust Fund (VHTF), Housing Innovations in Energy Efficiency (HIEE), and Permanent Supportive Housing (PSH) funds[1] to multifamily rental developments and single family homeownership developments across the Commonwealth.

The Program's goals are to expand the supply of decent, safe, sanitary, and affordable housing available to low-income, very low-income, and extremely-low income Virginians.

Eligible projects are scored on a 100 point scale (Need – 40 points; Feasibility – 30 points; Developer Capacity – 30 points) and projects with scores above a 60 point threshold are ranked and considered for funding awards of the sources above.

These Program Guidelines are intended to provide guidance on applicant and project eligibility, program and regulatory requirements, funding availability and limits, as well as the application and decision notification process for the FY23 ASNH application cycle. If you require information not contained below, please contact DHCD staff for assistance.

ASNH Program Staff		
Chloe Rote	Program Manager, Multifamily Developments	Chloe.Rote@dhcd.virginia.gov

Carly Blake	Program Administrator	Carly.Blake@dhcd.virginia.gov
Nakia Kittrell	Program Administrator	Nakia.Kittrell@dhcd.virginia.gov

HIEE Program Staff		
Daniel Farrell	Associate Director, Energy Efficiency	Daniel.Farrell@dhcd.virginia.gov
Aaron Shoemaker	Program Administrator	Aaron.Shoemaker@dhcd.virginia.gov

[1] DHCD also uses HOME, VHTF, and HIEE funds for other eligible activities administered by other programs.

Funding Sources Available

HOME

The *HOME Investment Partnerships Program* (HOME) was created through the National Affordable Housing Act of 1990. Funds from the HOME program are made available annually through formula allocations to states and local governments (*Participating Jurisdictions* or PJs).

PJs are responsible for conducting needs assessments and establishing priorities and goals, and developing and managing the programs that will help meet these goals. The ASNH Program is a subset of DHCD's HOME funding, and uses HOME to support the development of rental units made available to individuals or families with incomes at or below 50% or 60% of their Area Median Income (AMI), and to the development of homeownership units made available to buyers with incomes between 60% and 80% AMI.

While projects may be located anywhere in Virginia, DHCD's HOME program gives priority to projects located in cities or counties which do not receive a direct federal HOME allocation through a local PJ or HOME Consortium through a scoring preference. The list of cities and counties which do not receive a scoring preference are listed in **Appendix A**.

The ASNH program also gives DHCD-certified Community Housing Development Organizations (CHDOs) a scoring preference for HOME funding. See DHCD's online resources for more information on CHDO requirements.

National Housing Trust Fund

The *National Housing Trust Fund* (NHTF) was created as a federal block grant to states, issuing its first allocation in 2016, and is the largest federal program designed to specifically support the production and preservation of affordable housing for extremely low income individuals and families.

DHCD awards all of its NHTF funds through the ASNH Program, and uses NHTF to support the development of rental units made available to individuals or families with incomes at or below 30% AMI.

Virginia Housing Trust Fund (Competitive Loan Pool)

The *Virginia Housing Trust Fund Competitive Loan Pool* is funded through Virginia's Housing Trust Fund, which is a special allocation of state funds intended to help address the commonwealth's housing needs and reduce homelessness. No less than 80% (eighty percent) of the VHTF must be allocated to a competitive loan pool.

The ASNH Program satisfies this requirement for a competitive loan pool, and provides low-interest loans to meet the financing needs of housing projects which address key state housing policies. Funds may be awarded to projects developing rental units or for sale homes which are made available to individuals or families with incomes at or below 80% AMI.

Virginia Housing Trust Fund expenditures associated with projects funded through the ASNH program will be used to meet the State's federal HOME program match requirement and may not be utilized for any subsequent regulatory match requirement without permission from DHCD.

State Permanent Supportive Housing Funds (PSH fund)

The State *Permanent Supportive Housing Funds* (PSH fund) are awarded to support the development of new permanent supportive housing (PSH) units. Supportive housing is an evidence-based housing intervention that combines non-time-limited affordable housing assistance with wrap-around supportive services for people experiencing homelessness, as well as other people with disabilities.

These funds are typically awarded to small development projects which specifically aim to provide independent living options for individuals with intellectual or developmental disabilities or serious mental illnesses, and which assist DHCD in meeting the requirements of the Department of Justice Settlement Agreement. These projects may be 100% 'special needs' populations and exempt from the five-unit minimum.

Housing Innovations in Energy Efficiency (HIEE) Funds

Housing Innovations in Energy Efficiency (HIEE) funds assist affordable housing project development teams in completing energy efficiency upgrades that would not have been feasible otherwise. These funds are made available by DHCD to projects which demonstrate that they are designed to meet the HIEE energy efficiency performance requirements detailed below, and supplement competitively awarded state and federal funds.

Projects must score well enough to obtain an award of ASNH's competitive sources (HOME, NHTF, VHTF, or PSH) to be eligible for an allocation of HIEE funds. During the application review process for each cycle, the panel will score and rank projects to determine competitive award recommendations. If a project which requests HIEE funds is recommended for a competitive award, the panel then evaluates the additional required documentation to ensure the project is designed to meet the relevant energy efficiency performance requirements. HIEE energy efficiency performance requirements are detailed in **Appendix B.**

Program Year Available Funds

For the 2022-2023 program year (Virginia FY23), the sources and approximate amounts allocated to the ASNH Program are below. DHCD reserves the right to update these funding amounts during the program year, and the right to roll over funding to future program years at its sole discretion.

Per project and per source maximums awards apply, with further details below and under Eligibility Criteria. DHCD reserves the right to restrict total funds awarded to a project.

SOURCE OF FUNDS	FY23 ALLOCATION[2]
HOME Investment Partnerships Program (HOME)	$8,766,531
National Housing Trust Fund (NHTF)	$12,975,688
Virginia Housing Trust Fund (VHTF)	$60,000,000
Housing Innovations in Energy Efficiency (HIEE)	$80,000,000
State Permanent Supportive Housing (PSH fund)	$500,000

Project Competitive Funding Limits

Each eligible project is subject to funding request limits, or caps. These caps are inclusive of all DHCD commitments to a project in previous application cycles. DHCD reserves the right to adjust funding offers by funding source to meet project needs, and reserves the right to limit funding offers made to a project even if 'cap' remains.

DHCD will consider excluding Vibrant Community Initiative VCI) commitments from these caps if such a request is made in writing prior to application. Exclusion of VCI commitments is not guaranteed and is granted at DHCD's sole discretion on a case-by-case basis.

Projects with HOME assistance from any source are ineligible for an award of HOME funds from the ASNH Program while the project is in its HOME affordability period.

Each project is limited to an award of $700,000 per competitive source (HOME, NHTF, or VHTF); with an increased limit of $900,000 for any two of those three sources if the project provides qualified Permanent Supportive Housing (PSH) units, as detailed in Criteria below, and provides the required documentation at the time of application.

- $700,000 – Maximum request per source (HOME, NHTF, or VHTF)
- $900,000 – Maximum request per source for projects providing qualified PSH units
- $2,100,000 – Maximum award for a project requesting HOME, NHTF and VHTF
- $2,400,000 – Maximum award for a project providing qualified PSH units and requesting HOME, NHTF, and VHTF

The State Permanent Supportive Housing fund (PSH fund) award is limited to $500,000 per project, and are typically awarded to small development projects which are either not are eligible for or do not request an award of HOME, NHTF, VHTF awards.

[2] Allocation amounts listed are approximate and subject to change.

Project HIEE Funding Limit

Each project earning a competitive source award (HOME, NHTF, VHTF, or PSH fund) which is designed to meet the HIEE minimum performance requirements is eligible for an award of up to $2,000,000 or ten percent (10%) of its total construction costs as calculated in the ASNH Application Workbook underwriting tab, whichever is the lesser amount.

- $2,000,000 – Maximum HIEE award for an eligible project
- $4,100,000 – Maximum total awarded funds for an eligible project requesting HOME, NHTF, VHTF, and HIEE
- $4,400,000 – Maximum total awarded funds for an eligible project providing qualified PSH units and requesting HOME, NHTF, VHTF, and HIEE

Eligibility

Applicant Eligibility

Eligible Applicants are non-profit organizations or for-profit housing developers, DHCD-certified Community Housing Development Organizations (CHDOs), and public housing authorities seeking to develop affordable housing projects in Virginia.

The Applicant must be the Owner, Developer, or Sponsor of the proposed project:

- Owner – holds valid legal title to, or long term leasehold interest in the property
- Developer – owns the property and is developing the project, or has a contractual obligation to develop the project
- Sponsor – is the owner or partial owner and agrees to convey ownership to a second non-profit at a predetermined time prior to or during development or upon completion (requires consultation with DHCD prior to application)

The Applicant must be registered in CAMS as an eligible organization defined above, and should be the primary partner in the project, responsible for long-term operations and compliance. Applicants with incomplete CAMS profiles (including applicants without UEIs) are ineligible.

Applications made by a project legal entity or limited liability corporation are ineligible.

Applicants with outstanding or unresolved findings from audit or monitoring findings, unresolved IRS findings, unresolved compliance findings – including those issues which may be identified to DHCD by another previous partner such as Virginia Housing (VH or VHDA) –, or which are not in compliance with previous DHCD agreements will not be eligible for a funding commitment for any Project until such findings and/or compliance issues are resolved. DHCD staff are committed to working with any interested party to develop a plan for resolution and restoration of eligible status.

Developer Requirements

Federal regulations require DHCD to certify developer capacity, including Community Housing Development Organizations (CHDOs) prior to the commitment of HOME or NHTF funds.

The evaluation of developer capacity includes reviewing:

- Developer's demonstrated experience developing similar projects
- Staff experience in housing development (excluding consultants, contractors, or partners)
- Current financial soundness, including compliance with DHCD's audit policy

DHCD also evaluates the capacity of applicants requesting only state sources of funding. It is critical that applicants and development teams have demonstrated success with similar projects including ongoing operations and long-term compliance. Applicants must be able to clearly articulate the relationship between all partners involved in the development, ownership, and property management of a project, and describe partner capacity and experience.

CHDO Certification Requirements

Applicants must have an approved CHDO Certification application in CAMS, and the related Certification or Re-Certification letter provided by DHCD to be eligible for the five (5) point scoring preference on applications for HOME funds. This scoring preference enables DHCD to meet the 'CHDO Reserve' or 'CHDO set-aside' requirements of the HOME program.

Generally, CHDOs must meet organizational, mission, financial management, and capacity requirements, which include, but are not limited to, the following:

- Certified nonprofit status
- Being a community-based organization
- Low-income representation in board composition
- Primary mission is the provision of affordable housing
- Demonstrated capacity to develop affordable housing
- Conformance to accounting standards and financial soundness

CHDO requirements must be met at the time of fund commitment, for the duration of the development phase, and through the long-term compliance period for CHDO's in the role of project/property owner.

Organizations interested in determining if they meet the requirements to become certified as CHDOs and therefore eligible for the HOME scoring preference should refer to the HUD publication CHDO Survivor Kit[3] or the CHDO Capacity Self-Assessment Tool

Project Eligibility

To be eligible for ASNH funding, all projects must be new construction or substantial renovation of affordable housing units, or the adaptive reuse of buildings to create new affordable housing units for lower income homeowners or renters. Acquisition-only projects, public housing, and public facilities including emergency shelter, hospitals, nursing homes, or intermediate care or assisted living facilities are not eligible for ASNH funding.

In limited cases group homes may be eligible for ASNH funding. There must be an identified local need, and these projects require a pre-application consultation with DHCD. Applications submitted without completing this pre-application consultation are ineligible.

[3] Link validated September 2022; document title is searchable on hudexchange.info

Eligible property types include multi-unit structures, single family, two- to four-unit structures, and manufactured homes. Scattered site projects are allowable, but all projects must be under common ownership, management, and financing. Regardless of type, the units must be considered modest relative to the neighborhood.

Projects may include units structured as Single Room Occupancy (SRO) units. Eligible SROs are efficiency-style units that are the primary resident of a single one- or two-person household, with a valid twelve-month lease to that household. The unit must contain food preparation and/or sanitary facilities. If the unit does not contain food preparation or sanitary facilities, then the building must contain and provide access to these.
Generally, an eligible project must:

- Include a minimum of five units,
- Be under common ownership, management, and financing,
- Represent a minimum investment/development cost of $15,000 per unit, and
- Meet the affordability requirements of every source for which it is requesting funds.

Eligible Project Types

Projects may be new construction, substantial rehabilitation, or adaptive reuse. Development activity beyond the original footprint will be considered new construction. Projects must meet Section 504 accessibility requirements based on project type, as described in these Guidelines.

For rehabilitation projects, minimum total development cost per unit is $15,000 and must include replacement of at least three out of five major systems (e.g., HVAC, plumbing, roofing, electrical). Development costs are limited to eligible costs and must exclude non-eligible costs such as community buildings, market rate units, and retail space.

Projects of any type must meet DHCD's Minimum Design, Construction, and Rehab Requirements to ensure that no further investment is required during the affordability period. Projects awarded National Housing Trust Funds must follow the Housing Trust Fund Rehabilitation Standards.

Rental & Homebuyer Project Eligibility

An eligible project must be either a **homebuyer** project or a **rental** project (not both).

Homebuyer projects must be a minimum of five units of housing, which will be made available for sale to households earning incomes below 80% AMI. These projects may apply for either HOME or VHTF funds.

Rental projects must be a minimum of five units (unless 100% special needs, with DHCD approval), and must be structured to meet each individual program's affordability requirements. For rental projects requesting federal sources, a minimum of five units are required to meet AMI targeting requirements per source.

For example, a project requesting HOME and NHTF funds would need a minimum of ten total units, five of which must meet the NHTF requirement of 30% AMI or below; and five of which must meet the HOME requirement of 60% and 50% AMI or below. Rental projects requesting

state funding sources (VHTF, PSH funds, or HIEE) must restrict at least some units to households with incomes at or below 80% AMI.

Mixed income and multiple-use projects are eligible; however these projects must contain assisted units that will meet income and rent or sales value requirements, and the number of assisted units must meet Program Guidelines.

For both homebuyer and rental projects, applications designed to provide a greater proportion of lower income targeting will be given scoring preference on the *need* criteria. The actual number of ASNH assisted units and income mix will be determined by DHCD during underwriting.

For both homebuyer and rental projects, the maximum investment of HOME or NHTF funds must be equal to or less than the actual costs *or the 221 (d)(3) limit*, whichever is lower, on a per-assisted-unit basis.

Maximum Subsidy Limit – *221(d)(3) limit* (effective March 17, 2022)	
Bedrooms	Cost Limit
0	$159,754
1	$183,132
2	$222,694
3	$288,094
4+	$316,236

Program requirements including the number of required assisted units are based on total amount of HOME or NHTF assistance (including HOME from other resources) as compared to the total development costs. For this purpose, total development costs are limited to HOME or NHTF eligible costs (Appendix C) and must exclude non-eligible costs such as community buildings, market rate or unrestricted units, and retail space.

The final number of assisted units in a project will be determined by DHCD during underwriting. Selected projects will always be assisted with the minimum amount of funds needed, as demonstrated by the underwriting and subsidy layering review.

Program Terms & Agreements

Affordability Period

All commitments of ASNH funds to a project result in a mandatory affordability period on the project property, which is the period of time that the rental units or single family home must be maintained as "affordable" according to the agreement between the developer and DHCD, and is enforced through a restrictive covenant deed recorded on the property.

Affordability periods for ASNH funded rental projects are thirty (30) years. As noted below, for HOME-assisted projects, this affordability period is comprised of a federal compliance period followed by a state-level affordability period. For all sources, the required type and number of

source-assisted units to be maintained as "affordable" for this time period determined by DHCD during underwriting.

For ASNH funded homeownership projects, the affordability periods for any available source are based on the total amount of funds (including HOME funds from local Entitlements or Consortiums) invested in the project and DHCD's determination of investment through developer subsidy or direct homeowner assistance.

Rental Affordability Periods	
Source/Activity	**Length**
NHTF (all activities)	30 years (federal compliance only)
HOME New Construction	20 years (federal compliance) + 10 years state affordability)
HOME Rehabilitation	15 years (federal compliance) + 15 years state affordability)
VHTF, HIEE, and PSH funds	30 years (state compliance only)

Homeownership Affordability Periods	
Investment By Unit	**Length**
HOME or VHTF/HIEE; less than $15,000*	5 years
HOME or VHTF/HIEE; $15,000 - $40,000*	10 years
HOME or VHTF/HIEE; more than $40,000*	15 years

**If only homebuyer developer subsidy, a resale provision applies. If DHCD DPA is included in a unit then a recapture provision applies and affordability is based on the amount of DPA only.*

Type of Assistance Provided

Funds made available through the ASNH Program have standard terms based on project type.

Rental project assistance is provided as permanent, must pay debt after all other financial commitments are received. These funds are leveraged to close a financing gap in the affordable housing project, and the amount of funds committed must be the minimum amount needed.

All rental project applications must assume permanent financing structured as a 3% interest-only, deferred principal loan, with must-pay interest over the full required affordability period of time of 30 years. Cash flow loan requests will not be considered. Construction draws or other payments of ASNH funds prior to conversion to permanent financing will not be considered.

Homebuyer project assistance is structured as reimbursement-based construction financing. Construction draws are allowed based on predetermined and specific project completion milestones. No reimbursement draws are permitted until DHCD has received a fully executed deferred loan agreement, and a copy of the restrictive covenant deed of trust recorded on all properties under the loan agreement. Reimbursement draws or remittances are sent to the Applicant's organization address as listed in CAMS via paper check until the organization completes registration with the Department of Accounts for ACH payments.

This structure may also be available to rental projects with only PSH funds assistance.

For all projects, DHCD reserves the right to charge agency-incurred project costs to the project. These costs include only actual, applicable project costs such as environmental review notices and legal services. Any incurred costs charged to the project are structured as a grant, included in the total amount of project assistance. The total ASHN project assistance is reflected in the restrictive deed, the program agreement, underwriting, and subsidy layering analysis.

Additional Criteria

Income Restriction Criteria

Each ASNH awarded source has income restriction criteria, and regulations about how and when income determinations or qualifications are made.

Projects must be able to meet the ASNH Program requirement of a minimum of five units, but the actual number of assisted units in a project will be determined during underwriting. These units must be made available to eligible households that meet the income-restriction requirements of the source based on Area Median Incomes (AMI). Income calculations must be based on HUD's Section 8 income eligibility standard.

For all projects, households must meet income-restriction eligibility requirements at the time that program eligibility is determined, and determinations expire after six months.

For rental projects, all NHTF-assisted units must be restricted to households with incomes at or below 30% AMI; HOME-assisted units must be restricted to households with incomes at or below 60% AMI, and twenty percent (20%) of HOME-assisted units in a project must be further restricted to households with incomes at or below 50% AMI. VHTF and HIEE assisted projects must have units restricted to households with incomes at or below 80%. All ASNH sources allow for rental projects to be mixed-income and/or include 'workforce units,' market-rate or unrestricted units, but these projects must have appropriate numbers of restricted units to meet program requirements and have eligible costs to support the ASNH award value or investment.

For homebuyer projects, all sales must be made to households at or below 80% AMI regardless of ASNH source. For homebuyer projects, closing must occur within six months of income determinations. If closing does not occur during that time, then income eligibility must be re-established.

HOME Program Criteria

Match Funds and non-Entitlement Preference

Eligible projects may be located in any locality in Virginia. For projects requesting HOME funds, there are criteria that change based on the locality in which the project will be developed.
Some localities in Virginia, called HOME Entitlements or HOME Consortiums, receive HOME funds directly from HUD.

Projects located in these localities (listed in **Appendix A**) must meet a *local match requirement*. These projects must have a commitment of 25% of their ASNH Program HOME funds request from locally-administered funds. Examples of local match include local HOME, CDBG, or other federal or state funds awarded and administered by a local government. Match requirements can also be met based on the waiver of locally collected fees directly associated with the specific development (e.g., water and sewer connection fees). Documentation of local match must be included in the application.

Projects located in non-Entitlement or non-Consortium localities do not have a match requirement on their application for ASNH Program HOME funds, and have a scoring preference of 5 points on their HOME funds score.

HOME Environmental Reviews

Projects awarded HOME funds will require an additional environmental record review completed and approved by DHCD. **No development activity including the acquisition of the property can occur prior to the completion of this review, which may include the publication of a notice of findings and the request for release of funds from HUD.** Projects proceeding with development or 'choice limiting' activities prior to the completion of the review may be ineligible.

Coordination of the environmental review will be required for any project combining DHCD's State HOME funds with local HOME or Community Development Block Grant (CDBG) funds.

NHTF Program Criteria

NHTF Environmental Reviews

Projects awarded NHTF funds will require an additional environmental record review. The NHTF Environmental Provisions for new construction and rehabilitation under the Property Standards at 24 CFR § 93.301(f)(1) and (2) are similar to HUD's Environmental Regulations at 24 CFR Parts 50 and 58 for HOME funds. The main difference is that the HTF Environmental Provisions are outcome based, and exclude consultation procedures (including notice requirements and public comment periods) that would be applicable if NHTF project selection was a federal action. Parts 50 and 58 are process based, and include consultation procedures for several laws and authorities where there may be environmental impacts. See CPD notice 16-14 for further details.

Permanent Supportive Housing Criteria

Rental projects may include permanent supportive housing (PSH) units, which is permanent housing made available to individuals in qualified target populations in which supportive services are provided to assist at least that individual (who may be a member of a multi-person household) in achieving housing stability. These units may also have housing assistance in the form of rental

subsidies, or the individuals may have their own tenant-based rental assistance. Projects may target special needs populations such as veterans, formerly homeless, or elderly individuals.

However, for the purposes of achieving a scoring preference (5 points) or accessing the increased funding cap, projects must target households which meet the HUD definition of chronic homelessness, households with at least one member with an intellectual or developmental disability (ID/DD), or households with at least one member with a serious mental illness (SMI).

The minimum number of PSH units required per project to gain the scoring preference is as follows:

Total Unit Count	PSH requirement
32 units or greater	8% of total units
11-31 units	Minimum of 2 units
10 Units or less	Minimum of 1 unit

Compliance with fair housing always applies, tenants must have a lease in their name, and participation in services may not be a condition of tenancy.

HIEE Funds Criteria

Projects must meet or exceed the following performance requirements, and must submit their HERS rater plan review and preliminary rating, and their preliminary documentation of green build certification. Applications for which these documents are incomplete or missing will be considered ineligible for an award from this ASNH HIEE Supplemental Funding Round, and DHCD staff will advise applicants that they will need to resubmit documentation in conjunction with a completed application for the ASNH competitive loan pool at a later date.

Please note the minimum requirements differ substantially from Virginia Housing's Low-Income Housing Tax Credit (LIHTC) energy efficiency requirements. Meeting the LIHTC Qualified Allocation Plan energy-related standards or meeting EnergyStar standards do not qualify a project for HIEE funding.

Presentation recording available at dhcd.virginia.gov/hiee
Further information available at buildings.energy.gov

HIEE Minimum Energy Efficiency Performance Requirements	
New Construction	Green building certification required* Zero Energy Ready Homes (ZERH)**
Substantial Rehabilitation	Green building certification required* Average HERS index of 70 or below across all units OR 40% improvement in HERS index Additional requirements: ACCA Manual J calculations for heating/cooling loads Fresh air ventilation and dehumidification** Duct leakage testing and sealing*** Architect cost certification of upgrades needed to meet HIEE requirements
Adaptive Reuse	Green building certification required* Average HERS index of 80 or below across all units Additional requirements: ACCA Manual J calculations for heating/cooling loads Fresh air ventilation and dehumidification** Duct leakage testing and sealing*** Architect cost certification of upgrades needed to meet HIEE requirements

*Eligible green building certifications include: LEED, EarthCraft Gold or higher, National Green Building Standard Silver or higher, and Enterprise Green Communities.

**Dehumidification strategy/equipment shall provide for occupant comfort and health by maintaining interior RH in 40-60 percent range. For renovations and adaptive reuse projects, if building/unit envelopes are tightened to new construction standards (5 ACH_{50}), ventilation system(s) shall provide fresh air supply per the most current version of ASHRAE 62.1 or 62.2, or the most current version of USBC, whichever is more stringent.

***Existing ductwork shall be sealed and tested to be ≤10 percent total duct leakage; if HVAC system/ductwork will be newly-installed, duct leakage shall meet new construction energy code requirements (≤4 percent total duct leakage).

Additional Federal and State Requirements

Section 504

Section 504 applies to all ASNH assisted rental projects based on project type, which is determined by DHCD staff in coordination with the Applicant/Developer.

New Construction

New construction of multifamily rental housing with five or more units must be designed and constructed to be readily accessible to and usable by persons with disabilities. All common areas in the building must be made accessible, and a minimum of individual units must also be accessible.

- A minimum of five percent (5%) of the dwelling units in the project (but not less than one unit) must be accessible to individuals with mobility impairments.
- An additional two percent (2%) of the dwelling units (but not less than one unit) must be accessible to individuals with sensory impairments (i.e., hearing or vision impairments).

Rehabilitation: Substantial alterations

Multifamily rental projects of fifteen units or more that undergo "substantial alterations" must also comply with Section 504's accessibility requirements. Substantial alterations are defined as projects where costs of the planned rehabilitation will be seventy-five percent (75%) or more of the replacement cost of the completed facility. For these projects, all common areas in the building must be made accessible, and a minimum of individual units must also be accessible.

- A minimum of five percent of the dwelling units in the project (but not less than one unit) must be accessible to individuals with mobility impairments.
- An additional two percent, at a minimum (but not less than one unit), must be accessible to individuals with sensory impairments.

The requirements for multifamily projects undergoing substantial alterations are found at 24 CFR 8.23(a).

Rehabilitation: Other Alterations

If a multifamily rental project does not meet the definition of substantial alterations, the alterations that are made must, to the maximum extent feasible, make the dwelling units accessible to and usable by individuals with mobility impairments.

If alterations of single elements or spaces of a dwelling unit, when considered together, amount to an alteration of a dwelling unit, then the entire dwelling unit shall be made accessible to persons with mobility impairments. This would include alterations that involve certain kitchen and bathroom renovations, as well as entrance door jamb replacements. In addition, alterations to common spaces must make those areas accessible to the maximum extent feasible.

For this category of rehabilitation, only:

- When a minimum of five percent of the dwelling units (but not less than one unit) are accessible to people with mobility impairments, then no additional units are required to be made accessible
- There is no requirement to make any units accessible to individuals with sensory impairments.

A recipient is not required to make these accessibility alterations if doing so would impose undue financial *and* administrative burdens on the operation of the multifamily housing project (24 CFR 8.23(b)). However, projects in this category of rehabilitation may not be funded at DHCD's sole discretion when projects which do create additional accessible units are eligible within the same application round.

Program agreements will reflect Section 504 units, and will require that any vacant 504 units are listed on Virginia Housing Search and held for at least 60 days before being leased to household not requiring a unit-specific accommodation. Tenant selection plans must also include 504 units.

Fair Housing Act

The Fair Housing Act prohibits discrimination in the sale or rental of housing based race, color, religion, sex, national origin, handicap or familial status. This prohibition applies to all projects assisted with the ASNH program, and any project or applicant that discriminates or projects which are structured to discriminate are ineligible.

Lead Safe Housing

Lead Safe Housing policies apply to ASNH projects, unless they are found to be exempt. For non-exempt projects appropriate measures must be taken to assure that:

- Rehabilitation or demolition activities meet lead safe requirements;
- Development costs include associated costs;
- Homebuyers or tenants will receive notification (if applicable);
- Operating costs include ongoing associated maintenance costs for rental projects; and
- Records are maintained to document all measures taken.

Uniform Relocation Act (URA)

Accommodations for any relocations are required for all funding sources. However, the Uniform Relocation Act (URA) applies to all HOME/NHTF assisted projects where development activity will result in the permanent or temporary dislocation of households, businesses, farms and nonprofit organizations. When permanent or temporary dislocation is possible, a notice of the intent and a survey of the occupants must be conducted prior to the ASNH application. All application must include a completed URA Assessment Form and documentation of the notice and survey results. Development costs must reflect any associated costs that the project anticipates.

Section 3 Requirements

Section 3 requirements apply to all HOME/NHTF-assisted projects. These requirements mean that development-generated opportunities must be designed to benefit to the greatest degree possible low and very low income persons in the project services area and the business that employ them.

Developer hiring, contracting, and subcontracting must be structured to maximize this benefit. Project owner/developers are required to adopt specific goals, develop a Section 3 plan, and comply with required notifications, documentation, and reporting documented to DHCD through CAMS.

Labor Standards

Labor Standards apply to all projects. All projects must assure that workers receive "overtime" compensation at a rate of 1.5 times their basic rate of pay for all hours worked in excess of 40 hours a work week. This applies to all project associated construction contracts funding in whole or in part with HOME/NHTF resources.

Davis-Bacon Act and the Copeland "Anti-Kickback" Act requirements apply to projects with 12 or more HOME assisted units (determined in underwriting by DHCD, in part on the proportion of HOME funds to total development costs). In these cases, Davis-Bacon prevailing wages must be paid to workers at least weekly without any deductions or rebates except permissible deductions. Reporting requirements include the payroll submissions.

Violence Against Women Act

Violence Against Women Act applies to all projects and provides housing protection for survivors of domestic and date violence, sexual assault, and stalking. This requirement requires that all tenants are notified of their rights under the provision. The provision allows for emergency transfers to other units, bifurcation of leases, protection against denials, evictions, and terminations that directly result from being a victim, and allow for a low-barrier certification process.

Environmental Review

All applicants must complete and submit with their application a Phase 1 Environmental Site Assessment. In addition, as stated in the HOME and NHTF Criteria sections above, compliant environmental review must be completed before DHCD can execute any HOME or NHTF Program Agreement to secure a formal commitment of funds.

It is essential that developers not proceed with any project activity (e.g., acquisition, rehabilitation, demolition, construction, etc.) prior to the execution of the program agreement or the project will likely be rendered ineligible for funding. Applicants must allow sufficient time to complete and submit all required environmental site assessment documentation to DHCD.

Coordination on the environmental review procedure is required if combining ASNH resources with CDBG or other federal funding such as local HOME. Part 58 checklists must be submitted within six months of a HOME or NHTF award being made, and prior to any potentially choice limiting activities being undertaken.

Application Submission and Evaluation

All applications for Affordable and Special Needs Housing (ASNH) must be submitted through DHCD's Centralized Application and Management System (CAMS) prior to the application submission deadline.

The deadline for Fall 2022 submissions is October 31, 2022 at 11:59pm
CAMS automatically closes the application to submissions at this time.

The CAMS User Guide provides information and instructions on setting up and managing a CAMS account, and should be used first to troubleshoot any errors. Please allow up to two business days for responses to any CAMS Help Desk request. DHCD technical assistance is limited to normal business hours.

ASNH Application Instructions are available in CAMS to further assist Applicants in completing and submitting applications for ASNH funds. Applications submitted with incorrect or missing information will be reviewed *as is,* and may be ruled ineligible.

DHCD conducts panel reviews of all Applications submitted in CAMS prior to the submission deadline. During this panel review, the Application is first screened to ensure the Project and Applicant meet the eligibility requirements. Projects or Applicants which do not meet eligibility requirements are not provided with a numerical score.

Applicants with outstanding or unresolved findings from audit or monitoring findings, unresolved IRS findings, unresolved compliance findings – including those issues which may be identified to DHCD by another previous partner such as Virginia Housing (VH or VHDA) –, or which are not in compliance with previous DHCD agreements will not be eligible for a funding commitment for any Project until such findings and/or compliance issues are resolved. DHCD staff are committed to working with any interested party to develop a plan for resolution and restoration of eligible status.

Scoring Criteria

Applications are scored on a one hundred (100) point scale, and Projects must score sixty (60) points or higher to be qualified for funding.

Scoring criteria are as follows

- Need – 40 points
    - The Applicant demonstrates through narrative responses and information in attachments that the Project fills a critical need in the market area.
    - For rental projects only, PSH projects receive points (5) in this category
    - For HOME funds only, projects in non-Entitlement or non-Consortium localities receive points (5) in this category

- Feasibility – 30 points

    - The Applicant demonstrates through narrative responses and information in attachments that the Project is likely to come to a timely completion

- Developer Capacity – 30 points
    - The Applicant demonstrates through narrative responses and information in attachments that the development team has the ability to successfully complete projects and deliver affordable housing
    - For HOME funds only, CHDO-involved projects receive points (5) in this category

DHCD staff will rank all qualified Applications based on score. The highest scoring Applications from each round will received offers of funding from DHCD, up to the amount requested in the Application as available based on per-project and per-source caps, and remaining funds for allocation through the ASNH Program. These offers are preliminary awards and are contingent upon the Applicant meeting certain requirements as outlined in the Program Guidelines and in the source-specific letter of award offer.

DHCD reserves the right to retain any funds offered during an application cycle or program year as unallocated, and such unallocated funds will carry forward to future application cycles and program years as allowed.

Notification of Funding Decision

The Office of the Governor of Virginia makes the Affordable and Special Needs Housing program funding award announcements public, typically by the publication of a press release.

After the ASNH Program application cycle closes, ASNH staff are unable to answer inquiries as to the timing or contents of this announcement. Any such inquiries will not be returned.

After the public announcement of ASNH Program awards, DHCD staff will send an email to the Project Primary Contact as listed for each Project in CAMS containing either a notification of awarded funds or a denial of funding. Projects which are denied funding may request to schedule a technical assistance call, or *debrief*, with ASNH staff to discuss comments or feedback on the Application.

Execution of Award Terms

Applicants receiving a notification of awarded funds for Projects are considered preliminarily qualified. For each source awarded, the notification of awarded funds is comprised of two documents. The first document is a letter of award, which will be signed by the Senior Deputy Director of Community Development and Housing.

The second document will contain additional terms of the awarded funds, including interest rate, length of affordability period, and details program requirements (including environmental review processes). This *terms letter* must be countersigned by the Applicant and returned to DHCD staff prior to the issuance of a Program Agreement.

DHCD's expectation is that all Applicants requesting ASNH funds are prepared to return executed *terms letter(s)* in a timely manner. Applicants which delay the return of an executed terms letter without communicating with their assigned Program Administrator may not be eligible for an extension of time to complete the Program Agreement.

Execution of Program Agreement(s)

Applicants have a maximum twelve (12) months from the date on the notification of awarded funds and *terms letter(s)* to complete all program requirements and execute the Project's Program Agreement. This window of time is intended to allow both Applicants and DHCD to complete necessary processes which may have predetermined time requirements, such as Applicant underwriting review or DHCD public notice and comment periods.

The Program Agreement (a formal commitment of funds, and prerequisite for a legal loan commitment for rental projects or prerequisite to Deeds of Trust and remittance eligibility for homeownership projects.) Program requirements vary by source, but may include an environmental review process with public comment periods as required by HUD, and program agreements cannot be issued until all contingencies and program requirements are met.

ASNH Program Agreements generally expire two years from the date of execution, by which time the Project should be completed and ready to schedule permanent conversion or closing (rental projects) or should be completed and ready to submit closing disclosures on final home sales (homebuyer projects). Written requests for extensions of any deadline above must be received by DHCD prior to the expiration of the agreement or commitment, and are approved on a case-by-case basis at DHCD's discretion.

Marketing Materials

DHCD and the specific funding source(s) must be including on all marketing materials to include press releases, the project website, and signage. DHCD requires that a project sign be installed within thirty (30) days of the execution of the Agreement. Please see signage requirements for more details.

Appendix A – HOME Consortiums & Entitlements

Projects in these localities must provide evidence of matching funds as detailed in the Program Guidelines to be eligible for an award of HOME funds from the ASNH Program.

HOME Consortiums

Charlottesville Consortium
- Albemarle County
- Charlottesville
- Fluvanna County
- Greene County
- Louisa County
- Nelson County

New River Consortium
- Blacksburg
- Christiansburg
- Giles County
- Montgomery County
- Pulaski County
- Radford

Suffolk Consortium
- Franklin City
- Isle of Wight
- Southampton
- Suffolk

Winchester Consortium
- Clarke County
- Frederick County
- Page County
- Shenandoah County
- Warren County
- Winchester

HOME Entitlements

Alexandria
Arlington County
Bristol City (TN Consortium)
Chesapeake
Chesterfield County
Danville
Fairfax County, including
- Fairfax City
- Falls Church

Hampton
Henrico County
Lynchburg
Newport News
Norfolk
Portsmouth
Prince William County, including
- Manassas
- Manassas Park

Richmond
Roanoke City
Virginia Beach

Appendix B – HIEE Minimum Energy Efficiency Performance Requirements

HIEE Minimum Energy Efficiency Performance Requirements	
New Construction	Green building certification required* Zero Energy Ready Homes (ZERH)**
Substantial Rehabilitation	Green building certification required* Average HERS index of 70 or below across all units OR 40% improvement in HERS index Additional requirements: ACCA Manual J calculations for heating/cooling loads Fresh air ventilation and dehumidification** Duct leakage testing and sealing*** Architect cost certification of upgrades needed to meet HIEE requirements
Adaptive Reuse	Green building certification required* Average HERS index of 80 or below across all units Additional requirements: ACCA Manual J calculations for heating/cooling loads Fresh air ventilation and dehumidification** Duct leakage testing and sealing*** Architect cost certification of upgrades needed to meet HIEE requirements

*Eligible green building certifications include: LEED, EarthCraft Gold or higher, National Green Building Standard Silver or higher, and Enterprise Green Communities.

**Dehumidification strategy/equipment shall provide for occupant comfort and health by maintaining interior RH in 40-60 percent range. For renovations and adaptive reuse projects, if building/unit envelopes are tightened to new construction standards (5 ACH_{50}), ventilation system(s) shall provide fresh air supply per the most current version of ASHRAE 62.1 or 62.2, or the most current version of USBC, whichever is more stringent.

***Existing ductwork shall be sealed and tested to be ≤10 percent total duct leakage; if HVAC system/ductwork will be newly-installed, duct leakage shall meet new construction energy code requirements (≤4 percent total duct leakage).

Appendix C – Eligible Costs

For all project types, all funded development costs must be allowable:

Eligible or Allowable Costs:

- *Demolition cost*s are eligible costs, however construction must begin within 12 months
- Construction, labor, and materials costs
- Project development costs (e.g., financing fees, legal fees, affirmative action marketing)
- Up to 18 months rental project operating deficit reserve
- Relocation costs for any household in project as a part of the project development costs

Ineligible Costs:

- HOME/NHTF investments not resulting in HOME/NHTF eligible units
- Project reserves other than the rental operating (above) or beyond 18 months
- Costs for the development, operation, or modernization of any public housing
- Some specific costs related to RAD (Rental Assistance Demonstration) projects
- Items not allowed under 2 CFR 200 or not deemed cost-reasonable
- Project-based rental assistance
- Delinquent taxes, fees, charges

Appendix D – Additional Program Requirements and Compliance

Rental Projects

While final cost certification and completion reports are required at closing, progress reports may be required quarterly on each project during the development phase, and regular construction inspections may be conducted to verify progress.

Affordability periods begin after permanent conversion (DHCD loan conversion) when all closing checklist items (which may include but are not limited to completion reports, including lease up data or rent rolls, HUD-required demographic data as determined by source) are provided to DHCD for review and approval.

Assisted units have income restrictions as detailed in the Program Guidelines, with initial certification and annual recertification required. HOME- and NHTF-assisted units also have HUD-determined rent limits. Rents cannot exceed these HUD-determined rent limits, with the exception of project-based rental assistance. Rent increases over those proposed in the project application must be approved by DHCD.

The Compliance in HOME Rental Projects: Guide for Property Owners and HOME Rental Compliance Training provide more detail on income and rent requirements; Additional requirements will be detailed in an individual project's program agreement and loan commitment documents.

Long-Term Compliance

During the affordability period each project will be required to submit annual rent and occupancy reports and project financials. DHCD will verify through onsite monitoring compliance with rent, occupancy, property standards, and other programmatic requirements. **Non-compliance may suspend eligibility for subsequent commitments and could result in the repayment of all funds to DHCD.**

Projects will be inspected for property standards and program compliance within 12 months of project completion. Projects will be inspected thereafter no less than every three years. All rental projects must submit annual rent and occupancy reports and project financials. Onsite inspections and monitoring frequencies are based on performance and risk assessments.

Rental projects must meet program rent, occupancy, and property standards and other applicable federal or state requirements for the duration of the affordability period in accordance with the program agreement. Additional HOME/NHTF program investments cannot occur during this time period. Projects unable to meet these requirements or projects at-risk of non-compliance may be required to submit to more frequent monitoring, to change property management, and/or transfer ownership.

Homebuyer Projects

Project Completion

While final cost certification and completion reports are required at the end of the development phase and prior to the last reimbursement remittance or draw, progress reports may be required quarterly on each project during the development phase, and regular construction inspections may be conducted to verify progress.

For homebuyer developments assisted with any ASNH source, the final reimbursement remittance or draw (typically 10% of the total award) will not be approved until all completion documentation is submitted and approved by DHCD. Completion documentation required may include the COs for all properties named on the deed of trust by DHCD, and covered by the deferred loan agreement between the Applicant and DHCD, closing disclosures and lien documentation from each sale, and completion reports such as the HUD HOME Homebuyer Set Up/Completion report. **Non-compliance could suspend eligibility for additional funds and could result in the repayment of all funds to DHCD.**

HOME-assisted homebuyer developments automatically convert to HOME rental units for the duration of the affordability period if there if there is no ratified sales contract at nine months after the date a Certificate of Occupancy is issued to the project. HUD allows no exception to this requirement.

Value or Sales Limits

Homebuyer properties must be considered *modest*, based on property sales price or value. The sales price cannot exceed 95% of the median area purchase price, using HUD 203 (b) limits or a local market survey. No luxury homes or amenities as determined by neighborhood standards are allowed for assisted units.

Lease-Purchase Projects

Homebuyer projects may be structured as lease-purchase projects, but must be identified as lease-purchase in the application. Lease-purchase projects must convert to a tenant-purchased homebuyer unit within three years. Any units which failing to meet this requirement will convert to HOME rentals unit for the duration of the affordability period. Applicants considering this option **are required** to consult with DHCD prior to submitting an application for a project.

Resale Requirement: Homebuyer Developer Subsidy Projects

Homebuyer units assisted through developer subsidy are subject to a resale provision. A resale provision requires the assisted unit to be resold to an income eligible household if the original purchaser chooses to sell their home prior to the end of the applicable affordability period.

The developer must monitor sales, foreclosures, and title transfers to assure affordability requirements. The developer must ensure that resale requirements are imposed if the housing does not continue to be the principal residence of the occupant or family for the duration of the period of affordability, and must also ensure that the housing is only made available for subsequent purchase to a buyer whose family household qualifies as a low-income family and will use the property as its principal residence.

The resale requirement must also ensure that the price at resale provides the original assisted owner a fair return on investment, which is can be *additional* amount calculated to return, based on the homeowner's original cash/equity investment in the property and any capital improvement made to the property. This calculation limit also ensures that the housing property will remain affordable to a reasonable range of qualified low-income homebuyers for the full period of affordability as determined by DHCD according to the amount of funds invested in the housing.

A "fair return on investment*"* is determined by the resale price that takes into account a return of the initial homebuyer's initial investment plus any capital improvements made to the housing unit, which are typically set or limited based on changes in area median sales price. These factors typically establish the fair market value for the city or county that the property is located. The intent is to provide a fair return to the seller while limiting price based solely on the Median Sales Price to a potential buyer.

To determine a *"*a fair return on investment*"*, the ASNH Program will measure the percentage change in median sales prices over the period of ownership as a reasonable index that is directly related to real estate prices in the area which will simplify the resale approach by taking both market appreciation and depreciation into account. It is important to note that in certain circumstances, such as a declining housing market where home values are depreciating, the original homebuyer may not receive a return on his or her investment because the home sold for less or the same price as the original purchase price. DHCD's intent is to set a resale price that provides a fair return to the original homebuyer while ensuring that the property is affordable to the target population, thus reducing the need for additional subsidies to eligible buyers.

A capital improvement is any addition or alteration to real property that meets the following conditions:

- It substantially adds to the value of the real property, or appreciably prolongs the useful life of the real property; and
- It becomes part of the real property or is permanently affixed to the real property so that removal would cause material damage to the property or article itself.

The value of any capital improvement will be determined by the national average increase in value that a specific type of improvement brings at sale. For example, if homeowner's down payment was $5000, the value of capital improvements is $9000 and the percentage change of median sales price over ownership period was 3.5%, then a calculation of ($5000 + $9000) x 3.5= $490. The fair return on investment is $490, and the total return to the original homebuyer at resale would not exceed $14,490 ($5000 + $9000 + $490).

A *"reasonable range of low-income buyers"* is defined in the ASNH Program as a household or family at or below 80 percent of Area Median Income paying no more than 30 percent of income for principal, interest, property taxes, and insurance.

DHCD will use deed restrictions, covenants running with the land, or other similar mechanisms as the mechanism to impose the resale and continued affordability requirements as outlined in §92.254(a)(5)(i)(A) of the HOME Rule. The developer may use purchase options, rights of first

refusal or other preemptive rights to purchase the housing before any conveyance to preserve affordability. The affordability restrictions shall be revived according to the original terms if, during the original affordability period, the owner of record before the termination event, obtains an ownership interest in the housing.

Recapture Provision: Direct Homebuyer Assistance

ASNH Homebuyer HOME-assisted units including DHCD HOME Down Payment Assistance (DPA) direct buyer assistance are subject to a recapture provision in order to assure that the units either remain affordable (i.e., housing eligible clients) or that DHCD recovers its investment based on the terms of the agreement. Recapture applies and the amount to be recaptured is limited to the amount of direct buyer assistance (not the developer subsidy).

Virginia will use the recapture provision at §92.254(a)(5)(ii))1) to recapture the entire amount. The total original amount of the direct buyer assistance is recaptured from the net proceeds in the case of sale, refinance (see exception below), foreclosure or failure to maintain as primary residency prior to the end of the affordability period. In these cases the required amount returned (total assistance amount from net proceeds) is due and payable in full to DHCD to the Treasurer of Virginia.

The assistance may not be subordinated to refinancing of the first lien position primary mortgage or an equity loan or line of credit during the period of affordability except under special hardship conditions at DHCD's discretion. Affordability requirements are secured by a Restricted Deed of Covenant in the amount of direct assistance. The loan is forgiven in full at the end of the affordability period.

ABOUT THE WILDER SCHOOL

The L. Douglas Wilder School of Government and Public Affairs at Virginia Commonwealth University informs public policy through cutting-edge research and community engagement while preparing students to be tomorrow's leaders. The school's Center for Public Policy aims to advance research and training that informs public policy and decision-making to improve our communities.

ABOUT URBAN AND REGIONAL STUDIES AND PLANNING AT VCU

Urban and Regional Studies and Planning (URSP) is an academic unit within the L. Douglas Wilder School of Government and Public Affairs at Virginia Commonwealth University, offering a Bachelors of Urban and Regional Studies and a Masters of Urban and Regional Planning (MURP). Its mission is to educate students to think critically, apply technical and methodological skills, engage with diverse viewpoints, and contribute positively to civic life.

ABOUT THE INSTITUTE FOR SUSTAINABLE ENERGY AND ENVIRONMENTS

The VCU Institute for Sustainable Energy and Environments (ISEE) was formed in 2022 to pursue innovative scientific, technological, policy and social justice solutions addressing the climate and energy crisis. This includes innovations in clean, secure and energy efficient systems, carbon capture and other mitigation strategies, sustainable ecosystems, and environmental justice. The goals of the Institute are to disseminate knowledge on sustainable energy and environments through patents and commercialization, publications, community outreach, engagement with policymakers and pedagogy.

Frequently Used Acronyms

ACEEE: American Council for an Energy Efficient Economy

AMI: Area Median Income

APCO: Appalachian Power Company

ASNH: Affordable and Special Needs Housing

BIL: Bipartisan Infrastructure Law (i.e., the federal Infrastructure Investment and Jobs Act)

BTU: British Thermal Units

DHCD: Virginia Department of Housing and Community Development

DOE: U.S. Department of Energy

EERE: Office of Energy Efficiency & Renewable Energy (part of U.S. Department of Energy)

EIA: U.S. Energy Information Administration (part of U.S. Department of Energy)

FPL: Federal Poverty Level

GTSA: Grid Transformation and Security Act

HIEE: Housing Innovations in Energy Efficiency

IRA: Inflation Reduction Act

KWH: Kilowatt-hours

LEAD: Low-Income Energy Affordability Data tool

LIHEAP: Low-Income Home Energy Assistance Program

LIHTC: Low-Income Housing Tax Credit

MWH: Megawatt-hours

NREL: National Renewable Energy Laboratory

RECS: Residential Energy Consumption Survey (U.S. Department of Energy)

RGGI: Regional Greenhouse Gas Initiative

SCC: State Corporation Commission

VCEA: Virginia Clean Economy Act

VHDA: Virginia Housing Development Authority (aka Virginia Housing)

WAP: Weatherization Assistance Program

Executive Summary

This study examines the low-income energy efficiency programs funded by Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI). Its goal is to understand the extent to which those programs can address the problem of high energy burdens among Virginia's low-income residents, and to estimate the impacts that those energy efficiency investments could have on the broader Virginia economy.

Our report begins with a review of existing research on "energy burdens," or the concept that some residents, particularly those in lower income brackets, spend a disproportionate percentage of their incomes on home energy costs (heating, cooling, etc.). We then discuss the potential to relieve those burdens through investments in energy efficiency, and summarize some of the federal and state-level policies and programs that support energy efficiency and "weatherization" for low-income households.

We then present our original analysis for this study, which includes the following components:

- A series of maps that evaluate the spatial distribution of low-income energy burdens in Virginia
- A projection of potential future RGGI revenue for Virginia (high and low scenarios) through 2030
- An analysis of the potential energy efficiency benefits from the two RGGI revenue scenarios, including the number of housing units that could be upgraded and the resulting energy consumption reductions and customer bill savings
- An analysis of the broader economic impacts that would result from these RGGI-funded energy efficiency investments, including total economic impact, value added, and jobs created

Some of the more notable findings from our analysis are as follows:

- Average energy burdens for low-income households are at or above the 10% threshold for "Severe" energy burden across much of Virginia, particularly in rural areas.
- Virginia's metro regions have lower low-income energy burdens on average, with some exceptions in in parts of Hampton, Newport News, Norfolk, Portsmouth, and Richmond
- Virginia has approximately 579,000 low-income households located in Census tracts with a High average low-income energy burden (above 6%), and about 154,000 low-income housing households in Census tracts with a Severe average low-income energy burden (above 10%).
- If Virginia continues to participate in the RGGI program through 2030, the estimated total revenue over the decade (2021-2030) will be in the range of $2.5 - $3.3 Billion, resulting in between $125 - $165 million per year for low-income energy efficiency programs.
- This estimated revenue from the RGGI program far exceeds the total funding otherwise available for low-income energy efficiency via existing state and federal programs.
- These RGGI funds could provide energy efficiency upgrades to up to 130,000 homes in the High revenue scenario, leading to over 590,000 MWh in annual electricity reductions and $89 million in annual customer bill savings, for an average of $676 in annual energy savings per household.
- The expenditure of these RGGI energy efficiency funds would have a statewide economic impact of between $2.03 billion and $2.67 billion over the course of the decade (2021-2030), including up to $1.75 billion in Value Added, and would create and sustain up to 2,115 new jobs.

Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI) program has generated over $250 million for low-income energy efficiency programs over the past two years (2021-2022). These funds, passed through the Department of Housing and Community Development's (DHCD) Housing Innovations in Energy Efficiency (HIEE) program, support energy-efficiency upgrades in two ways:

- Provide funding to include highly energy-efficient features in new and rehabilitated affordable multi-family housing developments, via the DHCD's existing Affordable and Special Needs Housing Program (ASNH-EE)
- Fund repairs to homes that have been deemed unsuitable for weatherization, via the DHCD's new Weatherization Deferral Repair (WDR) program, thus allowing those homes to gain access to federal Weatherization Assistance Program (WAP) dollars

The $125 million per year that Virginia's participation in RGGI has provided for the HIEE program thus far dwarfs all other low-income energy efficiency programs operating in the state, which are anticipated to provide less than $55 million per year combined over the next few years. This includes about $17.25 million from the federal Low-Income Home Energy Assistance Program (LIHEAP), which primarily provides bill relief but also supports low-income weatherization, and about $13 million a year in WAP funding. Both of these totals include recent short-term funding increases resulting from the 2021 passage of the federal Infrastructure Investment and Jobs Act. The $55 million total also includes the $15 million a year that Dominion Energy and Appalachian Power (APC) are required to spend on low and moderate income (LMI) energy efficiency programs under the provisions of the Grid Transformation and Security Act (GTSA) and the Virginia Clean Economy Act (VCEA). Finally, this total includes an additional $6 million per year from Dominion's Energy Share program, plus low-income energy efficiency investments from Virginia's natural gas utilities, which are believed to total less than $4 million.

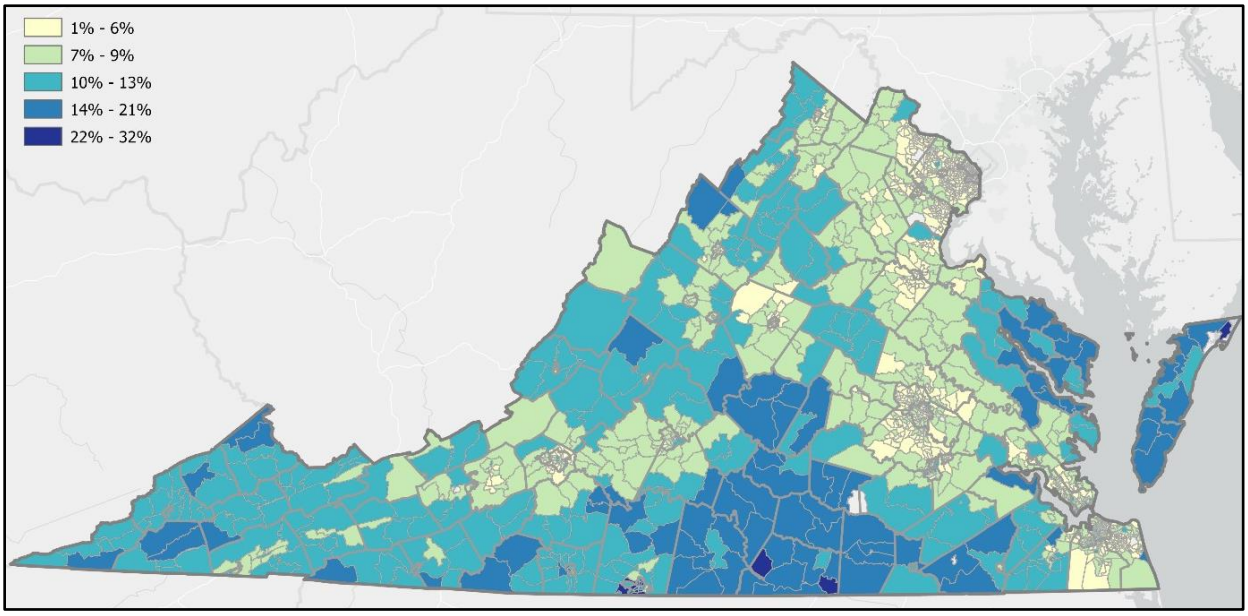
The Challenge of Low-Income Energy Burdens in Virginia

This substantial increase in low-income energy-efficiency funding will go a long way towards addressing the significant "energy burden" problems facing many of Virginia's low-income residents. According to data from the U.S. Department of Energy (DOE), low-income households in Virginia – defined as those earning less than 80% of the Area Median Income (AMI) – spend about 7% of their income on home energy costs (heating, cooling, etc.). This exceeds the 6% threshold that constitutes "High" energy burden. Extremely-low-income households in Virginia (incomes of 0-30% AMI) have an average energy burden of 17%, which is well above the 10% threshold for "Severe" energy burden and more than eight times the 2% average for households with incomes above 80% AMI.

Energy burden is not only a function of income. Low-income households tend to live in less-efficient housing units, have less-efficient appliances, etc., which leads them to spend more on household energy costs (per square foot) compared to non-low-income households. This leads to higher rates of "energy insecurity," in which households react to high energy burdens by reducing their food and/or medical expenditures and/or resort to dangerous coping mechanisms, such as leaving their homes at unhealthy temperatures or using ovens and space heaters to heat their homes.

While low-income energy burdens are a challenge throughout Virginia, they are particularly acute in certain regions. We evaluated these regional disparities, using data from the Census Bureau and the DOE's Low-Income Energy Affordability Data (LEAD) Tool, to produce a series of maps found in Section 3. The first of these maps, shown here as Figure ES-2, demonstrates the average energy burden by Census tract for households with incomes below 80% AMI.

Figure ES-1. Map of Average Energy Burden of Low-Income Households by Census Tract



Source: Low-Income Energy Affordability Data (LEAD), US Department of Energy

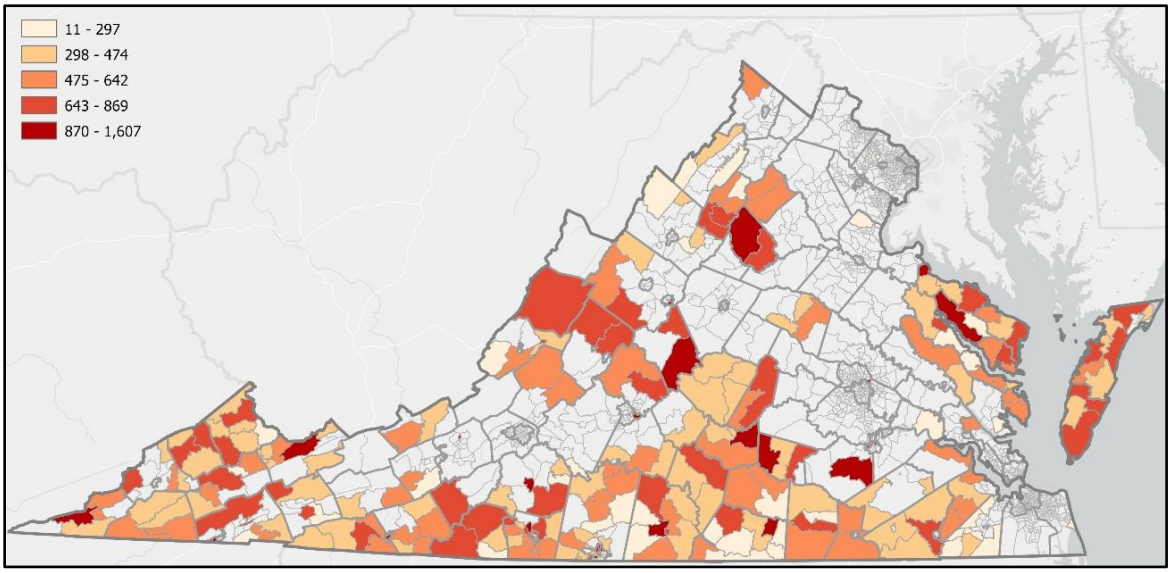
The map above shows that average energy burdens for low-income households are at or above the 10% threshold for Severe energy burden across much of Virginia's rural areas. This is particularly the case in Southwest Virginia, Southside Virginia, the Northern Neck, and the Eastern Shore.

Average low-income energy burdens are generally lower in the state's metro regions. However, Map 1.A. in Section 3.1 shows that concentrations of High to Severe low-income energy burden are found in some urban areas, particularly in parts of Hampton, Newport News, Norfolk, Portsmouth, and Richmond.

Our research also identified some pockets of extreme low-income energy burden. There are 76 Census tracts in Virginia where the average energy burden for low-income households is at or above 15%, or more than twice the national average for households in the 0-80% AMI range. Twelve of those tracts are in the Danville area. There are also 15 Census Tracts in Virginia where the average low-income energy burden is at least 22%, or more than double the threshold for Severe energy burden.

We then mapped the number of housing units within each of the Census Tracts that have average low-income energy burdens exceeding the High and Severe energy burden thresholds, with the latter shown in Figure ES-2 below. Additional housing unit maps are found in Section 3.1 and Appendix C.

Figure ES-2. Housing Units in Census Tracts with Severe Low-Income Energy Burden



Source: Low-Income Energy Affordability Data (LEAD), US Department of Energy

The map above demonstrates the total housing units in each of Virginia's Census Tracts where the average energy burden for low-income households exceeds the 10% threshold for Severe energy burden. Like the map shown in Figure ES-1 above, this map demonstrates that many of the low-income households facing Severe energy burdens are found in the state's rural areas, particularly in Southwest Virginia, Southside Virginia, the Northern Neck, and the Eastern Shore.

Section 3.1 includes zoomed in maps of the state's metropolitan regions, which demonstrate some concentrations of High average energy burden for low-income households in urban areas, but very few Census Tracts in which low-income households have a Severe average energy burden.

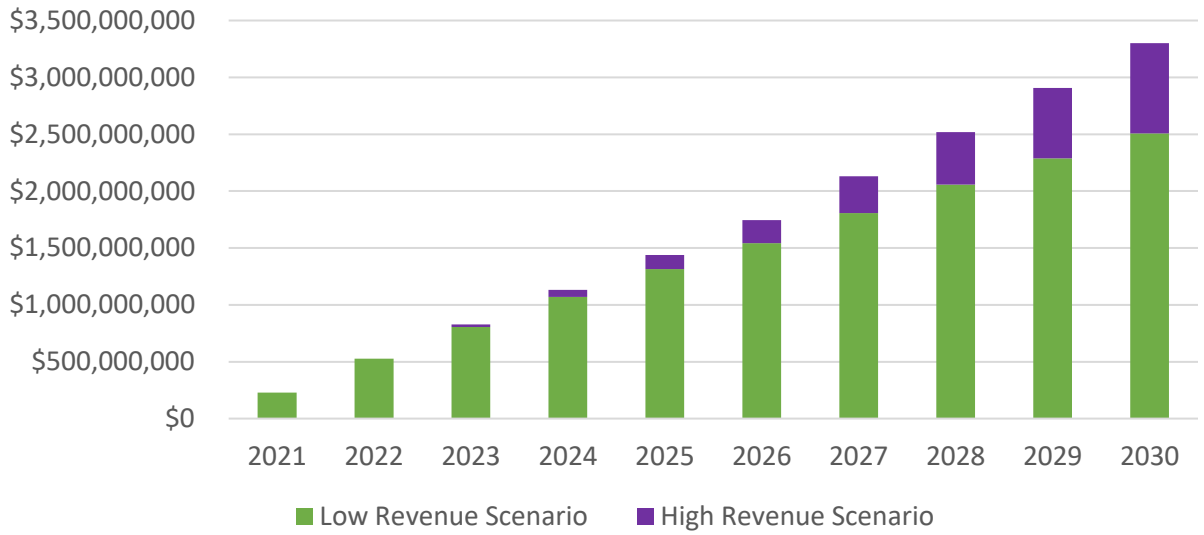
Addressing Virginia's Energy Burden Challenge via RGGI-Funded Energy Efficiency Programs

Energy efficiency is a powerful tool for reducing energy burdens and energy insecurity. Data from the National Renewable Energy Laboratory (NREL) shows that energy efficiency improvements could reduce low-income household electricity use in Virginia by roughly 30%, which is a higher rate than all but five other states. Numerous other studies, from NREL and other sources, have demonstrated the vast potential for reducing low-income energy consumption and energy burdens via cost-effective energy efficiency solutions, as discussed further in Section 1.2 of this report.

However, low-income households face a variety of challenges when it comes to actually realizing these benefits, most significantly the upfront costs of investing in energy efficiency upgrades. Additionally, while a variety of tax credits and other financial incentives are available from the federal, state, and some local governments, utilizing these programs still requires some element of up-front investment. This is why programs that directly provide energy efficiency upgrades to qualifying homes, such as those under Virginia's HIEE program, are particularly important for addressing low-income energy burdens.

If Virginia continues to participate in the RGGI program through 2030, we estimate that the combined total revenue over the decade (2021-2030) will be in the range of $2.5 - $3.3 Billion, as shown in Figure ES-3 below. (A detailed discussion of the RGGI program, the mechanisms by which it raises revenue for Virginia, and our projections of future RGGI revenue is provided in Section 4 of this report).

Figure ES-3. Projected Virginia RGGI Revenue, Low vs. High Scenarios, 2021-2030



Source: VCU analysis of RGGI auction revenue trends and policies

As the Clean Energy and Community Flood Preparedness Act requires 50% of the state's RGGI revenue to be spent on low-income energy efficiency improvements, the total funding to HIEE or other similar programs would be about $1.25 - $1.65 Billion, or about $125 - $165 Million per year on average.

The DHCD created the Housing Innovations in Energy Efficiency (HIEE) program as the entity to manage and distribute these RGGI energy efficiency funds, according to the following objectives:

- Deep energy retrofits (exceeding energy code requirements) that complement existing affordable housing construction and rehabilitation incentives, to ensure lowest income population benefits from long-term cost savings;
- Incorporate innovative approaches that will overcome traditional barriers to building and retrofitting affordable housing at scale;
- Prioritize long-term sustainability/durability and occupant health (e.g. preventing moisture issues, improving ventilation) along with energy efficiency upgrades

The DHCD has approved about $37 million in ASNH-EE and WDR expenditures thus far, leading to weatherization and energy efficiency improvements for nearly 4,000 Virginia homes since July 2021. The DHCD has also announced the release of an additional $80 million in ASNH-EE funds, which could support up to 6,500 more highly energy-efficient multi-family units.

One of the goals of this research project was to estimate the potential number of housing units that could receive energy efficiency upgrades via these HIEE programs, assuming that Virginia remains in RGGI and continues to distribute the funding in a manner similar to the first two years. We then sought to estimate the amount of reduced energy consumption and resulting customer bill savings that would result from those energy efficiency investments.

To create these estimates, we relied on publicly available data from DHCD to estimate the average cost per housing unit for the WDR and ASNH-EE programs, which we then used to calculate the estimated number of units that could be upgraded via each program with continued RGGI / HIEE funding. For the WDR program this included separate average costs for single-family homes (SFH) and multi-family housing units (MFH). The results of this analysis are shown in Table ES-1 below.

Table ES-1. Estimated Units Upgraded via HIEE Programs, per 2021-2030 Revenue Scenario

Revenue Scenario	ASNH - EE	WDR - SFH	WDR - MFH	Total Units
Low ($1.24 billion)	78,373	10,806	11,653	100,832
High ($1.64 billion)	101,833	14,041	15,141	131,015

Source: Calculations by authors

Next, we estimated the total annual energy savings from the housing units receiving energy efficiency upgrades in each RGGI revenue scenario. For this step we used data from the Virginia Center for Housing Research at Virginia Tech, which completed a study of the HIEE program for DHCD in the fall of 2022. The Virginia Tech researchers calculated the average annual energy savings per unit for each of the three types of energy-efficiency upgrades funded by the HIEE program: WDR – single-family; WDR – multi-family, and ASNH-EE. We then multiplied those averages times the housing unit totals shown in Table ES-1, to get the total estimated annual energy and customer bill savings shown in Table ES-2.

Table ES-2. Total Units Upgraded (2021-2030) and Annual (Year 2030) Energy and Bill Savings

RGGI / HIEE Revenue Scenario	Units Upgraded	Total Energy Savings (MMBTU)	Total Energy Savings (MWH)	Total Bill Savings ($Millions)	Bill Savings / Unit ($)
Low ($1.24 billion)	100,832	1,551,322	454,666	$68.20	$676
High ($1.64 billion)	131,015	2,015,703	590,769	$88.62	$676

Source: Calculations by authors, using energy savings data from Virginia Center for Housing Research

To clarify, the energy and customer bill savings shown in Table ES-2 are based on the total number of housing units that could receive energy efficiency upgrades via our estimated HIEE revenue scenarios. These are annual values, representing the projected energy and customer bill savings benefits in the year 2030, based on a projected electricity rate of $0.15 / kWh in the year 2030, as a result of the energy efficiency investments funded by HIEE from 2021-2030. These annual energy savings would continue beyond 2030, with corresponding customer bill savings. Annual energy and customer bill savings realized in the preceding years of the HIEE program (i.e., 2021-2029) would be proportional to the number of energy efficiency projects completed by that time.

Analyzing the Economic Impacts of Virginia's RGGI-Funded Energy Efficiency Programs

In the final stage of this project we created an economic impact model to evaluate how the change in economic activity from Virginia's RGGI-funded energy efficiency investments would impact the broader regional economy. We used IMPLAN, an industry standard for this type of input-output modeling.

The primary result of this analysis is that the expenditure of HIEE funds – $1.24 to $1.64 billion from 2021 through 2030 – would have a statewide impact of between $2.03 and $2.67 billion.

In other words, every dollar spent by the HIEE program generates a total impact of $1.66 – the original $1.00 ("direct impact"), plus another $0.66 generated through indirect and induced impacts. "Indirect impacts" are the dollars from the original expenditures that go to suppliers inside Virginia, while "induced impacts" occur when workers receive income from this new economic activity and subsequently spend those dollars in their communities.

The estimated total impact includes $1.32 to $1.75 billion in Value Added across the 10-year period, which would represent an increase of 0.02% to 0.03% to the state's GDP. We estimate that the Labor Income component of that Value Added ($0.83 to $1.11 billion) would create and sustain 1,552 to 2,115 jobs, at approximately $52,500 to $53,500 per job. These findings are summarized in Table ES-3.

Table ES-3. Summary of HIEE Impact Components, 2021 - 2030 (Low vs. High Scenarios)

Impact	Employment	Labor Income ($Millions)	Value Added ($Millions)
Direct	1,069 - 1,457	$581 - $774	$849 - $1,128
Indirect	217 - 233	$102 - $133	$186 - $240
Induced	311 - 424	$150 - $199	$288 - $382
Total	**1,598 - 2,115**	**$834 - $1,106**	**$1,323 - $1,750**

Unlike the dollar-based impact figures, the job creation figures do not stack cumulatively from year-to-year. Figure 6 shows the number of jobs that the HIEE program would support over the 10-year period, as a function of the amount of revenue generated that year.

Figure ES-4. Annual Employment Supported by HIEE Expenditures, 2021 – 2030

Sources: VCU model of estimated annual RGGI revenue for Virginia (see Section 4)

1. Energy Efficiency as a Solution to Low-Income Energy Burdens

Energy burden and energy insecurity are growing issues for Virginians, particularly among low-income households. The average American household spends $2,177 per year on home energy costs (heating, cooling, lighting, etc.), representing about 3% of their household income.[1] Households that spend more than 6% of their total income on these home energy costs are considered to have "High" energy burden, while those who spend more than 10% are categorized as facing "Severe" energy burden.[2] Households with High or Severe energy burdens often experience "energy insecurity," which refers to an inability to afford basic household heating, cooling, and energy needs, leading to poor health and safety outcomes.

Low-income households are disproportionately more energy burdened, compared to non-low-income households. The concept of a "low-income" household can be defined in different ways, which can sometimes produce seemingly conflicting results when comparing data sources or research studies. Some of the sources cited in this section define "low-income" based on the Federal Poverty Line (FPL), while others are based on percentages of Area Median Income (AMI).[3] Generally speaking, households with incomes of up to 200% of the FPL are considered low-income, as are households with incomes of less than 80% AMI. Households with incomes less than 30% AMI are considered extremely-low-income.[4]

High energy costs are another driver of energy burden and energy insecurity. Virginia's average residential electricity bill of $130.92 per month was 13th highest in the nation as of 2021, but was just 0.33% from the top 10 and 4% away from the top five.[5] The average Dominion Energy customer's bills jumped 30% from 2006-2016,[6] and Appalachian Power bills increased 73% over a similar period.[7]

Energy efficiency is a key strategy to address these challenges, as well-designed energy-efficiency upgrades can substantially reduce household energy costs (i.e., customer bills). Energy efficiency is often cost-effective, according to conventional economic metrics, as an up-front investment in efficiency upgrades can "pay for itself" via reduced energy bills over a reasonable number of years. However, the low-income households that could most benefit from energy-efficiency investments are often unable to do so. First, the majority of low-income households are renters, which means they may not stay in a given housing unit long enough to pay off an energy-efficiency investment, if they are even authorized to make such physical changes to the structure. Low-income homeowners also face barriers, as they often lack the capital or access to financing to make up-front energy efficiency investments.

A variety of federal, state, and local policies exist to support residential energy efficiency investments, including a number of tax credits and rebates available as a result of the recent federal Inflation Reduction Act. However, these types of incentive-based energy-efficiency programs are generally not accessible for low-income households, as they still require some element of up-front investment. For this study, the more relevant government policies or programs are those that directly support energy-efficiency improvements to low-income households, such as the federal Weatherization Assistance Program (WAP) and the energy efficiency requirements that Virginia and other states place on housing developers who receive the federal Low-Income Housing Tax Credit (LIHTC). Other programs, such as the federal Low-Income Home Energy Assistance Program (LIHEAP) can help reduce low-income energy burdens by providing direct financial assistance to reduce energy bills, but those bill-assistance programs do not provide the same long-lasting benefits that households receive from energy efficiency improvements (some states, including Virginia, use a portion of their LIHEAP funds for weatherization). Finally, electric and natural gas utilities offer a variety of energy efficiency and bill assistance programs for low-income customers, often according to parameters set by state law.

In Virginia, participation in the Regional Greenhouse Gas Initiative (RGGI) has generated over $250 million in low-income energy efficiency funding since 2021, an amount that far exceeds the annual funding provided via the types of programs described above.

1.1. Energy Burden and Energy Insecurity

According to the U.S. Department of Energy (DOE) Office of Energy Efficiency & Renewable Energy's (EERE) Low-Income Energy Affordability Data (LEAD) tool, the average energy burden of low-income households in the U.S. (i.e., those with incomes of 0-80% of AMI) is 7%, compared to 2% for households with incomes above 80% AMI. Broken down into more detail, extremely-low-income households (0-30% AMI) have an average energy burden of 16%, compared to 6% for those in the 30-60% AMI range and 5% in the 60-80% range. In other words, average energy burdens are eight times higher for extremely-low-income households (0-30% AMI), compared to non-low-income households (80% AMI or above).[8]

The average energy burdens across these various income categories are nearly identical for Virginia households, albeit slightly higher (17%) for those in the lowest (0-30% AMI) income bracket. Defining income in a different way, the average energy burden for Virginia households with incomes below the federal poverty level (FPL) is 21%, compared to 18% nationwide. Virginia's average energy burdens are slightly above the national average (8% vs. 7%) for households with incomes between 100-200% of FPL.[9]

However, while low-income energy burdens in Virginia are comparable to the national average, more detailed analysis reveals substantial disparities within the state, with many areas experiencing average energy burdens that far exceed state or national rates. For example, a 2020 study by the American Council for an Energy Efficient Economy (ACEEE) found that 25% of low-income households in the Richmond metro region (defined as less than 200% of the FPL) have an energy burden greater than 15.6%.[10] Energy burden is even more prevalent in some rural parts of the state, as an analysis of LEAD data shows that average energy burdens for low-income households exceed 10% in much of Southwest

[8] U.S. DOE, EERE, 2022. Low-Income Energy Affordability Data Tool. Analysis by authors.

[9] U.S. DOE, EERE, 2022. Low-Income Energy Affordability Data Tool. Analysis by authors.

[10] Drehobl, et al., 2020. How High Are Household Energy Burdens? An Assessment of National and Metropolitan Energy Burden across the United States.

and Southside Virginia, reaching as high as 32% in some Census tracts.[11] These local energy burden trends within Virginia are examined in more detail in Section 3 of this report.

These discrepancies are not merely a function of income. According to data from the U.S. Energy Information Administration (EIA), low-income households spend an average of $1.23 per square foot for utilities, while non-low-income households spend $0.98 per square foot.[12] This can be attributed to housing discrimination and market pressures that push low-income people into older, less efficient housing.[13] In particular, older housing, especially in neighborhoods that have experienced historical disinvestment, tend to have poor insulation, an inefficient building envelope, outdated heating and/or cooling systems, and inefficient appliances, all leading to higher energy use.[14]

The disparity in housing conditions leads to higher rates of energy insecurity for low-income households. The characteristics of an energy insecure household can be divided into three categories - physical, economic, and "coping" or behavioral outcomes. Beyond the immediate economic barriers these trends create for vulnerable households, energy insecurity is also an important social determinant of health, as it can eventually lead to significant health issues and dangerous coping strategies.

For example, a low-income household is more likely to live in low-quality housing with older, energy inefficient appliances, which in turn have a higher energy consumption, higher maintenance costs, and increased risk of failure. In response, the household observes certain practices to reduce their use of energy – such as not using air conditioning, or using ovens and space heaters to heat their homes – leading to uncomfortable and potentially unsafe conditions. Besides the acute risks of fire, these strategies have been proven to disrupt sleep, cause stress, anxiety, and depression, increase risks of respiratory illness, and even increase the risk of death due to extreme heat, extreme cold, or carbon monoxide exposure. The elderly and children are most vulnerable to these impacts.[15, 16]

The U.S. Department of Energy's Residential Energy Consumption Survey (RECS) provides data on energy insecurity across different housing types and population demographics. The 2020 RECS data indicates that 27% of U.S. households reported having experienced at least one form of energy insecurity at some point, such as reducing food and/or medical expenditures in order to pay for energy costs, or leaving their homes at an unhealthy temperature. This includes 23% of households living in single-family homes, and 35% of those living in apartments, as well as 40% of renters and 37% of households with children under 18. The prevalence of these forms of energy insecurity varies greatly by income level and racial demographics, as indicated in Figure 1.[17]

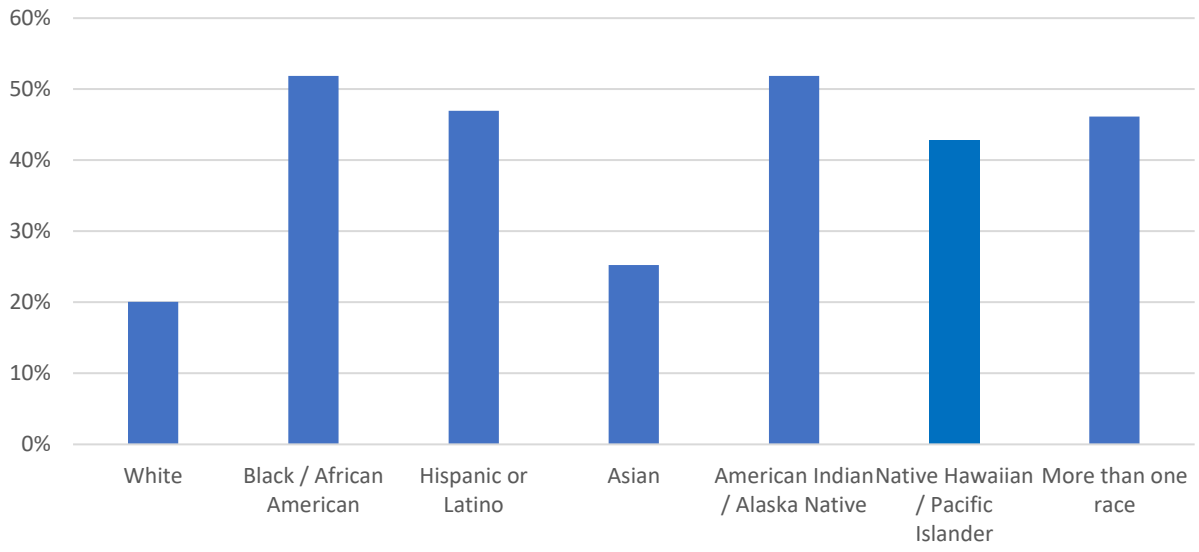
Energy insecurity also varies greatly by race, with about 20-25% of White and Asian households experiencing these impacts, versus 43-52% in all other racial categories, according to the RECS data.

Figure 2. Percentage of Households Experiencing Energy Insecurity, by Racial Category



Source: U.S. DOE, 2020. Residential Energy Consumption Survey. Table HC11.1. Additional analysis by authors.

1.2. Energy Efficiency Opportunities and Policies

An analysis of U.S. Department of Energy data by the American Council for an Energy Efficient Economy (ACEEE) suggests that energy efficiency can reduce residential energy consumption by 25-35% for all income groups. For low-income households, these energy consumption savings could reduce energy burdens by 25%.[18] Potential savings for Virginia households are even higher, as data from the National Renewable Energy Laboratory (NREL) shows that Virginia is one of six states in the highest range of potential low-income household electricity savings, at 29-32%.[19]

Energy efficiency is also a cost-effective option for reducing energy burdens. Cost-effectiveness can be understood as an investment in energy efficiency that produces cost savings – via lower energy bills – that offset the initial investment. Cost effectiveness can be measured in a variety of ways, most commonly through the Simple Payback Period (SPP), or the number of years it takes for energy bill savings to catch up with the initial up-front cost of the energy-efficiency investment. Another method is to calculate the Net Present Value (NPV) of an energy-efficiency investment, or the difference between the initial cost of an upgrade and the energy bill savings over a given period of time. For an energy-efficiency investment to be considered cost-effective, one would look for the SPP to be fewer years than the "life" of the efficiency upgrades, or an NPV greater than zero over that product lifespan.[20]

However, it must be noted that these traditional cost effectiveness metrics do not consider a variety of other important factors. Most notably, basic SPP and NPV calculations typically do not account for future price increases for the energy that is being saved (e.g., electricity is highly likely to cost more per kilowatt-hour in five or ten years than it does today). These metrics also do not recognize important co-benefits that come with an energy-efficiency investment. For example, reducing energy insecurity through energy efficiency can improve residents' health, as detailed in section 1.1. In addition to reducing medical bills, this can lead to fewer medical absences from work and/or school.[21]

Researchers from the National Renewable Energy Laboratory (NREL) have completed numerous studies on residential energy efficiency opportunities in the United States. One study from 2017 estimated that cost-effective energy efficiency retrofits (NPV > 0) to single-family detached homes in the U.S. could produce 4.2 quadrillion British Thermal Units (BTUs) of annual energy savings, equal to 24.4% of all primary energy consumption in those types of homes and 4.2% of all primary energy consumption nationwide.[22] State-level analysis found the potential energy savings in Virginia to be even greater, at approximately 30% of total primary energy consumption in single-family detached homes.[23]

[21] Wilson, et. al., 2019. Evaluating energy efficiency potential in low-income households: A flexible and granular approach. Energy Policy vol. 129, p. 710-737.

[22] Wilson, et al., 2017. Energy Efficiency Potential in the U.S. Single-Family Housing Stock.

[23] Wilson, et al., 2017. Energy Efficiency Potential in the U.S. Single-Family Housing Stock. See Table A-1, Figure A-2.

The economic benefits and potential savings are especially important for low-income households. In one study, researchers estimated that cost-effective energy efficiency upgrades (defined as an SPP of 13-19 years and NPV > 0) could result in a total potential energy cost savings of $13 billion per year for low-income households across the U.S., or $726 per year per household.[24]

A subsequent NREL study found that economically viable energy-efficiency upgrades to single-family detached homes in Virginia with incomes of less than 200% of the federal poverty level could reduce those customers' bills by $356 million. Among those with incomes of less than 80% of AMI, the total increases to $514 million in potential cost-effective energy efficiency savings.[25] Per the LEAD dataset, there are 375,604 single-family detached homes in Virginia with incomes below 200% of the federal poverty level, and 569,559 below 80% AMI.[26] Cross-referencing these figures generates a potential cost-effective per-household energy savings of $902.45 per year for households below 80% AMI, and $947.48 per year for households below 200% of the federal poverty level.

For multi-family housing, a 2016 study by Optimal Energy found that electricity savings of over 20% could be cost-effectively achieved for affordable multi-family housing units in Virginia, resulting in over $227 million in electricity cost savings, or $354 million after including natural gas and other fuels.[27]

However, while low-income energy efficiency has great technical potential, there are many barriers to low-income residents actually realizing those opportunities, most significantly the upfront cost of investing in energy-efficiency upgrades. One barrier is that many existing energy-efficiency programs are not specifically designed for low-income households. These "market-rate" programs, i.e. programs that provide a tax credit, rebate, or other economic incentive to offset the up-front cost of an energy efficiency upgrade, are generally inaccessible to non-low-income households, due to an inability to meet even those reduced upfront costs, and/or a lack of qualifying credit.[28]

These challenges are compounded for renter-occupied households, which represent an estimated 59% of all low-income households across the country. Owners and landlords do not have a financial incentive to pay for energy-efficiency improvements, which leaves the energy burden on the tenants.[29] This is known as the "split-incentive" problem, in that the residents of multifamily buildings or other rental housing units can benefit from energy-efficiency improvements to reduce their energy bills, but the owners of those units would not realize any economic benefit and therefore have no direct financial incentive to pay for those efficiency improvements.[30]

1.2.1 Federal Programs to Address Energy Burden and Increase Energy Efficiency

This section discusses the primary federal programs that support residential energy efficiency or can help to reduce energy burdens for low-income households. While a variety of tax credits and other programs exist to support market-rate energy-efficiency investments for the broader population, those are generally not accessible to low-income households for the reasons stated earlier in section 1.2.

One of the most significant sources of support for low-income residential energy efficiency is the U.S. Department of Energy's Weatherization Assistance Program (WAP). The WAP program was created in 1976 to provide upgrades to "weatherize" homes for households with incomes less than 200% of the federal poverty level.[31] These improvements, such as insulation and air sealing as well as updated appliances, also contribute to improving health and safety standards by reducing energy related hazards. The WAP program supports 8,500 jobs and provides weatherization services to approximately 35,000 homes across the U.S. yearly, with an average annual savings of $372 per household.[32]

The Low-Income Home Energy Assistance Program (LIHEAP) was formed in 1981 and provides federal assistance – passed through state, territorial, and tribal agencies – to reduce energy costs for low-income households.[33] This program primarily provides monetary relief to low-income households, in the form of heating, cooling, and emergency bill assistance, but states also have the flexibility to allocate up to 15% of their LIHEAP funds to energy conservation measures (often via the same agency that manages the WAP program).[34] From 2018-2022 Virginia received roughly $85-$95 million per year in LIHEAP funds, but this number is increasing to over $115 million in FY 2023 due to additional funding from the Infrastructure Investment and Jobs Act.[35] In FY 2022 Virginia spent 42% of its LIHEAP funds on heating assistance, 20% on cooling and crisis assistance, and 15% on weatherization. (Federal law allows states to spend up to 10% of LIHEAP funds on administration, and carry up to 10% to the next fiscal year).[36]

The Low-Income Housing Tax Credit (LIHTC) program was created by the Tax Reform Act of 1986, and allows state and local agencies to issue approximately $8 billion in tax credits for the acquisition, rehabilitation, or new construction of rental housing targeted to lower-income households.[37] State agencies receive a set amount of tax credits, based on population, which are then distributed according to the state's qualified allocation plan. These plans typically include criteria for energy efficiency and green building, to support sustainability and resilience for low-income families.[38] The Virginia Housing Development Authority (aka Virginia Housing) requires projects that receive LIHTC credits to achieve certain energy efficiency benchmarks,[39] as discussed in Section 1.4.1 of this report.

[39] Virginia Center for Housing Research, 2017. Sustaining Energy Efficiency: Longitudinal Evidence of Virginia's Low-Income Housing Tax Credit Properties.

In 2021 the U.S. Congress passed the Infrastructure Investment and Jobs Act, also known as the "Bipartisan Infrastructure Law" (BIL). The BIL is intended to support various aspects of American infrastructure, such as rebuilding roads, bridges, and rails, expanding access to clean drinking water, ensuring high-speed internet access, tackling the climate crisis, advancing environmental justice, and investing in communities.[40] The BIL also supports low-income residential energy efficiency by including $3.5 billion in additional WAP funds.[41] This will provide a one-time investment of $65.59 million for Virginia, on top of the state's regularly allocated WAP funding.[42] The BIL makes another $550 million available for energy efficiency and clean energy projects through the Energy Efficiency and Conservation Block Grant Program.[43] In recent years Virginia has used these block grant funds for projects such as audits and improvements to public buildings, energy efficiency training for localities,[44] and building energy code trainings,[45] none of which is specifically targeted to low-income households.

In 2022, Congress passed the Inflation Reduction Act (IRA),[46] which included billions of dollars in grant and loan programs, as well as a variety of new and modified tax incentives, to support investments in clean energy technology and address the climate change crisis. The IRA extends tax credits for residential energy efficiency projects with a total of $8.6 billion split between the Home Energy Performance-Based Whole-House Rebate program and the High-Efficiency Electricity Home Rebate Program.[47] However, these programs are generally not applicable to low-income households, as they still require some up-front investment in order to receive the applicable tax credits and rebates. Furthermore, low-income homeowners that do not have an income tax liability cannot access these credits.[48] There is a provision that allows local governments and non-profits to receive these tax credits in rebate form, but this option cannot be used by individual households.[49]

1.2.2 Virginia Energy Efficiency Programs

A variety of state, local and utility-sponsored energy-efficiency programs are available in Virginia, offering customers tax credits, subsidies, and rebates for installing and using energy-efficient appliances and products. These programs are available to the general public, and help to reduce energy use and carbon emissions, but without addressing energy burdens for low-income households. For example, the Virginia Department of Taxation created a financial incentive program for residential properties called

the Income Tax Reduction for Energy-Efficient Products program.[50] Taxpayers may deduct from their taxable personal income an amount equal to 20% of the sales taxes paid for certain equipment, capped at $500. Another state financial incentive is the Property Tax Assessment for Energy Efficient Buildings. This program allows local jurisdictions to assess the property taxes of energy efficient buildings at a reduced rate, by considering them as a separate class of property for local taxation purposes. Localities that have enacted this ordinance include Charlottesville and Virginia Beach.[51]

Another existing program is the State Energy Program (SEP). The SEP is a federal program that provides funding and technical assistance for states to administer energy efficiency and renewable energy programs.[52] From 2015 to the present, Virginia has received $9.4 million from SEP, for an average of $1.34 million/ year. Virginia uses these funds for a few programs, only one of which, the Commercial-Property Assessed Clean Energy (C-PACE) programs, can be accessed by residential property owners.[53] Virginia's C-PACE program can be used by owners of commercial and 5+-unit multi-family buildings to cover the up-front cost of energy efficiency and clean energy projects. The cost is then paid back through annual property tax increases. These programs are not currently available for homeowners, and there are no income eligibility requirements.[54] While C-PACE programs have been enabled in 18 Virginia localities,[55] it has not been widely used, and has mostly remained within the commercial sector.[56]

Before the Virginia Clean Economy Act (VCEA) was passed in 2020, utility companies had some limited energy efficiency programs for low-income customers. For example, Dominion Energy has run its EnergyShare program for 40 years, which currently provides about $6.5 million per year in bill assistance and $6 million in weatherization for vulnerable customers.[57] Appalachian Power Company (APCO) launched a low-income weatherization program in 2014 that supplemented existing state and federal weatherization programs,[58] for which they were able to recover the costs through their base rate.[59]

Some of Virginia's natural gas utilities also offer small low-income energy efficiency programs. For example, Washington Gas and Columbia Gas of Virginia both operate programs in partnership with Community Housing Partners, which together offer about $1.5 million in upgrades per year.[60]

[60] Community Housing Partners, 2023. Personal communication from Chase Counts, Senior Director of Operations, Energy Solutions. (January 12, 2023).

In 2018, the passage of the Grid Transformation and Security Act (GTSA) required the state's two primary investor-owned electric utilities propose just over $1 billion in customer energy efficiency programs over the next decade – $870 million for Dominion and $140 million for APCO – including any previously approved energy efficiency programs existing at the time. It did not include specific energy savings goals or require the State Corporation Commission (SCC) to approve the proposed programs.[61]

In 2020, the Virginia Clean Economy Act (VCEA) was signed into law. This legislation is designed to create a 100% carbon-free electricity grid and end in-state fossil fuel generation in Virginia by the year 2050, in addition to creating thousands of new instate jobs in renewable energy and keeping bills low with ratepayer protections and energy efficiency investments.[62] The VCEA includes a specific program that caps monthly bills for low-income Virginians to help alleviate the energy burden of rising costs.[63]

The passage of the VCEA also set mandatory Energy Efficiency Resource Standards for investor-owned electric utilities, which must be met through energy efficiency programs for customers. These standards set a mandatory target of 5% energy reduction for Dominion by 2025, while APCO's reduction target is 2%. After 2025, the SCC is directed to set these targets every three years. They are enforceable because approval of new fossil fuel plants is contingent on evidence of reaching these targets. Dominion and APCO are able to recover the cost of energy efficiency programs though their customers.

The VCEA also increased the percentage of the utilities required energy efficiency spending that must go to LMI households from 5 to 15%.[64] As noted above, the GTSA required the state's investor-owned utilities to spend a combined $1.01 Billion over 10 years, thus about $15 million per year must go to LMI programs. According to the SCC's annual report on energy efficiency programs pursuant to the VCEA, Dominion's Income and Age Qualifying Home Improvement program will spend around $27 million over seven years. They report that this will result in 9,588 Megawatt-hours (MWh) of annual electricity savings. This same report indicates that APCo's low-income single and multi-family programs will result in a net electricity savings of 1,460 MWh per year.[65]

In 2020, the Virginia General Assembly passed the Clean Energy and Community Flood Preparedness Act (HB 981 / SB 1027), which directed the Department of Environmental Quality to develop regulations for entering Virginia into the Regional Greenhouse Gas Initiative (RGGI). The legislation requires that 50% of Virginia's revenue from RGGI "shall be credited to an account administered by [the Department of Housing and Community Development (DHCD)] to support low-income energy efficiency programs," while 45% shall be used for "assisting localities and their residents affected by recurrent flooding, sea level rise, and flooding from severe weather events," with the last 5% going to administrative costs.[66]

2. The Regional Greenhouse Gas Initiative (RGGI) and Energy Efficiency for Virginia

The Regional Greenhouse Gas Initiative (RGGI) is an agreement between eleven eastern U.S. states to lower greenhouse gas emissions from power plants by establishing a regional cap on carbon dioxide (CO_2) emissions. To enforce the cap, power plants in participating states must purchase allowances to cover their carbon emissions. Each allowance permits the emission of 1 short ton of CO_2. Participating states receive a set number of allowances based on their share of regional emissions, with the total cap going down each year. Participating states sell CO_2 allowances quarterly at auctions, organized and regulated by RGGI member states and an independent market monitor. To ensure stability in the market for allowances, there is a minimum reserve price, as well as minimum and maximum prices that will trigger either the removal of allowances or the release of reserve allowances.[67]

So far, Virginia has brought in $524 million in revenue from eight quarterly RGGI auctions, which would have translated into $262 million in low-income energy-efficiency funding via the DHCD's Housing Innovations in Energy Efficiency program (HIEE).[68] However, in 2022 the General Assembly diverted $11.4 million from HIEE to support the town of Hurley, VA, which had experienced a major flooding event in 2021.[69] This results in a final total of $252 million allocated to the HIEE program thus far, as shown in Table 1 and Figure 3 below.

Table 1. RGGI Revenue and HIEE Allocations for FYs '21-23

Fiscal Year	Auctions	RGGI Revenue ($Millions)	HIEE Allocation ($Millions) [a]
2021	51	$43.59	$21.79
2022[b]	52, 53, 54, 55	$258.27	$117.73[c]
2023	56, 57, 58	$224.6	$112.3
Totals		$526.5	$251.8

Source: RGGI, 2022. Cumulative Allowances and Proceeds-Virginia. Additional calculations by authors.

a. HIEE *revenue is equal to half of the total RGGI auction results for Virginia for each fiscal year*

b. While Auction 52 took place in June 2021 (i.e., FY '21) and Auction 56 occurred June 2022 (FY '22), the resulting funds were allocated to the DHCD FY '22 and FY '23 budgets, respectively.[70, 71]

c. The total shown here for the FY 2022 HIEE allocation includes 50% of that year's RGGI revenue ($129.1 million), minus the $11.4 million diverted to the Hurley Flood Relief fund.

Source: RGGI, 2022. Cumulative Allowances and Proceeds-Virginia. Additional calculations by authors.

2.1. The Housing Innovations in Energy Efficiency (HIEE) Program

Upon passage of the Clean Energy and Community Flood Preparedness Act, the DHCD formed the HIEE program as the entity to manage and distribute the low-income energy efficiency funds generated by Virginia's participation in the RGGI program. The DHCD formed a 15-member Stakeholder Advisory Group, comprised of "advocacy groups, affordable housing developers, housing development authorities, weatherization agencies and building energy consultants" to provide expertise on the affordable housing market, "achieve broad agreement on key program components," and help the agency "connect with community and thought leaders on strategic investments of Regional Greenhouse Gas Initiative (RGGI) funds.[72]

A presentation from the first stakeholder meeting listed the following objectives for the RGGI funds:

- Deep energy retrofits (exceeding energy code requirements) that complement existing affordable housing construction and rehabilitation incentives, to ensure lowest income population benefits from long-term cost savings;
- Incorporate innovative approaches that will overcome traditional barriers to building and retrofitting affordable housing at scale;

[72] Virginia DHCD, 2020. Housing Innovations in Energy Efficiency (HIEE) Program: First Stakeholder Advisory Group and Public Meeting (presentation slides).

- Prioritize long-term sustainability / durability and occupant health (e.g. preventing moisture issues, improving ventilation) along with energy efficiency upgrades[73]

The HIEE Stakeholder Advisory Group met at least nine times between Dec. 2020 and Dec. 2021. By the fourth meeting, in Feb. 2021, the DHCD had decided to divide the HIEE funds across the Affordable and Special Needs Housing (ASNH), Weatherization Deferral Repair (WDR), and Housing Innovations Partnership (HIP) grants programs, according to the percentages indicated in Table 2.

Table 2. RGGI Revenue and HIEE Allocations for FYs '21-23

Fiscal Year	ASNH	WDR	HIP
FY '21	40%	60%	0%
FY '22	60%	30%	10%

Source: Virginia Department of Housing and Community Development, 2021. Housing Innovations in Energy Efficiency (HIEE) Program: Fourth Stakeholder Advisory Group and Public Meeting (presentation slides).

The RGGI auctions have generated over $250 million in funding for HIEE, as shown in Table 1, approximately $117 million of which has been spent or committed to energy efficiency projects thus far:

- In July, 2021, the DHCD announced the release of over $21 million in ASNH funds (from various sources) to support 24 low-income multi-family housing projects across Virginia. This included $6.2 million in HIEE funds, which was divided among 11 projects with a total of 707 units.[74]
- In January, 2022, the DHCD announced the release of an additional $60 million in ASNH funds. This included $22.96 million from HIEE, divided among 25 projects with a total of 1,682 units.[75]
- In an October 2022 webinar, DHCD staff stated that approximately $80 million in HIEE funding would be available for Affordable and Special Needs Housing projects (ASNH) during FY '23.[76]
- According to a December, 2022 update from DHCD, the WDR program has committed $7.92 million thus-far, including funds spent and the estimated costs of pre-approved projects. The current total of 558 projects (306 completed, and 252 pre-approved) includes 544 single family projects and 507 multi-family units across 14 projects, for a total of 1,051 units.[77]
- No HIEE funds appear have been spent to-date via the HIP program.

2.2. The Affordable and Special Needs Housing (ASNH) Program

The ASNH program combines funds from a variety of sources, including HIEE, to "expand the supply of decent, safe, sanitary, and affordable housing available to low-income, very low-income, and extremely-low income Virginians." Eligible projects fall into one of three categories – new construction, substantial rehabilitation, or adaptive reuse – and must include a minimum of five units of housing. The HIEE funding dedicated to the ASNH program is intended to "assist affordable housing project development teams in completing energy efficiency upgrades that would not have been feasible otherwise," and which meet certain energy performance requirements indicated in Table 3 below. Additional HIEE energy efficiency requirements include green building certification, fresh air ventilation, dehumidification, and duct leakage testing and sealing, among others stipulations.[78]

Table 3. Energy Efficiency Requirements for HIEE Funds Included in ASNH Program

Project Type	VA Housing LIHTC Requirement	HIEE Requirement
New Construction	ENERGY STAR v3.0	Zero Energy Ready Homes (ZERH)
Substantial Rehab	30% improvement in HERS index [a] or HERS index 80 (or below)	40% improvement in HERS index or avg. of HERS 70 (or below) across all units
Adaptive Reuse	HERS index 95 (or below)	Average HERS index of 80 or below across all units

Source: Virginia Department of Housing and Community Development, 2021. Housing Innovations in Energy Efficiency (HIEE) Program: Seventh Stakeholder Advisory Group and Public Meeting (presentation slides.

a. The Home Energy Rating System (HERS) Index is a standard metric for home energy efficiency. A score of 100 represents baseline standard energy efficiency for a given unit type, and lower scores represent increasing efficiency. A HERS index 80 indicates that a housing unit is 20% more efficient than the baseline reference unit.[79]

Individual ANSH projects that meet the HIEE performance requirements are eligible for HIEE awards of up to $2 million, or 10% of the total project construction costs, whichever is less.[80] To avoid confusion, the HIEE funds dedicated to the ASNH program are hereafter referred to as "ASNH-Energy Efficiency" funds (ASNH-EE) in this report. As indicated above, the DHCD has announced over $29 million in ASNH-EE funds, supporting 2,389 total units,[81, 82] with an additional $80 million available for FY '23.[83]

2.3. The Weatherization Assistance (WAP) and Weatherization Deferral Repair (WDR) Programs

The WDR program is funded exclusively by HIEE, and supports repairs to housing units (single-family homes or multi-family buildings) that are in such poor condition as to have been deemed unsuitable for weatherization, and have thus been "deferred" from the U.S. federal government's Weatherization Assistance Program (WAP).[84] In Virginia, DHCD administers this program in partnership with WAP providers throughout the state. Virginia receives funds from WAP each year to realize specific weatherization projects through the state's weatherization providers.

Nationally, about 1 in 5 households that apply for the WAP program have to be rejected because the homes are in such poor condition that they are not deemed eligible for weatherization. In Virginia, weatherization providers had to defer services to 525 out of 2,901 applicants (25%) in 2018. As the weatherization program grows, the anticipated number of deferrals in Virginia increases to 1,500 per year.[85] The WDR program bridges this gap by investing in repairs needed to bring otherwise ineligible households out of deferral.[86]

A review of the annual "State Plans" that DHCD submits to the U.S. Department of Energy indicates that Virginia received approximately $22.62 million in WAP funding from 20018-2022, of which $15.61 million was spent on program operations (i.e., spent directly on weatherization projects). This resulted in the weatherization of over 2,300 homes (average of around $6,700 per unit), as shown in Table 4 (note that these plans do not distinguish between single-family and multi-family units).[87]

A report from the U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy provides slightly different numbers for weatherization in Virginia. According to that data, the state received $36.4 million in WAP funding from 2015-2022, and has weatherized 6,628 homes in that time period (an average of 828.5 homes per year at less than $5,500 per unit). The same source also indicates that Virginia weatherized an average of 707 homes per year from 2010-2021.[88]

Table 4. Annual WAP Allocations for Virginia Weatherization Projects

Calendar Year	Total WAP Funding ($Millions)	Program Operations ($Millions)	Total Dwelling Units Weatherized	Average Cost per Dwelling Unit [a]
2018	$3.14 [b]	$2.34	325	$7,212
2019	$4.74	$2.84	377	$7,526
2020	$6.28	$3.69	490	$7,531
2021	$6.44	$3.85	649	$5,938
2022[c]	$5.16	$2.89	488	$5,932
Totals	$22.62	$15.61	2,329	$6,702

Source: Virginia Department of Housing and Community Development, 2022. Weatherization Assistance Program (WAP). *Data pulled from links for DOE State Plans, 2018-2022.*

[a] *Totals in this column do not exactly match results from dividing Program Operations / Total Dwelling Units Weatherized columns, due to rounding of Program Operations totals.*

[b] *The 2018 plan only included funding totals for subgrantee awards. All other years also included overhead totals.*

[c] *The 2022 DOE State Plan is still listed as a "draft" on DHCD's website as of 12/12/22.*

The passage of the federal Infrastructure Investment and Jobs Act (H.R.3684) in November 2021, commonly known as the Bipartisan Infrastructure Law (BIL), includes $3.5 billion for the WAP program. This will provide $65.59 million for Virginia WAP,[89] which is in addition to the regular WAP annual grants and is available until expended.[90] The DHCD's draft application for these funds indicates that $38.5 million of those funds would go to program operations, resulting in the weatherization of 4,808 units of housing at an average of around $8,000 per unit weatherized.[91]

Assuming that Virginia's regular annual WAP awards continue to fund about 465 units per year (the average from 2018-2022 per Table 4), that would add up to about 3,720 units weatherized from 2023 through 2030. If the additional BIL funds were distributed over that same period of time, those projected additional 4,808 units would bring the total to over 8,500 units, or about 1,065 per year.

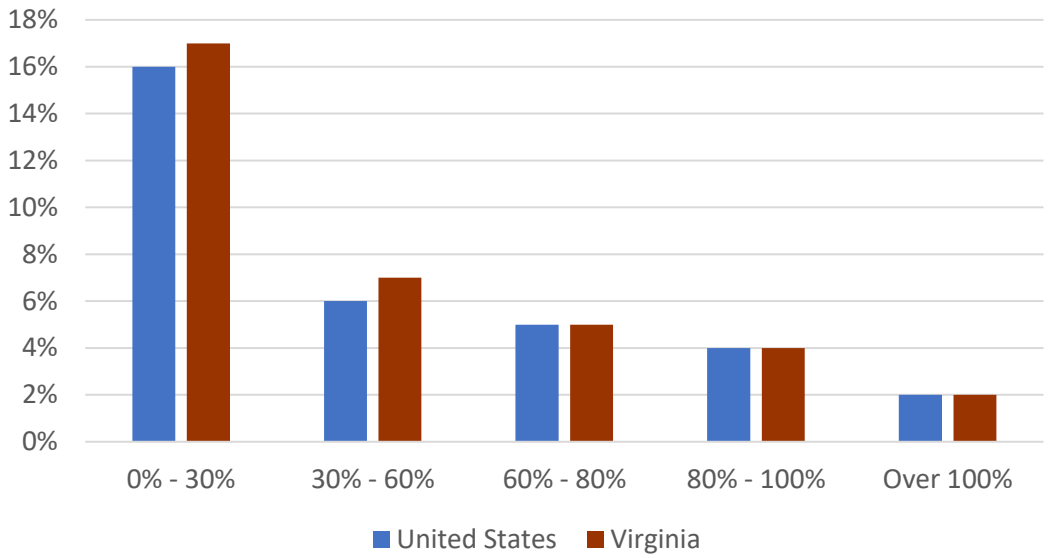
3. Analysis of Energy Burden in Virginia

As discussed earlier in this report, the U.S. Department of Energy's (DOE) Low-Income Energy Affordability Data (LEAD) Tool demonstrates how low-income households spend significantly greater percentages of their income on household energy costs (heating, cooling, etc.). This is particularly true of extremely-low-income households, i.e., those household incomes between 0-30% of the Area Median Income (AMI), whose average energy burden of 16% is eight times higher than that of households with an income above 80% AMI. Average energy burdens for Virginia households generally match those national averages across AMI income groups, as shown in Figure 4 below.[92]

Figure 4. Average Energy Burden by Household Income, Virginia vs. United States



Source: U.S. DOE, EERE, 2022. Low-Income Energy Affordability Data Tool. Analysis by authors.

Using the Federal Poverty Level (FPL) as the income metric, rather than AMI, produces somewhat different results. The FPL is a standardized metric that applies equally across the contiguous United States, based on family size (e.g., $27,750 for a family of four).[93] The AMI is calculated at the regional level, and can vary widely. In Virginia, the 30% AMI threshold for a family of 4 is $42,700 in the Washington-Arlington-Alexandria region, but is less than half of that amount in many other regions of the state (e.g., $21,350 in King and Queen County).[94]

The average energy burden for Virginia households with incomes below the FPL is 21%, compared to 18% nationwide. Virginia's average energy burdens are also slightly above the national average (8% vs. 7%) for households with incomes between 100-200% of FPL.[95]

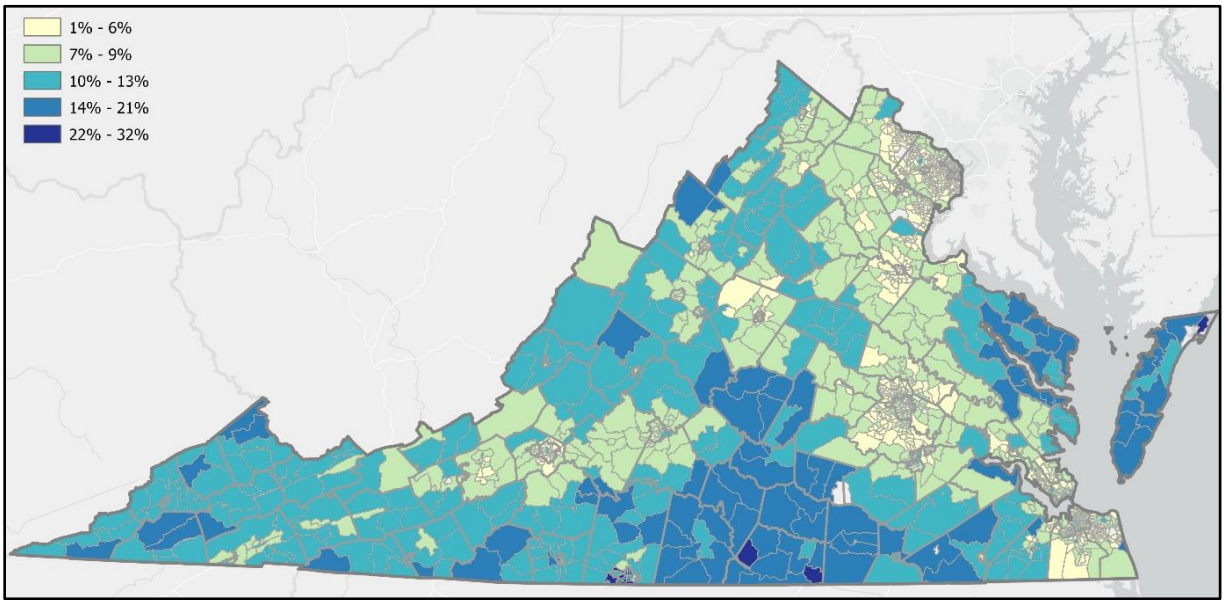
3.1. Regional Comparison of Average Low-Income Energy Burdens Across Virginia

Comparing Virginia's energy burdens to the national average obscures the substantial disparities that exist within the state. To evaluate these regional disparities, we conducted additional analysis using raw data from the LEAD tool, which incorporates the US Census Bureau's 2018 American Community Survey (ACS) Public Use Microdata Samples (PUMS),[96] and the US Census TIGER/Line Geodatabases.[97] More details on these data sources and our methodology can be found in Appendix A.

Through this process we calculated the average energy burden for low-income households (incomes below 80% AMI), for every Census tract in Virginia, as shown in Map 1 below. Hereafter we refer to the average energy burden for low-income households in a given Census tract using the acronym AEB-LI.

Map 1. Average Energy Burden of Low-Income Households by Census Tract (2018)



Source: Low-Income Energy Affordability Data (LEAD), US Department of Energy

Map 1 demonstrates that low-income households face High (above 6%) to Severe (above 10%) average energy burdens throughout much of the state. Every Census Tract shaded in any color but light yellow has an AEB-LI of at least 7%. Much of the state's rural areas have an AEB-LI of 10% and above, including nearly all of Southwest Virginia, Southside Virginia, the Northern Neck, and the Eastern Shore.

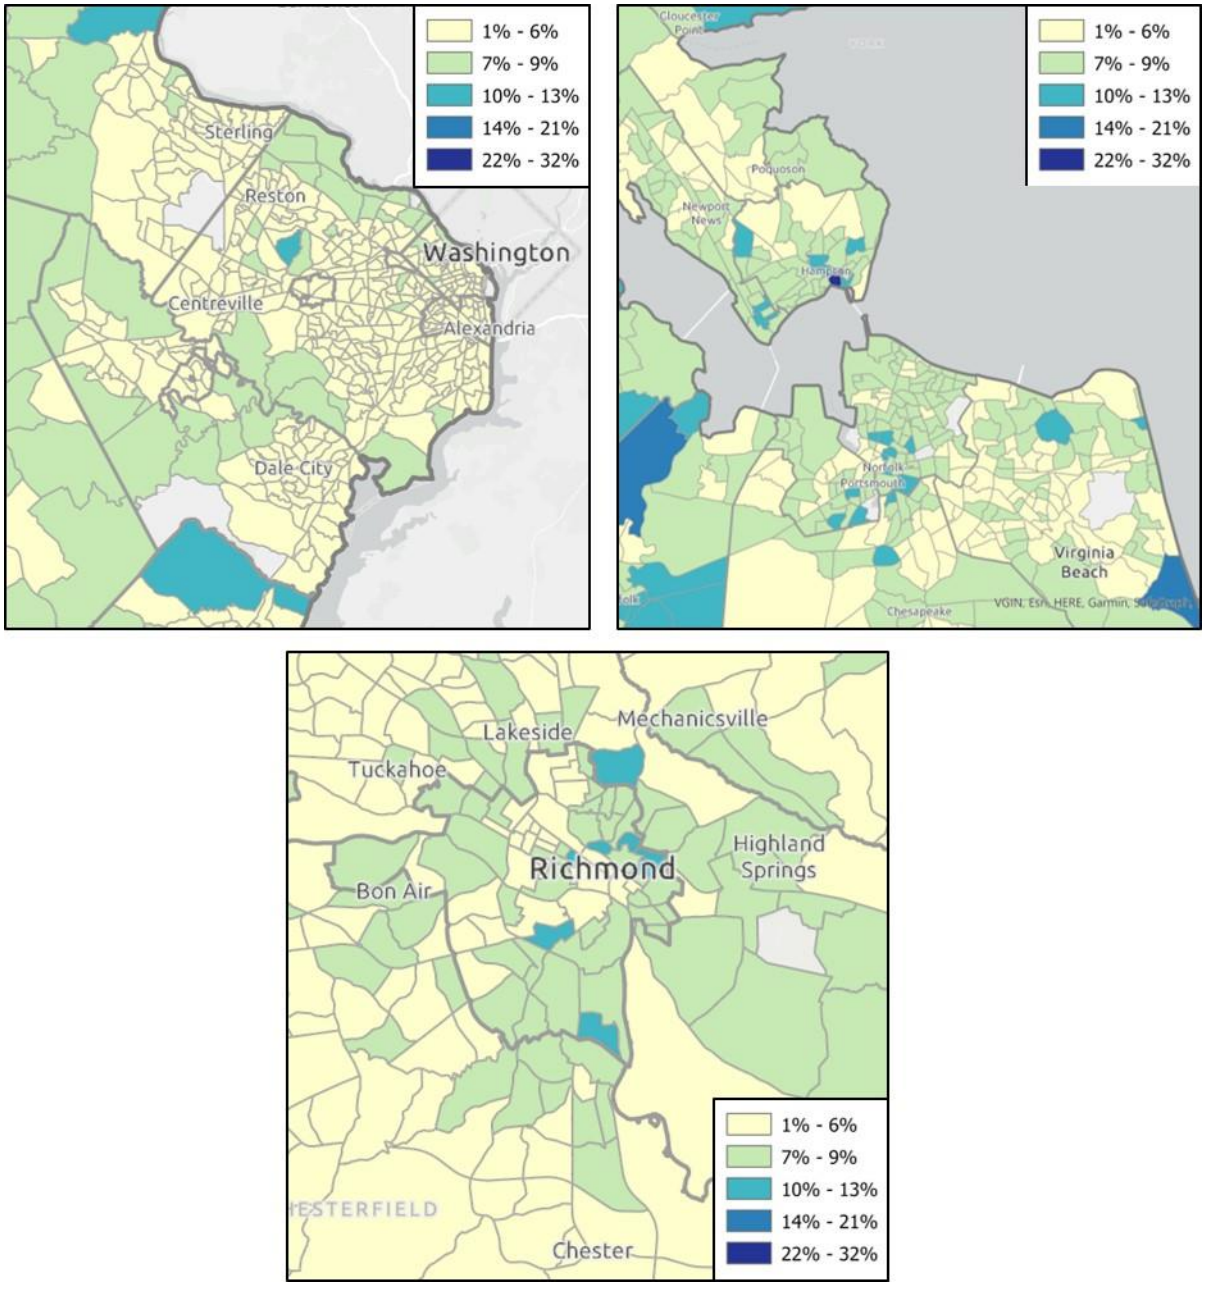
A detailed look at the LEAD data demonstrates that there are 76 Census Tracts in Virginia with an AEB-LI of at least 15%, more than twice the national average of 7% for households in that same income bracket. Of those, twelve are located in the Danville area. The other localities with at least six such Census Tracts are Mecklenburg County (8), Halifax County (7), and Accomack County (6). There are also 15 Census Tracts in Virginia that have an AEB-LI above 22%. This is over three times the national average energy burden for households in that same income bracket. (See detailed list in Appendix B).

[96] U.S. Census Bureau, 2022. Public Use Microdata Sample (PUMS).

[97] U.S. Census Bureau, 2022. TIGER/Line Geodatabases.

Map 1 suggests that AEB-LI percentages are relatively low in the state's metropolitan regions, compared to many rural areas. While this is generally accurate, Map 1.A shows that zooming into those regions reveals pockets of higher AEB-LI throughout each of those regions, particularly in parts of Hampton, Newport News, Norfolk, Portsmouth, and Richmond.

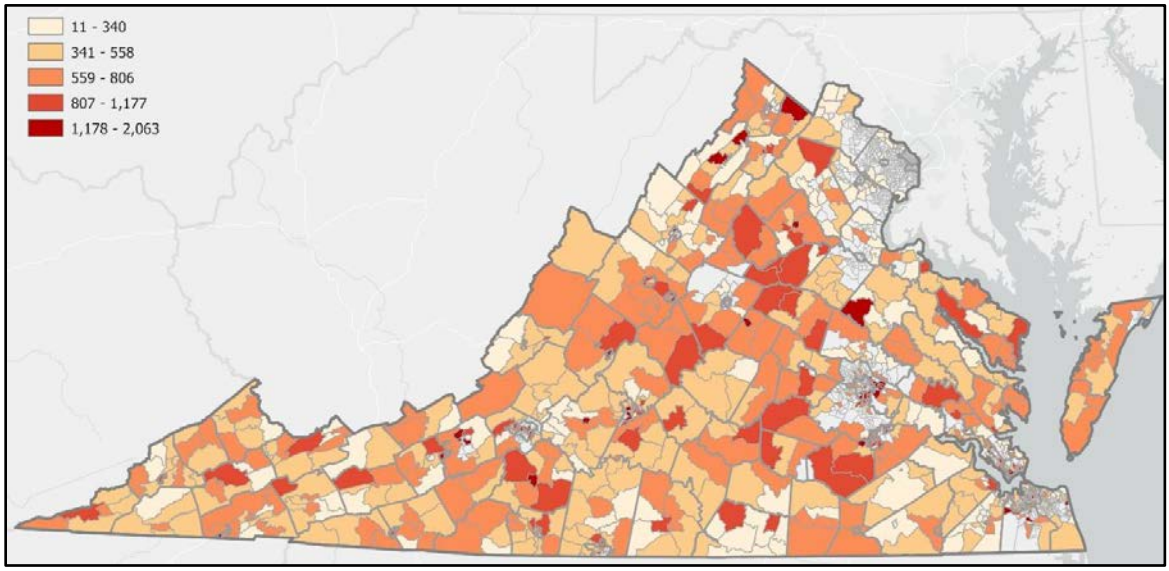
Map 1.A. Average Energy Burden of Low-Income Households (2018) – Metro Regions



We then identified the Census tracts in which the AEB-LI is above 6%, and those above 10%, to reflect the standard definitions of "High" energy burden and "Severe" energy burden, respectively. Within these AEB-LI High energy burden and AEB-LI Severe energy burden Census tracts we then calculated the total housing units, single-family homes (SFH) and multi-family housing units (MFH).

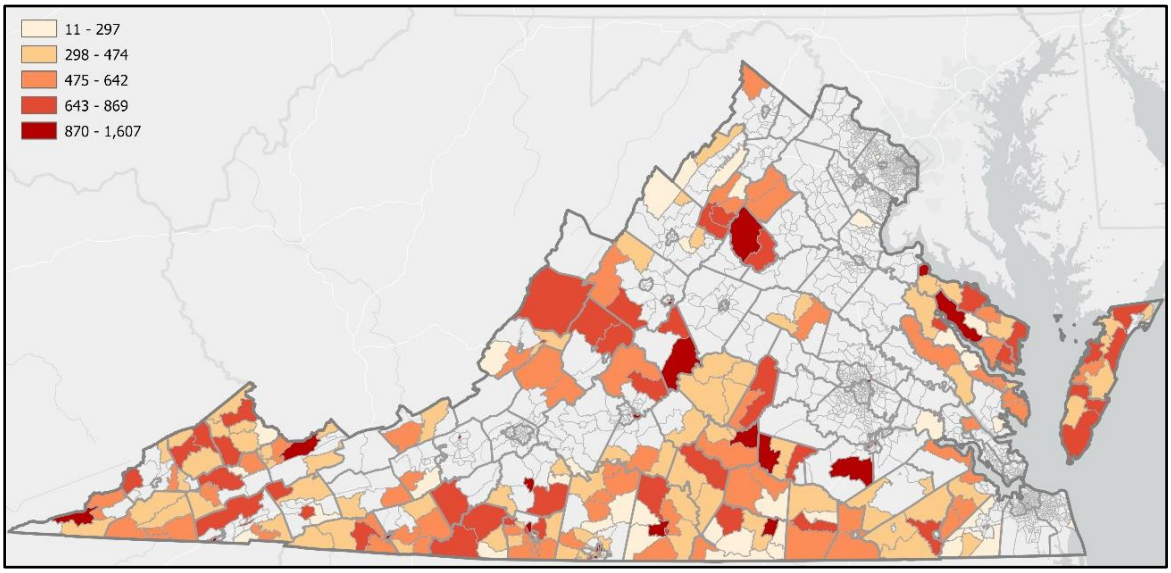
Maps 2 and 3 below show the number of housing units within Virginia Census tracts that have High or Severe average energy burdens, respectively, among their low-income households (0 - 80% AMI). Similar maps focused on single-family homes and multi-family units can be found in Appendix C.

Map 2. Housing Units in Census Tracts with High Low-Income Energy Burden (2018)



Source: Low-Income Energy Affordability Data (LEAD), US Department of Energy

Map 3. Housing Units in Census Tracts with Severe Low-Income Energy Burden (2018)

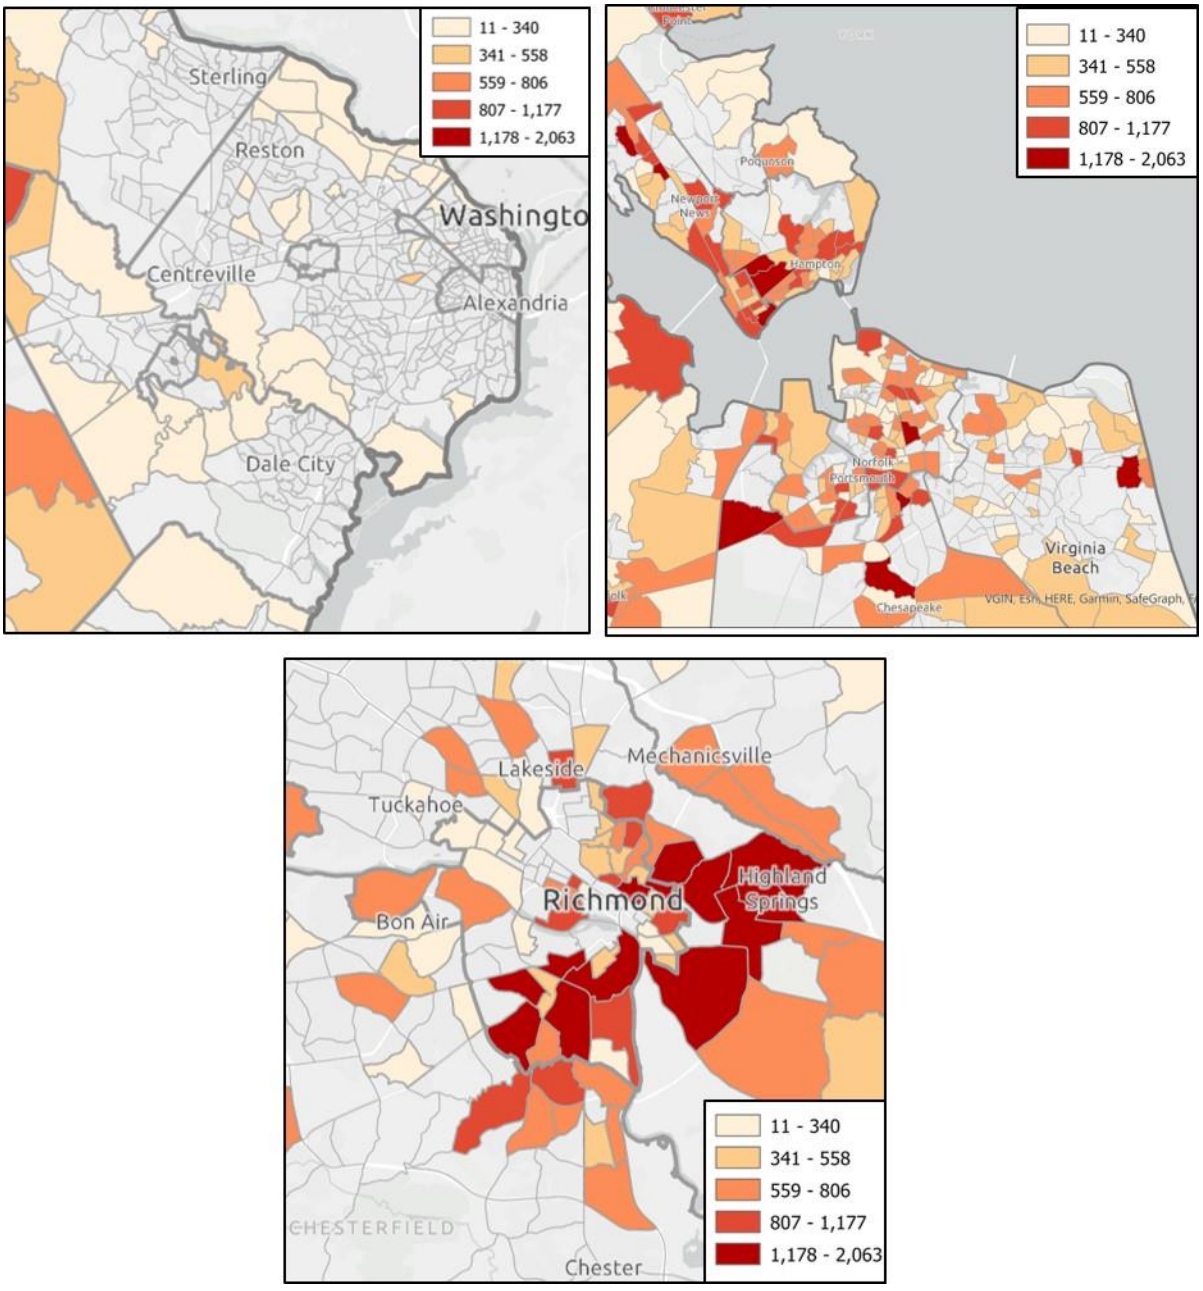


Source: Low-Income Energy Affordability Data (LEAD), US Department of Energy

Maps 2 and 3 demonstrate concentrations of High AEB-LI housing units in many rural areas of Virginia, similar to Map 1, along with pockets of Severe AEB-LI throughout much of the state. Many of these Severe AEB-LI tracts are found in SW Virginia, Southside Virginia, the Northern Neck, and the Eastern Shore, again consistent with Map 1. Map 2 also shows concentrations of households in High AEB-LI Census Tracts in some exurban areas outside of the Northern Virginia and Richmond metro regions.

Maps 2.A and 3.A identify housing units in High and Severe AEB-LI areas of the state's metro regions.

Map 2.A. Housing Units in Tracts with High Low-Income Energy Burden – Urban Regions

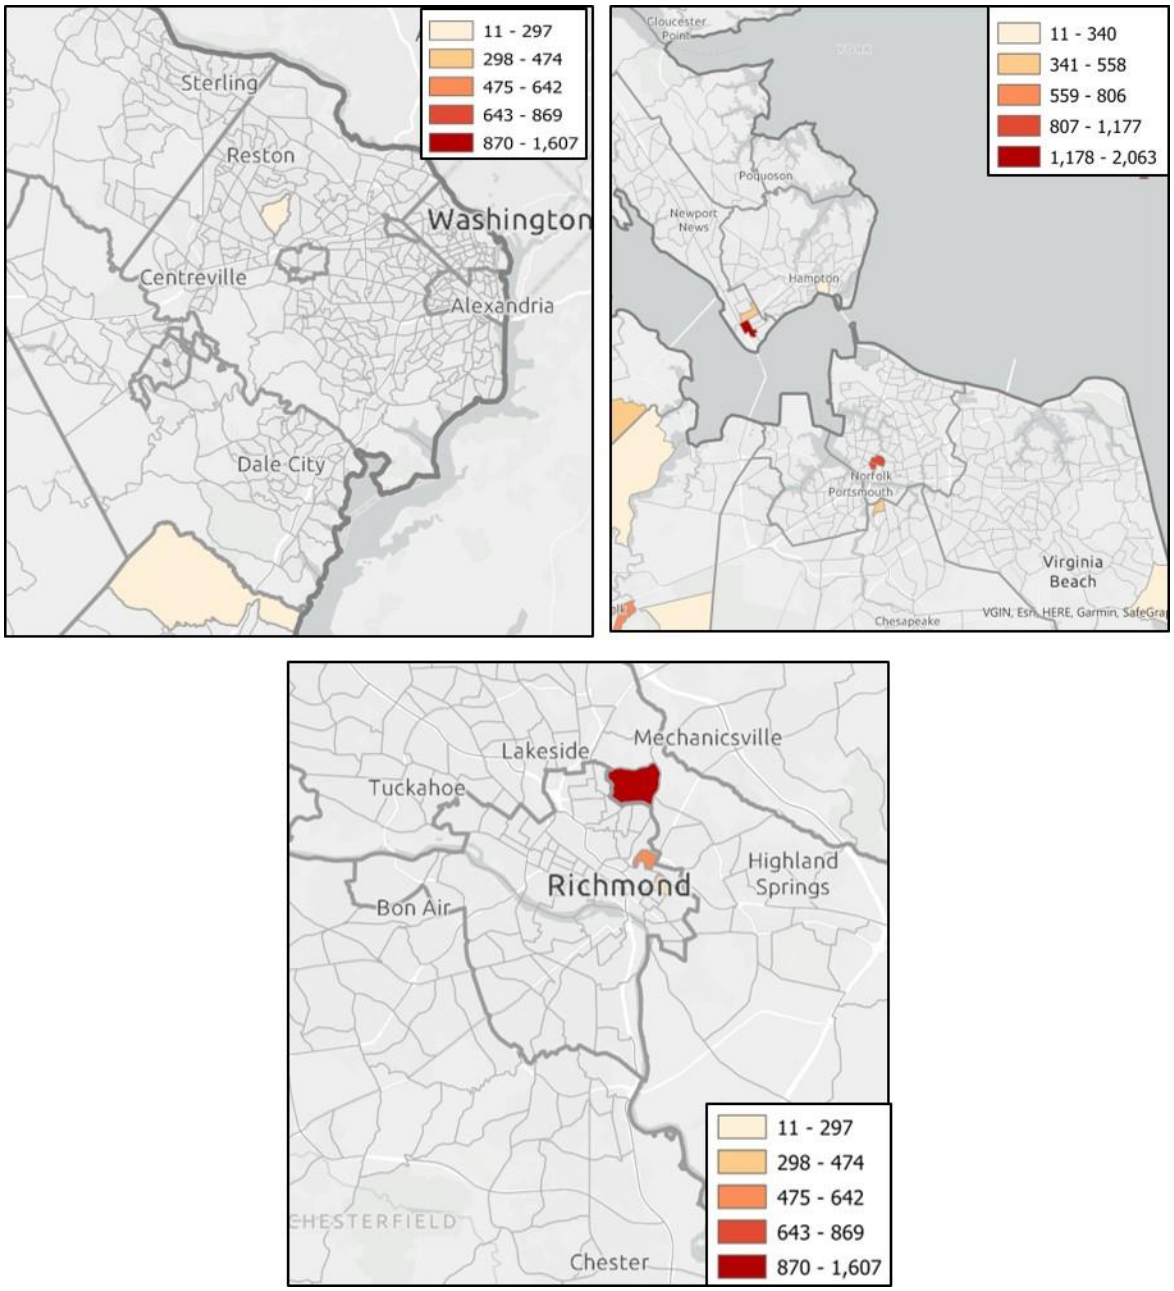


Map 2.A. shows significant concentrations of housing units in High AEB-LI Census Tracts in both the Hampton Roads and Richmond regions, but very little in the Northern Virginia region. In Hampton Roads

this includes large parts of the cities of Hampton, Newport News, Norfolk, and Portsmouth, among other parts of the region. In the Richmond area this includes much of the city's Southside, Northside, and East End areas, as well as portions of eastern Henrico County and northern Chesterfield County.

While the urbanized portions of the Hampton Roads and Richmond regions have large areas with High AEB-LI, Map 3.A. shows that very few of the Census Tracts in those regions have Severe AEB-LI.

Map 3.A. Housing Units in Tracts with Severe Low-Income Energy Burden (2018)



3.2. Discussion of Low-Income Energy Burden Findings

The housing data represented in Maps 2 and 3 shows that there are approximately 579,000 households in Virginia that have low-incomes (below 80% AMI) and are located in Census tracts with a High average low-income energy burden (above 6%). This includes roughly 436,000 single-family units and 143,000 multi-family units. Of these, about 154,000 total low-income housing households are located in Census tracts with a Severe average low-income energy burden (above 10%). This includes about 129,000 single-family units and 25,000 multi-family units. (Please note that the single-family plus multi-family units do not add up to the exact total units, due to rounding within the underlying data). For comparison, Census data estimates that there are about 3.25 million households in Virginia as of 2019.[98]

It is important to clarify that the household totals in the preceding paragraph do not represent an estimate of the total households that are actually both low-income and High or Severe energy burdened. Rather, they are low-income households located in Census tracts for which the average low-income energy burden is High or Severe. There are certainly some low-income households in those High or Severe AEB-LI tracts that do not have high energy burdens, just as there are likely many low-income households that do have High energy burdens but are located in tracts where the AEB-LI is not so high.

A closer examination of the 76 tracts with an AEB-LI of at least 15%, shown below in Map 4, indicates that about 10 of them have extreme concentrations of poverty, with anywhere from 48% to 94% of households below 80% AMI. However, the majority do not have extraordinary concentrations of low-income households. In fact, the average percent of households with incomes below 80% AMI in these 76 Census Tracts, 34.2%, is just a shade above the average of 32.9% for all Census Tracts in Virginia. Rather, the common thread among these Census Tracts with an AEB-LI of at least 15% is that almost all of them have an average annual energy cost (AAEC) that is much higher than the statewide average of $2,343. In fact, the average AAEC for those tracts ($3,717) is nearly 60% higher than the statewide average. In 14 of those Census Tracts the AAEC is more than double the statewide average, and in most of those the average energy burden is above 10% for all households. This suggests the opportunity to significantly reduce energy burdens in those areas through investments in low-income energy efficiency.

Map 4. Census Tracts with Average Low-Income Energy Burden above 15%

4. Modeling Virginia's Future RGGI Income and Energy Efficiency Benefits

4.1. Understanding RGGI Policies and Trends

This section describes our methodology and assumptions for predicting future RGGI revenue for Virginia. As discussed in Section 1.3, participating states receive a set number of "allowances" based on their share of a regional emissions cap that goes down each year. Power plants in participating states must purchase these allowances at quarterly auctions, with each allowance permitting the emission of one short ton of CO_2.

The program includes three "auction mechanisms" that collectively ensure stability in the allowance market. The Minimum Reserve Price is the minimum price that allowances can be sold for at a RGGI auction. The Cost Containment Reserve (CCR) and Emissions Containment Reserve (ECR) are reserves of allowances that help provide market stability if the cost of reducing emissions is higher or lower than expected. The CCR allowances are made available for sale at an auction if the allowance price would otherwise exceed a set trigger price. Conversely, ECR allowances are withheld from sale at an auction, if the price would otherwise fall below a set trigger price.[99]

Virginia's base budget allowance began at 27,160,000 in 2021 and reduces by 840,000 per year, down to 19,600,000 in 2021.[100] However, RGGI announced in 2021 that there would be an "adjustment for banked allowances," which would adjust each state's allowances over the coming five years in order to account for an excess of allowances that had been privately banked from 2009-2020. The effect of this adjustment is a reduction of Virginia's allowances by 4,329,155 per year from 2021-2025.[101]

The ECR trigger prices, set by RGGI program operators, began at $6.00 when Virginia entered the market in 2021. They will increase by 7% per year, reaching $11.02 in 2030.[102] The CCR trigger prices began at $13.00 and will also increase by 7% per year, to $23.89 in 2030.[103] Over the eight auctions since Virginia joined RGGI, the auction clearing price has remained between the ECR and CCR trigger prices, with one exception. In late 2021, the auction price surged from $9.30 in the September auction to the CCR trigger price of $13.00 in the December auction, resulting in the release of 3.9 million allowances from the Cost Containment Reserve, including 888,829 for Virginia. Subsequent prices have remained close, but have not met, the 2022 CCR trigger price of $13.91, closing at $12.99 in the December 2022 auction.[104]

This information is summarized in Table 5, which identifies Virginia's base budget allowances, adjustments, resulting actual allowances, and the identified ECR and CCR trigger prices for each year from 2021-2030. The "net adjustments" column includes the aforementioned adjustment for banked allowances, which reduces Virginia's total by 4,329,155 per year from 2021-2025, as well as the additional 888,829 in allowances added to Virginia's total from the Cost Containment Reserve in 2021.

Table 5. Adjusted Virginia RGGI Allowance Totals and Price Trigger Points, 2021-2030

Year	Base Budget Allowances	Net Adjustments	Actual Allowances	ECR Trigger Price	CCR Trigger Price
2021	27,160,000	-3,440,326	23,719,674	$6.00	$13.00
2022	26,320,000	-4,329,155	21,990,845	$6.42	$13.91
2023	25,480,000	-4,329,155	21,150,845	$6.87	$14.88
2024	24,640,000	-4,329,155	20,310,845	$7.35	$15.92
2025	23,800,000	-4,329,155	19,470,845	$7.86	$17.03
2026	22,960,000	-4,329,155	18,630,845	$8.41	$18.22
2027	22,120,000	0	22,120,000	$9.00	$19.50
2028	21,280,000	0	21,280,000	$9.63	$20.87
2029	20,440,000	0	20,440,000	$10.30	$22.33
2030	19,600,000	0	19,600,000	$11.02	$23.89

Sources identified in preceding text and footnotes.

In order to model future RGGI revenue for Virginia, one must start with estimates for the future clearing prices. If those estimates at any point reach the ECR or CCR trigger prices shown above, then the total number of allowances sold would have to decrease or increase accordingly.

To date there have been very few attempts to model future RGGI clearing prices. The most notable attempt comes from a study prepared by ICF International, as part of RGGI's "second program review," which led to the development of RGGIs 2017 Model Rule.[105] This study modeled a lower projected RGGI allowance price curve that would rise from about $8 in 2023 to roughly $13 in 2030, and a higher projected curve starting at around $14 in 2023 and reaching $23 in 2030 (all prices in nominal dollars for those future years). This lower projected price curve remains above the ECR trigger price from 2021-2030, and the higher price curve remains below the CCR price.[106] While the actual RGGI auction prices were lower than ICF's modeled lower price curve through mid-2020, auction prices have been closer to ICF's modeled higher price curve since September 2021.

4.2. Modeling Future RGGI Clearance Prices and Virginia Revenue Scenarios

Given the recent clearing price trends, relative to the ICF's modeled price curves, it is reasonable to assume that RGGI clearance prices are likely to remain above the ECR trigger price, and below the CCR trigger price, from 2023 through 2030.[107] The CCR trigger has only been reached once since late 2015, as a result of the significant clearance price surge in the December 2021 auction. The ECR trigger price has

[105] The Regional Greenhouse Gas Initiative, 2022. Program Review.

[106] ICF International, 2017. DRAFT 2017 Model Rule Policy Scenario Overview.

[107] Shobe, W., 2022. University of Virginia. Personal communication. (December 8, 2022).

not been reached since it came into effect in January 2021. The modeled RGGI clearance prices from ICF do not reach the trigger prices, in either their low price or high price scenarios, from 2023 through 2030.

Given these assumptions, our Low-end and High-end Virginia RGGI revenue scenarios are as shown in Table 6. Both scenarios include the actual Virginia allowances sold, average clearing prices, and actual resulting RGGI revenue for 2021 and 2022. The Low-end, conservative scenario assumes that the average annual clearing price drops by 2.5% per year from the actual average of $13.59 in 2021 to $11.10 in 2030. This is the steepest possible average annual drop in prices without triggering the ECR at any point. The High-end, more aggressive scenario assumes that the average annual clearing price will increase by 5% a year, to $20.07 in 2030, which would not exceed the CCR at any point. All prices are listed in nominal dollars for their respective years.

With the assumption that neither the ECR or CCR price is reached, the allowances sold each year equal the "Actual Allowances" shown in Table 5. The minimum revenue is then calculated as the allowances sold times the Low average clearing price, while the maximum revenue is the allowances sold times the High clearing prices. (Again, actual values are shown for 2021 and 2022, while 2023-2030 are modeled).

Table 6. Modeled Allowances, Clearing Prices, and Virginia Revenue, Low and High Scenarios

Year	Allowances Sold	Average Clearing Price (Low)	Average Clearing Price (High)	Estimated Revenue – Low ($Millions)	Estimated Revenue – High ($Millions)
2021	23,719,674	$9.47	$9.47	$227.64	$227.64
2022	21,990,845	$13.59	$13.59	$298.80	$298.80
2023	21,150,845	$13.25	$14.27	$280.59	$302.17
2024	20,310,845	$12.92	$14.98	$262.72	$304.70
2025	19,470,845	$12.59	$15.73	$245.58	$306.72
2026	18,630,845	$12.28	$16.52	$229.12	$308.18
2027	22,120,000	$11.97	$17.34	$264.82	$383.59
2028	21,280,000	$11.67	$18.21	$248.39	$387.48
2029	20,440,000	$11.38	$19.12	$232.62	$390.79
2030	19,600,000	$11.10	$20.07	$217.49	$393.47
Totals	**208,713,899**			**$2,507.77**	**$3,303.54**

Source: RGGI data and analysis by authors

As a result of the methods outlined above, the estimated total RGGI revenue for Virginia from 2021-2030 is $2.5 billion in the Low scenario, and $3.3 billion in the High scenario. The resulting HIEE funding, 50% of the total, is therefore $1.25 billion (Low scenario) to $1.65 billion (High scenario).

4.3. Modeling Household Energy Savings from HIEE Energy Efficiency Investments

In this section we analyze available data on the performance of the HIEE energy efficiency programs to-date, and estimate the projected energy and customer bill savings that the programs could produce through the year 2030. These estimates are presented in two scenarios – Low revenue and High revenue – based on the potential range of RGGI-generated HIEE revenue from the year 2021-2030. As the revenue projections in the prior section are in real, nominal dollars for the years 2021-2030, all cost estimates in this section incorporate reasonable assumptions for inflation over that same period. The initial steps in this modeling process, conducted separately for both revenue scenarios, are as follows:

- Identify a reasonable assumption for how future HIEE revenue would be distributed across the Weatherization Deferral Repair (WDR) and Affordable and Special Needs Housing energy efficiency (ASNH-EE) funds, as well as the distribution of WDR funding across single-family (WDR-SFH) versus multi-family (WDR-MFH) housing projects.
- Identify the average cost per unit upgraded via the ASNH-EE, WDR-SFH, and WDR-MFH projects completed to-date, and project those costs forward through 2030 at a reasonable inflation rate.
- Divide the annual funding estimates for each project type – ASNH-EE, WDR-SFH, and WDR-MFH – by their respective projected costs per unit, producing an estimated number of units receiving energy efficiency or weatherization deferral upgrades, per year (2021-2030), via each program.

Here one must note that there is a natural lag time between when the state receives RGGI funding and when the subsequent HIEE funds result in completed energy efficiency projects. As previously discussed, the revenue generated for the HIEE program since Virginia joined RGGI equals nearly $252 million ($526.5 in RGGI auction revenue times 50%, minus the $11.4 million diverted to the Hurley flood relief fund). But as of December, 2022, DHCD had spent or committed only $37.08 million of those funds (29.16 to ASNH-EE and $7.92 to WDR), with another $80 million in ASNH-EE funds to be released in FY ‘23. Therefore, in our analysis, the number of units identified for each year corresponds to the estimated number of units that could be upgraded with the revenue generated that year, with an understanding that the actual energy efficiency projects would take place within the subsequent couple of years.

Once the projected number of units upgraded per year has been calculated, the next steps are to estimate the resulting energy efficiency and customer savings benefits. These savings are calculated in the aggregate, based on the total number of housing units that could receive energy efficiency upgrades via the projected HIEE revenue through 2030, and represent the annual energy and customer bill savings benefits resulting from those energy efficiency investments. This is calculated as follows:

- Multiply the number of housing units that could be upgraded, per project type (ASNH-EE, WDR-SFH, and WDR-MFH), by their corresponding estimated annual energy savings per housing unit, in millions of British thermal units (MMBTUs).
- Convert the estimated total annual energy savings from MMBTU to kilowatt-hours (kWh), and multiply the resulting estimated electricity savings times an estimated electricity rate ($ / kWh) for the year 2030, projected forward based on past electricity rate trends.

A key assumption, discussed further below, is that all of the energy savings from the HIEE programs are in the form of reduced electricity consumption. Another key assumption of this analysis is that every WDR project results in a subsequent WAP project, as is the intent of the WDR program, with ensuing energy efficiency benefits. These steps are discussed in more detail in the following sections.

4.3.1. Estimating Total Units to be Upgraded with Future HIEE Program Funds

As noted in Section 1, Table 2, the initial distribution of HIEE funds for FY 2021 was 60% to WDR and 40% to ASNH-EE. In FY 2022 these percentages were essentially reversed, with 60% of funds going to ASNH-EE, 30% to WDR, and 10% to a proposed "Housing Innovations Partnerships" grant program.

Of the HIEE funds spent or committed to-date, roughly 80% has gone to ASNH-EE, versus 20% to WDR. This does not include the additional $80 million in ASNH-EE funds announced in late 2022, which will skew the percentage even higher towards that program. Projecting forward, the amount of weatherization deferral repair work that can be completed is constrained by both the capacity of the state's weatherization provider network as well as the availability of federal WAP funds. While Virginia has experienced a substantial increase in WAP funding from the Bipartisan Infrastructure Law, that is a one-time source of additional funds that is currently only available until expended.

Considering these factors, our model assumes that 85% of HIEE funds generated from 2021-2030 will be dedicated to the ASNH-EE program, and 15% to the WDR program. This amount of funding would still support substantial ongoing weatherization deferral support, as indicated in the final modeling results.

The next critical assumption is the distribution of WDR funds between single-family and multi-family projects. The aforementioned total of $7.92 million in WDR expenditures thus far includes both funds already spent and the estimated costs of projects currently approved and in-progress, including both single-family and multi-family projects. However, detailed cost data is only available for the $4.60 million that has actually been spent thus far. Of those funds, 86.5% ($4.02 million) has been spent on single-family WDR projects, and 13.5% ($627,000) on multi-family projects.[108]

Moving forward, we assume that WDR funding will be split 85% to single-family projects and 15% to multi-family. This results in an overall HIEE funding distribution of 85% to ASNH-EE, 12.75% to WDR-SFH, and 2.25% to WDR-MFH.

Data on the estimated cost per unit for the three HIEE program types is based on information released by DHCD. For ASNH-EE, a July 2021 announcement indicated that $6.2 million in ASNH-EE funds would be spent across 11 projects, supporting a total of 707 units.[109] A subsequent announcement in January 2022 included $22.96 million in ASNH-EE funds, supporting 1,682 units across 25 projects.[110] Combining the numbers from these two announcements results in an average cost per unit of $12,190. For WDR, the aforementioned totals provided by DHCD indicate an average cost per unit of $13,260 for WDR-SFH and $2,170 for WDR-MFH.

Our model uses these totals as the average cost per unit for the respective programs in 2021 and 2022. For future years we apply a 3% average annual increase to each of these costs. This assumption is based on analysis from CBRE, one of the country's leading real estate services and investment firms, which

[108] Virginia DHCD, 2022. Personal communication from Aaron Shoemaker, Program Administrator, Energy Efficiency Office. (December 8, 2022).

[109] Virginia DHCD, 2021. Governor Northam Announces Over $21 Million in Affordable and Special Needs Housing Loans.

[110] Virginia DHCD, 2022. Governor Northam Announces Over $60 Million in Affordable and Special Needs Housing Loans.

indicates a 14% increase in construction costs from 2021-2022 and anticipates that price escalation "should stabilize to the 2% - 4% range in 2023 and 2024, on par with historical averages."[111] Projecting the per-unit project costs forward at 3% per year, beginning in 2023, results in averages of $15,442 for ASNH-EE, $16,797 for WDR-SFH, and $2,749 for WDR-MFH in the year 2030.

With these assumptions in place for the annual HIEE revenue scenarios, distribution of revenue across project type, and average costs per unit, we can then calculate an estimated number of units across each program that could be upgraded with anticipated funding through the year 2030. While the more detailed calculation tables can be seen in Appendix D, the final results are summarized in Table 7 below.

Table 7. Estimated Units Upgraded via HIEE Programs, per 2021-2030 RGGI Revenue Scenario

Revenue Scenario	ASNH - EE	WDR - SFH	WDR - MFH	Total Units
Low ($1.24 billion)	78,373	10,806	11,653	100,832
High ($1.64 billion)	101,833	14,041	15,141	131,015

As discussed above, there is a natural lag time between when the state receives RGGI funding and when the subsequent HIEE funds result in completed energy efficiency projects. Therefore, the totals shown above correspond to the estimated number of units that could be upgraded with the total revenue generated from 2021-2030, with an assumption that the actual energy efficiency projects would take place within the subsequent couple of years.

4.3.2. Estimating Energy Consumption and Bill Savings from HIEE Energy Efficiency Investments

Having determined the estimated number of units to be upgraded under each funding scenario, we can now project the resulting energy efficiency and customer savings benefits.

First, we used data from the Virginia Center for Housing Research at Virginia Tech, which completed a study of the HIEE program for DHCD in the fall of 2022. The Virginia Tech study found that the WDR-SFH projects that had been completed by that time had generated an average energy savings of 37.1 MMBTU per year, versus 4.8 MMBTU per year for multi-family units in WDR-MFH projects.[112]

As noted above, these modeled savings incorporate the resulting energy efficiency upgrades that would occur as the completed WDR project is further weatherized, with federal funds, via the WAP program. The additional costs of those WAP projects are not incorporated here, as the intent of this study is to evaluate the benefits of the RGGI funding that Virginia routes through HIEE, and the capacity of the WDR program to unlock federal WAP dollars for low-income Virginia residents is one such benefit.

The Virginia Tech study also modeled the energy savings resulting from the various types of ASNH-EE projects. As discussed in Section 1.4.1, any project receiving ASNH funds can be assumed to also be receiving the Low-Income Housing Tax Credit (LIHTC), administered through Virginia Housing. Projects receiving the LIHTC tax credit in Virginia are required to achieve a certain level of energy efficiency performance, based on their project type (new construction, substantial rehabilitation, or adaptive

[111] CBRE, Inc. 2022. 2022 U.S. Construction Cost Trends.

[112] Virginia Center for Housing Research, Virginia Tech, 2022. *Housing Innovations in Energy Efficiency Report*.

reuse), and projects that receive ASNH-EE funds via the HIEE program are expected to reach even more rigorous energy efficiency benchmarks (see details in Table 3).

Therefore, the energy savings from a given ASNH-EE project can be calculated based on that margin between the LIHTC requirements and the ASNH-EE requirements. The Virginia Tech study found those marginal savings to be 29% for New Construction projects, 20% for Substantial Rehabilitation, and 14% for Adaptive Reuse. The Virginia Tech study also calculated an estimated average per-unit energy consumption, in energy use intensity (EUI), customer bill amounts (dollars per year) and greenhouse gas emissions (CO_2-equivalent, or CO_2-e) for each ASNH-EE project type.

Table 8. Annual per Unit Energy Performance of ASNH-EE Projects vs. LIHTC Requirements

Project Type	Energy Savings (EUI)	Energy Savings (%)	Bill Savings ($)	GHG Savings (tons CO_2-e)
New Construction	6.97	29%	$200	1.6
Substantial Rehab	7.94	20%	$103	0.8
Adaptive Reuse	6.90	14%	$154	1.3

Source: Virginia Center for Housing Research, Virginia Tech, 2022. Housing Innovations in Energy Efficiency Report.

Based on the results from Table 8, and employing the current carbon coefficient for electricity in Virginia (626.3 lbs / MWh),[113] we were able to calculate the average annual energy savings for housing units upgraded via each ASNH-EE program. For example, according to the Virginia Tech study, an ASNH-EE new construction project emits 1.6 tons CO_2-e / year less than an equivalent project meeting only the LIHTC energy efficiency requirements. The aforementioned carbon coefficient rate for Virginia electricity of 626 lbs / MWh translates to 3193 kWh / ton. Multiplying this carbon ratio times the 1.6 ton difference in emissions results in an annual energy savings of 5,110 kWh from the ANSH-EE new construction unit. At a conversion rate of 3,412 Btu / kWh, this equals 17.43 MMBTU.

Replicating this same process for substantial rehabilitation and adaptive reuse projects resulted in estimated annual energy savings per housing unit of 8.72 MMBTU and 14.16 MMBTU respectively. Using the detailed data on units per ASNH-EE housing type from the DHCD's July 2021 and January 2022 press releases, we then calculated a weighted average of 13.97 MMBTU savings from all ASNH-EE units, relative to equivalent low-income housing units that meet the LIHTC performance standards only.

With the average annual energy savings calculated for ASNH-EE, WDR-SFH, and WDR-MFH projects, we were then able to calculate the total energy savings (MMBTU) and electricity savings (kWh) for the year 2030, for both revenue scenarios. To convert electricity savings to customer bill savings required an estimated cost of electricity in the year 2030. We calculated this estimate based on data from the U.S. Energy Information Administration, which shows that the average retail price of electricity in Virginia has increased from 7.79 cents / kWh in 2002 to 11.96 cents / kWh in 2021, for an average annual growth rate of 2.17%. Extrapolating that same growth rate out produces an estimated average price of 15 cents per kWh in 2030. Multiplying that projected price times the estimated electricity savings produced the estimated total and average per unit customer bill savings shown in Table 9.

[113] U.S. Environmental Protection Agency, 2022. eGrid 2020. See data for SRVC sub-region.

Table 9. Total Units Upgraded (2021-2030) and Annual (Year 2030) Energy and Bill Savings

RGGI / HIEE Revenue Scenario	Units Upgraded	Total Energy Savings (MMBTU)	Total Energy Savings (MWH)	Total Bill Savings ($Millions)	Bill Savings / Unit ($)
Low ($1.24 billion)	100,832	1,551,322	454,666	$68.20	$676
High ($1.64 billion)	131,015	2,015,703	590,769	$88.62	$676

Source: Calculations by authors, using energy savings data from Virginia Center for Housing Research, Virginia Tech, 2022. Housing Innovations in Energy Efficiency Report.

To reiterate, the energy and customer bill savings shown above are based on the total number of housing units that could receive energy efficiency upgrades via the projected HIEE revenue from 2021 through 2030. These are annual values, representing the projected energy and customer bill savings benefits in the year 2030, as a result of the energy efficiency investments funded by HIEE. These annual energy savings would continue in subsequent years (i.e., beyond 2030), with resulting customer bill savings increasing along with the average price of electricity. Annual energy and customer bill savings realized in the earlier years (i.e., 2021-2029) would be proportional to the number of HIEE energy efficiency projects completed by a given year, and the average electricity price at that time.

A key assumption of this analysis is that virtually all residential energy use in the year 2030 comes in the form of electricity, with direct consumption of natural gas or other fossil fuels for heating, water heating, etc. having been largely phased out in the residential sector. This assumption is in part for simplicity's sake. To include an estimated percentage of energy savings that would come from direct fossil fuel use, rather than electricity, would introduce significant additional complexity to the analysis, without substantively impacting the final results. This assumption is also reflective of a trend towards electrification in new and renovated housing, particularly for subsidized housing units.

5. Economic Impact Analysis of Virginia's HIEE Program

An economic impact model describes how a change in economic activity in one or more industries can influence a broader regional economy. The model developed for this analysis utilizes IMPLAN, an input-output modeling system. An input-output model traces a change in spending from the source backwards through the supply chain, identifying how much of the spending is likely to remain inside the region with suppliers and workers, and how it will be spent in turn. The resulting dollar figures describe how the original change in economic activity reverberates through a regional economy, making an impact greater than the initial dollar figure.

The total economic impact of a given economic activity is comprised of several dimensions, as each stage of that activity is comprised of resources that go towards supplies, labor, profit, and taxes. The components of the total impact are divided into Employment, Labor Income, and Value Added. Value Added refers to the amount that a good increases in value at each step of the production process, after subtracting the cost of materials. More broadly, the value added of an industry is the difference between its gross sales and the cost of its supplies (including raw materials, energy, and services).[114]

Each component of economic impact flows from one of three possible stages in the economic process.

1. Direct impacts: Direct impacts are dollars that come from the initial source or change. In this case, the direct impacts are those that flow directly from HIEE funds.
2. Indirect impacts: These impacts flow from an industry's "backward linkages," or the relationship an industry has to its supply chain. For example, a bakery relies on supplies and materials produced by grain farmers, flour producers, and packaging manufacturers. An increase in demand at the bakery will influence purchases from those suppliers.
3. Induced impacts: Labor income changes allow households that receive that labor income to spend additional money on wants and needs. Induced impacts refer to the new spending that happens as a result of income changes spurred by direct and indirect impacts.

The direct impact constitutes the largest component of economic impact. However, indirect and induced impacts represent an essential component of a market economy, as they demonstrate the effects of backwards linkages, supply chains, and household spending that occur in response to direct impacts.

Economic impact analyses should not be considered a cost-benefit analysis. The impacts described may be considered benefits to one industry and costs to another. Impact analysis describes economic activity flowing from a change in production. The input-output modeling used in economic impact analysis is not able to trace the path of each dollar after it leaves the region. Inter-regional economic activity, where spending happens between economic regions, is not captured. Further, input-output models are static. They model changes in demand using existing knowledge of supply chains, but they do not model how those changes may increase or decrease the availability and cost of supplies and labor.

[114] U.S. Bureau of Economic Analysis, 2006. What Is Industry Value Added?

5.1. Model Inputs and Outputs

An economic impact begins with a change in economic activity. In this case, we are modeling the spending associated with HIEE revenue generated between 2021 and 2030. After identifying the total HIEE funding for each year, we can divide that funding by program (WDR and ASNH-EE) and, ultimately, categorize each program's dollars by industry equivalent IMPLAN category (e.g., construction of new multifamily residential structures). Similar efforts have classified RGGI-related energy efficiency spending by states in IMPLAN's construction and maintenance categories.[115] Those dollars are entered into the model using the relevant industry code and dollar year.

The model uses a combination of industry and employment multipliers, household spending estimates, and regional purchasing coefficients, or estimates of the percentage of a region's demand for a good met by production within that region. Together, these tools are used to estimate how the inputs – $1.24 billion to $1.64 billion in total – will change demand for suppliers, change demand for labor, and change household spending patterns. The results are expressed in 2022 dollars.

5.2. Economic Impact Analysis Results

The anticipated output of HIEE funding from 2021 through 2030—between $1.24 billion and $1.64 billion – would have a statewide impact between $2.03 and $2.67 billion (see Table 10).

Each dollar dedicated to the HIEE program flows through a chain of workers, manufacturers, and suppliers inside and outside of Virginia. Each dollar that leaves the state is considered economic leakage. The dollars that remain inside Virginia, passing from contractor to supplier to manufacturer to worker, constitute what we describe as the economic impact of the original event or spending.

For every $1.00 of HIEE funds spent, the total impact is between $1.656 and $1.658—the original $1.00 plus another $0.66 generated through indirect and induced effects (see Table 11). This means that HIEE program spending has a "multiplier effect" of 1.66, which is comparable to those of the following industries in Virginia:[116]

- Air transportation 1.666
- Wood windows and door manufacturing 1.661
- Glass container manufacturing 1.659
- Paper mills 1.654
- Electric power generation - Solar 1.651
- Electric power generation - Hydroelectric 1.634
- Electric power generation - Fossil fuel 1.619

These multipliers do not indicate that the industries have a net benefit or cost. They describe the ways that dollars flow backwards through the supply chain and worker households inside the region.

[115] Hibbard, P., et al., 2018. The Economic Impacts of the Regional Greenhouse Gas Initiative on Nine Northeast and Mid-Atlantic States.

[116] IMPLAN, 2021. Estimates of Industry Multipliers in Virginia.

The HIEE program's total economic impact is summarized in Table 10. Please note that the table does not include every element of economic impact, and some elements are subcategories of others. For example, Labor Income is a component of Value Added.

Table 10. Estimated Economic Impacts of the HIEE Program in Virginia, 2021 through 2030

Revenue Scenario	Output	Value Added	Labor Income	Employment [a]
Low	$2.03 Billion	$1.32 Billion	$834 Million	1,552
High	$2.67 Billion	$1.75 Billion	$1.11 Billion	2,115

Sources: CURA modeling and analysis of VCU projections of HIEE program spending

[a] *Figure represents new jobs across 10-year study period.*

The impact of HIEE-related spending from 2021 to 2030 will be a function of how much money is spent, and when. In Section 4 we modeled the estimated Low and High ranges of annual RGGI revenue, 50% of which will go to the HIEE program, based on the amount of CO_2 allowances available each year and a reasonable estimate of the potential range of allowance prices. As discussed in that section, the HIEE revenue generated from a given year's RGGI auction allowances will fund a certain amount of energy efficiency upgrades via the WDR and ASNH-EE programs over the subsequent years. This allows for an estimation of the economic impacts of that spending on a year-by-year basis.

The estimated annual economic impacts range between $200 million and $300 million each year, resulting in the aforementioned cumulative effect of between $2.0 billion (Low scenario) and $2.7 billion (High scenario), as shown in Figure 5.

Figure 5. Cumulative Economic Impact of HIEE Expenditures, 2021 – 2030

Sources: VCU model of estimated annual RGGI revenue for Virginia (see Section 4)

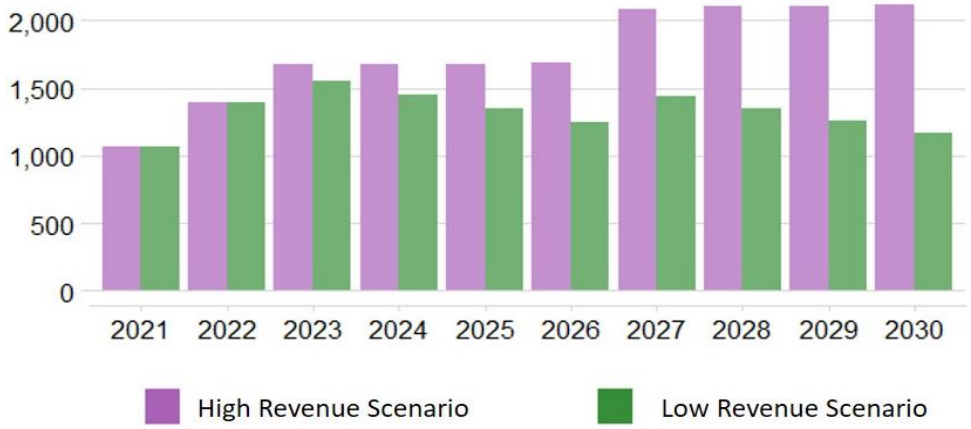
The total impact includes $1.32 (Low RGGI revenue scenario) to $1.75 billion (High revenue scenario) in Value Added across the 10-year period. Value added can be considered a measure of contribution to Virginia's GDP. The Value Added impact of the HIEE program generates an average annual contribution of $132 to $175 million to the state GDP, or around 0.02% to 0.03% of the 2021 GDP.[117]

[117] U.S. Bureau of Economic Analysis, 2022. What Is Industry Value Added?

We estimate that $0.83 to $1.11 billion of the value added would go towards Labor Income, which includes all employee compensation (salaries, benefits, payroll taxes) and "proprietor income" (i.e., payments received by self-employed individuals and unincorporated business owners).[118] This labor income across 10 years would create and sustain 1,552 to 2,115 jobs, at approximately $52,500 to $53,500 per job. The remainder of the value added would go towards corporate profits, capital depreciation, and taxes, and is treated as leakage.

Unlike the dollar-based impact figures, employment is not able to be stacked year-over-year in a cumulative manner. After the change in economic activity supports the job, adding it to the total year-after-year would misrepresent the impact. Figure 6 shows the number of jobs that the HIEE program would support over the 10-year period, as a function of the amount of revenue generated that year.

Figure 6. Annual Employment Supported by HIEE Expenditures, 2021 – 2030



Sources: VCU model of estimated annual RGGI revenue for Virginia (see Section 4)

Table 11 breaks down the direct, indirect, and induced impacts of projected HIEE funding through 2030. Indirect and induced impacts total $806 million to $1.06 billion over 10 years, roughly 40% of the aforementioned total economic impacts under the Low and High revenue scenarios. Those impact phases represent dollars that have moved through the initial round of business spending to other suppliers in Virginia (indirect) and spending by workers shopping in Virginia (induced).

Table 11. Summary of HIEE Direct, Indirect, and Induced Impacts, 2021 through 2030

Revenue Scenario	Direct	Indirect	Induced	Total
Low	$1.22 Billion	$326 Million	$480 Million	$2.03 Billion
High	$1.61 Billion	$422 Million	$636 Million	$2.67 Billion

Sources: CURA modeling and analysis of VCU projections of HIEE program spending

[118] Clouse, C., 2020. IMPLAN – Support. Understanding Labor Income (LI), Employee Compensation (EC), and Proprietor Income (PI).

The direct impact constitutes the largest component of economic impact. However, the indirect and induced impacts together account for about 40% of the total impact in each scenario, demonstrating the effects of backwards linkages, supply chains, and household spending that are essential components of a market economy. The induced impact outpaces the indirect impact, highlighting the importance of household spending in the Virginia's economy. Consumer spending often occurs close to home, and the dollars continue to ripple through the economy.

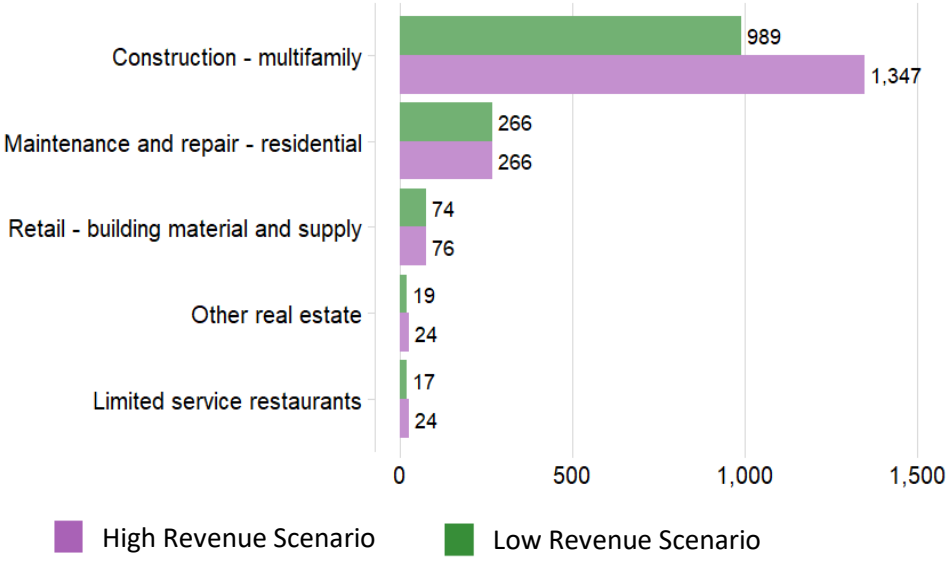
Table 12 merges the information in the previous two tables, demonstrating in greater detail how the various elements of economic impact (employment, labor income, and value added) are distributed across the direct, indirect, and induced components of that impact, per the HIEE revenue scenarios.

Table 12. Summary of HIEE Impact Components, 2021 - 2030 (Low vs. High Scenarios)

Impact	Employment	Labor Income ($Millions)	Value Added ($Millions)
Direct	1,069 - 1,457	$581 - $774	$849 - $1,128
Indirect	217 - 233	$102 - $133	$186 - $240
Induced	311 - 424	$150 - $199	$288 - $382
Total	1,552 - 2,115	$834 - $1,106	$1,323 - $1,750

The indirect effects of HIEE funding would create and support 217 to 233 jobs through 2030. The induced effects – those generated by the new household spending that accompanies increases in labor income – would support 311 to 424 jobs through 2030. The influence of those effects is visible in the industries the model estimates will see the greatest increase in employment, such as the increases in retail and restaurant employment shown in Figure 7 below.

Figure 7. Industries with Largest Employment Impact



Sources: VCU model of estimated annual RGGI revenue for Virginia (see Section 4)

6. Summary and Conclusions

The research presented here has demonstrated the vast scope of the low-income energy burden challenge in Virginia, as well as the potential to significantly mitigate those energy burdens through continued participation in the energy efficiency programs funded by Virginia's participation in RGGI.

Hundreds of thousands of low-income households in Virginia experience "High" or "Severe" energy burdens, based on the percent of their incomes that are spent on home energy costs. This energy burden challenge does not sort out along geographic, demographic, or political lines. Concentrations of severe energy burden can be found throughout much of Virginia's rural areas, from the farthest corner of Southwest Virginia to the Eastern Shore, as well as in some of the state's most urban neighborhoods. This includes pockets of extreme energy burden, where low-income households are spending over 20% of their incomes on home energy costs. At these high levels, energy burden is not merely a financial challenge, but brings with it a degree of energy insecurity that threatens residents' health and safety.

Existing federal, state, and utility-sponsored energy efficiency programs – without RGGI – are insufficient to address the vast scope of the energy burden problem in Virginia. The variety of tax credits and financial incentives available to support residential energy efficiency, including the recently adopted or expanded tax credits under the federal Inflation Reduction Act, are largely inaccessible to low-income Virginians who live in rental housing and/or cannot afford even the subsidized up-front costs of energy-efficiency investments. The long-standing federal WAP and LIHEAP programs provide meaningful weatherization services for low-income residents, but even with increased funding under the Bipartisan Infrastructure Law they only address a tiny portion of the problem. While recent Virginia laws direct investor-owned utilities to invest significant funding into achieving ambitious energy-efficiency targets, only 15% of those funds are required to support Low- and Moderate-Income households.

The energy efficiency funding generated through Virginia's participation in RGGI vastly exceeds that of these other existing programs. While the aforementioned federal and state / utility programs will provide less than $55 million per year over the coming years, Virginia's RGGI revenue has already generated $250 million for low-income energy efficiency programs in just two years (2021-2022). If Virginia remains in the RGGI program through 2030, then we project the total funds raised for low-income energy efficiency to be between $1.24 and $1.64 billion over the course of the decade.

Using available data from the state, and a recent analysis from Virginia Tech, we were able to estimate the reduced energy consumption and customer bill savings that these future RGGI energy efficiency funds could provide. According to our calculations, Virginia's projected RGGI revenue through 2030 could eventually lead to energy efficiency improvements for anywhere from 100,000 to 130,000 low-income homes. The resulting energy savings would be between 1.56 and 2.01 trillion Btu per year, or 455,000 to 591,000 MWh of electricity. This would result in $68 to $89 million in customer bill savings per year, at an average of $676 per year per household.

Finally, we estimate that spending the projected RGGI funds through 2030 would have a statewide economic impact of between $2.03 and $2.67 billion. These findings indicate a "multiplier effect" of 1.66, meaning that every dollar invested in low-income energy efficiency generates an additional $0.66 in indirect and induced impacts. The estimated total impact includes $1.32 to $1.75 billion in Value Added across the 10-year period, which would represent an increase of 0.02% to 0.03% to the state's GDP. We estimate that the Labor Income component of that Value Added ($0.83 to $1.11 billion) would create and sustain 1,552 to 2,115 jobs, at approximately $52,500 to $53,500 per job.

Appendix A. Energy Burden Mapping Methodology

Low-Income Energy Affordability Data (LEAD)

The US Department of Energy's Office of Energy Efficiency and Renewable Energy (EERE) developed the Low-Income Energy Affordability Data (LEAD) Tool, to help users examine household energy characteristics in relation to household income levels. The LEAD Tool provides three income models to depict income levels: Area Median Income (AMI), Federal Poverty Level (FPL), and State Median Income (SMI). For mapping purposes of this study, AMI was chosen to account for income variations across Virginia, and to establish the threshold of "low-income" defined as income below 80% AMI.

At the time of the study, the LEAD Tool provides estimates derived from the US Census Bureau's 2018 American Community Survey (ACS) Public Use Microdata Samples (PUMS). In specific, LEAD includes estimated household energy cost, energy burden, and housing count according to the following criteria:

- Geographic levels – this study obtained and mapped LEAD at the Census Tract level
- AMI levels – income below 80% AMI was defined as "low-income" in this study
- Building age (construction year of housing unit)
- Heating fuel types
- Building types – this study excluded boat/RV/van and mobile/trailer from single- and multi-family units counts
- Tenure status (homeowner or renter)

A notable limitation of the LEAD data is that it always reports average energy burdens as whole numbers, without a clear indication of how those numbers are rounded. Therefore, we identified Census tracts with a LEAD-reported Average Energy Bruden of seven or more as High Energy Burden, and eleven or more as Severe Energy Burden. It is possible that this method excludes some Census tracts with an actual, un-rounded Average Energy Burden above 6.0 from the High Energy Burden category, or some above 10.0 from the Severe Energy Burden category. However, we chose to err on the side of caution, and avoid inadvertently including Census tracts in which the actual Average Energy Burden is less than 6.0 or 10.0 from those categories.

Census Geography

Given that the LEAD Tool provides estimates based on 2018 Census data, this study obtained 2018 Virginia Census Tracts from the US Census TIGER/Line Geodatabases page. This study also obtained the 2018 ACS Table B01003 which contains tract-level geography names and population estimates.

Geodatabase Creation and Mapping

The LEAD Tool allows users to specify their own criteria and download the respective data sets in CSV (comma-separated values) format. A number of CSV files about household energy cost, energy burden, and housing count were downloaded according to the criteria stated earlier. The CSV files were further prepared in Excel before they were joined to the 2018 Virginia Census Tracts in ArcGIS Pro. The resulting geodatabase contains attributes listed in the table below.

Attribute	Description
GEO_ID	Unique Identifier
County	Jurisdiction Name (County or City)
Tract	Census Tract Number
Pop_2018	Population (2018 ACS 5-year estimate)
Total_HU	Total - Housing Counts (Single- and Multi-Family combined)
Total_AAEC	Total - Average Annual Energy Cost ($)
Total_AEB_pct	Total - Average Energy Burden (% income)
Single_HU	Single-Family - Housing Counts
Single_AAEC	Single-Family - Average Annual Energy Cost ($)
Single_AEB_pct	Single-Family - Average Energy Burden (% income)
Multi_HU	Multi-Family - Housing Counts
Multi_AAEC	Multi-Family - Average Annual Energy Cost ($)
Multi_AEB_pct	Multi-Family - Average Energy Burden (% income)
AMI_below80_AEB	Low-Income (below 80% AMI) - Average Energy Burden (% income)
AMI_below80_HU	Low-Income (below 80% AMI) - Housing Counts (Single- and Multi-Family combined)
AMI_below80_AEB_single	Low-Income (below 80% AMI) - Single-Family Average Energy Burden (% income)
AMI_below80_HU_single	Low-Income (below 80% AMI) - Single-Family Housing Counts
AMI_below80_AEB_multi	Low-Income (below 80% AMI) - Multi-Family Average Energy Burden (% income)
AMI_below80_HU_multi	Low-Income (below 80% AMI) - Multi-Family Housing Counts

Three sets of maps were created to illustrate the spatial distribution and variation of average energy burden, high energy burden (above 6%), and severe energy burden (above 10%) low-income households at the Census Tract level. Virginia Census Tracts were classified into five groups using the Natural Breaks method which optimizes classification by minimizing the within-group difference while maximizing the between-group difference. These maps and their associated attributes are listed below.

<u>Average Energy Burden</u>

- Average Energy Burden of Low-Income (below 80% AMI) Households
  Attribute: AMI_below80_AEB
- Average Energy Burden of Single-Family Low-Income (below 80% AMI) Households
  Attribute: AMI_below80_AEB_single
- Average Energy Burden of Multi-Family Low-Income (below 80% AMI) Households
  Attribute: AMI_below80_AEB_multi

High Energy Burden (above 6%) Housing Units

- Housing Units of High Energy Burden and Low-Income (below 80% AMI)
  Attribute: AMI_below80_HU, where AMI_below80_AEB > 6
- Single-Family Housing Units of High Energy Burden and Low-Income (below 80% AMI)
  Attribute: AMI_below80_HU_single, where AMI_below80_AEB_single > 6
- Multi-Family Housing Units of High Energy Burden and Low-Income (below 80% AMI)
  Attribute: AMI_below80_HU_multi, where AMI_below80_AEB_multi > 6

Severe Energy Burden (above 10%) Housing Units

- Housing Units of Severe Energy Burden and Low-Income (below 80% AMI)
  Attribute: AMI_below80_HU, where AMI_below80_AEB > 10
- Single-Family Housing Units of Severe Energy Burden and Low-Income (below 80% AMI)
  Attribute: AMI_below80_HU_single, where AMI_below80_AEB_single > 10
- Multi-Family Housing Units of Severe Energy Burden and Low-Income (below 80% AMI)
  Attribute: AMI_below80_HU_multi, where AMI_below80_AEB_multi > 10

Appendix B. Census Tracts in Virginia with Extreme Low-Income Energy Burden

The following table lists all 76 Virginia Census Tracts in which the average energy burden (AEB) for all low-income households (AEB-LI) is 15% or above (i.e., twice the U.S. national average). These tracts are listed in descending order based on their AEB-LI. The table also lists the percent of all households in each tract that are low-income (PCT HU < 80 AMI), the Average Annual Energy Costs (AAEC) for all households in that Census Tract, and the average annual energy burden (AEB) for all households in the Tract.

County	Census Tract	Pop. (2018)	Housing Units	PCT HU < 80 AMI	AAEC	AEB (All Households	AEB (AMI < 80)
Danville city	4	3300	1389	72.1%	$5,117	18	32
Danville city	11	1387	596	58.6%	$5,283	12	29
Danville city	6	1945	919	48.5%	$5,250	11	29
Albemarle County	109.03	3159	98	93.9%	$1,538	20	29
Danville city	10	3944	1548	63.8%	$4,903	12	27
Danville city	3	2840	1461	57.2%	$5,237	15	26

Appendix D. Data Tables for HIEE Program Modeling

Tables A.2 and A.3 below demonstrate the detailed calculations for the total number of low-income housing units, listed in Table 7, that could receive energy efficiency upgrades under our Low and High RGGI / HIEE revenue scenarios, respectively. The Total HIEE Revenue column is equal to half of Virginia's actual RGGI revenue in 2021-2022, and projected revenue for 2023-2030 (Low and High scenarios), per the process outlined in Section 4.2 and summarized in Table 6. The HIEE revenue totals for 2022 include the $11.4 million deduction from that year's HIEE budget and transferred to the Hurley flood relief fund.

As described in Section 4.2.1, we assume an overall HIEE funding distribution of 85% to ASNH-EE projects, 12.75% to WDR-Single-Family projects, and 2.25% to WDR-Multi-Family projects, which is consistent with the actual HIEE funding distributions to-date. The Total HIEE Revenue values, multiplied by those percentages, produce the values listed in the respective "Budget by Project Types" columns.

The average costs per unit for 2021-2022 are based on our calculations of the actual costs per unit for each HIEE project type, based on available DHCD data. For each subsequent year the average costs per unit are increased by 3%. Dividing the Budget by Project Type values by the Average Cost per Unit values produces the "Potential Units Funded" totals for each HIEE project type.

Table A.4. shows our detailed calculations for the reduced energy consumption and customer bill savings that would result from the energy efficiency upgrades calculated for each revenue scenario. The total units match the values found in Tables A.2 and A.3. The Energy Savings per Unit are based on research findings reported by the Virginia Center for Housing Research at Virginia Tech. Customer bill savings are based on Virginia's average electricity rate of $0.12 / kWh in 2021, increased by 2.17% per year in ensuing years, consistent with the statewide trend from 2002-2021.

Table A.2. Housing Model Details – Low Revenue Scenario

Year	Total HIEE Revenue ($Million)	Budget by Project Types			Average Cost per Unit			Potential Units Funded		
		ASNH-EE	WDR-SFH	WDR – MFH	ASNH-EE	WDR-SFH	WDR – MFH	ASNH-EE	WDR-SFH	WDR – MFH
2021	$113.82	$96.75	$14.51	$2.56	$12,190	$13,260	$2,170	7,936	1,094	1,180

GOVERNOR NORTHAM ANNOUNCES OVER $21 MILLION IN AFFORDABLE AND SPECIAL NEEDS HOUSING LOANS

July 8, 2021

FUNDING WILL SUPPORT NEW CONSTRUCTION AND REHABILITATION OF 1,266 AFFORDABLE AND PERMANENT SUPPORTIVE HOUSING UNITS

Governor Ralph Northam today announced more than $21 million in Affordable and Special Needs Housing loans for 24 projects across Virginia, creating or preserving 1,266 affordable housing units for low-income and extremely low-income households. The funding will improve access to affordable housing, reduce homelessness, provide permanent supportive housing options for individuals with intellectual and developmental disabilities, and complete energy efficiency updates in affordable housing units.

“Quality, affordable housing is the key to advancing equity, opportunity, and economic prosperity in every corner of our Commonwealth,” said Governor Northam. “The Affordable and Special Needs Housing program is an important resource for increasing access to safe and sustainable housing for low-income families, individuals with disabilities, and Virginians experiencing homelessness.”

The Virginia Department of Housing and Community Development (DHCD) administers Affordable and Special Needs Housing (ASNH) loans, which combine state and federal resources to provide a simplified and comprehensive application process. Funding comes from four main sources: the federal HOME Investment Partnerships Program, the federal National Housing Trust Fund (NHTF), the Virginia Housing Trust Fund (VHTF), and Housing Innovations in Energy Efficiency (HIEE) funds. In this round, DHCD awarded approximately $1.6 million in HOME funding, $1.1 million in NHTF funding, $12.6 million in VHTF funding, and $6.2 million in HIEE funding.

Governor Northam and the General Assembly invested an historic $70.7 million in the Virginia Housing Trust Fund this fiscal year, which provides financing for housing construction projects that create or preserve affordable housing units, reduce the cost of affordable housing, and increase homeownership. VHTF is a key source of

financing to support moderate- and-low-income families in addition to providing homeless reduction grants for rapid re-housing and longer-term housing solutions for individuals experiencing chronic homelessness.

“Providing housing stability and supporting programs to make homelessness rare, brief, and nonrecurring is more important now than ever as we turn the corner from this pandemic,” said Secretary of Commerce and Trade Brian Ball. “These loans will fill gaps in financing to make safe and affordable housing for our most vulnerable populations possible, which in turn strengthens our communities, our economy, and improves the lives of many Virginians across the Commonwealth.”

ASNH loans are awarded through a competitive process. Forty-one applications requesting over $45 million were received for this round of funding. Proposals were reviewed, evaluated, and scored with proposals ranked and award offers recommended to the highest-ranking proposals based on funding availability. The funded projects will leverage over $307 million in additional federal, state, local, and private lending resources.

2021 Spring Affordable and Special Needs Housing Awardees:

Friendship Court Phase I | Piedmont Housing Alliance
$1,500,000 (HIEE)
$200,000 (NHTF)
$200,000 (VHTF)
City of Charlottesville

Friendship Court Phase I is the new construction of 106 units in the phased redevelopment of the existing Friendship Court site in Charlottesville. This new construction will occur in greenspace so there will be no displacement during construction, and it will consist of both stacked townhomes and a multi-family building. Friendship Court was previously awarded funds through a competitive ASNH application, and this additional application supports the implementation of Zero Energy Ready Homes and Passive House certification standards, as well as permanent supportive housing units, which will provide select tenants with additional wraparound services on site.

Premier Circle Permanent Supportive Housing | Virginia Supportive Housing
$900,000 (VHTF)
$560,000 (HIEE)
Albemarle County

Premier Circle Permanent Supportive Housing is the construction of 80 units for formerly homeless and low-income adults from the Charlottesville region. Each studio unit will be approximately 350 square feet and contain a kitchen and full bathroom, and resident amenities include phone and computer rooms, laundry facilities, a fitness area, and free Wi-Fi. The building will have staff offices for on-site supportive services and property management, a front desk staffed 16 hours per day, and a night monitor unit. The entire building will meet Universal Design standards and EarthCraft Gold certification.

Southwood Affordable Homeownership | Greater Charlottesville Habitat for Humanity

$1,400,000 (VHTF)

Albemarle County

Southwood Affordable Homeownership is the construction of 16 single-family condo units, five single-family attached townhome units, four single-family duplex units, and one single-family detached unit. The 26 new homes will be constructed in the existing Southwood mobile home park and serve families relocating from substandard mobile homes in the park. The homes will serve residents at or below 60 percent of the Area Median Income (AMI).

Braddock Four Senior | Arlington Partnership for Affordable Housing

$700,000 (VHTF)

$655,000 (HIEE)

Fairfax County

Braddock Four Senior is the new construction of a four-story building housing 44 senior housing units. All residents will have in-unit washers and dryers, free Wi-Fi, and access to a business center, fitness room, and wellness suite. The building will have on-site property management and leasing, bilingual resident services, and active outreach to residents at risk of eviction to enable immediate and long-term stability. All units are accessible via Universal Design and are available to seniors with incomes less than 60 percent of the AMI. Braddock Four will be co-located with another senior housing community, Braddock Nine Senior.

Braddock Nine Senior | Arlington Partnership for Affordable Housing

$700,000 (VHTF)

$555,000 (HIEE)

Fairfax County

Braddock Nine Senior is the new construction of a four-story building housing 36 senior housing units. All residents will have in-unit washers and dryers, free Wi-Fi, and access to a business center, fitness room, and wellness center. The building will have on-site property management and leasing, bilingual resident services, and active outreach to residents at risk of eviction to enable immediate and long-term stability. All units are accessible via Universal Design. Four units will be available to very-low income seniors with incomes less than 30 percent of the AMI, 14 will be available to those with incomes less than 50 percent of the AMI, and the remaining will be reserved for seniors with incomes less than 60 percent of the AMI.

Bickerstaff Crossing | Surber Development and Consulting, LLC

$637,052 (VHTF)

$590,835 (HIEE)

Henrico County

Bickerstaff Crossing is the new construction of one building containing 60 two- and three-bedroom rental units serving individuals or families earning less than 30, 50, and 60 percent of the AMI. All units will be built to meet Universal Design standards and with Energy Star appliances, and five units will be fully accessible and marketed

to individuals with disabilities. The building will be EarthCraft certified, contain community space, an on-site leasing office, and shared laundry, and each unit will have washer and dryer connections. Through its established adult programs, nonprofit Soar365 will provide support services and training and education programs to residents. The building will be served by a Tenants Council.

Powhatan Terrace Townhomes | Housing Partnership, Inc.
$700,000 (VHTF)
$500,000 (NHTF)
James City County

Powhatan Terrace Townhomes is the new construction of 36 two- and three-bedroom rental townhomes spread across six two-story buildings, one of which includes a community room with free Wi-Fi for residents. The site also features a playground, greenspace, and a walking path. Five units will meet Universal Design requirements and all buildings will meet Energy Star standards. Colonial Behavioral Health will provide permanent supportive housing services to residents with intellectual or developmental disabilities or serious mental illness. Housing and financial counseling services will be available to all residents. The development will serve individuals and families with incomes less than 60 percent of the AMI.

Poplar Creek Homes 2 | Southside Outreach Group
$900,000 (HOME)
$270,000 (HIEE)
Town of South Boston

Poplar Creek Homes 2 is the new construction of 16 duplexes that will have 32 units of rental housing in a new subdivision. These two-story units will be comprised of one-, two-, and three-bedroom homes on a 1/5 acre lot with their own driveways and will meet EarthCraft Gold standards and the Department of Energy's Zero Energy Ready Homes program.

South First Phase One | Charlottesville Redevelopment and Housing Authority
$434,000 (HIEE)
$250,000 (NHTF)
$250,000 (VHTF)
City of Charlottesville

South First Street Phase One is the new construction of 62 one-, two-, and three-bedroom apartment units across three garden-style apartment buildings. The development includes substantial indoor community resource space programmed and designed by residents. Outdoor amenity spaces and access to trails and recreational space along Pollack's Branch will be available for residents and the surrounding community. The buildings will be EarthCraft Gold certified, meet passive-house standards, and support a photovoltaic array.

Newport Gardens | The Hanson Company
$850,000 (VHTF)
City of Norfolk

Newport Gardens is the new construction of 50 apartments in the Park Place neighborhood. The single building of one- and two-bedroom apartments will be EnergyStar-certified and include a gym, community space, and laundry facilities. Individual units will have granite countertops, hardwood floors, and ceramic tile as well as full size appliances and washer and dryer connections.

Crescent Halls | Charlottesville Redevelopment and Housing Authority

$735,000 (HIEE)

$100,000 (VHTF)

City of Charlottesville

Crescent Halls is the substantial rehabilitation of an eight-story building comprised of 105 apartment units for lower-income seniors in Charlottesville. This renovation includes new unit layouts, finishes, plumbing fixtures and appliances, building-wide mechanical systems and windows, elevator modernization, and roofing that will support a photovoltaic array. The renovated units will continue to serve seniors and disabled residents, providing better access through the retrofitting of 11 units that will include roll-in showers, grab bars, roll under sinks, and front controls on ranges. Renovations will also address necessary repairs to asphalt paving and create accessible parking and building routes.

Holly Court | Community Housing Partners

$700,000 (VHTF)

Lancaster County

Holly Court is the substantial rehabilitation of 40 one-bedroom senior apartments across three one-story buildings in Kilmarnock. All units will meet Universal Design standards and five units will have additional design for accessibility under Section 504. Two units will be designed to serve residents with hearing or visual impairments. Improvements include a new roof, gutters, and downspouts, replacement of cabinets, countertops, appliances, lighting and bath fixtures, installation of low-flow faucets, shower heads, and toilets as well as the replacement of the existing HVAC and water heater systems. The building will be EarthCraft Gold certified.

Goose Creek Crossing | Hill Tide Housing Investments, LLC

$700,000 (VHTF)

Augusta County

Goose Creek Crossing is the new construction of 116 units of two- and three-bedroom rental apartments across a 6.6 acre site in Staunton. The site will include a community building with an exercise area, computer room, laundry facilities, and management and maintenance offices. A playground and picnic shelter for residents will be on site and Commonwealth Catholic Charities will provide resident services such as homeownership and financial counseling and employment services. All buildings in the development will be EarthCraft Gold certified for efficiency.

Oak Terrace | Hill Tide Housing Investments, LLC

$700,000 (VHTF)

City of Suffolk

Oak Terrace is the new construction of 120 two- and three-bedroom apartments across five three-story buildings in Suffolk. The construction will be built to EarthCraft standards and include a playground and picnic shelter, a community building with laundry facilities, a computer room, and exercise area. Forty units will meet Universal Design requirements, and 12 units will be ADA-compliant with three units equipped to serve individuals with sensory impairments. Commonwealth Catholic Charities will provide financial coaching and education and employment services to tenants.

Aaron Mills Apartments | Landmark Asset Services, Inc.

$700,000 (VHTF)

City of Martinsville

Aaron Mills Apartments is the new construction of 52 one- and two-bedroom senior apartments in a single building. Every unit and all common areas will meet Universal Design standards, and the building will be EarthCraft certified. The site includes a community room with free Wi-Fi, a business center with computers and printer, an exercise room, on-site laundry facilities, a covered picnic shelter with tables and a grill, and planting gardens. Units will be equipped with LED light fixtures, energy efficient appliances and mechanical systems, front-control ranges, and in-unit washer and dryer hookups.

Brook Villas | Mark-Dana Corporation

$175,000 (HIEE)

$175,000 (HOME)

$175,000 (NHTF)

$175,000 (VHTF)

Henrico County

Brook Villas is the new construction of 84 units of one-, two-, and three-bedroom low-rise apartments in Henrico County. The apartments will be built to EarthCraft Gold standards and all 28 first floor units will meet Universal Design requirements. All apartments will be built to allow high speed internet connectivity and will have washer and dryer connections. Community laundry machines will be provided and there will be on-site leasing, a community room and fitness facilities, and financial counseling and job search services available to tenants.

Magnolia Place Apartments | TM Associates Management, Inc.

$700,000 (VHTF)

Nottoway County

Magnolia Place Apartments is the substantial rehabilitation of 56 one-bedroom senior garden-style apartments. All units will be renovated to meet Universal Design standards and will have a dishwasher. Renovations include structural work, installation of free Wi-Fi in the community building, and apartments will have WaterSense fixtures and EnergyStar appliances installed to complement the new mechanical systems, cabinets, vanities, countertops, fixtures, and appliances. The buildings will be EarthCraft Gold certified. This development will continue to serve seniors with incomes less than 50 percent of the AMI.

Dupuy Road Project | Maggie Walker Community Land Trust

$700,000 (VHTF)

Chesterfield County

Dupuy Road is the new construction of 10 three-bedroom, single family affordable homes on the site of the former Ettrick Elementary School Annex. These homes will be built in partnership with project:Homes to meet EarthCraft standards. The site will include the installation of a road, utilities, walking paths, and greenspace.

Quarry Station | Wesley Housing

$700,000 (VHTF)

City of Manassas

Quarry Station is the substantial rehabilitation of 79 units of existing one- and two-bedroom senior apartments. This renovation allows for individuals with incomes less than 40 percent of the AMI to qualify for further reduction in rent while also increasing livability of the building. The renovation scope will include improvements to HVAC systems, installation of new water-saving fixtures, improvements to the accessibility and durability of common area spaces, the addition of a single one-bedroom unit, and upgrades to the parking lot and outdoor areas.

Lambert Landing II | Woda Cooper Companies, Inc.

$700,000 (VHTF)

Chesterfield County

Lambert Landing II is the new construction of 48 family apartment units comprised of 40 two-bedroom apartments and eight three-bedroom units in a single four-story garden apartment building. The apartments will have an open layout, ample storage and closets, and unit amenities including central air conditioning, dishwashers, garbage disposals, and full-size kitchen appliances. The building will be EnergyStar certified.

Cool Lane Apartments | Virginia Supportive Housing

$602,000 (HIEE)

Henrico County

Cool Lane Apartments is the adaptive re-use of a vacant building in Henrico County. Virginia Supportive Housing will renovate the former assisted living facility into permanent supportive housing for homeless and low-income individuals. The existing structure will be redesigned and adapted to create 86 units for homeless and low-income individuals earning less than 50 percent of the AMI from Henrico County and the City of Richmond.

Canterbury Subdivision Phase II | Greater Fredericksburg Habitat for Humanity

$500,000 (HOME)

City of Fredericksburg

Canterbury Subdivision Phase II is the new construction of five single-family homes in the Mayfield neighborhood in Fredericksburg. To accommodate five new affordable homes in the existing market-rate community, the neighborhood streets, including power lines, the sewer system, and the road will be extended. Homes will be built

to EnergyStar standards, lowering the ongoing costs to homeowners, and will be sold to families making less than 60 percent of the AMI. Homebuyers will be provided with pre- and post-closing homeownership and financial counseling and will perform ‘sweat equity’ to contribute to the construction of their home.

Oak Street Aging in Place | Community Havens, Inc.

$400,000 (VHTF)

City of Manassas

Oak Street Aging in Place is the new construction of a single-level, fully ADA-accessible home with six bedrooms and adjoining baths. The site already serves five individuals in a two-story home that is not ADA-compliant. This new construction will serve individuals with intellectual or developmental disabilities who have escalating needs as they age. Residents will be able to participate in activities such as gardening and meal preparation. Once demolition of the older structure is complete, residents will have ample space for yard games and activities.

Fairview Town Homes Energy Efficiency | Helping Overcome Poverty’s Existence, Inc.

$84,000 (HIEE)

Town of Wytheville

The Fairview Town Homes Energy Efficiency project will create 12 two-bedroom units with four units reserved for permanent supportive housing. These townhomes will be part of a larger 51-unit redevelopment effort at the former Woodlawn School. The permanent supportive housing services will be provided through a memorandum of understanding with Mount Rogers Community Services.

EQUAL HOUSING OPPORTUNITY

GOVERNOR NORTHAM ANNOUNCES OVER $60 MILLION IN AFFORDABLE AND SPECIAL NEEDS HOUSING LOANS

January 13, 2022

FUNDING WILL SUPPORT NEW CONSTRUCTION AND REHABILITATION OF OVER 2,500 AFFORDABLE AND SPECIAL NEEDS HOUSING UNITS

Governor Ralph Northam today announced more than $60 million in Affordable and Special Needs Housing loans for 42 projects across the Commonwealth, creating or preserving 2,552 affordable housing units for low-income and extremely low-income households. The funding will improve access to energy efficient affordable housing, reduce homelessness, provide permanent supportive housing options for individuals with intellectual and developmental disabilities, and complete energy efficiency updates in affordable housing units.

“Quality, affordable housing is essential to building vibrant communities and ensuring every Virginian has the opportunity to thrive,” said Governor Northam. “We must keep investing in the Commonwealth’s stock of affordable housing, and the Affordable and Special Needs Housing programs will continue to be a vitally important resource for vulnerable Virginians. In addition to its tremendous work supporting affordable housing, community development, and other priorities, DHCD has led our programs to keep people in their homes and support small businesses during the pandemic. I want to thank DHCD Director Erik Johnson for his superb leadership of the agency, especially during the past 22 months. He has led an outstanding and creative team in finding innovative ways to help people during a challenging time.”

The Virginia Department of Housing and Community Development administers Affordable and Special Needs Housing loans, which combine state and federal resources to provide a simplified and comprehensive application process. Funding comes from four main sources: the federal HOME Investment Partnerships Program, the National Housing Trust Fund, the Virginia Housing Trust Fund, and Housing Innovations in Energy Efficiency funds.

Governor Northam and the General Assembly invested a historic $55 million in the Virginia Housing Trust Fund this fiscal year. VHTF provides financing for housing construction projects that create or preserve affordable housing units, reduce the cost of affordable housing and increase homeownership. This funding is a key source of

financing for these affordable housing initiatives to support moderate-and-low-income families, as well as supporting homeless reduction grants to provide rapid re-housing and longer-term housing solutions for individuals experiencing chronic homelessness.

“Housing stability is more important now than it has ever been as we turn the corner on this pandemic,” **said Secretary of Commerce and Trade Brian Ball.** “These projects will help address the affordable housing needs of the Commonwealth, protect our most vulnerable, strengthen our communities, and support our economy.”

Affordable and Special Needs Housing loans are awarded through a competitive process. Fifty-five applications requesting more than $79 million were received for this round of funding. Proposals were reviewed, evaluated, and scored with proposals ranked and award offers recommended to the highest-ranking proposals based on funding availability. The funded projects will leverage over $651 million in additional federal, state, local and private lending resources.

2021 Fall Affordable and Special Needs Housing Awardees:

ASPIRE | TRG Community Development LLC

$900,000 (VHTF)

$900,000 (NHTF)

$1,764,819 (HIEE)

City of Norfolk

The ASPIRE project consists of demolition and new construction of 85 apartment units in downtown Norfolk to serve families with area median incomes (AMI) between 40% and 80%. The project will accept project-based vouchers for 21 units and will have six permanent supportive housing units.

Southwood Apartments A | Piedmont Housing Alliance

$1,600,000 (HIEE)

$900,000 (NHTF)

$900,000 (VHTF)

Albemarle County

Southwood Apartments A will be a new construction of 70 rental units in Albemarle County. These one-, two- and three- bedroom units will be available for households earning between 30% and 60% AMI. Eight units will have project-based vouchers and six units will be designated for permanent supportive housing. Piedmont Housing is working with a partner to include an onsite Head Start program for residents.

Choice Neighborhood III-R| Newport News Redevelopment and Housing Authority

$700,000 (VHTF)

$700,000 (NHTF)

$2,000,000 (HIEE)

City of Newport News

Choice Neighborhood III-R is a new construction rental project consisting of four buildings for a total of 71 units located in Newport News.

Choice Neighborhood IV-R | Newport News Redevelopment and Housing Authority

$700,000 (VHTF)

$700,000 (NHTF)

$2,000,000 (HIEE)

City of Newport News

Choice Neighborhood IV-R is a new construction rental development with 84 apartments located in Newport News.

Arna Marbella | Arlington Partnership for Affordable Housing

$700,000 (VHTF)

$2,000,000 (HIEE)

Arlington County

Arna Marbella is the renovation of 163 rental units between two properties, Marbella Apartments and Arna Valley View, in Arlington County. The project will include onsite bilingual resident services and free Wi-Fi in each unit.

Premier Circle | Virginia Supportive Housing

$900,000 (HOME)

$900,000 (NHTF)

$714,909 (HIEE)

Albemarle County

Premier Circle is the new construction of 80 units of permanent supportive housing for formerly homeless and low-income adults from the Charlottesville region. Each studio unit will be approximately 350 square feet and contain a kitchen and full bathroom. Resident amenities include phone, computer rooms, a fitness room, laundry facilities and free Wi-Fi. The building will contain staff offices for on-site supportive services and property management, a front desk staffed 16 hours per day and a night-monitor unit.

Middlebrook Trace | Taft-Mills Group

$900,000 (VHTF)

$899,530 (NHTF)

$697,470 (HIEE)

City of Staunton

Middlebrook Trace is the new construction of 82 rental units in Staunton. Eight units will be reserved for permanent supportive housing, and 15 units will accept project-based vouchers. The project will include two- and three-bedroom units. The project will include services to tenants with intellectual and/or developmental disabilities.

CRHA South First Phase Two | Charlottesville Redevelopment and Housing Authority

$400,000 (NHTF)

$2,000,000 (HIEE)

City of Charlottesville

South First Phase Two is a new construction project of 113 rental units in Charlottesville. The project includes one-, two-, three- four-, and five-bedroom apartments across 21 buildings. Fifty-eight of the units will have either a Section 8 or Section 9 subsidy. The project will include a program, in partnership with the Charlottesville Office of Economic Opportunity and Piedmont Virginia Community College, to provide job training. The development also includes substantial indoor community resource space, outdoor amenity spaces, access to trails and recreational space along Pollack's Branch.

Arbors at Birchwood | Marlyn Development Corporation

$100,000 (VHTF)

$2,000,000 (HIEE)

City of Virginia Beach

Arbors at Birchwood is a new construction rental unit development for elderly persons 62 and older on 4.92 acres in Virginia Beach. This project will consist of 150 units designed to meet accessibility needs of residents.

Fairfax Hall | South River Development Corporation

$350,000 (VHTF)

$350,000 (NHTF)

$1,300,000 (HIEE)

City of Waynesboro

Fairfax Hall is an existing project serving primarily senior households in an historic structure in the former Brandon Hotel. This project proposes to retrofit the existing 54 apartments to meet physical accessibility requirements and promote universal access. This project aims to improve energy and operating efficiency by replacing outmoded systems, adding insulation and minimizing water waste. The project has 12 project-based vouchers through Waynesboro Redevelopment and Housing Authority.

Southwood Apartments B | Piedmont Housing Alliance

$900,000 (VHTF)

$1,075,000 (HIEE)

Albemarle County

Southwood Apartments B is a new construction of 51 rental units in Albemarle County. All units will be available for households at or below 60% AMI, with four designated permanent supportive housing units. Piedmont Housing is working with a partner to include an onsite Head Start program for residents.

Watermark Gardens | Surber Development and Consulting LLC

$600,925 (VHTF)

$600,925 (NHTF)

$638,150 (HIEE)

Chesterfield County

Watermark Gardens is the new construction of 80 rental units in Chesterfield. The project will provide services to tenants with intellectual and/or developmental disabilities and the project will accept project-based vouchers.

Horner | Better Housing Coalition

$900,000 (VHTF)

$900,000 (HOME)

Chesterfield County

Horner is the new construction of a 49-unit apartment building in Chesterfield County, comprised of one-, two- and three-bedroom apartments serving families with incomes up to 60% AMI. This development is designed to be pedestrian friendly with well-lit sidewalks, a walking trail, and both active and passive recreation sites. Residents will have access to a fitness room and a community room, which will be programmed with financial literacy classes.

The Villas on Main | Cumberland Plateau Redevelopment and Housing Authority

$450,000 (HOME)

$450,000 (VHTF)

$450,000 (NHTF)

$347, 550 (HIEE)

Russell County

The Villas on Main is a new construction independent residential facility project consisting of 21 units across 10 buildings located in Lebanon. All 21 units will meet Universal Design Standard and include patios and front gardens for the residents. The Villas on Main will serve low-income seniors and disabled persons. The Villas on Main will partner with local service providers to bring supportive services and partner with local agencies to provide transportation for residents.

Townhomes at Liberty Place | Cantebury Enterprises

$700,000 (VHTF)

$900,000 (HOME)

City of Richmond

The Townhomes at Liberty Place are the new construction of 39 rental townhomes in Richmond. The townhomes will consist of a mix of one-, two- and three-bedroom units and for families with incomes between 40-60% AMI. All units will meet Universal Design standards.

Colbrook | Better Housing Coalition

$700,000 (VHTF)

$700,000 (HOME)

Chesterfield County

Colbrook is the adaptive reuse of the historic Colbrook Motel to provide 47 affordable apartments in Chesterfield County. There will be a mix of one-, two- and three-bedroom units. Five units will be set aside for Chesterfield Community Service Board (CSB) clients who will receive rental assistance through the CSB. This project will include a standalone building to provide community space and a museum to honor the motel's previous appearance in the “Green Book,” a travel guide for African Americans during segregation.

Brinshore Block 17 | Brinshore Development, LLC

$700,000 (VHTF)

$700,000 (NHTF)

City of Norfolk

Block 17 Apartments is part of a HUD Choice Neighborhood Initiative and will consist of 68 newly constructed rental units in Norfolk. These units will be a mix of market-rate units and units dedicated for families earning between 30-60% AMI. The units will come with free Wi-Fi and residents will have access to Crestar Health, a nearby Mental Health Clinic, at no cost.

Brinshore Block 18 | Brinshore Development, LLC

$700,000 (VHTF)

$700,000 (NHTF)

City of Norfolk

Block 18 Apartments is part of a HUD Choice Neighborhood Initiative and will consist of 72 newly constructed rental units in Norfolk. These units will be a mix of market rate units and units dedicated for families earning between 30%-60% AMI. Block 18 Apartment residents will have access to Crestar Health, a nearby Mental Health Clinic, at no cost.

Spring Creek, Coleman and Cleveland | Greater Charlottesville Habitat for Humanity

$700,000 (HOME)

$700,000 (VHTF)

Louisa County and City of Charlottesville

Spring Creek, Coleman and Cleveland is a new construction home-buyer project consisting of eight units among three sites. Spring Creek is located in Louisa County, and Coleman Court/Cleveland Avenue is located in the city of Charlottesville. Spring Creek consists of four single-family, four-bedroom homes sitting on .25 acre lots. Coleman Court and Cleveland will consist of two duplex units located within established neighborhoods in Charlottesville. All eight homebuyer units will incorporate Universal Design concepts.

Bellwood Crossing | Hill Tide Investments

$700,000 (VHTF)

$700,000 (NHTF)

Chesterfield County

Bellwood Crossing is a new construction rental property, and this development will consist of 102 units with one- and two-bedroom options. Of the total units, 15 will be allocated for veterans, and up to 10 units will be available for lease through the Chesterfield County Community Services Board. All units will prioritize persons on the public housing waiting list and/or Section 8 of the Richmond Redevelopment and Housing Authority.

Ashlake Trails | Mark-Dana Corporation

$700,000 (VHTF)

$700,000 (HIEE)

Chesterfield County

Ashlake Trails is a low-rise new construction rental development for seniors (55+) comprised of 67 units. The project will consist of 36 one-bedroom units and 31 two-bedroom units. Each unit will be provide free individual Wi-Fi access.

Saint Elizabeth Apartments | Commonwealth Catholic Charities

$800,000 (VHTF)

$500,000 (NHTF)

City of Richmond

Saint Elizabeth Apartments is the new construction of 56 apartments comprised of studios, one-, two-, and three-bedroom units across15 buildings. The apartments would serve families with incomes between 30% and 60% AMI, and would have a community building, playground, and on-site rental office. Six units will be reserved for individuals living with HIV/AIDS that receive HOPWA tenant-based vouchers as well as financial counseling and case management.

Winchester Forest 4 | Better Housing Coalition

$350,000 (VHTF)

$915,000 (HIEE)

Chesterfield County

Winchester Forest 4 is the new construction of 88 one-, two- and three-bedroom rental apartments in North Chesterfield County. Winchester Forest 4 is an expansion of Winchester Greens and Market Square. Site-based services will be provided to improve residents' academic, health and economic outcomes.

Grande Oak III | Surber Development

$375,062 (VHTF)

$375,062 (NHTF)

$499,875 (HIEE)

City of Williamsburg and York County

Grande Oak III is the new construction of 49 rental units in York County. The project has two-bedroom apartments, all of which will fit Universal Design standards and be actively marketed towards people with disabilities.

Wellesley | Community Housing Partners

$900,000 (VHTF)

$285,000 (HIEE)

City of Newport News

Wellesley is the substantial renovation of an existing three-story, 40-unit building in Newport News. All units will serve residents over the age of 55, with an income at or below 50% AMI. All units will be occupied by households receiving project-based Section 8 vouchers. The proposed acquisition and rehabilitation will include but is not limited to new flooring, roofing, windows, mechanical systems, appliances, cabinetry, kitchen and bathroom fixtures.

Cross Creek Rehab | Community Housing Partners

$600,000 (VHTF)

$546,000 (HIEE)

City of Portsmouth

Cross Creek Rehab is an existing affordable multifamily development in the city of Portsmouth comprised of 78 two- and three-bedroom garden-style apartments, which will serve families with incomes between 40-80% AMI. Seven units will be reserved for permanent supportive housing and eight for project-based vouchers. This project proposes new flooring, windows, mechanical systems, appliances and fixtures and increased accessibility for eight units.

HRHA Lineweaver Annex Renovation | Harrisonburg Housing and Redevelopment Authority

$900,000 (VHTF)

$230,000 (HIEE)

City of Harrisonburg

The Lineweaver Annex is an extensive rehabilitation rental project located in downtown Harrisonburg. This rehabilitation consists of 60 one-bedroom units designated for the elderly and persons with disabilities, and 20 of the 60 units will be reserved for permanent supportive housing.

Grayson Manor | Community Housing Partners

$900,000 (VHTF)

$161,180 (HIEE)

Grayson County

Grayson Manor is an existing 32-unit affordable senior development with one-bedroom, garden-style units. This project will acquire and renovate Grayson Manor, with rehabilitation to include new flooring, windows, mechanical systems, fixtures and appliances. In addition, five units will be made more accessible. The units will serve seniors with income at or below 60% AMI.

Leggett Building Apartments | Taylor Hollow Construction

$700,000 (HOME)

$239,700 (HIEE)

City of Radford

The Leggett Building Apartments will convert the former Leggett Building in Radford into 11 mixed-income rental units. Seven of the units will be for households earning up to and between 50% and 60% AMI, and four will be market rate. The project will include free broadband access for tenants and is located in downtown Radford.

Mt. Sterling Nine | Arlington Partnership for Affordable Housing

$900,000 (VHTF)

Loudoun County

Mt. Sterling Nine is the new construction of 48 rental units for seniors in Loudoun County. The project will be a mix of one- and two-bedroom apartments. Residents will have access to free Wi-Fi in unit and communal spaces, as well as access to community amenities, such as a business center and a fitness and wellness suite. Five units will be available for seniors at 30% AMI and the remaining 43 will be available for seniors at 50% AMI.

Oak Terrace | Hill Tide Housing Investments, LLC

$700,000 (VHTF)

City of Suffolk

Oak Terrace is the new construction of 120 two- and three-bedroom apartments across five three-story buildings in Suffolk. The buildings will be built to EarthCraft standards and include a playground, picnic shelter, a community building with laundry facilities, a computer room and exercise room. Twelve units will comply with ADA requirements, with three units equipped to serve individuals with sensory impairments. Commonwealth Catholic Charities will provide financial coaching, education and employment services to tenants.

Goose Creek Crossing | Hill Tide Housing Investments, LLC

$700,000 (VHTF)

City of Staunton

Goose Creek Crossing is the new construction of 116 units of two- and three-bedroom rental apartments across a 6.6 acre site in Staunton. The site will include a community building with an exercise room, computer room, laundry facilities, and management and maintenance offices. A playground and picnic shelter for resident use will also be onsite. The development will be served by Commonwealth Catholic Charities to provide resident services such as homeownership, financial counseling and employment services.

Expanding Affordable Housing 2020-2021 | Richmond Habitat for Humanity

$700,000 (VHTF)

City of Richmond

Expanding Affordable Housing is the new construction of eight affordable homes. The scattered-site homes will be available for purchase by families earning up to between 40% and 80% AMI. All homes will be built to EarthCraft and Energy Star standards and four will be built to meet Universal Design standards.

Mecklenburg Manor | NFP Affordable Housing Corporation

$700,000 (VHTF)

Mecklenburg County

Mecklenburg Manor is an extensive rehabilitation of an existing Section 8 and family complex. This rehabilitation will consist of eight buildings for a total of 51 units. This project will continue to prioritize Section-8 applicants, located in South Hill. Upon completion the project will be Enterprise Green Communities certified.

Sweetbriar II Apartments 2021 | People Inc. Housing Group

$517,000 (HIEE)

Washington County

Sweetbriar II Apartments is a new construction rental development located in Abingdon. This development will consist of 22 units in 11 duplex-style buildings and comprised of two- and three-bedroom garden-style townhome units. Five of the garden-style units will be fully accessible, and six will include Universal Design features. The accessible units will be subsidized with project-based Mainstream Vouchers with prioritization of low-income households with disabilities.

Covenant Heights VII | Hope Community Builders

$500,000 (HOME)

Rockingham County

Covenant Heights will consist of eight new construction homebuyer units in two buildings located in Rockingham County. These units will be used to help low-income and first-time homebuyers.

Cool Lane Apartments | Virginia Supportive Housing

$466,872 (HIEE)

Henrico County

Cool Lane Apartments is the adaptive re-use of a vacant building located in Henrico County. The project will renovate the former assisted living facility into permanent supportive housing for homeless and low-income individuals. The existing structure will be redesigned and adapted to create 86 units for homeless and low-income individuals earning 50% or less AMI from Henrico County and the city of Richmond.

Fifeville Rehab | Piedmont Housing Alliance

$300,000 (VHTF)

$32,500 (HIEE)

City of Charlottesville

Fifeville Rehab is the rehabilitation of five vacant units across three buildings in Charlottesville for the sale to households at or below 50% AMI. Improvements to the properties include the addition of solar panels, the modernization of kitchens and upgrades to promote energy-efficiency and home health.

712-714 High Street | Southside Community Housing and Development Corporation

$300,000 (HOME)

City of Petersburg

High Street is the new construction of 12 rental units in Petersburg. The one-, two- and three-bedroom apartments will be targeted for households earning up to and between 30% and 80% AMI. This project will contribute two permanent supportive units to the region. Two of the units will be accessible for physically impaired persons. This project will accompany the 714 High Street project already funded by ASNH, bringing 22 total units, 12 of which are permanent supportive housing.

Holly Court | Community Housing Partners

$231,220 (HIEE)

Lancaster County

Holly Court is the substantial rehabilitation of 40 one-bedroom senior apartments across three one-story buildings in Kilmarnock. All units will meet Universal Design standards, and five units will have additional design for accessibility under Section 504. Two units will be designed to serve residents who have hearing or visual impairments. Improvements include a new roof, gutters, downspouts, replacement of cabinets, countertops, appliances, lighting and bath fixtures, installation of low-flow faucets, shower heads, toilets and the replacement of the existing HVAC and water heater systems.

Mt. Sterling Four | Arlington Partnership for Affordable Housing

$200,000 (VHTF)

Loudoun County

Mt. Sterling Four is the new construction of 50 rental units for seniors in Loudon County. The project will be a mix of one- and two-bedroom apartments. Residents will have access to free Wi-Fi in unit and communal spaces, as well as access to community amenities, such as a business center and a fitness and wellness suite. Five units will be available for seniors at 30% AMI and five units will be available for seniors at 50% AMI, with the remaining 40 available for seniors at 60% AMI. Mt. Sterling Nine will be co-located with Mt. Sterling Nine.

Armstrong Renaissance | Better Housing Coalition

$200,000 (VHTF)

City of Richmond

Armstrong Renaissance is a new construction project of 36 homes for purchase in Richmond. Twenty-eight of the units will be at market rate, and eight will be for homebuyers at or below 80% AMI. The project provides $15,000 in down payment assistance to eligible homebuyers. The development is next to a new supermarket, a community college and a library.

GOVERNOR YOUNGKIN ANNOUNCES OVER $93 MILLION IN AFFORDABLE AND SPECIAL NEEDS HOUSING LOANS

March 10, 2023

FUNDING WILL SUPPORT NEW CONSTRUCTION AND REHABILITATION OF OVER 3,936 AFFORDABLE AND SPECIAL NEEDS HOUSING UNITS

Governor Glenn Youngkin today announced more than $93 million in Affordable and Special Needs Housing loans for 57 projects across the Commonwealth. The recommended projects will create and preserve 3,936 total units for low-income and extremely low-income households, including 298 permanent supportive housing, 3,825 rental units and 111 units for sale as homeownership opportunities.

“Increasing Virginia’s supply of attainable, affordable and accessible housing is foundational to strengthening Virginia’s economy, and furthers my administration’s Make Virginia Home Plan,” said Governor Glenn Youngkin. “These awarded projects will create and preserve almost 4,000 units of affordable, quality housing for our most vulnerable residents.”

The Virginia Department of Housing and Community Development (DHCD) administers Affordable and Special Needs Housing (ASNH) loans, which combines state and federal resources to provide a simplified and comprehensive application process. Funding comes from four main sources: the federal HOME Investment Partnerships Program, the federal National Housing Trust Fund (NHFT), Housing Innovations in Energy Efficiency (HIEE), Permanent Supportive Housing (PSH) state funds and the Virginia Housing Trust Fund (VHTF).

VHTF is provided by the General Assembly and supports financing for housing construction projects that create or preserve affordable housing units, reduce the cost of affordable housing and increase homeownership. This funding is a key source of financing for these affordable housing initiatives to support moderate- and low-income families, as well as supporting homeless reduction grants to provide rapid re-housing and longer-term housing solutions for individuals experiencing chronic homelessness.

“Stable and affordable housing is vital to building a thriving economy, and we are aligning housing development resources to holistically fill this need across Virginia,” said Secretary of Commerce and Trade Caren Merrick. “Increasing the supply of affordable housing is integral to our economic development efforts as we continue to build an economy that works for all Virginians.”

Affordable and Special Needs Housing loans are awarded through a competitive process. Sixty-one applications were received for this round of funding, requesting more than $108 million. The funded projects will leverage over $1.39 billion in additional federal, state, local and private lending resources. To learn more about the ASNH program, visit www.dhcd.virginia.gov/asnh.

ENERGY + ENVIRONMENT GOVERNMENT + POLITICS

Flood Fund future uncertain as Youngkin pushes for carbon market withdrawal

State racks up $203 million for flood protection from RGGI revenues

BY: **CHARLIE PAULLIN** - SEPTEMBER 30, 2022 12:02 AM

Increased precipitation and sea level rise are leading to more frequent flooding in Virginia. (NBC12)

In January, strong winds led to high tides drowning parts of Hampton. Some roads were impassable, with water levels rising to near the top tread of the tires. Almost two years prior, stormwater had led to flooding severe enough to sweep parked cars down the roadways.

With climate change driving sea levels up and altering rainfall patterns, Hampton is certain to continue to be hit by flooding. What's less certain is where it will get funding to combat it.

Over the past two years, Virginia has accumulated over $200 million for flood protection from the state's participation in the Regional Greenhouse Gas Initiative. But the future of that funding pool is in doubt as Republican Gov. Glenn Youngkin has made it clear he wants to leave the initiative.

Gov. Glenn Youngkin. (Ned Oliver / Virginia Mercury)

"RGGI is a bad deal for Virginia," said Travis Voyles, acting secretary of natural and historic resources, when he outlined the administration's plans for withdrawing Virginia from RGGI at the end of last month.

RGGI is the 11-state cap-and-invest program in which energy producers must buy allowances at auction for the carbon they emit, and a cap is placed on overall carbon emissions.

The proceeds of those auctions are returned to the state. In Virginia, half is directed to low-income energy efficiency programs, while 45% goes toward the Community Flood Preparedness Fund, a pool of money that provides flood assistance to communities and local governments.

Including the latest sale of allowances on Sept. 7, Virginia has received some $452 million from RGGI, meaning $203 million will go toward flood resiliency efforts.

Local flood protection

Whether flooding occurs on Virginia's coast from sea level rise or in its inland areas from rainfall increases, the impacts are real, said Skip Stiles, executive director of Wetlands Watch, a Norfolk-based nonprofit working to address sea level rise adaptation, floodplain management and other waterway impacts.

Prior to Virginia joining RGGI in 2020 – a Democratic priority during the party's brief period in power – flood protection was left up to local and regional planning bodies, with no central pool of funds governments could draw from. Since the state joined, the Department of Conservation and Recreation, which administers the Flood Fund, has begun paying out grants from the revenues.

"Before Virginia joined RGGI there were ZERO state dollars going toward these resilience efforts," said Stiles in an email.

Any state spending on these efforts through the Virginia Coastal Zone Management Program, Virginia Sea Grant or the Virginia Department of Emergency Management used money derived from federal agencies, he said.

“We have to assume that if we leave RGGI we will return to that low-priority status for this work,” Stiles said.

The Flood Fund has proved to be “absolutely helpful” to combat problems linked to climate change, particularly stormwater issues and sea level rise, said City of Hampton Resiliency Officer Carolyn Heaps-Pecaro.

“We have a lot of projects lined up,” she said. “We have a lot of ideas for how to fix the town. We need that money to actually make them a reality.”

Hampton was the largest recipient of the second round of grants announced in December from the proceeds, receiving about a third of the $24.5 million the Flood Fund paid out. The projects that were funded included plans for elevating a roadway, improving drainage canals and reducing nutrient pollution.

Millions in local funding is needed to complete the projects, but the state funds help cover design and engineering costs to begin them, Heaps-Pecaro said.

“Several of these projects probably would not have moved forward nearly as quickly as they did had we not received the grant funding,” she said.

Flood Fund dollars also go toward projects outside of coastal areas. In the first round of grants, announced in October 2021, $400,000 was awarded to Buchanan County.

An underpass in Big Rock, Buchanan County, on Aug. 31, 2021. (Sarah Vogelsong / Virginia Mercury)

The Southwestern Virginia locality had been slammed with devastating floods the prior August. The region also suffered severe flooding this July and, according to a Thursday morning update from the National Hurricane Center and Central Pacific Hurricane Center, could lie in the pathway of Hurricane Ian.

The Buchanan funding is intended to go toward an engineering analysis that would lead to a local flood resilience plan and training for a staff member to become a certified floodplain manager.

A quarter of Flood Fund dollars need to go to low-income communities, a designation Buchanan qualifies for, with a median income that in 2019 was less than half of the state's average.

"Buchanan County and our neighbors in Southwest Virginia have experienced devastating recurrent flooding that has increased in recent years," the county's application stated. "Flooding is often thought of as a coastal problem, but we are pleased to see that DCR seeks to direct some of this fund to mountainous and disadvantaged communities such as ours."

An unclear future

While Youngkin has been adamant that he believes Virginia should withdraw from RGGI, the administration's plans for how the state will help local governments pay for the massive costs of flood protection are less clear.

Youngkin has been arguing for months that RGGI proceeds are being generated from an unfair "tax" on electric utility ratepayers. Virginia utilities, which are responsible for about three-quarters of the carbon emissions subject to RGGI, are allowed to pass on the cost of buying allowances to their customers, an approach Youngkin says is flawed.

"RGGI was sold to Commonwealth residents as a deal that returned the 'proceeds' to the ratepayers to offset the costs of the program, but that is not what is happening," a statement from the governor's office to the Mercury said. "We can provide funding for flood resiliency in a transparent way without using an RGGI tax on Virginians."

Youngkin's office said the administration intends to develop a plan to provide direct funding for flood resiliency with the General Assembly. That would require buy-in from Senate Democrats.

But when pressed for specifics of the plan, such as whether it will be crafted through legislation or the budget process, which can involve fluctuating revenues and regular competition among different interests competing for a piece of the pie, the governor's office didn't clarify beyond saying it will "provide direct funding and coordination for flood resiliency."

“We can do this in a way that is transparent and not a hidden tax that was misrepresented to Virginians,” the governor’s office stated. “This will ensure we have a long-term comprehensive strategy to sustain flood resilience efforts in Virginia.”

Millions of dollars remain uncommitted

Even while the future of the Flood Fund remains uncertain, millions of dollars remain on its books.

Before leaving office, Gov. Ralph Northam’s administration awarded two rounds of grants in the last three months of 2021 equal to $32.3 million.

A third round of $13.6 million was announced Wednesday, nine months into Youngkin’s term.

Flood Fund oversight to remain with executive branch

Virginia’s Community Flood Preparedness Fund, a pot of millions of dollars earmarked for community flood protection work across the state, will remain under the oversight of the executive branch despite recent legislative efforts to shift authority to an appointed citizen board. Gov. Glenn Youngkin has vetoed legislation that would have transferred administration of the Flood … Continue reading

Virginia Mercury

Round 3 was initially advertised to award $40 million, but with applications requesting nearly $93 million, DCR said it has been authorized to release an additional $30 million. The agency is allowing 32 applicants to revise and resubmit their proposals and plans to make a decision on them by the end of the year.

If DCR awards all $70 million it’s been authorized to grant during the third round, Virginia will have spent about 50% of its Flood Fund revenues to date, with just over $100 million left to be designated.

A DCR spokesperson said plans for that unused funding include “future grant rounds as well as loan opportunities going forward.” A fourth application round is expected to be opened in early 2023, along with the first round of the newly created Resilient Virginia Revolving Loan

Fund, which will provide loans or grants for resilience to not only local governments, but also residents.

Increasing climate impacts

Stiles pointed to data from Carnegie Mellon University, the Northeast Regional Climate Center at Cornell University and the RAND Corporation showing that rainfall intensity has increased an average of 18% since 2006.

Increased rainfall in the state has been documented for years, and the Virginia Coastal Resilience Master Plan projects that between 2020 and 2080, the number of residents living in homes exposed to major coastal flooding will grow from approximately 360,000 to 943,000, an increase of 160%. The report also found that more residential, public and commercial buildings will be exposed to extreme coastal flooding, while annualized flood damages will increase from $0.4 to $5.1 billion.

What's more, a recent Climate Central study found that rising water levels on land reduce the amount of property that local governments can tax.

"Climate change isn't going away," Heaps-Pecaro stated. "We have to accelerate" the fight against it.

THE BULLETIN

Virginia looking to loans for local flood resiliency efforts

BY: **CHARLIE PAULLIN** - OCTOBER 10, 2022 12:02 AM

Flooding at Rockett's Landing in Richmond. (NBC 12)

HAMPTON – The head of the Department of Conservation and Recreation said Virginia would begin using more loans rather than just relying on grants to fund local flood resiliency efforts.

DCR Director Matt Wells told the Joint Subcommittee on Recurrent Flooding Thursday his agency is looking to tap into the new Resilient Virginia Revolving Loan Fund as well as the Community Flood Preparedness Fund, also known as the Flood Fund.

"I think if you were looking at a Venn diagram of the two, the circles wouldn't be quite the same, but they would be significantly overlapped," Wells said.

The revolving fund was created through legislation in the last session by state Sen. Lynwood Lewis, D-Accomack, and Del. David Bulova, D-Fairfax, to provide localities and people with loans for flood resiliency efforts.

The revolving fund was appropriated $25 million in the budget with Flood Fund dollars, which have been generated through the state's participation in the Regional Greenhouse Gas Initiative. The Flood Fund has received just over $200 million since Virginia joined in 2020.

The difference between the two funds lies around the intended audience: the revolving fund is available for residential, commercial and industrial properties, whereas the Flood Fund is directed toward community-scale projects, Wells explained.

The revolving fund is also designed to be self-sustaining.

A DCR spokesperson previously told the Mercury future awards of Flood Fund dollars would include loan opportunities.

"Part of the reason we are considering doing loans through the CFPF is because that's a potentially larger pot of money that could be leveraged," Wells said Thursday.

Chris Stone, the CEO of architecture firm Clark Nexsen and the business representative on the subcommittee, questioned if the revolving fund is substantial enough for the demand.

"The $25 million ... it won't even really do a simple project, a substantial project," Stone said.

Lewis, who chairs the subcommittee, said the funds would provide gap funding for projects.

EXECUTIVE SUMMARY

This document contains the report of the Virginia State Corporation Commission ("Commission") pursuant to § 56-596 B of the Code of Virginia ("Code"), which directs the Commission to provide an update by September 1 of each year on the status of the implementation of the Virginia Electric Utility Regulation Act, Code §§ 56-576 through 56-596.3 ("Regulation Act"). The Regulation Act has expanded in recent years with new programs and requirements that fall within the Commission's purview. This report summarizes the Commission's efforts to implement the Regulation Act for incumbent electric utilities[1] as well as the electric cooperatives.

Key highlights from the report include:

A. Current Status of the Regulation Act

- Over the past several years, the Regulation Act has been amended to require new or expanded programs and rulemakings that apply to the Commonwealth's incumbent electric utilities and electric cooperatives. These programs include ones that implement the requirements of the Virginia Clean Economy Act ("VCEA").[2] The VCEA includes provisions establishing mandatory Renewable Energy Portfolio Standard ("RPS") and Energy Efficiency Resource Standard. The relevant Commission dockets that implement or update these programs, as well as the dockets that continue to provide oversight of the utility's existing operations, are summarized in Section IV, below.

- On November 18, 2021, the Commission issued its Final Order concerning its triennial review of Dominion Energy Virginia's ("DEV") rates, terms, and conditions for the provision of generation, distribution, and transmission services.[3]

[1] Code § 56-580 G generally suspends application of the Regulation Act to Kentucky Utilities, d/b/a Old Dominion Power Company ("KU/ODP"), which is an investor-owned incumbent electric utility whose service territory is located entirely within Dickenson, Lee, Russell, Scott, and Wise Counties. However, certain provisions of the Regulation Act, including Code §§ 56-585.5 and 56-594, have been made applicable, at least in part, to KU/ODP.

[2] 2020 Va. Acts chs. 1193, 1194.

[3] *Application of Virginia Electric and Power Company, For a 2021 triennial review of the rates, terms, and conditions for the provision of generation, distribution,and transmission services pursuant to § 56-585.1 A*

- On January 7, 2022, the Commission issued a Final Order concerning its review of DEV's petition for approval of Phase II of its Grid Transformation ("GT") Plan.[4] The approved GT Plan investments focus on grid reliability and are designed to accommodate or facilitate the expected increase in distributed energy resources. Approved Phase II investments include (i) advanced metering infrastructure; (ii) the customer information platform; (iii) grid infrastructure, which comprises targeted corridor improvement and voltage island mitigation; (iv) grid technologies; (v) telecommunications; (vi) cyber security; (vii) physical security; and (viii) customer education. The projected capital and operations expenses for Phase II are projected to be approximately $776 million. The Commission's approval of these projects was made subject to certain contingencies, cost caps, and reporting requirements.

- On March 15, 2022, the Commission issued a Final Order concerning its review of DEV's 2021 RPS Filing which included (i) DEV's RPS Development Plan (encompassing proposed development of new solar, onshore wind, and energy storage resources); (ii) requests for approval to construct 13 new utility-scale projects and to enter into 24 new purchase power agreements ("PPAs"); and (iii) DEV's request for approval of revised Rider CE. The Commission (i) found that, for the limited purpose of filing its second annual RPS plan under Code § 56-585.5 D 4, DEV's plan was reasonable and prudent; (ii) approved the utility-scale projects and PPAs proposed by the Company; and (iii) approved revised Rider CE.[5]

- On July 1, 2022, the Commission issued a Final Order concerning its review of DEV's request for approval of a rate adjustment clause, designated Rider SNA, for costs associated with preparing Petitions for Subsequent License Renewal to the Nuclear Regulatory Commission to extend the operating licenses of, and the projects reasonably appropriate to upgrade or replace systems and equipment deemed to be necessary to operate safely and reliability, Dominion's Surry Units 1

---

of the Code of Virginia, Case No. PUR-2021-00058, 2021 S.C.C. Ann. Rept. 444, Final Order (November 18, 2021).

[4] *Petition of Virginia Electric and Power Company, For approval of a plan for electric grid transformation projects pursuant to § 56-585.1 A 6 of the Code of Virginia,* Case No. PUR-2021-00127, Doc. Con. Cen. No. 22010126, Final Order (January 7, 2022).

[5] *Petition of Virginia Electric and Power Company, For approval of the RPS Development Plan, approval and certification of the proposed CE-2 Solar Projects pursuant to §§ 56-580 D and 56-46.1 of the Code of Virginia, revision of rate adjustment clause, designated Rider CE, under § 56-585.1 A 6 of the Code of Virginia, and a prudence determination to enter into power purchase agreements pursuant to § 56-585.1:4 of the Code of Virginia,* Case No. PUR-2021-00146, Doc. Con. Cen. No. 220320113, Final Order (March 15, 2022) (approving 857 megawatts ("MW") of new solar generation capacity and 103 MW of energy storage capacity). The Commission previously approved 498 MW of new solar facilities for Dominion. *See Commonwealth of Virginia, ex rel. State Corporation Commission, Ex Parte: Establishing 2020 RPS Proceeding for Virginia Electric and Power Company,* Case No. PUR-2020-00134, 2021 S.C.C. Ann. Rept. 242,243, Final Order (April 30, 2021).

and 2 and North Anna Units 1 and 2 in an extended period of operation.[6] The Commission adopted a proposed Stipulation in that case and approved the Petition as modified by the Stipulation.

- On July 15, 2022, the Commission issued its Final Order concerning Appalachian Power Company's ("APCo") 2021 RPS Plan. The Commission: (i) found APCo's RPS Development Plan is reasonable and prudent for the limited purpose of its second annual plan; (ii) approved APCo's requests for approval of cost recovery for 313.9 MW of solar and onshore wind capacity, including both company-owned resources and PPAs; (iii) granted APCo's request for a prudency determination for 238.9 MW of solar capacity, including company-owned resources and PPAs; (iv) approved the recovery of projected costs of renewable energy certificates ("RECs") purchased in the PJM[7] REC market; and (v) approved rate adjustment clauses ("RACs") for cost recovery.[8] The Commission also established additional directives regarding APCo's modeling in its subsequent RPS Plans.[9] The Commission further directed APCo to continue filing a consolidated bill analysis in its RPS Filings.

- On August 5, 2022, the Commission issued a Final Order approving requested cost recovery associated with DEV's proposed 2,587 MW Coastal Virginia Offshore Wind Commercial Project ("CVOW Project") to be located in a federal lease area off the coast of Virginia Beach, Virginia.[10] The project consists of 176 wind turbines, each designed to generate 14.7 MW. The project is expected to have a capital cost of $9.8 billion and will likely be the largest capital investment, and single largest project, in the history of Dominion Energy Virginia. The Commission also approved the electric interconnection and transmission facilities to connect the CVOW Project reliably with the existing transmission system. DEV and Consumer Counsel have requested the Commission reconsider aspects of the Final Order.

---

[6] *Petition of Virginia Electric and Power Company, For approval of a rate adjustment clause, designated Rider SNA under § 56-585.1 A 6 of the Code of Virginia*, Case No. PUR-2021-00229, Doc. Con. Cen. No. 220710001, Final Order (July 1, 2022).

[7] PJM Interconnection, L.L.C. ("PJM")

[8] *Petition of Appalachian Power Company, For approval of its 2021 RPS Plan under § 56-585.5 of the Code of Virginia and related requests*, Case No. PUR-2021-00206, Doc. Con. Cen. No. 220720045, Final Order on Petition and Associated Requests, and Order Bifurcating Proceeding (July 15, 2022).

[9] *See, e.g., id.* at 6-7.

[10] *Application of Virginia Electric and Power Company, For approval and certification of the Coastal Virginia Offshore Wind Commercial Project and Rider Offshore Wind, pursuant to § 56-585.1:11, § 56-46.1, § 56-265.1 et seq. and § 56-585.1 A 6 of the Code of Virginia*, Case No. PUR-2021-00142, Doc. Con. Cen. No. 220820117, Final Order (August 5, 2022).

- On August 10, 2022, the Commission issued a Final Order in DEV's annual demand-side management ("DSM") filing that approved, among other things, (i) DEV's proposed Phase X DSM Programs including proposed enhancement and expansion of certain previously approved programs; (ii) reorganization and consolidation of the DEV's DSM Portfolio; and (iii) cost recovery through associated RACs.[11] The Commission had previously approved, on September 7, 2021, the DEV's application seeking (i) approval of the Company's Phase IX DSM programs, including 11 new energy efficiency and demand response programs; (ii) the expansion and modification of certain existing programs; and (iii) approval of cost recovery through associated RACs.[12]

- Both APCo (a Phase I Utility) and DEV (a Phase II Utility) estimate that they are on target to implement energy efficiency programs and measures to achieve the total annual energy savings targets for 2023 as specified by Code § 56-596.2.

B. Rate and Capital Outlook

DEV

- DEV's typical[13] monthly residential bill has increased by $46.34 to $136.93[14] (a 51.15% increase) from July 1, 2007,[15] to July 1, 2022. Over the 12 months ended July 1, 2022, DEV's typical monthly residential bill has increased by $15.65.

- DEV did not file an Integrated Resource Plan ("IRP") in 2021. In accordance with Code § 56-599, DEV's next IRP will be due by May 1, 2023.

---

[11] *Petition of Virginia Electric and Power Company, For approval of its 2021 DSM Update pursuant to § 56-585.1 A 5 of the Code of Virginia*, Case No. PUR-2021-00247, Doc. Con. Cen. No. 220830003, Final Order (August 10, 2022).

[12] *Application of Virginia Electric and Power Company, For approval of its 2020 DSM Update pursuant to § 56-585.1 A 5 of the Code of Virginia*, Case No. PUR-2020-00274, 2021 S.C.C. Ann. Rept. 350, Final Order (September 7, 2021).

[13] For purposes of this report, a typical residential bill is based on usage of 1,000 kilowatt-hours ("kWh") per month.

[14] This amount includes an interim fuel factor rate of $0.35379 which is subject to change pending a final order in Case No. PUR-2022-00064. *Application of Virginia Electric and Power Company, To revise its fuel factor pursuant to § 56-249.6*, Case No. PUR-2022-00064, Doc. Con. Cen. No. 220540002, Order Establishing 2022-2023 Fuel Factor Proceeding (May 24, 2022).

[15] Enactment Clause 7 of 2007 Va. Acts chs. 888 and 933 requires the Commission, in consultation with the Office of the Attorney General, to "submit a report to the Governor and General Assembly by November 1, 2012, and every five years thereafter, assessing the rates and terms and conditions of incumbent electric utilities in the Commonwealth." The first five-year window for this rate assessment was 2007-2012. The Commission begins its rate analysis with the year 2007 in this report to coincide with this window.

- On November 18, 2021, the Commission issued a Final Order in DEV's first triennial review, covering the period 2017 – 2020.[16] The Commission approved a Stipulation among DEV, Commission Staff, and certain case participants.[17] The Stipulation provided for customer refunds, totaling $330 million, the statutory maximum annual rate reduction of $50 million, and customer credit reinvestment offsets of $309 million.[18] For a typical residential customer, this results in a decrease of approximately $0.90 per month effective January 1, 2022 and refunds totaling approximately $67.00 over the 2022-2023 period. The Commission also approved a 9.35% return on common equity ("ROE") as fair and reasonable for the 2021 – 2023 period that will be the subject of DEV's next triennial review.[19]

- As reported by DEV, its base rate financial results for 2021 reflect an actual earned ROE of 11.49%, which is above its authorized ROE of 9.35%.[20] DEV's 2021 financial results will be audited as part of its next triennial review, which will be filed in 2024 and will cover the period 2021 – 2023.

- In a February 2022 presentation to investors, DEI[21] identified DEV capital investments of approximately $27.9 billion for the five-year period 2022 – 2026, including investments in wind and solar generation, energy storage, nuclear facility relicensing, transmission, distribution undergrounding, and grid transformation. These investments would reflect a 74% increase in DEV's rate base by 2026, with 55% being recovered from customers through RACs.

APCo

- APCo's typical monthly residential bill has increased by $55.64 to $122.25 (an 83.53% increase) from July 1, 2007, to July 1, 2022. Over the 12 months ending July 1, 2022, APCo's typical monthly residential bill has increased by $5.16.

- On August 18, 2022, the Supreme Court of Virginia issued its opinion on the appeals of APCo and the Office of the Attorney General, Division of Consumer Counsel ("Consumer Counsel") concerning the Commission's decision in APCo's

[16] *Application of Virginia Electric and Power Company, For a 2021 triennial review of the rates, terms, and conditions for the provision of generation, distribution, and transmission services pursuant to § 56-585.1 A of the Code of Virginia*, Case No. PUR-2021-00058, 2021 S.C.C. Ann. Rept. 444, Final Order (November 18, 2021).

[17] The remaining participants did not join, but did not oppose, the Stipulation. *Id.* at 2-3.

[18] *Id.* at 3.

[20] *Id.*

[21] Dominion Energy, Inc. ("DEI").

2020 Triennial Review.[22] The Court affirmed in part, reversed in part, and remanded the case to the Commission for further proceedings consistent with the Court's opinion.[23]

- As reported by APCo, its base rate financial results for 2021 reflect an actual earned ROE of 5.38%, which is below its authorized ROE of 9.20%.[24] APCo's 2021 financial results will be audited as part of its next triennial review, which is due to be filed by March 31, 2023, and will cover the period 2020 – 2022.

- APCo filed its 2022 IRP on April 29, 2022. Based on APCo's billing analysis, showing projected annual impacts to a residential bill over the next five years incorporating the requirements of the VCEA, the monthly bill of a Virginia residential customer using 1,000 kWh per month is projected to be between $141.73 and $143.07 by 2026, an increase of between $19.50 and $20.84 per month over the April 29, 2022 typical residential bill (or an estimated annual increase of $234.00 to $250.08).[25] APCo's 2022 IRP is pending before the Commission and an evidentiary hearing is scheduled to begin on October 25, 2022.[26]

[22] *Application of Appalachian Power Company, For a 2020 triennial review of its base rates, terms and conditions pursuant to § 56-585.1 of the Code of Virginia*, Case No. PUR-2020-00015, 2020 S.C.C. Ann. Rept. 421, Final Order (November 24, 2020).

[23] *Appalachian Power Co. v. State Corp. Comm'n*, Record No. 210391 (Va. Aug. 18, 2022).

[24] The authorized ROE of 9.20% was set in the Commission's Final Order in Case No. PUR-2020-00015.

[25] The projected monthly bill increases of $19.50 and $20.84 are based on the 2022 IRP Least Cost Plan and Hybrid Plan, respectively.

I.
INTRODUCTION

The Commission appreciates this opportunity to provide an update to the General Assembly on the Commission's implementation of the Regulation Act including the VCEA. The Commission has conducted numerous proceedings over the last year pursuant to the Regulation Act that are discussed in detail below. As a general matter, the Commission is seeing upward pressure on utility rates, not just for investor-owned electric utilities,[27] but across all regulated utilities. Factors contributing to increased utility costs include inflation, pandemic recovery, supply chain limitations, and high natural gas and other commodity prices, as well as geopolitical events. The Commission is keenly aware of the economic pressures that are impacting all utility customers and takes seriously its responsibility to review rate recovery requests. In each case, the Commission evaluates the request pursuant to the applicable laws, as well as the findings of fact supported by the evidence in the record.

The Commission continues to implement the VCEA in a manner that faithfully applies the requirements that include carbon reduction, while best protecting consumers who expect and deserve reliable and affordable service. Since the effective date of the VCEA, the Commission has approved DEV's requests for approval of 1,355 MW of new solar facilities (DEV-owned and PPA) and 103 MW of new energy storage capacity under the VCEA.[28] The Commission also recently issued an order approving cost

[27] DEV's most recent fuel factor filing, for example, showed a projected fuel deferral balance over the July 2021-June 2022 period of approximately $1 billion, due to increases in commodity prices over the past year. *Application of Virginia Electric and Power Company, To revise its fuel factor pursuant to Va. Code § 56-249.*6, Case No. PUR-2022-00064, Application at 2 (filed May 5, 2022).

[28] *Commonwealth of Virginia, ex rel. State Corporation Commission, Ex Parte: Establishing 2020 RPS Proceeding for Virginia Electric and Power Company*, Case No. PUR-2020-00134, 2021 S.C.C. Ann.

recovery associated with DEV's 2,587 MW CVOW Project, which is discussed in more detail below. For APCo, the Commission has approved 498 MW of new renewable generation supply since the passage of the VCEA.[29]

The Commission also concluded the first triennial review of DEV, approving the statutory maximum annual rate reduction of $50 million effective January 1, 2022, and customer refunds totaling $330 million over the 2022-2023 period, which is discussed in further detail below.

As detailed in Section V below, in addition to reviewing individual utility applications, the Commission has also sponsored and contributed to several stakeholder processes related to various aspects of utility regulation. Among those, as directed by House Bill 2282,[30] the Commission conducted a stakeholder process in the fall of 2021 focused on the transportation electrification with over 60 different organization participating in these meetings. On April 29, 2022, the Commission submitted a report to the General Assembly regarding policy proposals governing public electric utility programs to accelerate widespread transportation electrification in the Commonwealth,

---

Rept. 242, 243, Final Order (April 30, 2021) (approving 498 MW of new solar facilities); *Petition of Virginia Electric and Power Company, For approval of the RPS Development Plan, approval and certification of the proposed CE-2 Solar Projects pursuant to §§ 56-580 D and 56-46.1 of the Code of Virginia, revision of rate adjustment clause, designated Rider CE, under § 56-585.1 A 6 of the Code of Virginia, and a prudence determination to enter into power purchase agreements pursuant to § 56-585.1:4 of the Code of Virginia*, Case No. PUR-2021-00146, Doc. Con. Cen. No. 220320113, Final Order at 6 (March 15, 2022) (approving 857 MW of new solar generation capacity and 103 MW of energy storage capacity).

[29] *Petition of Appalachian Power Company, For approval of its 2021 RPS Plan under § 56-585.5 of the Code of Virginia and related requests*, Case No. PUR-2021-00206, Doc. Con. Cen. No. 220720045, Final Order on Petition and Associated Requests, and Order Bifurcating Proceeding (July 15, 2022); *Petition* of A*ppalachian Power Company, For a prudency review, pursuant to § 56-585.1:4 H of the Code o*f *Virginia, with respect to the purchase of the Amherst Solar Facility*, Case No. PUR-2021-00066, Doc. Con. Cen. No. 220230049, Final Order (February 18, 2022).

[30] 2021 Va. Acts ch. 268 (Special Session 1).

noting that the increased deployment of motor vehicles powered by electricity presents several issues that potentially could affect the affordability and reliability of electricity service delivered to consumers by regulated utilities.[31] Consistent with the recommendations of the stakeholder report, the Commission subsequently issued an Order that required DEV and APCo to file transportation electrification plans on or before May 1, 2023.[32]

Pandemic-related Activities

The Commission has previously reported on its response to the public health concern related to the spread of the coronavirus, or COVID-19. As noted in the 2021 Report, through several orders, the Commission directed regulated electric, natural gas, and water and sewer companies in Virginia to suspend service disconnections through October 5, 2020, affording the General Assembly and the Governor time to address the economic impact on utility customers legislatively.[33] Thereafter, the General Assembly in a November 2020 Special Session enacted budget legislation further prohibiting utility shut-offs during the then state of emergency declared by the Governor, subject to certain

No. 8, Report: Policy Proposals Governing Public Electric Utility Programs to Accelerate Widespread Transportation Electrification in the Commonwealth Pursuant to Chapter 268 of the 2021 Virginia Acts of Assembly (Special Session I) (HB 2282) (April 29, 2022). https://rga.lis.virginia.gov/Published/2022/HD8/PDF

[32] *Commonwealth of Virginia, ex rel. State Corporation Commission, Ex Parte: Electrification of Motor Vehicles*, Case No. PUR-2020-00051, Doc. Con. Cen. No. 220630077, Order Directing the Filing of Transportation Electrification Plans (June 15, 2022).

[33] *Commonwealth of Virginia, ex rel. State Corporation Commission, Ex Parte: Temporary Suspension of Tariff Requirements*, Case No. PUR-2020-00048, 2020 S.C.C. Ann. Rept. 467, Order Suspending Disconnection of Service and Suspending Tariff Provisions Regarding Utility Disconnections of Service (March 16, 2020); 2020 S.C.C. Ann. Rept. 467, Order Extending Suspension of Service Disconnections (April 9, 2020); 2020 S.C.C. Ann. Rept. 469, Order on Suspension of Service Disconnections (June 12, 2020); 2020 S.C.C. Ann. Rept. 473, Order on Moratorium (August 24, 2020); 2020 S.C.C. Ann. Rept. 475, Additional Order on Moratorium (September 15, 2020).

conditions and limitations.[34] This budget legislation also directed the Commission to distribute $100 million of Virginia's portion of coronavirus relief funds ("CRF") received under Public Law 116-136: Coronavirus Aid, Relief, and Economic Security Act, to electric, natural gas, and water and sewer utilities, including municipal utilities, throughout the Commonwealth to offset utility customer billing arrearages due to COVID-19.[35] Relatedly, budget legislation enacted by the General Assembly during a 2021 Special Session directed the Commission, in coordination with the Department of Housing and Community Development, to distribute $120 million of additional coronavirus relief funds received by Virginia under Public Law 117-2: American Rescue Plan Act of 2021 ("ARPA").[36] These funds were also distributed to Virginia's utilities (as identified above) to offset utility customer billing arrearages due to COVID-19. The Commission and its Staff continue to provide oversight of these CRF and ARPA distributions. Additionally, and at the General Assembly's direction, the Commission since 2020 has submitted annual reports to the General Assembly and the Executive Branch detailing current utility customer billing arrearages and utility service disconnections.[37] The annual submission of these reports will continue through 2023.

Composition of the Electric Industry in Virginia

The Commission's responsibilities include regulating a diverse electric industry pursuant to the Virginia Constitution and the laws enacted by the General Assembly.

[34] *See*, House Bill 5005, 2020 Va. Acts, Special Session I, ch. 56 (Item 4-14)

[35] *See*, House Bill 5005, 2020 Va. Acts, Special Session I, ch. 56 (Item 479.10). *See also*, House Bill 1800, 2021 Va. Acts, Special Session I, ch. 552 (modifying pertinent provisions in Item 479.10).

Rate and Capital Outlook

2021 RPS Plans

On September 15, 2021, DEV submitted its petition for approval of its 2021 RPS Plan to develop new solar and onshore wind generation capacity and energy storage as required by the VCEA pursuant to Code § 56-585.5 D 4. Among other things, DEV's 2021 RPS Plan calls for 3,105 MW of solar and onshore wind development through 2024 and the development of 331 MW of energy storage resources through 2025.[43] DEV

[42] The TRR Rider Credit is a temporary base rate rider credit to return to customers the impacts of the 2018 Tax Cuts and Jobs Act.

[43] *Petition of Virginia Electric and Power Company, For approval of its 2021 RPS Development Plan under § 56-585.5 D 4 of the Code of Virginia and related requests,* Case No. PUR-2021-00146, Doc. Con.

estimates that by 2045, it may have 18,356 MW (nameplate) of solar resources, 5,174 MW (nameplate) of offshore wind resources, and 316 MW (nameplate) of hydroelectric resources that it will use toward meeting its capacity obligations in PJM, in addition to 2,580 MW (nameplate) of energy storage.[44]

The Commission issued a Final Order on March 15, 2022, wherein it: (i) found DEV's RPS Plan was reasonable and prudent for the limited purpose of its second annual plan; (ii) approved approximately 857 MW of new solar generation capacity in the Commonwealth including both company-owned resources and PPAs; (iii) approved 103 MW of energy storage capacity; and (iv) approved a RAC for cost recovery associated with approved company-owned solar facilities.[45] The Commission also established additional directives regarding DEV's modeling in its subsequent RPS Plans.[46] The Commission further directed DEV to continue filing a consolidated bill analysis in its IRP and RPS Plan proceedings with information through 2035.[47] DEV has filed a notice of intent to file its 2022 RPS Plan on or after September 15, 2022.

On December 30, 2021, APCo submitted its 2021 RPS Plan to develop new solar and onshore wind generation capacity required by the VCEA. Among other things,

---

Cen. No. 210930080, RPS Plan at 4, 7 (filed September 15, 2021). For additional information on renewable deployment, on or before December 1 of each year, the Commission files an annual report to the General Assembly on the construction of new solar and wind projects pursuant to Enactment Clause 14 of the GTSA, as amended by 2020 Va. Acts ch. 1190.

[44] *Id*. at 14.

[46] *See, e.g., id.* at 8-10.

[47] *Id.* at 11.

APCo's 2021 RPS Plan calls for approximately 553 MW of solar and onshore wind development through 2025, including resources that became operational in 2021 and resources expected to become operational by the end of 2022.[48] APCo anticipates adding storage resources beginning in 2025.[49] APCo estimates that by 2040, it may have 2,736 MW (nameplate) of solar, 750 MW (nameplate) of onshore wind, and 2,937 MW (nameplate) of energy storage, through a mix of company-owned resources and PPAs, to meet the requirements of the VCEA.[50]

On July 15, 2022, the Commission issued a Final Order on APCo's 2021 RPS Plan, wherein the Commission: (i) found APCo's RPS Development Plan is reasonable and prudent for the limited purpose of its second annual plan; (ii) approved APCo's requests for approval of cost recovery for 313.9 MW of solar and onshore wind capacity, including both company-owned resources and PPAs; (iii) granted APCo's request for a prudency determination for 238.9 MW of solar capacity, including company-owned resources and PPAs; (iv) approved the recovery of projected costs of RECs purchased in the PJM REC market; and (v) approved RACs for cost recovery.[51] The Commission also established additional directives regarding APCo's modeling in its subsequent RPS

[48] *Petition of Appalachian Power Company, For approval of its 2021 RPS Plan under § 56-585.5 of the Code of Virginia,* Case No. PUR-2021-00206, RPS Plan at 7 (filed December 30, 2021).

[49] *Id.* at 8, 37.

Plans.[52] The Commission further directed APCo to continue filing a consolidated bill analysis in its RPS Filings.[53]

The Commission also found that a separate proceeding should be established to further consider the appropriate cost recovery framework for APCo's VCEA-related resources, the allocation of costs net of benefits pursuant to Code § 56-585.5 F, and class and jurisdictional cost allocation.[54] The Commission directed APCo to make a filing addressing these issues on or before October 1, 2022.[55]

DEV Offshore Wind

On August 5, 2022, the Commission issued a Final Order on DEV's application for cost recovery associated with its proposed CVOW Project.[56] The project consists of 176 wind turbines, each designed to generate 14.7 MW, to be located approximately 27 miles off the coast of Virginia Beach. The project is expected to have a capital cost of $9.8 billion and will likely be the largest capital investment, and single largest project, in the history of Dominion Energy Virginia.[57]

The Commission approved a revenue requirement of $78.702 million for the rate year of September 1, 2022, to August 31, 2023, to be recovered through a new rate

[52] *See, e.g., id.* at 6-7.

[56] *Application of Virginia Electric and Power Company, For approval and certification of the Coastal Virginia Offshore Wind Commercial Project and Rider Offshore Wind, pursuant to § 56-585.1:11, § 56-46.1, § 56-265.1 et seq. and § 56-585.1 A 6 of the Code of Virginia,* Case No. PUR-2021-00142, Doc. Con. Cen. No. 220820117, Final Order (August 5, 2022).

[57] *Id.* at 5-6.

adjustment clause, designated Rider OSW.[58] Over the projected 35-year lifetime of the project, for a residential customer using 1,000 kWh of electricity per month, Rider OSW is projected to result in an average monthly bill increase of $4.72 and a peak monthly bill increase of $14.22 in 2027.[59]

The Commission recognized that significant concerns were raised throughout the proceeding regarding the affordability of the project and the financial risk to ratepayers. With a project of this magnitude, the Commission ordered the following consumer protections:[60]

- Dominion shall file a notice with the Commission within 30 calendar days if it determines that the total project costs are expected to exceed the current estimate, or if the final turbine installation is expected to be delayed beyond February 4, 2027.
- Each annual Rider OSW update application filed by Dominion prior to the project's commercial operation shall include any material changes to the project, the most recent biannual project update, and a written explanation as to the reason for any cost overruns above the most recent estimate provided by the company to include the reasonableness and prudence of the additional costs.
- Beginning with the commercial operation and extending for the life of the project, customers shall be held harmless for any shortfall in energy production below an annual net capacity factor of 42 percent, as measured on a three-year rolling average ("Performance Standard").

In a concurring opinion, Commissioner Jagdmann wrote that she agrees with the Final Order in all respects. She emphasized that these aforementioned protections do not completely address potential Project abandonment risks, stating:

> [i]mportantly, the General Assembly has effectively maintained its ability to implement additional protections – for example through funding mechanisms such as general

[58] *Id.* at 11-12.

[59] *Id.* at 5.

[60] *Id.* at 14-16.

> fund appropriation or other means, such as implementing new legislation designating the consumer-funded proceeds from Dominion's participation in the Regional Greenhouse Gas Initiative ("RGGI") be used to lessen the cost of the CVOW Project.... Such action may be appropriate given the public policy support for and economic development aspects of this Project.[61]

On August 22, 2022, DEV filed a Petition for Limited Reconsideration of the Commission's decision requesting the Commission reconsider the Performance Standard. Among other things, Dominion states that "[a]s ordered, [the performance standard] will prevent the Project from moving forward, and the Company will be forced to terminate all development and construction activities."[62] On August 24, 2022, the Commission issued an order granting reconsideration for purposes of continuing jurisdiction over the case and directed the filing of responses to DEV's request for reconsideration. On August 25, 2022, Consumer Counsel filed a Petition for Clarification or Reconsideration related to the Performance Standard.[63]

Nuclear License Extensions

The Commission approved DEV's petition for approval of a RAC, designed Rider SNA, for cost recovery associated with preparing Petitions for Subsequent License Renewal to the Nuclear Regulatory Commission to extend the operating license of, and

[62] *Application of Virginia Electric and Power Company, For approval and certification of the Coastal Virginia Offshore Wind Commercial Project and Rider Offshore Wind, pursuant to § 56-585.1:11, § 56-46.1, § 56-265.1 et seq. and § 56-585.1 A 6 of the Code of Virginia*, Case No. PUR-2021-00142, Petition of Virginia Electric and Power Company for Limited Reconsideration at 3 (filed August 22, 2022).

[63] *Application of Virginia Electric and Power Company, For approval and certification of the Coastal Virginia Offshore Wind Commercial Project and Rider Offshore Wind, pursuant to § 56-585.1:11, § 56-46.1, § 56-265.1 et seq. and § 56-585.1 A 6 of the Code of Virginia*, Case No. PUR-2021-00142, Petition for Clarification or Reconsideration of Office of the Attorney General, Division of Consumer Counsel (filed August 25, 2022).

the projects reasonably appropriate to upgrade or replace systems and equipment deemed to be necessary to extend the life of, Dominion's Surry Units 1 and 2 and North Anna Units 1 and 2 nuclear generation facilities from 60 to 80 years.[64] The approved revenue requirement for the initial rate year of Rider SNA commencing September 1, 2022, is $106.664 million.[65]

Grid Transformation Plan

The Commission issued a Final Order concerning its review of DEV's petition for approval of Phase II of its GT Plan.[66] The approved GT Plan investments focus on grid reliability and are designed to accommodate or facilitate the expected increase in distributed energy resources resulting from recent policy developments, including the VCEA and FERC Order 2222. Approved Phase II investments include (i) advanced metering infrastructure; (ii) the customer information platform; (iii) grid infrastructure, which comprises targeted corridor improvement and voltage island mitigation; (iv) grid technologies; (v) telecommunications; (vi) cyber security; (vii) physical security; and (viii) customer education. The projected capital and operations expenses for Phase II are projected to be approximately $776 million. The Commission's approval of these projects was made subject to certain contingencies, cost caps, and reporting requirements.

APCo did not file a grid transformation plan in 2021.

---

[64] *Petition of Virginia Electric and Power Company, For approval of a rate adjustment clause, designated Rider SNA under § 56-585.1 A 6 of the Code of Virginia*, Case No. PUR-2021-00229, Doc. Con. Cen. No. 220710001, Final Order (July 1, 2022).

[65] *Id.* at 6.

[66] *Petition of Virginia Electric and Power Company, For approval of a plan for electric grid transformation projects pursuant to § 56-585.1 A 6 of the Code of Virginia*, Case No. PUR-2021-00127, Doc. Con. Cen. No. 22010126, Final Order (January 7, 2022).

Integrated Resource Plans

DEV did not file an IRP in 2021.[67] In accordance with Code § 56-599, DEV's next IRP will be due by May 1, 2023. In DEV's most recent prior IRP, the Commission directed DEV's future IRPs to include actual bill impact information as each year passes.[68] Further, the Commission found that DEV should address environmental justice in future IRPs and updates, as appropriate.[69]

APCo did not file a 2021 IRP. It filed its 2022 IRP on April 29, 2022. Based on APCo's billing analysis, showing projected annual impacts to a residential bill over the next five years incorporating the requirements of the VCEA, the monthly bill of a Virginia residential customer using 1,000 kWh per month is projected to be between $141.73 and $143.07 by 2026, an increase of between $19.50 and $20.84 per month over the April 29, 2022 typical residential bill (or an estimated annual increase of $234.00 to $250.08).[70] APCo's 2022 IRP is pending before the Commission and an evidentiary hearing is scheduled to begin on October 25, 2022.[71]

---

[67] DEV filed an update to its 2020 IRP, which was accepted for filing by the Commission. *Commonwealth of Virginia, ex rel. State Corporation Commission, In re: Virginia Electric and Power Company's 2021 Update to its Integrated Resource Plan pursuant to Va. Code § 56-597 et seq.*, Case No. PUR-2021-00201, 2021 S.C.C. Ann. Rept. 544, Final Order (October 28, 2021).

[68] *Commonwealth of Virginia, ex rel. State Corporation Commission, In re: Virginia Electric and Power Company's Integrated Resource Plan filing pursuant to Va. Code § 56-597 et seq.*, Case No. PUR-2020-00035, 2021 S.C.C. Ann. Rept. 190, 195-196, Final Order (February 1, 2021). The Commission further directed that in addition to residential bills, the Company should include a billing analysis of small general service and large general service customer bills. *Id.* at 196.

2022 Investor Presentations

DEI presented its fourth quarter earnings to investors on February 11, 2022.[72] [73] This February 2022 presentation to investors identified approximately $27.9 billion in anticipated growth capital expenditures for DEV over the period 2022 – 2026.[74] DEI identified the primary drivers as zero-carbon generation and storage, transmission, and customer growth, as outlined in the chart below.

February 11, 2022 Investor Presentation
DEV Identified Capital Investment
Five Year Outlook 2022 through 2026

	Growth Capex 2022 - 2026
Offshore Wind	$10 Billion
Solar	$6.8 Billion
Transmission	$4 Billion
Customer Growth	$2 Billion
Nuclear Relicensing	$2 Billion
Grid Transformation	$1.5 Billion
Strategic Undergrounding	$1 Billion
Energy Storage	$0.6 Billion
Total Growth Capex	$27.9 Billion

[72] Slides for the February 11, 2022 presentation ("Fourth Quarter Presentation Slides") are available at: https://s2.q4cdn.com/510812146/files/doc_financials/2021/q4/2022-02-11-DE-IR-4Q-2021-earnings-call-slides-vTCIII.pdf. DEI is the parent company of DEV.

[73] DEI also gave an investor presentation on May 5, 2022, for the first quarter of 2022, and August 5, 2022, for the second quarter of 2022. These presentations did not include the same level of DEV-specific capital investment information as the 2021 fourth quarter presentation. Slides for the May 5, 2022, presentation are available at: https://s2.q4cdn.com/510812146/files/doc_financials/2022/q1/2022-05-05-DE-IR-1Q-2022-earnings-call-slides-vTCI_Final.pdf. Slides for the August 5, 2022 presentation are available at https://s2.q4cdn.com/510812146/files/doc_presentations/2022/08/2022-08-08-DE-IR-2Q-2022-earnings-call-slides-vTC.pdf.

[74] *See* Fourth Quarter Presentation Slides 47-49.

In its February 2022 presentation to investors, DEI estimated that by 2026, 92% of the $27.9 billion of growth capex would be eligible to be recovered through RACs.[75] As a result, by 2026, DEI projected that a total of 55% of DEV's $50.7 billion net rate base would be eligible to be recovered through RACs.[76] DEV's projected $50.7 billion net rate base in 2026 would reflect an increase of 74% when compared to 2021. As with the Commission's 2021 report, the totality of these projected capital investments reflect DEI's presentation to investors and have not been independently reviewed by Commission Staff or as part of a Commission proceeding.

III.
BASE RATE FINANCIAL RESULTS

DEV 2017-2020 Triennial Review

On March 31, 2021, DEV filed its application for the 2021 triennial review provided for by Code § 56-585.1 A, docketed as Case No. PUR-2021-00058.[77] As filed, DEV presented a combined generation and distribution base rate earned ROE of 9.61%[78] for the combined test periods of 2017 through 2020, which is within the 70 basis point band above and below the 9.20% ROE approved by the Commission in Case No. PUR-2019-00050 to be used to measure earnings in DEV's first triennial review.[79] DEV's earned return was driven in large part by the impairment of the unrecovered balances of several generating units it had retired in 2019 and 2020, which it treated as a period expense subject to the provisions of Code § 56-585.1 A 8.

The evidentiary hearing for the case was held on October 25, 2021. On November 18, 2021, the Commission issued its Final Order in DEV's triennial review.[80]

---

[77] *Application of Virginia Electric and Power Company, For a 2021 triennial review of the rates, terms and conditions for the provision of generation, distribution, and transmission services pursuant to § 56-585.1 A of the Code of Virginia*, Case No. PUR-2021-00058, Doc. Con. Cen. No. 210340128, Application (filed March 31, 2021), *amended by* Doc. Con. Cen. No. 210530106, Amended Application (May 18, 2021) (including an amended application, supplemental testimony and filing schedules reflecting a revision to its earned return in the combined earnings test analysis).

[78] This ROE includes the earnings reduction resulting from $206 million of customer accounts receivable written off pursuant to House Bill 5005, 2020 Va. Acts, Special Session I, ch. 56, and House Bill 1800, 2021 Va. Acts, Special Session I, ch. 552. The earned ROE was 10.42% excluding this write-off.

[79] *Application of Virginia Electric and Power Company, For the determination of the fair rate of return on common equity pursuant to § 56-585.1:1 C of the Code of Virginia*, Case No. PUR-2019-00050, 2019 S.C.C. Ann. Rept. 400, Final Order (November 21, 2019).

[80] *Application of Virginia Electric and Power Company, For a 2021 triennial review of the rates, terms and conditions for the provision of generation, distribution and transmission services pursuant to § 56-585.1 of the Code of Virginia*, Case No. PUR-2021-00058, 2021 S.C.C. Ann. Rept. 444, Final Order (November 18, 2021).

The Commission approved a stipulation proposed by the majority of case participants, and which was unopposed by any party to the case. In so doing, the Commission approved customer refunds totaling $330 million, the statutory maximum annual rate reduction of $50 million,[81] and customer credit reinvestment offsets of $309 million. For a typical residential customer, this results in a decrease of approximately $0.90 per month effective January 1, 2022, and refunds totaling approximately $67.00 over the 2022-2023 period.

The Commission also approved a 9.35% ROE as fair and reasonable for the 2021 – 2023 period that will be the subject of DEV's next triennial review.[82]

APCo 2017-2019 Triennial Review

As the Commission previously reported, on November 24, 2020, the Commission issued its Final Order in APCo's 2017-2019 triennial review, finding APCo earned an ROE of 9.48% for the 2017 – 2019 triennial period.[83] APCo and Consumer Counsel both filed notices of appeal of the Commission's decision to the Supreme Court of Virginia. On August 18, 2022, the Court issued its opinion affirming in part, reversing in part, and remanding the case to the Commission for further proceedings consistent with the Court's opinion.[84] On remand, the Commission will recalculate APCo's earned ROE for the

[81] Code § 56-585.1 A 8 c.

[82] *Application of Virginia Electric and Power Company, For a 2021 triennial review of the rates, terms and conditions for the provision of generation, distribution and transmission services pursuant to § 56-585.1 of the Code of Virginia*, Case No. PUR-2021-00058, 2021 S.C.C. Ann. Rept. 444, Final Order (November 18, 2021).

[83] *Application of Appalachian Power Company, For a 2020 triennial review of its base rates, terms and conditions pursuant to § 56-585.1 of the Code of Virginia*, Case No. PUR-2020-00015, 2020 S.C.C. Ann. Rept. 421, Final Order (November 24, 2020).

[84] *Appalachian Power Co. v. State Corp. Comm'n*, Record No. 210391 (Va. Aug. 18, 2022).

2017-2019 triennial period and determine whether APCo is entitled to a rate increase effective January 1, 2021, and by what amount, based on the Court's findings in its opinion. On August 22, 2022, the Commission issued an Order Initiating Remand Proceedings directing APCo to file interim rates for (a) base rates going forward, and (b) a rider designed to collect revenues not collected from January 1, 2021, through September 30, 2022, to be implemented October 1, 2022.[85]

APCo will file its next triennial review application on or before March 31, 2023, which will cover the period 2020-2022.

DEV 2021 Base Rate Financial Results

During 2022, in response to requests from Staff pursuant to Code § 56-36, DEV provided certain analyses of its combined generation and distribution base rate financial results for calendar year 2021 on a regulatory accounting basis. Calendar year 2021 is the first year of DEV's second triennial review, which will be filed with the Commission in 2024 and will cover the period 2021 – 2023.

DEV analysis reflects a combined base rate generation and distribution ROE of 11.49% for 2021.[86] [87]

[85] *Application of Appalachian Power Company, For a 2020 triennial review of its base rates, terms and conditions pursuant to § 56-585.1 of the Code of Virginia*, Case No. PUR-2020-00015, Doc. Con. Cen. No. 220840166, Order Initiating Remand Proceedings (August 22, 2022).

[86] A 0.01 percentage point of ROE was worth approximately $709,000 in combined generation and distribution annual revenues for DEV in 2021 provided by its customers through payment of their electric bills.

[87] This 2021 earned ROE is based on information provided by DEV. The Commission did not conduct an audit or investigation of the financial information provided by DEV. The Commission will conduct an audit of DEV's 2021 earnings as part of its 2024 triennial review. Interested parties will have an opportunity to participate in that proceeding. The 2021 earned ROE determined by the Commission in the 2024 triennial review may differ from the information provided by DEV and included in this report.

DEV 2021 Earned Return on Equity

Generation	Distribution	Combined
19.39%	4.49%	11.49%

DEV's reported 2021 combined generation and distribution unaudited earned ROE is above the 9.35% base ROE approved by the Commission in Case No. PUR-2021-00058 to be used for the 2021 – 2023 period. The following table provides a breakdown of DEV's 2021 earnings in both percentage points and revenues:

DEV 2021 Earnings in Excess of or Below a 9.35% ROE
(Revenues in Millions of Dollars)

	Generation	Distribution	Combined
Percentage Points	10.04%	-4.86%	2.14%
Revenues	$334.8	-$182.7	$152.1

As discussed above, Code § 56-585.1 A 8, as amended by the GTSA, states that certain costs are deemed fully recovered in the test period in which they were recorded per books by the company for financial reporting purposes. DEV stated it recorded costs in base rates related to severe weather events of $45.5 million during 2021 that are subject to Code § 56-585.1 A 8. DEV also recorded costs in base rates related to coal combustion residual management of $3.0 million during 2021 subject to Code § 56-585.1 A 8. These costs reduced DEV's reported 2021 earned ROE by 0.64 and 0.04 percentage points, respectively.

DEV did not defer any COVID-19-related expenses in 2021.

APCo 2021 Base Rate Financial Results

During 2022, in response to requests from Staff pursuant to Code § 56-36, APCo provided certain analyses of its combined generation and distribution base rate financial results for calendar year 2021 on a regulatory accounting basis. Calendar year 2021 is the second year of APCo's second triennial review, which will be filed with the Commission in 2023 and will cover the period 2020 – 2022.

APCo's analysis reflects a combined base rate generation and distribution ROE of 5.38% for 2021.[88] [89]

APCo 2021 Earned Return on Equity

Generation	Distribution	Combined
11.16%	1.32%	5.38%

APCo's reported 2021 combined generation and distribution unaudited earned ROE is below the 9.20% base ROE approved by the Commission in Case No. PUR-2020-00015 to be used for the 2020 – 2022 period. The following table provides a breakdown of APCo's 2021 earnings above or below the 9.20% approved ROE in both percentage points and revenues:

[88] A 0.01 percentage point of ROE was worth approximately $177,000 in combined generation and distribution annual revenues for APCo in 2021 provided by its customers through payment of their electric bills.

[89] This 2021 earned ROE is based on information provided by APCo. The Commission did not conduct an audit or investigation of the financial information provided by APCo. The Commission will conduct an audit of APCo's 2021 earnings as part of its 2023 triennial review. Interested parties will have an opportunity to participate in that proceeding. The 2021 earned ROE determined by the Commission in the 2023 triennial review may differ from the information provided by APCo and included in this report.

APCo 2021 Earned Return on Equity

(Revenue in Millions of Dollars)

	Generation	Distribution	Combined
Percentage Points Above/(Below) 9.20% ROE	1.96%	-7.88%	-3.82%
Revenue Sufficiency/(Deficiency)	16.2	(73.9)	(67.4)

Section 56-585.1 A 8 of the Code, as amended by the GTSA, directs the Commission to order increases to base rates necessary to provide the opportunity to fully recover the costs of providing the utility's services and to earn a fair combined rate of return if APCo's combined 2020-2022 earnings are more than 0.70 percentage points below the approved ROE of 9.20%.[90]

APCo Combined Earnings

(Earnings in Millions)

	2020	2021	Combined
Net Deficiency (From Bottom of the Range)	57.4	51.4	108.8

As discussed above, Code § 56-585.1 A 8, as amended by the GTSA, states that certain costs are deemed fully recovered in the test period in which they were recorded per books by the company for financial reporting purposes. To the extent those costs cause APCo's combined return to fall below the bottom of the 0.7 percentage point range, they may be deferred and amortized over a future period. APCo stated it recorded costs in base rates related to severe weather events of $11.7 million during 2021 that are subject to Code § 56-585.1 A 8. These costs reduced APCo's reported 2021 earned return by 0.05 percentage points.

[90] If the Commission finds, based on the evidence in the 2023 triennial review, APCo has a combined ROE more than 0.7 percentage points above the approved ROE, the Commission shall order refunds or consumer credit reinvestment offsets equal to the amount above the approved ROE plus 0.7 percentage points.

APCo also reported that it incurred and deferred $2.1 million in COVID-19-related expenses in 2021, which consisted primarily of bad debt expense and protective materials and supplies.

IV.

CURRENT STATUS OF PROCEEDINGS UNDER THE REGULATION ACT

The Regulation Act has undergone a number of amendments over the last few years resulting in numerous new programs, requirements, and rulemakings that apply to the Commonwealth's incumbent electric utilities and electric cooperatives. Since the Commission's 2021 Report, the Commission has conducted additional proceedings brought pursuant to the Regulation Act. This section provides a high-level summary of certain proceedings decided by the Commission since September 1, 2021, the date of the 2021 Report, or pending at the time of this report.[91]

Renewable Energy Cases

Below is a table summarizing the renewable energy cases decided by or pending with the Commission at the time of this report. A description of the proceedings follows the table.

Company	Topic	Pending or Resolved?	Code Section	Case No.
DEV	Regulations for a multi-family shared	Pending	§ 56-585.1:12	PUR-2020-00124

DEV	Rider TRG (Update)	Pending	§ 56-577	PUR-2022-00101

Decisions

- APCO RPS RAC (PUR-2021-00048). The Commission approved APCo's application to revise its RPS-RAC to recover residual, incremental costs related to APCo's participation in its voluntary RPS program that was in place prior to the passage of the VCEA. (Final Order, December 6, 2021). §§ 56-585.1 A 5 d and 56-585.2 E of the Code.

- GATS Business Rules: Registration and retirement of Virginia-eligible renewable energy certificates (PUR-2021-00064). The Commission revised its business rules concerning the registration and retirement of Virginia-eligible RECs in the PJM-EIS Generation Attribute Tracking System ("GATS"). This revision followed the Commission's then-recent update to these rules to reflect the categories of eligible generation sources for Virginia-qualified RECs in 2021-2024 under Virginia's mandatory RPS statute (§ 56-585.5). This docket was established to invite comment on that update and resulted in further revisions to these business rules. (Final Order, September 30, 2021). § 56-585.5 C of the Code.

- APCo Amherst Solar Facility (PUR-2021-00066). The Commission approved a prudency determination for APCo's proposed 4.875 MW Amherst Solar Facility. APCo did not seek cost recovery for the facility in this case. (Final Order, February 18, 2022). § 56-585.1: 4 H of the Code.

- Rules related to Accelerated Renewable Energy Buyers (PUR-2021-00089). The Commission adopted regulations implementing the provisions of Code § 56-585.5 G, enacted as part of the VCEA. Section 56-585.5 G permits certain customers of APCo and DEV to be certified as accelerated renewable energy buyers, and to be exempted from some or all of the RPS costs of these utilities. (Final Order, December 10, 2021). § 56-585.5 G of the Code.

- DEV US-3 Solar Projects RAC (PUR-2021-00118). The Commission approved DEV's annual update to its RAC for cost recovery associated with its US-3 Solar Projects (the Colonial Trail West Solar Facility, an approximately 142 MW solar generating facility located in Surry County, Virginia, and the Spring Grove 1 Solar Facility, an approximately 98 MW solar facility located in Surry County, Virginia). (Final Order, March 24, 2022). § 56-585.1 A 6 of the Code.

- DEV US-4 Solar Project RAC (PUR-2021-00119). The Commission approved DEV's annual update to its US-4 RAC for cost recovery associated with its Sadler Solar Facility (an approximately 100 MW utility-scale solar photovoltaic generating facility located in Greensville County, Virginia). (Final Order, March 18, 2022). § 56-585.1 A 6 of the Code.

- DEV Rider TRG Update (PUR-2021-00138). The Commission reviewed DEV's annual update of its previously approved 100% renewable tariff, Rider TRG. The update was filed on July 1, 2021. The update requested no change to the approved rate or to the portfolio of renewable resources providing service under Rider TRG. Rider TRG limits the ability of customers in DEV's service territory to purchase renewable energy from competitive suppliers under Code § 56-577 A 5. The Commission exercised its discretion not to address participant levels, and not to modify the filed rate, until Rider TRG has been in effect for a longer period of time in order to gain additional experience with its implementation. (Final Order, December 8, 2021). *See also below,* Case No. PUR-2022-00101, DEV's 2022 Rider TRG update filing. § 56-577 A 5 of the Code.

- DEV 2021 RPS Filing (PUR-2021-00146). The Commission reviewed DEV's 2021 RPS Filing which included (i) DEV's RPS Development Plan (encompassing proposed development of new solar, onshore wind, and energy storage resources); (ii) requests for approval to construct 13 new utility-scale projects and to enter into 24 new PPAs; and (iii) DEV's request for approval of revised Rider CE. The Commission (i) found that, for the limited purpose of filing its second annual RPS plan under Code § 56-585.5 D 4, DEV's plan was reasonable and prudent; (ii) approved the utility-scale projects and PPAs proposed by the Company; and (iii) approved revised Rider CE. In total, the Commission approved 857 MW of new solar generation capacity and 103 MW of energy storage capacity. The Commission directed DEV to continue filing a consolidated bill analysis in its RPS Filings. The Commission also established additional directives regarding DEV's modeling in its subsequent RPS Plans (Final Order, March 15, 2022). §§ 56-580 D, 56-46.1, 56-585.1 A 6, and 56-585.1:4 of the Code.

- APCO 2021 RPS Filing (PUR-2021-00206). The Commission reviewed APCo's 2021 RPS Filing where APCo estimates that by 2040, it may have 2,736 MW (nameplate) of solar, 750 MW (nameplate) of onshore wind, and 2,937 MW (nameplate) of energy storage, through a mix of company-owned resources and

PPAs, to meet the requirements of the VCEA. The Commission found that: (i) APCo's RPS Development Plan is reasonable and prudent for the limited purpose of its second annual plan; (ii) approved APCo's requests for approval of cost recovery for 313.9 MW of solar and onshore wind capacity, including both company-owned resources and PPAs; (iii) granted APCo's request for a prudency determination for 238.9 MW of solar capacity, including company-owned resources and PPAs; (iv) approved the recovery of projected costs of RECs purchased in the PJM REC market; and (v) approved RACs for cost recovery. The Commission directed APCo to continue filing a consolidated bill analysis in its RPS Filings. The Commission also established additional directives regarding APCo's modeling in its subsequent RPS Plans. (Final Order, July 15, 2022) § 56-585.5 of the Code.

- DEV Rider PPA (PUR-2021-00248). The Commission approved DEV's application for approval of a rate adjustment clause, designated Rider PPA, to recover projected and actual costs associated with certain PPAs for the energy, capacity, ancillary services, and RECs owned by third parties. (Final Order, August 3, 2022). § 56-585.1 A 5 d of the Code.

- DEV Rider RPS (PUR-2021-00282). The Commission approved revisions to DEV's Rider RPS. Rider RPS recovers the Company's projected and actual costs related to compliance with the mandatory RPS program established in the VCEA. (Final Order, June 30, 2022). § 56-585.1 A 5 d of the Code.

- DEV - GATS Business Rules; calculating RECs for a hybrid facility (PUR-2022-00075). DEV sought an exception to the GATS Business Rules for a combination solar generator/energy storage facility (Scott Solar/BESS-3). DEV requested that the Commission direct GATS to calculate the RECs for this hybrid facility based on the amount of energy that enters the BESS-3 system as charging energy, rather than the amount of energy discharged by BESS-3 to the grid. The Commission granted DEV's petition for exception in this matter, noting that (i) no comments or requests for hearing concerning it had been filed by interested parties or the Staff, and (ii) the exception granted may be subject to modification in the future as experience is gained with these types of facilities. (Order Granting Exception to GATS Business Rules, August 12, 2022). § 56-585.5 C of the Code, and the Commission's GATS Business Rules.

Pending Cases

- Regulations for a multi-family shared solar program (PUR-2020-00124) (DEV): DEV requests approval of an administrative charge associated with the Company's participation in a program affording eligible multi-family customers of investor-owned utilities the opportunity to participate in shared solar projects.[92] (Case filed September 1, 2021). § 56-585.1:12 of the Code.

[92] KU/ODP also has a multi-family shared solar program but did not request an administrative charge be set for its program.

- Regulations for a shared solar program (PUR-2020-00125) (DEV): The Commission issued a Final Order establishing the minimum bill, which may be modified over time, and set the bill credit rate for participants in DEV's shared solar program under Code § 56-594.3. The Commission is currently considering a petition for reconsideration filed by two respondents. (Order Granting Reconsideration, July 27, 2022) § 56-594.3 of the Code.

- Axton Solar Project (PUR-2021-00085). Axton seeks Commission approval to construct a 201.1 MW solar generating facility to be constructed in Henry and Pittsylvania Counties. The Application was initially filed on April 28, 2021. Axton subsequently filed with the Commission an amended application and supporting documents. (Amended application filed March 31, 2022). §§ 56-46.1 and 56-580 D of the Code.

- DEV offshore wind generation facilities (PUR-2021-00142). The Commission issued a Final Order approving requested cost recovery associated with DEV's proposed 2,587 MW CVOW Project to be located in a federal lease area off the coast of Virginia Beach, Virginia. The project consists of 176 wind turbines, each designed to generate 14.7 MW. The project is expected to have a capital cost of $9.8 billion and will likely be the largest capital investment, and single largest project, in the history of Dominion Energy Virginia. The Commission also approved the electric interconnection and transmission facilities to connect the CVOW Project reliably with the existing transmission system. The Commission issued an Order Granting Reconsideration for purposes of retaining jurisction over the case in response to a Petition for Limited Reconsideration filed by DEV. (Final Order, August 5, 2022; Order Granting Reconsideration, August 24, 2022). §§ 56-585.1, 56-585.1:11, 56-46.1, 56-265.1 of the Code.

- DEV allocation of RPS-related costs (PUR-2021-00156). This Commission docket was established to consider issues related to DEV's recovery of its RPS related costs, and the jurisdictional and class allocation of those costs among its customers. (Case filed December 22, 2021). § 56-585.5 of the Code.

- GATS business rules (PUR-2022-00045). This Commission proceeding will consider potential revisions to the Commission's GATS business rules ("GATS Business Rules"). In particular, the Commission will consider (i) incorporating language to establish a self-certification process for resources seeking to qualify as low-income projects pursuant to Code § 56-585.5 C; and (ii) additional issues related to the GATS Business Rules. (Case docketed April 14, 2022). § 56-585.5 C of the Code.

- DEV Rider TRG (PUR-2022-00101). DEV seeks approval of an annual update of its 100 percent renewable energy tariff, designated Rider TRG whereby participating customers can voluntarily elect to purchase 100 percent of their

energy grid capacity needs sourced from renewable energy resources. (Case filed July 1, 2022). §§ 56-577 A 5 and 56-234 of the Code.

Environmental Cases

Below is a table summarizing the environmental cases decided by or pending before the Commission at the time of this report. A description of the proceedings follows the table.

Company	Topic	Pending or Resolved?	Code Section	Case No.
DEV	Rider E (Update)	Resolved	§ 56-585.1 A 5	PUR-2021-00013
DEV	Rider CCR	Resolved	§ 10.1-1402.03	PUR-2021-00045
DEV	Rider RGGI Update	Resolved	§ 56-585.1 A 5	PUR-2021-00281
APCo	Environmental RAC	Pending	§ 56-585.1 A 5	PUR-2022-00001
DEV	Rider E (Update)	Pending	§ 56-585.1 A 5	PUR-2022-00006
DEV	Rider CCR	Pending	§ 10.1-1402.03	PUR-2022-00033
DEV	Rider RGGI (Suspension)	Resolved	§ 56-585.1 A 5	PUR-2022-00070

Decisions

- DEV Rider E (PUR-2021-00013). The Commission approved DEV's annual update to its Rider E to recover costs incurred to comply with state and federal environmental regulations at the Company's Chesterfield, Bremo, Clover, and Mt. Storm Power Station. (Final Order September 23, 2021). § 56-585.1 A 5 e of the Code.

- DEV Rider CCR (PUR-2021-00045). The Commission approved DEV's application seeking approval of Rider CCR to recover costs related to the removal of coal combustion residual from DEV's Bremo, Chesterfield, and Possum Point Power Stations and Chesapeake Energy Center. Such approval was made subject to certain cost allocations, reporting, and filing requirements applicable to future Rider CCR updates. (Final Order, October 6, 2021). §§ 56-585.1 A 5 e and 10.1-1402.03 of the Code.

- DEV Rider RGGI Update (PUR-2021-00281). On December 26, 2021, DEV filed an annual update of the Company's rate adjustment clause, Rider RGGI. This

Rider recovers projected and actual costs related to the purchase of allowances through the RGGI market-based trading program for carbon dioxide emissions. DEV subsequently sought, and the Commission granted, the Company's motion to withdraw the update filing, subject to future update and filing requirements. (Order Granting Motion, April 1, 2022). See, also, related docket, Case No. PUR-2022-00070. § 56-585.1 A 5 e of the Code.

- DEV Rider RGGI Suspension (PUR-2022-00070). The Commission approved DEV's May 5, 2022, petition to suspend Rider RGGI and to reset the Rider RGGI Projected Cost Recovery Factor to $0.00/kWh, effective July 1, 2022. The Commission further authorized DEV to recover RGGI compliance costs that are incurred up through July 31, 2022 (and ultimately approved by the Commission), and which have not been recovered prior to the suspension of the Rider through DEV's base rates for generation services in effect during the period incurred. This docket will remain open for future proceedings, including but not limited to an actual cost true-up proceeding to review incurred allowance costs that have been recovered through Rider RGGI. (Order Granting Petition, June 15, 2022). § 56-585.1 A 5 e of the Code.

Pending Cases

- APCo Environmental RAC (PUR-2022-00001). APCo seeks Commission approval to recover costs through its existing rate adjustment clause, the E-RAC, related to capital investments and operations and maintenance compliance expenses that are necessary to comply with state and federal environmental regulations. (Case filed March 18, 2022). § 56-585.1 A 5 e of the Code.

- DEV Rider E Update (PUR-2022-00006). DEV seeks an update to its Rider E to recover costs incurred to comply with state and federal environmental regulations at the Company's Chesterfield, Bremo, Clover, and Mt. Storm Power Stations. (Case filed January 25, 2022). § 56-585.1 A 5 e of the Code.

- DEV Rider CCR (PUR-2022-00033). DEV seeks to update its Rider CCR RAC. (Case filed February 28, 2022) §§ 56-585.1 A 5 e and 10.1-1402.03 of the Code.

Retail Access Cases

Below is a table summarizing the retail access cases decided by or pending before the Commission at the time of this report. A description of the proceedings follows the table.

Company	Topic	Pending or Resolved?	Code Section	Case No.
DEV	Aggregation Pilot	Continued	Chapter 796 of the 2020 Virginia Acts of Assembly	PUR-2020-00114
DEV	RPS Cost Allocation Proceeding	Resolved	§ 56-585.5 F	PUR-2020-00164

Decisions

- DEV RPS Cost Allocation to shopping customers (PUR-2020-00164). In this proceeding, DEV sought approval of its proposal to recover the non-bypassable RPS costs associated with Code § 56-585.5 F, net of benefits, from customers electing to take electric supply service from a competitive service provider. However, as part of the Commission's 2020 RPS Final Order, the Commission adopted the general RAC framework for the recovery of RPS-related costs as proposed by Staff, and as refined by Dominion, under which the Company will recover costs of resources approved under the VCEA, including the non-bypassable charge, in a single rate mechanism. As such, the Commission determined in this proceeding that Rider NBC (proposed by DEV) is no longer needed. Issues related to distinguishing between RPS Program compliance costs and other costs, as well as class cost allocation methodology and ARBs, will be addressed in appropriate subsequent proceedings, including Case No. PUR-2021-000156, discussed *supra*. (Final Order, September 23, 2021). §§ 56-585.5 and 56-585.1:11 of the Code.

Continued Cases

- DEV Aggregation Pilot (PUR-2020-00114). Pursuant to legislation passed by the 2020 General Assembly, the Commission established a pilot program through which non-residential customers that had previously sought to aggregate their load pursuant to Code § 56-577 A 4 in DEV's service territory would be permitted to purchase electric energy from a competitive service provider, subject to an overall cap of 200 MW of load participating in the Pilot. On June 17, 2022, the Commission issued an Order (i) finding that the Pilot should continue and remain open to any non-residential customer who is eligible for, and wishes to participate in, the Pilot; and (ii) continuing the case. Chapter 796 of the 2020 Virginia Acts of Assembly**.**

Energy Efficiency Cases

Below is a table summarizing the energy efficiency cases decided by or pending before the Commission at the time of this report. A description of the proceedings

follows the table. Both APCo (a Phase I Utility) and DEV (a Phase II Utility) estimate that they are on target to implement energy efficiency programs and measures to achieve the total annual energy savings targets for 2023 as specified by Code § 56-596.2.

Company	Topic	Pending or Resolved?	Code Section	Case No.
DEV	Evaluation, Measurement and Verification (EM&V) Methodologies	Resolved	§ 56-585.1 A 5	PUR-2020-00156
DEV	DSM RAC and Phase IX Programs	Resolved	§ 56-585.1 A 5	PUR-2020-00274
APCo	Energy Efficiency RAC and New Program	Resolved	§ 56-585.1 A 5	PUR-2021-00236
DEV	DSM RAC and Phase X Programs	Resolved	§ 56-585.1 A 5	PUR-2021-00247

Decisions

- DEV EM&V "Dashboard" proceeding (PUR-2020-00156). This Commission proceeding established guidelines for DEV's evaluation, measurement, and verification ("EM&V") reports related to the Company's DSM programs. DSM programs include energy efficiency and peak-shaving programs. EM&V reports address energy savings produced by such programs. (Final Order, October 27, 2021). § 56-585.1 A 5 of the Code.

- APCo Energy Efficiency RAC and New Program (PUR-2021-00236). The Commission approved APCo's application for approval of the continued implementation of its rate adjustment clause, the EE-RAC, to recover the costs of its existing portfolio of DSM programs, as well as for approval of one new pilot program, the Commercial and Industrial Custom Pilot Program. (Final Order, July 15, 2022). §§ 56-585.1 A 5 and 56-596.2 of the Code.

- DEV DSM RAC and Phase IX Programs (PUR-2020-00274). The Commission approved DEV's application seeking approval of its Phase IX DSM programs, including 11 new energy efficiency and demand response programs, the expansion and modification of certain existing programs, and approval of cost recovery through associated RACs. The Commission's approval was made subject to certain cost caps together with requirements for future DSM filings. (Final Order, September 7, 2021). § 56-585.1 A 5 of the Code.

- DEV DSM RAC and Phase X Programs (PUR-2021-00247). The Commission approved, among other things, (i) DEV's proposed Phase X DSM Programs including proposed enhancement and expansion of certain previously approved programs; (ii) reorganization and consolidation of the DEV's DSM Portfolio; and (iii) cost recovery through associated RACs. § 56-585.1 A 5 of the Code. (Final Order, August 10, 2022). § 56-585.1 A 5 of the Code.

Distribution Cases

Below is a table summarizing the distribution cases decided by or pending before the Commission at the time of this report. A description of the proceedings follows the table.

Company	Topic	Pending or Resolved?	Code Section	Case No.
APCo	Broadband Project	Resolved	§ 56-585.1:9	PUR-2020-00259
DEV	Rider GT	Resolved	§ 56-585.1 A 6	PUR-2021-00083
DEV	Rider U (Update)	Resolved	§ 56-585.1 A 6	PUR-2021-00110
DEV	Grid Transformation Plan	Resolved	§ 56-585.1 A 6	PUR-2021-00127
APCo	Broadband Project	Pending	§ 56-585.1:9	PUR-2022-00020
DEV	Broadband Project	Pending	§§ 56-585.1 A 6 and 56-585.1:9	PUR-2022-00062
SCC	Interconnection of Distributed Energy Resources	Pending	Pursuant to Final Order in Case No. PUR-2021-00127	PUR-2022-00073
DEV	Rider U (Update)	Pending	§ 56-585.1 A 6	PUR-2022-00089

Decisions

- APCo Broadband Project (PUR-2020-00259). The Commission approved APCo's petition seeking approval of a rate adjustment clause, the BC-RAC, for cost recovery of providing broadband capacity through its previously

approved Grayson County broadband pilot. (Final Order, October 1, 2021). §§ 56-585.1 A 6 and 56-585.1:9 of the Code.

- DEV Rider GT (PUR-2021-00083). The Commission approved DEV's application for a new rate adjustment clause, designated Rider GT, to recover certain costs of the Company's grid modernization plan that the Commission previously approved in Case Nos. PUR-2018-00100 and PUR-2019-00154. (Final Order, May 13, 2022). § 56-585.1 A 6 of the Code.

- DEV Rider U Strategic Undergrounding Program (PUR-2021-00110). The Commission approved DEV's annual update to Rider U. (Final Order, March 9, 2022). § 56-585.1 A 6 of the Code.

- DEV Grid Transformation Plan (PUR-2021-00127). The Commission approved DEV's third grid modernization proposal, which included requested approval of $669.4 million of capital investments and $109.5 million of operations and maintenance expense. The Commission's approval of these projects was made subject to certain contingencies, cost caps, and reporting requirements. (Final Order, January 7, 2022). § 56-585.1 A 6 of the Code.

Pending Cases

- APCo Broadband Project (PUR-2022-00020). APCo seeks approval of a new project to make available broadband capacity to an Internet Service Provider in parts of Bland County and Montgomery County and to revise its BC-RAC to reflect actual costs of providing broadband capacity under the Company's existing broadband project as well as the new project. (Case filed June 8, 2022) §§ 56-585.1 A 6 and 56-585.1:9 of the Code.

- DEV Broadband Project (PUR-2022-00062). DEV seeks approval to install middle-mile broadband capacity in certain unserved areas of Virginia, including the Northern Neck region and the Thomas Jefferson Planning District. The Company also seeks approval to revise rate adjustment clause Rider RBB, for the rate year commencing December 1, 2022, through November 20, 2023. (Case filed May 5, 2022). §§ 56-585.1 A 6 and 56-585.1:9 of the Code.

- Interconnection of Distributed Energy Resources (PUR-2022-00073). This Commission docket was established (pursuant to the Commission's Final Order in Case No. PUR-2021-00127) to address obstacles to the interconnection of distributed energy resources on electric utilities' distribution systems. (Docket established May 24, 2022).

- DEV Rider U Strategic Undergrounding Program (PUR-2022-00089). DEV seeks an annual update to Rider U. (Case filed June 13, 2022). § 56-585.1 A 6.

Integrated Resource Plan Cases

Below is a table summarizing the IRP cases decided by or pending before the Commission at the time of this report. A description of each proceeding follows the table.

Company	Topic	Pending or Resolved?	Code Section	Case No.
DEV	Integrated Resource Plan Update	Resolved	§ 56-597 *et seq.*	PUR-2021-00201
APCo	Integrated Resource Plan	Pending	§ 56-597 *et seq.*	PUR-2022-00051

Decisions

- DEV IRP Update (PUR-2021-00201). On September 1, 2021, DEV filed with the Commission the Company's 2021 update to its 2020 Integrated Resource Plan. The Commission found this update legally sufficient and accepted it for filing. The Commission stated, however, that such acceptance does not express approval of the magnitude or specifics of Dominion's future spending plans. (Final Order, October 28, 2021). § 56-599 of the Code.

Pending Cases

- APCo IRP (PUR-2022-00051). APCo has filed its 2022 IRP. Per the filing, the IRP, among other things, incorporates requirements of the VCEA related to resource acquisition, includes the most recent load forecast consistent with the VCEA, and incorporates updated renewable costs. The Commission will hear this case starting October 24, 2022. (Case filed April 29, 2022). § 56-599 of the Code.

Financial Review Cases

Below is a table summarizing the financial review cases decided by or pending before the Commission at the time of this report.

Company	Topic	Pending or Resolved?	Code Section	Case No.
APCo	Triennial Review	Pending	§ 56-585.1 A	PUR-2020-00015

DEV	Triennial Review	Resolved	§ 56-585.1 A	PUR-2021-00058

Decisions

- DEV Triennial Review (PUR-2021-00058). On March 31, 2021, DEV filed its application for the Commission's triennial review of the Company's rates, terms, and conditions for the provision of generation, distribution, and transmission services. The Commission Order in this case approved a stipulation that principally provided (i) customer refunds totaling $330 million; and (ii) the statutory maximum annual rate reduction of $50 million. (Final Order, November 18, 2021). § 56-585.1 A 3 of the Code.

Pending

- APCo Triennial Review (PUR-2020-00015). The Commission, among other things, determined that in the 2017-2019 triennial period under review, Appalachian earned 6 basis points above the fair ROE, which equates to approximately $1,992,987 in excess earnings for such period. Upon appeal to the Supreme Court of Virginia, on August 18, 2022, the Court affirmed in part, reversed in part, and remanded the case to the Commission for further proceedings consistent with the Court's opinion. (Final Order, November 24, 2020; Order on Reconsideration, March 26, 2021; Notice of Appeal, April 5, 2021; Petition of Appeal, July 6, 2021; Opinion of the Supreme Court of Virginia, Aug. 18, 2022; Order Initiating Remand Proceedings, August 22, 2022). § 56-585.1 A 3 of the Code.

See also, Section III, Base Rate Financial Results, of this report for details on these cases.

Miscellaneous Cases

Below is a table summarizing miscellaneous cases decided by or pending before the Commission at the time of this report. A description of the proceedings follows the table.

Company	Topic	Pending or Resolved?	Code Section	Case No.
DEV	Universal Service Fee/Rider PIPP	Pending	§ 56-585.6	PUR-2020-00109
APCo	Universal Service Fee/Rider PIPP	Pending	§ 56-585.6	PUR-2020-00117
DEV	Rider SNA	Resolved	§ 56-585.1 A 6	PUR-2021-00229

Decisions

- DEV Rider SNA (PUR-2021-00229). The Commission approved DEV's application for a RAC, Rider SNA, to recover the Company's costs associated with (i) preparing petitions to the Nuclear Regulatory Commission to extend the operating licenses of Dominion's Surry Units 1 and 2 and North Anna Units 1 and 2; and (ii) the projects reasonably appropriate to upgrade or replace systems and equipment deemed to be necessary to operate these units safely and reliably. (Final Order, July 1, 2022). § 56-585.1 A 6 of the Code.

Pending

- Percentage of Income Payment Program (DEV: PUR-2020-00109; APCo: PUR-2020-00117). The VCEA requires the Commission to determine the universal service fees to be collected from customers of APCo and DEV to fund the Percentage of Income Payment Program ("PIPP") established by statute. PIPP eligible utility customers are persons or households whose income does not exceed 150 percent of the federal poverty level.[93] § 56-585.6 of the Code.

  The Commission authorized DEV and APCo to begin collecting a universal service fee from the statutorily designated customers as soon as practicable, effective for service rendered on and after September 1, 2021, at a level designed to fund the estimated start-up costs of Department of Social Services ("DSS") needed to establish the PIPP. The Commission also continued the proceedings to determine the rates, terms, and conditions of a "non-bypassable universal service fee" to be charged to DEV and APCo's customers to fund the PIPP, instructing both utilities to file within 60 days after DSS rules or guidelines are published. (Orders, July 29, 2021). To date, DSS has not published these rules or guidelines. Consequently, neither APCO nor DEV has been required to make additional filings of their respective PIPP dockets, as otherwise required by the Commission's July 20, 2021 Orders.

V.
STAKEHOLDER MEETINGS

The Staff has been involved in multiple stakeholder meetings over the last year as required by recent legislation. Staff has attended these meetings as a resource to provide technical information or background on Commission procedures and proceedings. The following is a list of meetings the Staff has attended:

[93] Code § 56-576.

- Energy Efficiency Meetings: (required by SB 966,[94] SB 1605,[95] and HB 2293[96]) held on November 8, 2021, and April 25, 2022, for APCo; and, August 31, 2021, November 17, 2021, February 22, 2022, and, June 21, 2022, for DEV.

- Transportation Electrification Stakeholder Group Meetings: (required by HB 2282[97]) held on October 21, 2021, November 4, 2021, November 18, 2021, December 2, 2021, and December 16, 2021.

- Program to Encourage and Expedite Electric Utility Infrastructure Investments Stakeholder Meetings: (required by HB 894[98]) held on June 23, 2022, July 5, 2022, July 13, 2022, and July 25, 2022.

- Renewable Energy Facilities Lifecycle Task Force Meeting: (required by SB 499 and HB 774[99]) The Commission is in the process of selecting a third-party facilitator for this task force. Task force meetings are expected to occur in the fall of 2022.

- Shared Solar Stakeholder Workgroup for APCo and Kentucky Utilities: (required by SB 660[100]) The Commission is in the process of selecting a third-party facilitator for this work group. Stakeholder workgroup meetings are expected to occur in the fall of 2022.

VI.
PJM / FERC STATUS

DEV and APCo are members of PJM, a regional transmission organization that coordinates the movement of wholesale electricity across all or parts of the District of

[94] 2018 Va. Acts ch. 296.

[95] 2019 Va. Acts ch. 398.

[96] 2019 Va. Acts ch. 397.

[97] 2021 Va. Acts, Special Session I, ch. 268.

[98] 2022 Va. Acts ch. 488.

[99] 2022 Va. Acts chs. 69 and 70.

[100] 2022 Va. Acts ch. 591.

Columbia and 13 states.[101] Below is a list of recent matters involving PJM and FERC that may impact Virginia:

- In June 2018, FERC invalidated PJM's capacity market design. FERC ruled that state-subsidized resources were artificially and improperly suppressing market prices.[102] Following a FERC technical conference on wholesale market reform in March 2021, during which the FERC Chairman indicated FERC would take action to address deficiencies in the Minimum Offer Price Rule ("MOPR") (including concerns that the MOPR could cause undue burden to resources supported by state policies) by year-end if PJM did not do so, PJM initiated an accelerated stakeholder process, or Critical Issue Fast Path. On July 30, 2021, PJM filed its replacement MOPR proposal in Docket No. ER21-2582. On September 29, 2021, FERC allowed PJM's proposal to become effective by operation of law, stating that "[t]he Commission did not act on PJM's filing because the Commissioners are divided two against two as to the lawfulness of the change."[103] Several parties, including other state commissions, have appealed FERC's order.

- In April 2021, DEV announced that it would elect to procure its capacity through the Fixed Resource Requirement alternative to the PJM capacity market auction.[104] A competitive power supplier challenged PJM's approval of this election. FERC rejected this challenge on July 15, 2021.

- In September 2020, FERC issued Order 2222, which adopted reforms to allow distributed energy resource aggregations to participate in the regional transmission organization markets.[105] PJM made its compliance filing on February 1, 2022, outlining how it will comply with Order 2222.[106]

- On June 30, 2021, the transmission owners ("Transmission Owners") in the PJM region submitted a consolidated filing at FERC that proposed revisions to the PJM Tariff to provide Transmission Owners with the option to elect to fund the capital

[101] Specifically, the 13 states consist of Delaware, Illinois, Indiana, Kentucky, Maryland, Michigan, New Jersey, North Carolina, Ohio, Pennsylvania, Tennessee, Virginia, and West Virginia.

[102] *Calpine Corp. v. PJM Interconnection, LLC*, 163 FERC ¶ 61,236 (2018).

[103] *PJM Interconnection L.L.C.*, Notice of Filing Taking Effect by Operation of Law, Docket No. ER21-2582 (Sep. 29, 2021).

[104] APCo has always chosen the PJM Fixed Resource Requirement alternative since joining PJM in 2004.

[105] *Participation of Distributed Energy Resource Aggregations in Markets Operated by Regional Transmission Organizations and Independent System Operators*, 172 FERC ¶ 61,247 (September 19, 2020).

[106] *PJM Interconnection, L.L.C.*, Docket No. ER22-962.

cost of network upgrades necessary to accommodate generator interconnections.[107] The proposed revisions would allow the PJM Transmission Owners the opportunity to earn a return of and on the costs of network upgrades that are necessary to interconnect generation resources to the PJM transmission system. Under the current tariff, those costs must be paid by the interconnecting generator. FERC set this matter for paper hearing on November 19, 2021, and parties filed briefs in January 2022.

- On July 19, 2021, PJM filed a brief in a Pennsylvania federal court case challenging the Pennsylvania Public Utility Commission's ("PAPUC") rejection of a transmission line. Following the PAPUC's order, the developer (TransSource) sued the PAPUC in federal court, alleging that the PAPUC's decision violated the dormant Commerce Clause and was preempted by PJM's earlier determination of need. PJM claims that the PAPUC does not have authority to reject a line on the grounds that the line is not needed where PJM has concluded the line is necessary under mechanisms approved by FERC. On August 26, 2021, the District Court denied in part PAPUC's motion to dismiss, finding that TransSource had standing to file the action. The court abstained on the remainder of the motion, electing to wait until an appeal in state court was completed. On May 6, 2022, the Pennsylvania Commonwealth Court upheld the PAPUC's order rejecting the line. The District Court lifted its stay of the proceedings on May 17, 2022, and discovery in the case is ongoing. The current schedule calls for discovery to continue until January 2023, with dispositive motions and supporting briefs due on or before February 15, 2023.

- On April 21, 2022, FERC issued a Notice of Proposed Rulemaking ("NOPR") seeking comment on the potential need for change to existing regulations on electric regional transmission planning, cost allocation, and generator interconnection processes.[108] Comments were due by August 17, 2022.

- On June 14, 2022, PJM proposed changes to its generator interconnection process, seeking to change from a first-come, first-served process to a first-ready, first-served process, to give priority to projects that are more likely to be completed.[109] PJM claims this will help alleviate significant queue backlogs.

- On June 16, 2022, FERC issued a NOPR, proposing changes to its interconnection procedures to address interconnection queue backlogs, improve

certainty, and prevent undue discrimination for new technologies.[110] Comments on the NOPR are due October 13, 2022.

VII.
CONSUMER EDUCATION

The Regulation Act, specifically § 56-592 of the Code, directs the Commission to establish, implement, and maintain a consumer education program to provide retail customers with information regarding energy conservation and efficiency, DSM, demand response, and renewable energy. The Virginia Energy Sense ("VES") consumer education program is in its twelfth year of building awareness of the value of energy efficiency.

Highlighted VES accomplishments from the last year (July 1, 2021 – June 30, 2022) are as follows:

- VES' new contract team comprehensively analyzed communications about consumer energy in Virginia and developed a messaging framework to guide the program's strategies and activities.
- To measure public attitudes on energy conservation, VES conducted an online quantitative survey, which garnered responses from 1,208 Virginia residents. Survey results suggested that awareness of the VES program remains high; approximately 1 in 4 respondents recalled recently seeing or hearing messages from or about VES.
- VES secured 10 news stories about the program and its energy saving tips in 10 media outlets, including TV stations in Richmond, Charlottesville, and Norfolk.
- Following a pandemic-driven pause in community outreach events, VES exhibited at three in-person events in spring 2022. The events' total attendance was approximately 75,400.
- VES ran two statewide radio advertising campaigns that collectively generated over 9.7 million impressions. The campaigns ran in October 2021 and April –

[110] *Improvements to Generator Interconnection Procedures and Agreements*, Docket No. RM22-14, 179 FERC ¶ 61,194 (June 16, 2022).

May 2022 and drove a 31.5% and a 16.3% increase in web visits, respectively. VES also created 36 public service announcements for radio, tailored to the six regions of Virginia, that collectively garnered around 120,000 impressions as of May 31, 2022.

- A VES advertising campaign on Facebook and Instagram that ran from May 4 to June 1, 2022, garnered over 2.8 million impressions and drove 12,627 visits to VES' new "10 ways to save" landing page, shown below:

- The VES website garnered 19,891 site visits and 22,833 page views.

- VES published 218 posts on its Facebook and Twitter accounts, reaching 31,625 users and generating 722 engagements. VES also relaunched its Instagram account in March 2022.

VIII.
CLOSING

Code § 56-596 directs the Commission to provide "recommendations for any actions by the General Assembly, the Commission, electric utilities, or any other entity that the Commission considers to be in the public interest."[111] While the Commission has no statutory recommendations at this time, we bring to the General Assembly's attention a matter for its consideration, specifically the Commission's lack of proactive authority, under current law, to protect reliability and security of electric service resulting from VCEA-directed retirements unless there is a request by the utility. Code § 56-585.5 B prescribes certain retirements of fossil fuel generation owned by Phase I (APCo) and Phase II (DEV) utilities.

Code § 56-585.5 B 4 further states:

> A Phase I or Phase II Utility [APCo or DEV] *may* petition the Commission for relief from the requirements of this subsection on the basis that the requirement would threaten the reliability or security of electric service to customers. The Commission shall consider in-state and regional transmission entity resources and shall evaluate the reliability of each proposed retirement on a case-by-case basis in ruling upon any such petition.[112]

The Commission appreciates the General Assembly's awareness of the importance of reliability and security of electric service to end-use customers. That said, the above

---

[111] Specifically, Code § 56-596 B.

[112] Emphasis added. Similarly, Enactment Clause 9 of the VCEA reads:

> That nothing in this act shall require the utilities or the State Corporation Commission to take any action that, in the State Corporation Commission's discretion and after consideration of all in-state and regional transmission entity resources, threatens the reliability or security of electric service to the utility's customers.

While this Enactment Clause appears to protect the Commission *from having to* act, it does not appear to give the Commission authority *to* act.

provisions leave it to *the utility's* discretion whether to seek relief from VCEA requirements. The utility still has the ability to decide to retire and/or impair generating units even though customers may still be required to pay for such units. An after-the-fact review or finding of harm to reliability and/or security of electric service would leave the Commission with few options to protect customers.

If the General Assembly intends to leave this discretion solely in the hands of utilities, that is what the current law accomplishes. The General Assembly may wish to consider a required update or analysis from the Commission in close proximity and prior to unit closure.

The Commission continues to execute its responsibilities under the Regulation Act and stands ready to implement the laws passed by the General Assembly.

ENERGY + ENVIRONMENT

Virginians feeling the heat of high utility bills this winter

Global pressures, higher natural gas prices leading utilities to seek higher rates

BY: **CHARLIE PAULLIN** - FEBRUARY 20, 2023 12:04 AM

Natural gas meter with pipe on wall. (Getty Images)

On Christmas Eve 2022, temperatures in central Virginia hit a low of 8 degrees, 17 degrees below the record in 2021, according to the National Weather Service.

That and several other arctic blasts this winter came amid global conflicts like war in Ukraine that have strained natural gas supply in the U.S. At the same time, there has been an increase

in the use of natural gas to generate energy for the electric grid as more and more coal-fired plants come offline.

As a result, the U.S. Energy Information Administration predicted in October that natural gas bills in the South could increase during the October to March winter season by $761, or 24%, compared to the year before. Some 28% of homes in the South rely on natural gas for heat.

For homes relying on electricity for heat, bills could increase by $1,249, or 12%. About 65% of homes in the South rely on electricity for heat.

Virginia has eight investor-owned natural gas providers, two large electric utilities and 13 electric cooperatives that are regulated by the State Corporation Commission. There are also three municipal governments – Richmond, Danville and Charlottesville – that provide natural gas and are regulated by their city councils.

In filings with the State Corporation Commission and interviews with the Mercury, all gas and electric providers have acknowledged that global price pressures on natural gas are affecting customers' bills.

Southwest Virginia Gas Company, "like any other entity that purchases natural gas, has seen increases to the costs it pays for natural gas," wrote president and CEO James McClain II in one representative request to the SCC for a rate increase.

All of Virginia's electric and gas providers have assistance programs for customers to help alleviate the burden of rising bills. Millions of dollars are also available through state assistance and energy efficiency programs.

But customer advocates say all those programs can be improved.

"I don't think there's anybody out there that doesn't really want to make efforts to help utility customers," said Dana Wiggins, director of the Center for Economic Justice at the Virginia Poverty Law Center.

Investor-owned utilities

State law allows investor-owned natural gas and electricity companies like Dominion Energy, Appalachian Power Company and Virginia Natural Gas to recover their operating costs and earn a reasonable profit from customers.

Fuel costs are recouped from customers without any extra profit for the companies.

In filings with the SCC over the past few months, numerous gas and electric utilities have asked to raise rates to make up for rising fuel costs, as well as others like lost COVID-19 revenues from forgone late fees and inflationary pressures.

Roanoke Gas Company "is experiencing significant inflationary pressure on costs and prices for labor and benefits, insurance, pension, and bad debt, among other operating and

maintenance expenses," attorney Timothy E. Biller wrote in one filing.

Columbia Gas of Virginia, which serves about 285,000 customers in the eastern and central regions of Virginia, is asking for an average monthly residential bill increase of 12.37%. Roanoke Gas, which serves about 63,500 customers around Roanoke, is seeking a $2 residential customer charge increase. Southwest Virginia Gas Company, which serves about 4,300 customers around Martinsville, is seeking a rate increase that would add roughly $7.88 to the average residential customer's monthly bill. Virginia Natural Gas, which serves 312,000 customers in Tidewater Virginia, received an increase that would affect average monthly customer bills by $12.88.

"Despite our best efforts to keep costs down, the Company has experienced substantial increases in costs along our entire supply chain for capital, goods, services and personnel which has resulted in the need to seek a base rate increase," testified Paul Nestor, president and CEO of Roanoke Gas Company.

Dominion and Appalachian Power have also sought rate increases to cover spiking fuel costs. In September, the State Corporation Commission approved an increase for Dominion that added roughly $14.93 to the average residential customer's monthly bill. Appalachian Power is seeking about a $20 monthly bill increase.

The Dominion request sought to cover a $1 billion gap between expected and actual fuel costs for 2022 and almost $2.3 billion in projected costs for the year between July 2022 and June 2023.

According to a 2021 long-range plan filed by Dominion, natural gas constituted 40% of the fuel used for electricity generation that year. Nuclear accounted for 29%, while renewable energy sources like solar accounted for 4%.

"The mix is going to noticeably change as we add more renewables," Dominion Energy spokesperson Craig Carper said.

Municipal utilities

The municipal utilities, meanwhile, have adjusted their rates more periodically to avoid cost increases and, more recently, reflect subsiding fuel costs.

In Richmond, the purchased gas cost, which is passed directly on to customers, almost doubled between January and July 2022. It has since decreased to reflect what Richmond Department of Public Utilities spokesperson Rhonda Johnson called "actual market conditions" but remained 15% higher than the prior year in January 2023.

Charlottesville, in contrast, has seen gas bills fall by about 1.2%: This January, the average customer bill was $52.63 total, compared to $53.27 in January 2022.

Comparatively, the city of Danville purchased their natural gas for this winter at more affordable times, when it was about $5.50 a unit. Over the summer, costs spiked to $8 to $9.

Costs lowered to about $7 a unit in December.

“It’s kind of like an insurance policy,” Danville Utilities Director Jason Grey said

Lending a hand

All of the utilities offer varying levels of energy assistance, from monthly bill payment plans to weatherization programs.

On a larger scale, the state offers several ways to help with utility payments.

Utility customers in crisis or emergency situations can get financial help like bill payment assistance, security deposit coverage and fuel assistance funding to help pay for heating bill costs through the Virginia Department of Social Services.

Typically, $7 million in federal funds are allocated for crisis benefits, which are available to people facing a utility cutoff or broken heating equipment, according to an email from DSS. There were almost 1,000 applications for crisis assistance between the program’s opening in November and late December.

For fuel assistance, Virginia typically gets $45 million through the federal Low Income Housing Energy Assistance Program, or LIHEAP, said the department, but this year it got $50 million. That money is funneled into a state program called Energy Assistance. There were 128,000 applications for fuel assistance this year, with over 107,000 approved by late December.

“The number of applicants for fuel assistance has increased about 5% over last year,” said the department in its email. In recent years, about 10% of Virginia households that use natural gas as a heat source have gotten fuel assistance. Overall, about 65% of funding recipients use natural gas.

On the weatherization side, the Department of Housing and Community Development oversees Virginia’s Weatherization Assistance Program, which provides financial assistance for home improvements such as heating and cooling upgrades and insulation installation or air sealing to ensure heat is generated efficiently and contained within a home.

Last year, 1,075 Virginia households received about $20 million in services through the Weatherization Assistance Program, according to department spokesperson Amanda Love.

Weatherization Assistance Program funds are also federally sourced, with $4.4 million from the U.S. Department of Energy and $14 million from the U.S. Department of Health and Human Services.

Virginia has also received over $225 million for low-income energy efficiency programs from the state’s participation in the Regional Greenhouse Gas Initiative, a multistate cap-and-invest program under which electricity producers must buy allowances for the carbon they emit. The proceeds from the purchases are then returned to the state.

From that funding, $45 million has been allocated to the Weatherization Deferral Program, which pays for repairs to homes that make them ready for weatherization efforts, and $115 million to an Affordable and Special Needs Housing program that is geared toward building homes. An additional $11.4 million has gone toward repair assistance for homes in the town of Hurley damaged in catastrophic floods in 2021.

Virginia received $272,646 for the Weatherization Readiness Fund, which also goes toward making homes ready for weatherization upgrades, as part of 2022 annual appropriations from the U.S. Department of Energy.

Program changes

Some advocates say Virginia can help shield customers from the volatility of global energy markets through utility regulation reform.

For Wiggins of the Virginia Poverty Law Center, that includes reviving the state's Commission on Energy Utility Regulation to assist with crafting policies for state oversight of publicly regulated utilities.

Instead of relying on a part-time legislature to take up reforms in the complex energy sector, Wiggins said a year-round commission could give deeper consideration to proposals such as factoring in a cost of living index to account for rents when structuring rates. Bills mandating two commission meetings per year are still alive in the final days of this session.

The state could also bulk up its utility cutoff protections, said Kidest Gebre, communications and campaigns manager for the grassroots group Interfaith Power and Light. Del. Irene Shin, D-Fairfax, filed a bill this session to prevent utilities from disconnecting services to residential customers for not paying bills during a state of emergency – a proposal she also put forward in 2022 – but it failed in committee.

"It's a long haul to change over the system," Wiggins said.

Wiggins said improvements can also be made to how bill assistance funding, particularly through LIHEAP, is doled out. Application windows are short, she said – requests for assistance during heating emergencies have to be made between the first workday in January and March 15, for example – and "funding does run out very quickly."

On the federal level, the recently passed Inflation Reduction Act offers a variety of tax credits to install new, more efficient technologies like heat pumps.

But a decision to electrify a home depends on a family's economic circumstances.

"It's something that [low-income] families can't actually afford to do," Wiggins said.

That's where funding from RGGI is a game changer, said Chelsea Harnish, executive director of the Virginia Energy Efficiency Council. While federal funding can only be used to cover a portion of each weatherization and energy efficiency project, she said, state programs funded

by RGGI dollars can be used to cover the entirety of upgrades. Projects have included repairs of 52 low-income houses in Shenandoah County and roof and new heating and cooling system installations in Crewe.

One recent report from Virginia Commonwealth University's L. Douglas Wilder School of Government and Public Affairs found that if Virginia stayed in RGGI through 2030, improvements could be made to 100,000 to 130,000 low-income homes under the state's energy efficiency programs. That could result in $68 to $82 million in customer bill savings per year, an average of $676 per year per household, researchers found.

Re: Case No. PUR-2022-00064

Dear Mr. Logan:

Virginia Electric and Power Company ("Dominion Energy Virginia" or the "Company") hereby files with the Virginia State Corporation Commission ("Commission") its application to revise the fuel factor component of customer electric rates effective July 1, 2022 (the "Application"), pursuant to § 56-249.6 of the Code of Virginia. While in most years, this is a relatively routine filing, the dramatic increases in fuel prices as a result of the pandemic, inflation generally, and the war in Ukraine have created a significant fuel cost under-recovery and projections that fuel costs will remain elevated over the next year. The Company estimates that without steps to mitigate the effect of these costs, the fuel factor rate adjustment would result in an approximately 20% increase in the typical Dominion Energy Virginia residential customer's monthly bill for 1,000 kilowatt-hours of usage.

To avoid this outcome, the Company presents a voluntary mitigation proposal in the Application, including Two Year Mitigation and Three Year Mitigation alternatives. The Company recommends the latter option, which would reduce the impact to the typical residential customer to an approximately 12% bill increase due to the fuel factor rate adjustment. Taken together, the Three Year Mitigation proposal and separate rate revisions submitted to the Commission today would increase the typical residential customer's monthly bill by a net of approximately $9 or 7%, if approved as filed. This does not count a $1.98 savings from a filing previously approved by the Commission withdrawing a proposed increase for costs related to the Regional Greenhouse Gas Initiative. As always, the Company stands ready to work with customers to identify programs, services, and payment options that suit their particular needs.

The fuel factor rate is designed to recover purchased power costs and costs incurred to procure commodities, most notably natural gas and coal, needed to power the Company's traditional electric generating fleet and reliably serve its customers. The Company's current fuel factor rate, based on March 2021 commodity price projections, was set prior to significant increases in the price of purchased power, coal, and natural gas which have only been exacerbated by the war in Ukraine.

Differences between past projections and actual fuel costs are not unusual, and fuel factor rate revisions provide the opportunity to correct for any under- or over-recovery. However, the Company is mindful of the significant under-recovery which has accrued—the fuel deferral balance is expected to exceed $1 billion as of June 30, 2022. Additionally, current projections suggest that fuel commodity prices will remain at elevated levels for the medium term. This set of circumstances would ordinarily result in a significant customer impact from the fuel factor rate revision if the Commission were to approve a recovery rate over 12 months.

220510099

The Application therefore presents alternatives to instead spread recovery over either two or three years. Both the Two Year Mitigation and Three Year Mitigation options would reduce the effect of the fuel factor rate revision on customer electric bills. Between these two alternatives, the Company recommends the Three Year Mitigation proposal because it provides for the smallest near-term rate increase, rate stability over the next several years, and greater flexibility in the event commodity markets have improved when the Commission revisits the fuel factor rate next year.

Dominion Energy Virginia is sensitive to any proposed electric rate increase, as evidenced by its recent motion to withdraw the proposed update to the rate adjustment clause associated with Regional Greenhouse Gas Initiative compliance (Rider RGGI). The Commission's approval of this motion last month avoided what the Company expected would have been a $1.98 increase to the typical residential customer's monthly bill. Today, the Company has proposed to cease customer billing for Rider RGGI effective July 1, 2022 and recover unrecovered RGGI-related costs through July 31, 2022 in its base rates. This will reduce the typical residential customer's monthly bill by approximately $2.39, subject to Commission approval.

The proposed revision to Rider T1, the Company's recovery mechanism for certain transmission-related costs, would save the typical residential customer another $3.69 per month in electricity costs if approved. Dominion Energy Virginia has also petitioned for a revision to Rider RBB, which enables cost recovery for projects undertaken in partnership with internet service providers to expand broadband access in Virginia. If approved, the Rider RBB update would increase the typical residential customer's monthly bill by $0.14. Thus, the Company anticipates that the net impact of other applications filed today with the Commission will help to offset the customer rate increase attributable to the fuel factor.

The Company is taking significant action to reduce customers' exposure to future fuel cost fluctuations. The ongoing diversification of its electric generating fleet—specifically, the addition of solar and offshore wind resources including the Coastal Virginia Offshore Wind project which have no associated fuel costs—will mitigate the risk of commodity price upheavals. Additionally, the Company will continue its practice of entering into market transactions that act as a hedge against future price uncertainty.

Dominion Energy Virginia believes this Application exemplifies its focus on ensuring that its safe and reliable electric service also remains affordable. With the Commission's approval, the Three Year Mitigation proposal described herein will help shield customers from what would otherwise be a significant fuel factor rate adjustment. The Company looks forward to a constructive and customer-beneficial outcome in this proceeding.

Sincerely,

Edward H. Baine

Edward H. Baine
President, Dominion Energy Virginia

COMMONWEALTH OF VIRGINIA

STATE CORPORATION COMMISSION

APPLICATION OF	)	
	)	
VIRGINIA ELECTRIC AND POWER COMPANY	)	Case No. PUR-2022-00064
	)	
To revise its fuel factor pursuant to Va. Code § 56-249.6	)	
	)	

APPLICATION

Pursuant to § 56-249.6 of the Code of Virginia ("Va. Code"), Virginia Electric and Power Company ("Dominion Energy Virginia" or the "Company"), by counsel, files this application to revise its fuel factor effective July 1, 2022 (the "Application"). In support of its Application, the Company respectfully states the following:

1. Dominion Energy Virginia is a public service corporation organized under the laws of the Commonwealth of Virginia furnishing electric service to the public within its certificated service territory. The Company also supplies electric service to non-jurisdictional customers in Virginia and to the public in portions of North Carolina. The Company's electric system, consisting of facilities and associated facilities for the generation, transmission, and distribution of electric energy, is interconnected with the electric systems of neighboring utilities and is part of the interconnected network of electric systems serving the continental United States. Because of its operations in Virginia and North Carolina and its interconnections with other electric utilities, the Company engages in interstate commerce. The post office address of the Company is P.O. Box 26666, Richmond, Virginia 23261.

2. The facts supporting this Application are set forth in the accompanying testimony and exhibits of Gregory A. Workman, J. Scott Gaskill, Whitney W. Johnson, Katherine E.

220510089

Farmer, Dale E. Hinson, Tom A. Brookmire, Wesley A. Hudson, Ronnie T. Campbell, and Timothy P. Stuller.

3. The testimony and exhibits demonstrate that a revision to the Company's existing fuel factor rate is necessary to provide the Company with the appropriate level of fuel cost recovery pursuant to Va. Code § 56-249.6 over the period beginning July 1, 2022 through June 30, 2023.

4. The Company's total fuel factor, reflected in Fuel Charge Rider A, consists of both a current period and a prior period factor. As Company Witness Timothy P. Stuller discusses, for the July 1, 2022 through June 30, 2023 fuel year, the Company projects Virginia jurisdictional fuel expenses, including purchased power expenses, of approximately $2.278 billion, translating into a current period fuel factor rate of 3.0784 cents per kilowatt-hour ("¢/kWh"). The Company's projected June 30, 2022 fuel deferral balance is approximately $1.020 billion, translating into a prior period factor rate of 1.3784 ¢/kWh. Together, these components translate into a total proposed fuel factor rate of 4.4568 ¢/kWh for the period July 1, 2022 through June 30, 2023.

5. As explained by Company Witness Gregory A. Workman and others, the total projected fuel deferral balance attributable to the July 2021 – June 2022 is substantial, largely due to the increase in commodity prices over the past year. While significant, the under-recovery over the prior period was mitigated in part by the Company's comprehensive approach to fuel procurement and hedging, including the availability of a diverse generation portfolio, access to reliable fuel supply, and an effective commodity price hedging program. Comparing the July 2021 – March 2022 period with the similar period of July 2020 – March 2021, natural gas and coal fuel commodities experienced price increases of approximately 100% and 92%,

respectively, while the fuel component of the in-system generation output experienced only a 37% increase in $/MWh, as supported by Company Witness Dale E. Hinson.

6. While the Company is entitled to recovery of these prudently incurred fuel expenses on a prompt basis under Va. Code § 56-249.6, the Company recognizes the impact of such an increase in fuel rates on our customers. In order to mitigate the impact of an increase in the fuel factor rate on customers, the Company is voluntarily offering two alternative proposals to the full recovery rate, should the Commission find it to be in the public interest and so approve. Under the alternative proposals presented by Company Witness J. Scott Gaskill, the Company would waive its right to prompt recovery of the full deferral balance over the current period in favor of recovery of this balance equally over either two fuel periods ("Two Year Mitigation") or three fuel periods ("Three Year Mitigation"), at the Commission's discretion.

7. The Two Year Mitigation proposal would, if adopted, amortize the $1.020 billion projected June 30, 2022 fuel deferral balance for recovery equally over the fuel periods July 1, 2022 – June 30, 2023 *and* July 1, 2023 – June 30, 2024 (a total of 24 months). This would result in a prior period factor for the current fuel year of 0.6892 ¢/kWh and a total fuel factor rate of 3.7676 ¢/kWh for the current period—reducing the impact on the overall residential customer's monthly bill from 19.8% to 14.1%, compared to the full recovery rate during the current period.

8. The Three Year Mitigation proposal would, if adopted, amortize the $1.020 billion projected June 30, 2022 fuel deferral balance for recovery equally over the fuel periods July 1, 2022 – June 30, 2023, July 1, 2023 – June 30, 2024, and July 1, 2024 – June 30, 2025 (a total of 36 months). This would result in a prior period factor for the current fuel year of 0.4595 ¢/kWh and a total fuel factor rate of 3.5379 ¢/kWh for the current period—reducing the impact on the overall bill for the typical residential customer from 19.8% to 12.2%, compared to the full recovery rate during the current period. This represents a further 0.2297 ¢/kWh rate reduction,

or approximately $2.30 per month bill savings for a residential customer, over the Two Year Mitigation.

9. The Company believes that its voluntary fuel factor mitigation proposals recognize the interests of customers in avoiding abrupt rate increases, as referenced in Va. Code § 56-249.6, and are consistent with the public interest. While either mitigation proposal is preferable to the full recovery rate, the Three Year Mitigation offers the smallest near-term fuel rate increase, promotes rate stability across the next several years, and offers the Commission flexibility next year if circumstances around commodity markets have improved. For these reasons, the Company requests that the Commission approve the Three Year Mitigation proposal and set a fuel rate of 3.5379 ¢/kWh.

10. Further, to the extent that the Commission directs implementation of an interim fuel rate for usage on and after July 1, 2022, the Company requests that the proposed fuel factor rate of 3.5379 ¢/kWh based on the Three Year Mitigation proposal be implemented as the interim rate.

11. Concurrent with this filing, the Company has also filed a petition to suspend its rate adjustment clause designated Rider RGGI effective July 1, 2022, which, if approved by the Commission, would lower the typical residential bill by $2.39 per month at the same time the fuel factor increase would take place. Additionally, the Company has filed its annual update to Rider T1, which, if approved would result in a reduction in the typical residential customer bill of approximately $3.69 per month. Taken as a whole—the Three Year Mitigation, suspension of Rider RGGI, and the Rider T1 reduction—the increase to a typical residential customer bill is approximately $9.00 per month. While the Company does not take any such rate increase lightly, it is mindful of the impact to its customers and is taking meaningful steps to limit the impact felt from the current commodity market pressures.

12. In connection with this Application, the Company is also seeking approval of an accounting change as it relates to the funding of the fuel factor for customers taking service under the approved market-based rate ("MBR") schedules, Rate Schedule MBR, Rate Schedule MBR-GS-3, Rate Schedule MBR-GS-4, and the SCR Rate Schedule (collectively, the "MBR Customers"), to more timely align the timing of the fuel expense incurred by the Company and the revenues received through the market-based charges from these customers as presented by Company Witness Gaskill. This change holds both MBR and non-MBR customers harmless and is intended to resolve the timing mismatch between revenue and fuel expense that exists for customers taking service on these voluntary rate schedules.

13. Specifically, the Company is proposing a going-forward accounting change with respect to MBR revenues such that it will fund the Company's *actual* average system fuel costs on a month-by-month basis instead of the approved fuel rate. By making this accounting change, there will be better alignment between MBR revenue, and the fuel costs incurred to serve these customers. In other words, MBR-customer revenues would fund their share of actual fuel costs on a real-time basis instead of contributing to an over- or under-recovery of fuel costs. MBR revenue would be removed from the fuel deferral process. The Company proposes that this change take effect on July 1, 2022.

14. Fuel Charge Rider A specifies how MBR revenues are treated with respect to the fuel deferral. Therefore, Company Witness Timothy P. Stuller presents the revised Fuel Charge Rider A tariff sheet to incorporate this change.

WHEREFORE, Virginia Electric and Power Company respectfully files the proposed fuel factor of 3.5379 ¢/kWh, as set out herein, effective for usage on and after July 1, 2022, and requests that the Commission approve the revised Fuel Charge Rider A tariff incorporating the proposed accounting change for MBR customers effective July 1, 2022.

THE BULLETIN

Regulators approve Dominion bill increase for rising fuel costs; Appalachian Power also seeking hike

BY: **CHARLIE PAULLIN** - SEPTEMBER 19, 2022 12:01 AM

Transmission lines in Louisa County. (Ned Oliver/ Virginia Mercury)

Dominion customers will see their monthly electricity bills increase as a result of rising fuel costs, with Appalachian Power Company seeking similar hikes on the same grounds.

On Friday, the State Corporation Commission approved the increase for Dominion, which went into effect provisionally on July 1. According to

estimates, the average residential customer, defined as a household using 1,000 kilowatt-hours of electricity per month, will see their monthly bill increase by $14.93.

In its final order, the commission said it was aware "of the ongoing rise in gas prices, inflation, and other economic pressures that are impacting all utility customers."

"We are sensitive to the effects of rate increases, especially in times such as these," regulators wrote. "The commission, however, must follow the laws applicable to this case, as well as the findings of fact supported by the evidence in the record. This is what we have done herein."

Dominion applied for the increase in its fuel factor, the rate levied on customers to cover the costs of purchasing fuel for power plants, in May, citing increases in fuel costs linked to the COVID-19 pandemic, inflation and the ongoing war in Ukraine.

The company sought to minimize the impact on customers by proposing to spread its recovery of the additional $1 billion in fuel costs over three years, a recommendation the commission accepted.

Coinciding with the approval, Appalachian Power said Friday it intends to seek a similar rate increase that could raise monthly bills for the average residential customer by about $20.

The company is seeking to spread the recovery over a two year period.

"We recognize these are challenging financial times for many people and families," said Chris Beam, Appalachian Power's president and chief operating officer in a statement. "We strive each day to keep fuel costs as low as possible, continuously monitoring energy markets for opportunities to purchase fuel and energy at prices that are advantageous to customers."

The utility also said that its growing use of renewable energies such as solar and wind "is another step in reducing fuel costs."

"As Appalachian Power adds more renewables, there is less need for coal and natural gas to generate power," the company noted in its Friday statement.

Appalachian said that about 6% of the power used by the company's customers is generated by renewables.

Under the 2020 Virginia Clean Economy Act, both Appalachian and Dominion are required to decarbonize by 2050.

Dominion asks to halt ratepayer charge for carbon market

Critics say request to recoup remaining costs through base rates shows extra charge was never needed

BY: **SARAH VOGELSONG** - MAY 6, 2022 12:04 AM

Dominion Energy offices in Richmond, Va. (Parker Michels-Boyce/ For The Virginia Mercury)

Dominion Energy is asking state regulators to stop charging customers on their monthly bill for the utility's participation in a carbon market in anticipation of Gov. Glenn Youngkin's plans to withdraw Virginia from the Regional Greenhouse Gas Initiative.

Suspending the charge, known as Rider RGGI, "will provide an immediate, material reduction to customer bills," the utility wrote in a filing with the State Corporation Commission Thursday.

The move comes as Dominion is is looking for ways to offset soaring fuel costs that could increase customer bills by between 7 and 20 percent.

But critics said the utility's plan to get rid of the rider appeared to be more of a political move and that its decision to recover the remaining RGGI costs through base rates, which make up the largest portion of a customer's bill, demonstrates that Dominion never needed to impose the extra charge for market participation at all.

"They are conceding that they could have been complying with RGGI all along without raising rates but instead simply chose to rate rates just because they could," said Will Cleveland, an attorney with the Southern Environmental Law Center.

In Virginia, Dominion customers' bills are made up of three components: base rates, fuel costs and rate adjustment clauses, generally referred to as riders. The riders are intended to cover the costs of specific projects like coal ash cleanup or various generation resources.

Dominion has calculated that the RGGI rider adds $2.39 to the average residential customer's monthly bill. If approved, suspension of the rider would eliminate that charge beginning July 1.

Under state law, Dominion was allowed but not required to recover RGGI costs through a rider.

The utility said in its Thursday filing that it has recouped approximately $82 million in RGGI compliance costs through the rider and that approximately $178 million will remain to be recovered through base rates.

Dominion said recovering the remaining amount through base rates "will prevent future incremental rate increases."

"The company believes that these actions are particularly in the public interest given current geopolitical and market conditions beyond its control which are driving increases in the costs to be recovered from customers of fuel commodities," the utility wrote.

Base rates are reviewed by the State Corporation Commission every three years. If regulators find that the company has not earned enough to cover its expenses and an allowable profit, they can order that base rates be raised. If they find Dominion has overearned, they can order the utility to refund part of the excess earnings.

Cleveland said that the remaining RGGI costs could potentially contribute to Dominion requesting a higher base rate at the next triennial review, which is slated to occur in 2024.

“That will be one of the many line items balanced to determine whether Dominion’s revenues exceeded its costs,” he said.

The Mercury asked Dominion how it is able to absorb the remaining RGGI costs into its existing base rates and whether it could have recouped them that way all along. Dominion General Manager of Regulatory Affairs Scott Gaskill said in an email that because of rising commodity prices, the utility has “been looking at ways to mitigate the near-term customer impact” and pointed out that Dominion this January asked regulators to cancel an expected increase to the RGGI rider.

“Since we expect RGGI costs to end soon, it made sense to eliminate this rider at this time and move to base rates as a one-time expense,” he wrote.

Del. Tony Wilt, R-Rockingham, who unsuccessfully carried a bill during the last legislative session that among other provisions would have given regulators more leeway to decide if costs should be recovered through riders or base rates, said Dominion’s request “demonstrates the importance of ensuring our state regulators have the authority to review, assess and analyze rate-making policies in the best interests of customers.”

Dominion also stated in its filing that if Virginia does not withdraw from RGGI by the end of July, it reserves the right to ask regulators to resume charging customers for participation costs.

Coal fired units at Dominion Energy's Chesterfield Power Station are scheduled to close. (Ryan M. Kelly/ For the Virginia Mercury)

A simmering conflict

While conflict over RGGI has been simmering since Youngkin announced last December that he intended to pull Virginia out of the market, the administration is expected to begin attempting to roll back regulations governing state participation this summer.

In an executive order issued on his inauguration day, Youngkin ordered the Virginia Department of Environmental Quality to develop an emergency regulation to repeal existing rules for RGGI participation. That regulation will need to be approved by the Virginia State Air Pollution Control Board.

In its Thursday filing, Dominion said it expects the emergency regulation to go into effect as early as July. That time frame is in line with a statement made by DEQ Director Mike Rolband to the air board in April that the regulatory process was expected to start in the third quarter of the year.

An air board action isn't likely to be the end of the fight. Several environmental groups, including the Southern Environmental Law Center, have contended that legislation is necessary to pull Virginia out of the carbon market.

Republicans proposed such legislation during the 2022 session, but it failed in the Democrat-controlled Senate.

"We've said before and we maintain that the 2020 law requires Virginia to participate, and whether acting through an executive order or acting through the air board, you can't simply repeal a regulation and still be in compliance with that law," said SELC attorney Nate Benforado.

Dominion has been critical of Virginia's participation in RGGI, largely on the grounds of customer expense, particularly given the utility's investment in renewables required under the Virginia Clean Economy Act.

"We're concerned that Virginia's linkage to the RGGI program … would result in a financial burden on customers with no real mitigation of greenhouse gas emissions regionally," said Dominion Chief Financial Officer Jim Chapman on an investor call Thursday.

SCC Judge Judith Jagdmann has also questioned whether Dominion customers are paying duplicative costs to both participate in RGGI and comply with the Virginia Clean Economy Act.

Other energy analysts, however, have disputed the characterization of RGGI as ineffective at reducing carbon emissions, pointing to steep emissions declines in participating states compared to non-participating ones and changes in utilities' decision-making about which power plants it decides to run to power the grid. They also point out that roughly a quarter of

Virginia's carbon emissions governed by RGGI come from non-regulated power producers that otherwise have no legal requirement to reduce emissions.

E-FILED 2021-09-15 02:15 PM

BACKGROUND

4. Initiated in 2009, RGGI is the first mandatory market-based program in the United States to reduce greenhouse gas emissions. RGGI is a collaborative effort among the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont, and Virginia to cap and reduce CO_2 emissions from the power sector. CO_2 allowances are created and sold by RGGI member states in quarterly regional auctions. Virginia joined RGGI in 2021.

5. The Company owns regulated emissions sources, so it must comply with RGGI by obtaining and surrendering a CO_2 emission for every short ton of CO_2 emitted during a control period.

6. Va. Code § 56-585.1 A 5 e permits cost recovery related to compliance with RGGI and establishes the applicable standard of review:

> A utility may at any time, after the expiration or termination of capped rates, but not more than once in any 12-month period, petition the Commission for approval of one or more rate adjustment clauses for the timely and current recovery from customers of . . . [p]rojected and actual costs of projects that the Commission finds to be necessary . . . to comply with state or federal environmental laws or regulations applicable to generation facilities used to serve the utility's native load obligations, including the costs of allowances purchased through a market-based trading program for carbon dioxide emissions. The Commission shall approve such a petition if it finds that such costs are necessary to comply with such environmental laws or regulations.

7. On August 4, 2021, in Case No. PUR-2020-00169 ("2020 Rider RGGI Proceeding"), the Commission issued its Order Approving Rate Adjustment Clause ("2020 Rider RGGI Order"), approving Rider RGGI to be effective for usage on and after September 1, 2021.[3]

---

[3] *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia*, Case No PUR-2020-00169, Order Approving Rate Adjustment Clause at 11 (Aug. 4, 2021). The Supreme Court of Virginia affirmed the Commission's Final Order on

2022-12-22 09:41:19

8. On December 6, 2021, the Company filed its first Rider RGGI annual update in Case No. PUR-2021-00281.[4] Following an announcement from then-Governor-elect Glenn Youngkin on December 8, 2021, that he intended to withdraw Virginia from RGGI, on January 10, 2022, the Company moved the Commission to withdraw its 2021 Annual Update. By its Order on April 1, 2022, the Commission granted the Company's motion, and, among other things, directed the Company to file an update to Rider RGGI "on or before January 1, 2023."[5]

9. Following further developments concerning Virginia's participation in RGGI, on May 5, 2022, the Company filed a petition in the instant proceeding requesting the Commission issue an order (i) suspending the Rider RGGI rate approved in Case No. PUR-2020-00169; (ii) resetting the Rider RGGI rate to $0.000000 per kilowatt-hour ("kWh") effective July 1, 2022; and (iii) approving the Company's election to recover RGGI compliance costs incurred through July 31, 2022, but not recovered through Rider RGGI, through its base rates for generation services in the period in which they were incurred.[6] By its Order Granting Petition issued on June 15, 2022 in this docket, the Commission granted the Petition and directed that the docket remain open for future proceedings, including but not limited to the actual cost true-up proceeding to review incurred allowance costs that have been recovered through Rider RGGI, as required in the 2020 Rider RGGI Order.

October 27, 2022. *Appalachian Voices v. State Corp. Comm'n*, Record No. 220130, 2022 WL 14988165 (Oct. 27, 2022).

[4] 2021 Annual Update, Petition at *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia*, Case No. PUR-2021-00281, Petition (Dec. 6, 2021).

[5] *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia*, Case No. PUR-2021-00281, Order Granting Motion at Ordering Paragraph (5) (Apr. 1, 2022).

[6] The Company further reserved its right under Subsection A 5 e to petition for resumption of Rider RGGI and recovery of any costs incurred to meet its compliance obligations on or after August 1, 2022, as may be approved by the Commission, and requested that the Commission hold this docket open for further proceedings as future events concerning the Commonwealth's participation in RGGI develop.

E2E2E3E5E9

RIDER RGGI

10. In accordance with the Commission's 2020 Rider RGGI Order and 2022 Order Granting Petition, the Company files this Petition to account for allowance costs incurred and recovered through Rider RGGI prior to the July 1, 2022 suspension. Additionally, the Company seeks to reinstate Rider RGGI to recover deferred RGGI compliance costs incurred after July 31, 2022, and those projected to occur over the period of September 1, 2023 through August 31, 2024 (the "Rate Year"). For purposes of this proceeding, the Company has assumed that Virginia will withdraw from RGGI on December 31, 2023, and accordingly has not projected any RGGI-related compliance costs to be incurred after that date.[7]

11. From August 1, 2022, through December 31, 2023, the Company will require approximately 31 million CO_2 allowances to cover CO_2 emissions from its Virginia-based generation fleet. Approximately 7 million of these CO_2 allowances are projected to be incurred during the Rate Year.

12. Generally, to meet its obligations under RGGI, the Company is following a programmatic approach by purchasing most of the required allowances in the quarterly auctions and using the secondary market to fill any auction deficiencies. More specifically, Dominion Energy Virginia plans to acquire approximately 25% of the forecasted annual allowance requirement in each of the quarterly auctions. If the Company fails to secure approximately 25% in an auction, the Company will look to purchase allowances in the secondary market. The Company's compliance strategy is not based on any price outlook. Instead, the Company intends to continue to follow a programmatic, auction-based approach to compliance. However, the

[7] On December 7, 2022, the Virginia Air Pollution Control Board advanced a proposal to repeal the regulations establishing RGGI pursuant to the Virginia Administrative Process Act, with a targeted repeal date of December 31, 2023.

220126156

Company may adjust its compliance strategy as needed to adapt to changes in the structure of the RGGI program.

13. The Company has assumed a weighted average price of $13.52 per allowance. This assumption is based on December ICE futures contracts for 2022 and 2023.

14. Company Witness Paul M. McLeod details the Company's proposal to recover total RGGI compliance costs incurred since Virginia joined RGGI in 2021 through the expected exit date in December 2023. Specifically, Company Witness McLeod supports a total Virginia jurisdictional revenue requirement of $640 million for this period in the aggregate. For the period prior to August 1, 2022, the total revenue requirement was $267 million on a Virginia jurisdictional basis. The Company recovered $84 million of the $267 million through the initial Rider RGGI in effect from January 1, 2022 through June 30, 2022. The remaining amount of $183 million is being recovered through base rates in effect as incurred. For the period from August 1, 2022 through December 31, 2023, the projected revenue requirement is $373 million on a Virginia jurisdictional basis, which the Company is proposing to recover during the Rate Year through the reinstated Rider RGGI requested in this proceeding.

15. The Company's RAC revenue requirement in this proceeding includes the Projected Cost Recovery Factor and the Actual Cost True-Up Factor. The Projected Cost Recovery Factor reflects the revenue requirement necessary for recovery of amortization expense for CO_2 allowances as well as projected financing costs on the unamortized purchased CO_2 allowance balance. Additionally, the Projected Cost Recovery Factor includes the amortization of deferred costs, including financing costs, incurred prior to the Rate Year. The Actual Cost True-Up Factor will recover from, or credit to, customers any under- or over-recovery of costs from the most recently completed calendar year. No Actual Cost True-Up Factor is included in

E220272

this proceeding as all differences between costs incurred and amounts recovered through Rider RGGI through July 31, 2022, will be recovered through base rates pursuant to the Order Granting Petition. It is anticipated that any true-up for calendar year 2022 will be included in a 2023 update filing for implementation during the September 1, 2024 to August 31, 2025 rate year.

16. The total revenue requirement requested for recovery in this Rider RGGI Petition for the Rate Year beginning September 1, 2023, is $373,214,000.

17. For purposes of this Petition, and consistent with the Commission's November 18, 2021 Final Order in the Company's triennial review proceeding in Case No. PUR-2021-00058,[8] the Company is utilizing the approved return on common equity ("ROE") of 9.35% for the period subsequent to the date of that Final Order. For the time periods prior to the Final Order in that case, the Company is utilizing a ROE of 9.2%, as approved by the Commission in Case No. PUR-2019-00050.[9]

18. The implementation of the proposed Rider RGGI on September 1, 2023, will increase the typical residential customer's monthly bill, based on 1,000 kWh per month, by $4.64.[10]

RGGI COMPLIANCE AND RPS DEVELOPMENT PLAN MODELING

19. In the 2020 Rider RGGI Order, the Commission directed the Company to "include in future Rider RGGI filings an analysis of how its RGGI compliance corresponds to its

[8] *Application of Virginia Electric and Power Company For a 2021 triennial review of the rates, terms and conditions for the provision of generation, distribution and transmission services pursuant to § 56-585.1 A of the Code of Virginia*, Case No. PUR-2021-00058, Final Order (Nov. 18, 2021).
[9] *Application of Virginia Electric and Power Company For the determination of the fair rate of return on common equity pursuant to § 56-585.1:1 C of the Code of Virginia*, Case No. PUR-2019-00050, Final Order (Nov. 21, 2019).
[10] As of the date of this filing, the Rider RGGI rate is $0.000000 per kWh.

RPS plan filings."[11] The Company has prepared this analysis and included it as Exhibit 1 to this Petition. Exhibit 1 is sponsored by Company Witness Jeffrey D. Matzen.

SUPPORTING TESTIMONY AND FILING SCHEDULES 3, 4, 5, 8, AND 46

20. The Company's Petition is supported by the pre-filed direct testimonies of Company Witnesses George E. Hitch, Jeffrey D. Matzen, Paul M. McLeod, and C. Alan Givens.

21. Section 60 of the Rate Case Rules provides that an application filed pursuant to Subsection A 5 "shall include Schedule 46 as identified and described in 20 VAC 5-204-90, and which shall be submitted with the utility's direct testimony. Additionally, petitions requiring an overall cost of capital shall include Schedules 3, 4, 5, and 8."

22. With this Petition, the Company files the following Filing Schedules:

a. Filing Schedules 3 through 5 and Filing Schedule 8, sponsored by Company Witness McLeod, provide information regarding the Company's cost of capital.

b. Filing Schedule 46A, consisting of Statements 1 and 2, is co-sponsored by Company Witnesses Hitch and Matzen. Filing Schedule 46A, Statement 1, provides projected and actual costs associated with Rider RGGI, while Filing Schedule 46A, Statement 2, provides documentation supporting those costs.

c. Filing Schedule 46B, consisting of Statements 1 and 2, is sponsored by Company Witness McLeod. Filing Schedule 46B, Statement 1, addresses the estimated annual revenue requirement for the Rate Year. Given the assumption that the Commonwealth will withdraw from RGGI on December 31, 2023, and that there will be no further compliance costs incurred after that date, Filing Schedule 46B, Statement 2 notes that there is no long-term revenue requirement calculation included with this filing.

d. Filing Schedule 46C, consisting of Statements 1 and 2, is sponsored by Company Witness Givens. Filing Schedule 46C, Statement 1, provides the annual revenue requirement for Rider RGGI by class. Filing Schedule 46C, Statement 2, addresses the Company's methodology for allocating the Rider RGGI revenue requirement.

[11] *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia*, Case No PUR-2020-00169, Order Approving Rate Adjustment Clause at 11 (Aug. 4, 2021).

220929169

COMPLIANCE WITH RULE 10 OF THE RATE CASE RULES

23. The Company's Petition complies with the requirements contained in Rule 10 of the Rate Case Rules.

24. In accordance with Rule 10 A, the Company filed with the Commission its notice of intent to file this Petition on September 29, 2022, and provided that notice to those listed in Rule 10 J 1, as required by that subsection.

25. The Company has included all information required by Rule 10 B in its Petition, including a table of contents, direct testimonies with one-page summaries, and properly labeled exhibits and schedules.

26. In accordance with Rule 10 H, the Company will make a searchable PDF version of the Petition, direct testimonies, and Filing Schedules available via the eRoom contemporaneously with this filing, with immediate access available to (i) Commission Staff, including identified members of the Divisions of Utility Accounting and Financing and Public Utility Regulation; and (ii) identified members of the Office of the Attorney General's Division of Consumer Counsel ("Consumer Counsel").[12] Also in accordance with Rule 10 H, the Company will make electronic spreadsheets supporting the schedules that contain calculations available via an eRoom contemporaneously with this filing, with immediate access available to Commission Staff.

CONCLUSION

WHEREFORE, Dominion Energy Virginia respectfully requests that the Commission (i) reinstate Rider RGGI effective September 1, 2023; (ii) approve the proposed revenue

[12] Rule 10 J 3 requires the Company to provide a copy of the complete public version of the filing to Consumer Counsel at the same time it is filed with the Commission. As noted, pursuant to Rule 10 H, the Company will make a searchable PDF version of the petition, direct testimonies, and Filing Schedules available via an eRoom contemporaneously with this filing with immediate access available to Consumer Counsel.

2022120069

requirement, cost allocation, rate design, and accounting treatment for Rider RGGI for the Rate Year September 1, 2023 through August 31, 2024; and (iii) grant such other relief as deemed appropriate and necessary.

Respectfully submitted,

VIRGINIA ELECTRIC AND POWER COMPANY

Counsel for Virginia Electric and Power Company

December 14, 2022

Exhibit 1

2022-00169

Dominion Energy Virginia's RGGI Compliance and RPS Development Plan Modeling

In its Order Approving Rate Adjustment Clause in Case No. PUR-2020-00169, the Commission directed the Company "to include in future Rider RGGI filings an analysis of how its RGGI compliance corresponds to its RPS plan filings."[1] This document provides that analysis.

I. Background – VCEA

The Virginia Clean Economy Act ("VCEA")—Senate Bill No. 851 and House Bill No. 1526 from the 2020 Regular Session of the Virginia General Assembly—became law in the Commonwealth effective July 1, 2020. Relevant to this proceeding, the VCEA (i) requires the development of renewable energy generation resources; (ii) requires the development of energy storage resources; (iii) requires the submission of an annual plan to meet the development targets; and (iv) institutes a mandatory renewable energy portfolio standard program ("RPS Program").

Under Va. Code § 56-585.5 D 4, the Company must submit an annual plan outlining how it intends to meet the renewable energy generation and energy storage development targets. This annual filing must contain any request for approval to construct or purchase solar, energy storage, or onshore wind generation under Va. Code § 56-580 D, as well as any associated requests related to cost recovery of such facilities under Va. Code § 56-585.1 A 6. The Commission must determine whether such annual filings are reasonable and prudent, giving due consideration to certain factors: (i) the RPS and carbon dioxide reduction requirements of the VCEA, (ii) the promotion of new renewable generation and energy storage resources within the Commonwealth and associated economic development, and (iii) fuel savings projected to be achieved by the plan.

II. Background – RPS Development Plan

Dominion Energy Virginia submitted its first RPS Development Plan in Case No. PUR-2020-00134, which the Commission approved as reasonable and prudent on April 30, 2021. The Commission approved the Company's 2021 RPS Development Plan as reasonable and prudent on March 15, 2022 in Case No. PUR-2021-00146.

Dominion Energy Virginia submitted its 2022 RPS Development Plan on October 14, 2022 in Case No. PUR-2022-00124. In that filing, the Company affirms that the 2022 RPS Development Plan is consistent with Alternative Plan B from the Company's 2022 update to its Integrated Resource Plan ("2022 IRP Update") filed on September 1, 2022 in Case No. PUR-2022-00147, which is described in more detail in Part IV, below. The Company further affirms

---

[1] *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia*, Order Approving Rate Adjustment Clause at 11 (Aug. 4, 2021).

E0122222222

that the modeling inputs and assumptions are consistent between the 2022 IRP Update and the 2022 RPS Development Plan. The 2022 RPS Development Plan will (i) support RPS Program compliance; (ii) support carbon dioxide ("CO_2") reductions in the Commonwealth; (iii) promote new renewable energy generation and energy storage resources in the Commonwealth and the associated economic development; and (iv) result in fuel savings while maintaining reliability.

III. Background – Rider RGGI

On November 9, 2020, in Case No. PUR-2020-00169, the Company filed for approval of a rate adjustment clause, designated Rider RGGI, under Va. Code § 56-585.1 A 5 e to recover projected and actual costs related to the purchase of allowances through the Regional Greenhouse Gas Initiative ("RGGI") market-based trading program for CO_2 emissions, a program in which the Company is required to participate. In its August 4, 2021 Order Approving Rate Adjustment Clause and its November 17, 2021 Order on Reconsideration, the Commission approved Rider RGGI, finding that the Company's compliance approach is a reasonable way to manage operational facilities in the short-term and that the costs requested in that proceeding complied with the statutory standard.[2]

On December 6, 2021, the Company filed its first Rider RGGI annual update in Case No. PUR-2021-00281.[3] Following an announcement from then-Governor-elect Glenn Youngkin on December 8, 2021, that he intended to withdraw Virginia from RGGI, on January 10, 2022, the Company moved the Commission to withdraw its 2021 Annual Update. By its Order on April 1, 2022, the Commission granted the Company's motion, and, among other things, directed the Company to file an update to Rider RGGI "on or before January 1, 2023."[4]

Following further developments concerning Virginia's participation in RGGI, on May 5, 2022, the Company filed a petition in the instant proceeding requesting the Commission issue an order (i) suspending the Rider RGGI rate approved in Case No. PUR-2020-00169; (ii) resetting the Rider RGGI rate to $0.000000 per kilowatt-hour ("kWh") effective July 1, 2022; and (iii) approving the Company's election to recover RGGI compliance costs incurred through July 31, 2022, but not recovered through Rider RGGI, through its base rates for generation services in the period in which they were incurred.[5] By its Order Granting Petition issued on June 15, 2022 in this docket, the Commission granted the Petition and directed that the docket remain open for

---

[2] The Supreme Court of Virginia affirmed the Commission's Final Order on October 27, 2022. *Appalachian Voices v. State Corp. Comm'n*, Record No. 220130, 2022 WL 14988165 (Oct. 27, 2022).

[3] 2021 Annual Update, Petition at *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia*, Case No. PUR-2021-00281, Petition (Dec. 6, 2021).

[4] *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia*, Case No. PUR-2021-00281, Order Granting Motion at Ordering Paragraph (5) (Apr. 1, 2022).

[5] The Company further reserved its right under Subsection A 5 e to petition for resumption of Rider RGGI and recovery of any costs incurred to meet its compliance obligations on or after August 1, 2022, as may be approved by the Commission, and requested that the Commission hold this docket open for further proceedings as future events concerning the Commonwealth's participation in RGGI develop.

2022-0169

future proceedings, including but not limited to the actual cost true-up proceeding to review incurred allowance costs that have been recovered through Rider RGGI, as required in the 2020 Rider RGGI Order.

IV. Analysis

In the 2022 IRP Update, the Company presented five alternative plans ("Alternative Plans"). Alternative Plan A presents a least-cost plan that meets only applicable carbon regulations and the mandatory RPS Program requirements of the VCEA. The Company presented this Alternative Plan for cost comparison purposes only in compliance with prior Commission orders. Notably, Alternative Plan A does not meet the development targets for solar, wind, and energy storage resources in Virginia established through the VCEA. By contrast, Alternative Plan B is consistent with the 2022 RPS Development Plan.[6] Plan B complies with the development targets of the VCEA and includes significant buildout of renewable resources coupled with considerable CO_2 emissions reductions.

Using PLEXOS, the Company models reliability at a system level by ensuring that sufficient resources are available to meet customer load based on the hourly profile of both load and resources. Because the Company is a member of PJM Interconnection, LLC ("PJM"), PLEXOS has the option to fill any deficits in any specific hour with market purchases. PLEXOS does not currently show any reliability issues through 2036 based on the modeling completed for the 2022 IRP Update, as incorporated into the 2022 RPS Development Plan proceeding.

Importantly for future planning purposes, however, the Company must take other factors into account to ensure reliability in the long term. For example, if other states pursue the same clean energy future as the Company, resulting in significant volumes of intermittent resources with the same operational profiles as the Company's, the Company may not be able to fill any deficits in specific hours with market purchases. Separate from system level planning, planning at the more granular nodal and feeder level is also needed to ensure reliability, which is completed by the Company's transmission and distribution teams. It is at the nodal level that the system reliability and stability may become a concern based on physical transmission and distribution constraints. The Company continues to actively plan for these potential issues, and will continue to do so as the Company transitions to a cleaner fleet as envisioned by the Commonwealth, the Company, and its customers. See the Company's 2022 IRP Update for a further discussion of the Company's evaluation of seasonal concerns and a status of the Company's long-term transmission reliability analyses.

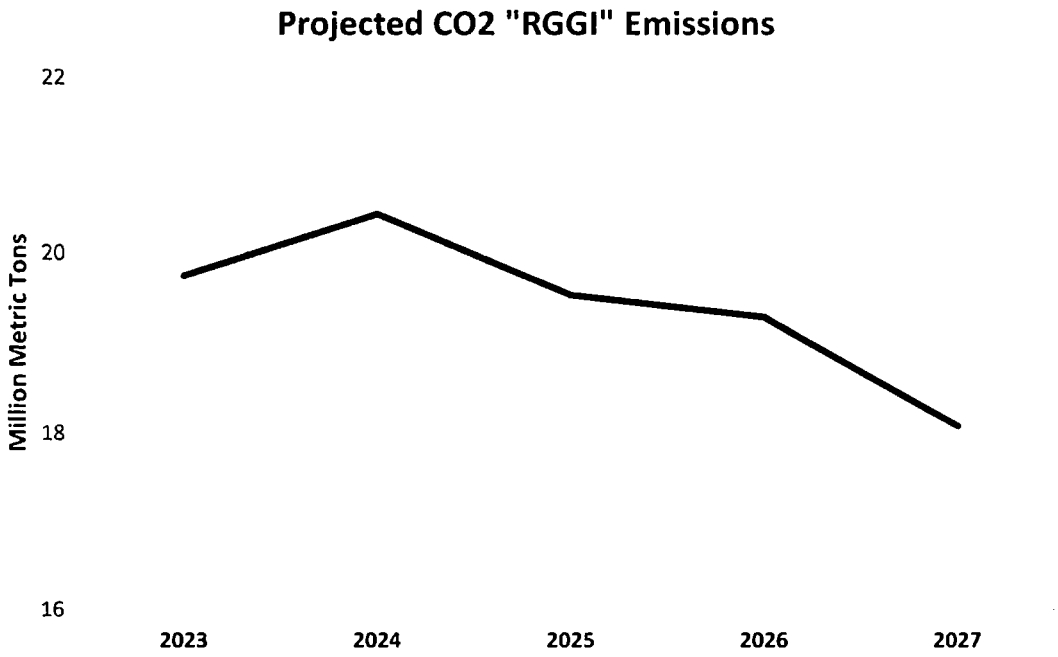
---

[6] Alternative Plan C differs from Plan B in that all new generation resources were selected on a least-cost optimization basis without regard for the development targets for solar, wind, and energy storage resources in Virginia established through the VCEA. Alternative Plan D uses similar assumptions as Plan B but retires all Company-owned carbon-emitting generation by the end of 2045, resulting in zero CO_2 emissions from the Company's fleet beginning in 2046. Alternative Plan E is like Plan D in retiring all Company-owned carbon-emitting generation by the end of 2045, but all new generation resources were selected on a least-cost optimization basis without regard for the development targets for solar, wind and energy storage resources in Virginia established through the VCEA.

2212-2016-00

The RPS Development Plan will support CO_2 reductions in the Commonwealth through the development of a significant amount of CO_2-free generation resources that will displace both market purchases and output from other traditional Company-owned generation units that emit CO_2 as a byproduct of combustion. Figure 1 below shows the projected CO_2 output from the Company's fleet in the Commonwealth through 2027. Figure 1 reflects the RGGI Model, which includes the RPS Development Plan, the tentative retirements of certain generation units as indicated in Alternative Plan B of the Company's 2022 IRP Update, and the assumption that Virginia will exit RGGI on December 31, 2023, as further described below.

Figure 1: RGGI Model



To date, the Company has followed the RPS Development Plan in developing CO_2-free generation. The Company has also retired certain generation units consistent with the RPS and IRP plans. The Company further endeavors to minimize customer cost while maintaining reliability through prudent dispatch of dispatchable units. As a member of PJM, the Company offers units for dispatch with accurate cost estimates that include RGGI compliance costs. The PJM market clearing process dispatches the fleet economically, subject to constraints.

For determining forward RGGI allowance requirements for this proceeding, the Company has projected CO_2 emissions by modeling the system dispatch using assumptions that are generally consistent with both the 2022 IRP Update (Alternative Plan B) and the 2022 RPS Development Plan. The modeling has assumed a capacity factor for existing and future solar

220269

resources of 22.5%, which is the three-year average of the Company's solar tracking facilities in Virginia, and used an updated load forecast and commodity price forecast. Additionally, the RGGI Model has adjusted for the Company's revised assumption that Virginia will withdraw from RGGI at the end of 2023 rather than at the end of 2022, as assumed in the 2022 IRP Update, as incorporated into the 2022 RPS Development Plan. The revised assumption appropriately affects the dispatch of the units in 2023 but does not affect the plan for the development of solar, onshore wind, and energy storage (which is constrained by project development times). The Company uses PLEXOS to model the dispatch of the fleet in the PJM energy market. The dispatch of the fleet produces the system's CO_2 emissions. The PLEXOS dispatch logic includes RGGI compliance costs in the same manner that it includes fuel costs. Therefore, a Company-owned fossil unit operates when the compliance cost of RGGI plus other variable costs like fuel are less than the cost of a market power purchase. In following the RPS Development Plan and including RGGI costs in dispatch decisions, the Company's RGGI compliance cost modeling corresponds to its RPS plan filings.

COMMONWEALTH OF VIRGINIA

STATE CORPORATION COMMISSION

PETITION OF	)	
	)	
VIRGINIA ELECTRIC AND POWER COMPANY	)	
	)	Case No. PUR-2020-00169
For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia	)	

PETITION OF VIRGINIA ELECTRIC AND POWER COMPANY
AND REQUEST FOR LIMITED WAIVERS

Virginia Electric and Power Company ("Dominion Energy Virginia" or the "Company"), by counsel, hereby files with the State Corporation Commission of Virginia ("Commission") its petition for approval of a rate adjustment clause ("RAC"), designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia ("Va. Code") to recover projected and actual costs related to the purchase of allowances through the Regional Greenhouse Gas Initiative ("RGGI") market-based trading program for carbon dioxide ("CO_2") emissions, a program in which the Company is required to participate. The Company further requests limited waivers of certain Rules Governing Utility Rate Applications and Annual Informational Filings (the "Rate Case Rules"). In support of its petitions and request for limited waivers (collectively, the "Petition"), the Company respectfully shows as follows:

GENERAL INFORMATION

1. Dominion Energy Virginia is a public service corporation organized under the laws of the Commonwealth of Virginia furnishing electric service to the public within its certificated service territory. The Company also supplies electric service to non-jurisdictional customers in Virginia and to the public in portions of North Carolina. The Company is engaged in the business of generating, transmitting, distributing, and selling electric power and energy to

20151202-5125

the public for compensation. The Company is also a public utility under the Federal Power Act, and certain of its operations are subject to the jurisdiction of the Federal Energy Regulatory Commission. The Company is an operating subsidiary of Dominion Energy, Inc.

2. The Company's address is:

Virginia Electric and Power Company
120 Tredegar Street
Richmond, Virginia 23219

3. The names, addresses, and telephone numbers of the attorneys for the Company are:

(804) 775-1199 (DRB)

BACKGROUND

4. Initiated in 2009, RGGI is the first mandatory market-based program in the United States to reduce greenhouse gas emissions. RGGI is a collaborative effort among the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York,

Rhode Island, Vermont, and New Jersey to cap and reduce CO_2 emissions from the power sector. CO_2 allowances are obtained by RGGI participants through quarterly, regional auctions.

5. In May 2019, the Virginia Department of Environmental Quality ("DEQ") issued a final rule establishing a state carbon regulation program linked to RGGI (the "DEQ Carbon Rule" or "Rule"). Although the DEQ Carbon Rule was finalized in 2019, language in the state budget bill prohibited DEQ from continued work on the Rule. During the 2020 Regular Session, the General Assembly passed the Clean Energy and Community Flood and Preparedness Act, Senate Bill No. 1027 and House Bill No. 981, which authorized Virginia to become a full participant of RGGI and authorized DEQ to implement the DEQ Carbon Rule. The legislation became effective July 1, 2020. With the passage of this legislation, DEQ revised the DEQ Carbon Rule to clarify that the Commonwealth will join RGGI in 2021. The revised Rule was signed by the DEQ on June 25, 2020, and became effective on July 10, 2020. DEQ held a meeting to inform stakeholders about the Rule revisions, including any near-term compliance submittals required of companies subject to the Rule, on August 12, 2020.

6. The DEQ Carbon Rule will cap CO_2 emissions for Virginia at 27.1 million short tons for calendar year 2021, and decrease the emissions cap annually by approximately 3% to achieve a 30% reduction from 2020 levels to a level of 19.6 million short tons in 2030. Emission sources subject to the Rule will be required to obtain and surrender a CO_2 emission allowance for every short ton of CO_2 emitted during a control period through participation in the RGGI allowance auction program.

7. The Company owns regulated emissions sources, so must comply with RGGI.

8. Va. Code § 56-585.1 A 5 e permits cost recovery related to compliance with RGGI and establishes the applicable standard of review:

> A utility may at any time, after the expiration or termination of capped rates, but not more than once in any 12-month period, petition the Commission for approval of one or more rate adjustment clauses for the timely and current recovery from customers of . . . [p]rojected and actual costs of projects that the Commission finds to be necessary . . . to comply with state or federal environmental laws or regulations applicable to generation facilities used to serve the utility's native load obligations, including the costs of allowances purchased through a market-based trading program for carbon dioxide emissions. The Commission shall approve such a petition if it finds that such costs are necessary to comply with such environmental laws or regulations.

RIDER RGGI

9. The Company estimates it will initially require approximately 19,000,000 CO_2 allowances per year to cover CO_2 emissions from its Virginia-based generation fleet. Accordingly, by July 31, 2022, the Company expects to need approximately 29,000,000 CO_2 allowances.

10. Generally, to meet its obligations under RGGI, the Company intends to follow a programmatic approach by purchasing most of the required allowances in the RGGI quarterly auctions and using the secondary market to fill any auction deficiencies. More specifically, Dominion Energy Virginia plans to acquire approximately 25% of the forecasted annual allowance requirement in each of the quarterly auctions. If the Company fails to secure approximately 25% in an auction, the Company will look to purchase allowances in the secondary market. Also, Dominion Energy Virginia will seek to maintain a bank of allowances equal to approximately 10% to 20% of the annual requirement. The purpose of the bank is to protect customers from short-term allowance price volatility. The Company's compliance strategy is not based on any price outlook. Instead, the Company intends to follow a programmatic, auction-based approach to compliance. The Company may adjust its compliance strategy as needed to adapt to changes in the structure of the RGGI program.

11. The Company has assumed a weighted average price of $6.84 per allowance. This assumption is based on the actual clearing pricing in RGGI Auction 49 and actual transactions in the secondary market, combined with the ICF forward price curve.

12. The Company's RAC revenue requirement in this proceeding includes the Projected Cost Recovery Factor. Beginning with the next RAC filing expected to be made in 2021, the revenue requirement will also include the Actual Cost True-Up Factor. The Projected Cost Recovery Factor calculation results in the operating income necessary for recovery of amortization expense for CO_2 allowances as well as projected financing costs on the unamortized purchased CO_2 allowance balances. In addition, the Projected Cost Recovery Factor includes the amortization of deferred costs, including financing costs, incurred prior to this initial Rate Year. No Actual Cost True-Up Factor is included in this initial proceeding because this filing represents the initial request for cost recovery. It is anticipated that any true-up for calendar year 2020 will be included in a 2021 update filing for implementation during an August 1, 2022 to July 31, 2023 rate year. At that time, and for years beyond, the Actual Cost True-Up Factor will recover from, or credit to, customers any under- or over-recovery of costs from the most recently completed calendar year. Actual revenues recovered during the test year are compared to actual costs incurred during the test year. Any difference in these amounts becomes the Actual Cost True-Up Factor credited to, or recovered from, customers through the total revenue requirement requested for recovery during the rate year.

13. The total revenue requirement requested for recovery in this initial Rider RGGI Petition for the Rate Year beginning August 1, 2021, is $168,260,000.

2021-00121

14. The Company proposes to use an energy allocation factor to allocate costs to the Virginia jurisdiction and that the costs be recovered through a uniform charge per kilowatt-hour ("kWh") from all bundled service customers in the Virginia jurisdiction.

15. The implementation of the proposed Rider RGGI on August 1, 2021, will increase the residential customer's monthly bill, based on 1,000 kWh per month, by $2.39.

SUPPORTING TESTIMONY, FILING SCHEDULE 46, AND REQUEST FOR LIMITED WAIVERS OF RATE CASE RULES FILING REQUIREMENTS

16. The Company's Petition is supported by the pre-filed direct testimonies of Company Witnesses C. Eric McMillan, Shane T. Compton, John C. Ingram, and Paul B. Haynes.

17. Section Rule 60 of the Rate Case Rules provides that an application filed pursuant to Subsection A 5 "shall include Schedules 45 and 46 as identified and described in 20 VAC 5-201-90, and which shall be submitted with the utility's direct testimony." The Company is filing with this Petition, Filing Schedule 46, as follows:

a. Company Witnesses McMillan and Compton co-sponsor Schedule 46A, consisting of Statements 1 and 2. Schedule 46A, Statement 1, provides projected costs associated with Rider RGGI, while Schedule 46A, Statement 2, provides documentation supporting the projected costs.

b. Company Witness Ingram sponsors Schedule 46B, consisting of Statements 1 and 2. These statements provide revenue requirement information for the proposed RAC and describe all significant accounting procedures and internal controls to identify costs related to RGGI allowances.

c. Company Witness Haynes sponsors Schedule 46C, consisting of Statement 1, which provides details of the Company's methodology for allocating the Rider RGGI revenue requirement.

18. The Company, for good cause shown and pursuant to 20 VAC 5-201-10 E of the Rate Case Rules, respectfully requests that the Commission waive, in part, the requirements under Rules 60 and 90 of the Rate Case Rules with respect to Filing Schedule 45 (Return on Equity Peer Group Benchmark). Pursuant to the provisions of Va. Code §§ 56-585.1 and 56-

585.1:1, and consistent with recent Commission orders granting similar limited waivers,[1] a return on equity determination is not to be made in this proceeding. Therefore, good cause exists, as required by Rule 10 E, for the Commission to waive in part the requirements of Rules 60 and 90 of the Rate Case Rules with respect to Filing Schedule 45.

19. The Company, for good cause shown and pursuant to 20 VAC 5-201-10 E, additionally respectfully requests that the Commission waive, in part, the requirement under Rules 60 and 90 of the Rate Case Rules to "[p]rovide the annual revenue requirement over the duration of the proposed rate adjustment clause by year and by class." Specifically, the Company requests waiver of two portions of this requirement. First, the Company seeks waiver of this requirement related to information for the "duration of the proposed rate adjustment clause." By statute, RGGI will continue indefinitely; Rider RGGI thus differs from other Company RACs approved by the Commission for assets that have a specific lifetime. Second, the Company seeks waiver of this requirement related to providing information on the revenue requirement "by class." As explained by Company Witness Haynes, the Company has developed a uniform charge per kilowatt-hour applicable to all bundled service customers in the Virginia jurisdiction. Accordingly, the revenue requirement is not available "by class." For these reasons, good cause exists, as required by Rule 10 E, for the Commission to waive in part the requirements of Rules 60 and 90 of the Rate Case Rules with respect to this limited portion of Schedule 46.

---

[1] *See, e.g., Petition of Virginia Electric and Power Company, For approval and certification of the proposed US-4 Solar Project pursuant to §§ 56-580 D and 56-46.1 of the Code of Virginia, and for approval of a rate adjustment clause, designated Rider US-4, under § 56-585.1 A 6 of the Code of Virginia,* Case No. PUR-2019-00105, Order for Notice and Hearing at 21, Ordering Paragraph (21) (Jul. 31, 2019).

COMPLIANCE WITH RULE 10 OF THE RATE CASE RULES

20. The Company's Petition for approval of Rider RGGI complies with the requirements contained in Rule 10 of the Rate Case Rules. In accordance with Rule 10 A, the Company filed with the Commission on September 8, 2020, the Company's notice of intent to file this Petition under Va. Code § 56-585.1 A 5.[2] Copies of the public version of this Petition, to the extent required by Rule 10 J, along with the additional information required by Rule 10 J, have been served upon the persons addressed in that Rule. A complete copy of the public version of this Petition has been served upon the Office of the Attorney General's Division of Consumer Counsel in conformity with Rule 10 J. Also included with and following this Petition, pursuant to Rule 10, is a table of contents of this filing, including testimony and schedules.

21. Beyond the initial Petition, Rate Case Rule 10 J requires the Company to serve copies of certain information related to Dominion Energy Virginia's rate proceedings upon local officials via first class mail or personal delivery. The Company has obtained a continuing waiver of Rule 10 J from the Commission to permit electronic delivery of rate application information to the localities in lieu of first class mail delivery upon request from the locality.[3] Accordingly, the Company requests that any procedural order issued in this proceeding allow for electronic service of materials going forward on localities that request such service in writing.

---

[2] This notice dated September 8, 2020, indicated the Company's intent to file this Petition on or after October 5, 2020. On that same day, the Company filed a motion for limited waiver of the 60-day notice requirement of Rule 10 A. On September 23, 2020, the Commission denied the motion. Based on that order, on September 25, 2020, the Company filed an amended notice of intent to file this Petition under Va. Code § 56-585.1 A 5 on or after November 9, 2020.

[3] *Petition of Virginia Electric and Power Company, For a continuing waiver of 20 VAC 5-201-10 J of the Rules Governing Utility Rate Applications and Annual Informational Filings to permit electronic service to local officials upon request*, Case No. PUE-2016-00039, Final Order at 2-3 (Apr. 19, 2016).

20211209012

CONCLUSION

WHEREFORE, Dominion Energy Virginia respectfully requests that the Commission (i) approve the proposed revenue requirement for service rendered on and after August 1, 2021, to recover projected and actual costs related to the purchase of CO_2 allowances to comply with RGGI; (ii) approve the Company's proposed Rider RGGI, effective for usage on and after August 1, 2021; (iii) grant the Company's requested limited waivers outlined in the Petition; and (iv) grant such other relief as deemed appropriate and necessary.

Respectfully submitted,

VIRGINIA ELECTRIC AND POWER COMPANY

20211208012

WITNESS DIRECT TESTIMONY SUMMARY

Witness: C. Eric McMillan

Title: Manager, Power Contracts and Origination

Summary:

Company Witness C. Eric McMillan provides a general overview of the Regional Greenhouse Gas Initiative ("RGGI") and describes the mechanics of the RGGI auctions. Mr. McMillan also explains how the Company plans to meet its obligations under RGGI, and will describe the Company's participation in these markets to date.

Mr. McMillan explains that RGGI is the first mandatory market-based program in the United States to reduce greenhouse gas emissions. CO_2 allowances are obtained by RGGI participants through quarterly, regional auctions or through secondary markets. In 2020, the Virginia General Assembly passed the Clean Energy and Community Flood and Preparedness Act, which authorized Virginia to become a full participant of RGGI and authorized the Virginia Department of Environmental Quality ("DEQ") to implement its DEQ Carbon Rule. The DEQ Carbon Rule caps CO_2 emissions for Virginia at 27.1 million short tons for calendar year 2021, and decreases the emissions cap annually by approximately 3% to achieve a 30% reduction from 2020 levels to a level of 19.6 million short tons in 2030. The Company owns regulated emissions sources, so must comply with RGGI.

Regulated emissions sources must acquire CO_2 allowances equal to their CO_2 emissions over each three-year RGGI control period. Each allowance represents a limited authorization to emit one short ton of CO_2 from a regulated source. RGGI has had four three-year control periods since it began in 2009. The fifth control period starts on January 1, 2021 and ends December 31, 2023. In addition to the three-year control period requirements, RGGI has interim control periods that require regulated sources to hold a minimum of 50% of their allowances by the end of each of the first two calendar years of the control period. Regulated sources demonstrate compliance by holding sufficient allowances in each source compliance account.

To meet its obligations under RGGI, the Company intends to follow a programmatic approach by purchasing most of the required allowances in the quarterly auctions and using the secondary market to fill any auction deficiencies. More specifically, Dominion Energy Virginia plans to acquire approximately 25% of the forecasted annual allowance requirement in each of the quarterly auctions. If the Company fails to secure approximately 25% in an auction, the Company will look to purchase allowances in the secondary market. Also, Dominion Energy Virginia will seek to maintain a bank of allowances equal to approximately 10% to 20% of the annual requirement. The purpose of the bank is to protect customers from short-term allowance price volatility.

Mr. McMillan supports the weighted average price assumption of $6.84 per CO_2 allowance. This assumption is based on the actual clearing pricing in RGGI Auction 49 and actual transactions in the secondary market, combined with the ICF forward price curve.

20121206 12

DIRECT TESTIMONY
OF
C. ERIC MCMILLAN
ON BEHALF OF
VIRGINIA ELECTRIC AND POWER COMPANY
BEFORE THE
STATE CORPORATION COMMISSION OF VIRGINIA
CASE NO. PUR-2020-00169

Q. Please state your name, business address, and position with Virginia Electric and Power Company ("Dominion Energy Virginia" or the "Company").

A. My name is C. Eric McMillan, and I am a Manager of Power Contracts and Origination for the Company. My business address is 600 East Canal Street, Richmond, Virginia 23219. A statement of my background and qualifications is attached as Appendix A.

Q. Please describe your areas of responsibility with the Company.

A. In my current position, I lead a team that is responsible for managing the Company's compliance with the Regional Greenhouse Gas Initiative ("RGGI") and the mandatory renewable energy portfolio standard program from a market procurement perspective. I also am responsible for the negotiation, origination, and day-to-day administration of the Company's non-utility generation power contracts.

Q. What is the purpose of your testimony in this proceeding?

A. I am testifying in support of the Company's petition for approval of a rate adjustment clause ("RAC"), designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia ("Va. Code") to recover projected and actual costs related to the purchase of allowances through the RGGI market-based trading program for carbon dioxide ("CO_2") emissions, a program in which the Company is required to participate. I will provide a general overview of RGGI and describe the mechanics of the RGGI auctions. I will also explain

20211202-0112

how the Company plans to meet its obligations under RGGI, and will describe the Company's participation in these markets to date.

Q. Are you sponsoring an exhibit in this proceeding?

A. Yes. Although there are no schedules attached to my testimony, I am co-sponsoring Filing Schedule 46A, Statements 1 and 2, with Company Witness Shane T. Compton, which provide information required by Rules 60 and 90 of the Commission's Rules Governing Utility Rate Applications and Annual Informational Filings. Schedule 46A, Statement 1, provides projected costs associated with Rider RGGI, while Schedule 46A, Statement 2, provides documentation supporting the projected costs. These statements were prepared under my direction and supervision and are accurate and complete to the best of my knowledge and belief.

Q. What is RGGI?

A. Initiated in 2009, RGGI is the first mandatory market-based program in the United States to reduce greenhouse gas emissions. RGGI is a collaborative effort among the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, Vermont, and New Jersey to cap and reduce CO_2 emissions from the power sector. CO_2 allowances are obtained by RGGI participants through quarterly, regional auctions. In most RGGI states, auction revenue is returned to state coffers. In addition to Virginia joining RGGI in 2021, Pennsylvania is expected to join RGGI in 2022.

Q. Please provide an overview of the Commonwealth's participation in RGGI.

A. In May 2019, the Virginia Department of Environmental Quality ("DEQ") issued a final rule establishing a state carbon regulation program linked to RGGI (the "DEQ Carbon Rule" or "Rule"). Although the DEQ Carbon Rule was finalized in 2019, language in the state budget bill prohibited the DEQ from continued work on the Rule. During the 2020 Regular Session, the General Assembly passed the Clean Energy and Community Flood and Preparedness Act, Senate Bill No. 1027 and House Bill No. 981, which authorized Virginia to become a full participant of RGGI and authorized the DEQ to implement the DEQ Carbon Rule. The legislation became effective July 1, 2020.

With the passage of this legislation, the DEQ revised the DEQ Carbon Rule to clarify that the Commonwealth will join RGGI in 2021. The revised Rule was signed by the DEQ on June 25, 2020, and became effective on July 10, 2020. The DEQ held a meeting to inform stakeholders about the Rule revisions, including any near-term compliance submittals required of companies subject to the Rule, on August 12, 2020.

Q. What does the DEQ Carbon Rule require in terms of reduced emissions?

A. The DEQ Carbon Rule will cap CO_2 emissions for Virginia at 27.1 million short tons for calendar year 2021, and decrease the emissions cap annually by approximately 3% to achieve a 30% reduction from 2020 levels to a level of 19.6 million short tons in 2030. Emission sources subject to the Rule will be required to obtain and surrender a CO_2 emission allowance for every short ton of CO_2 emitted during a control period through participation in the RGGI allowance auction program.

Q. Is the Company required to comply with the DEQ Carbon Rule?

A. Yes. The Company owns regulated emissions sources, so must comply with RGGI.

Q. How is compliance demonstrated under RGGI?

A. Regulated emissions sources must acquire CO_2 allowances equal to their CO_2 emissions over each three-year RGGI control period. Each allowance represents a limited authorization to emit one short ton of CO_2 from a regulated source. These regulated sources can use CO_2 allowances issued by any participating RGGI state during the current year, or any future year.

RGGI has had four three-year control periods since it began in 2009. The fifth control period starts on January 1, 2021 and ends December 31, 2023. In addition to the three-year control period requirements, RGGI has interim control periods that require regulated sources to hold a minimum of 50% of their allowances by the end of each of the first two calendar years of the control period. Regulated sources demonstrate compliance by holding sufficient allowances in each source compliance account.

Q. How do regulated sources acquire CO_2 allowances?

A. Regulated sources acquire CO_2 allowances by purchasing them at quarterly auctions or through secondary markets. CO_2 allowances purchased by the winning bidders in the quarterly auctions and CO_2 allowances traded in the secondary market are tracked and recorded in the RGGI CO_2 Allowance Tracking System ("COATS"). RGGI allowances currently do not have any limitations on banking. Potomac Economics serves as the independent market monitor for RGGI. The market monitor covers both the auctions and

the secondary market, and publishes quarterly reports analyzing each RGGI auction and activity in the CO_2 allowance secondary market.

Q. Please explain how the RGGI quarterly auctions work.

A. The RGGI member states use an online platform to offer and sell CO_2 allowances in quarterly auctions. The RGGI member states are the only market participants permitted to offer allowances in these auctions. The auctions are conducted in accordance with the statutory and/or regulatory authority of each state offering CO_2 allowances for sale in the auctions.

The quarterly auctions are open to any interested bidder that meets the financial qualifications. Auction bidders must provide sufficient collateral to fully cover all their bidding activity. The auction clearing prices are determined by ordering the bids by dollar value highest to lowest, and then allocating allowances to the bids in descending dollar value until all the allowances have been allocated. The marginal bid—or the lowest bid to receive allowances—then becomes the auction clearing price. All winning bidders pay the auction clearing price for every CO_2 allowance allocated to them.

Q. Please describe the secondary market for RGGI CO_2 allowances.

A. The secondary market allows market participants to buy and sell physical allowances outside of the quarterly auctions, facilitates price discovery in between quarterly auctions, and provides tools to manage price risk and volatility. The secondary market includes the trading of physical allowances and financial products.

A physical CO_2 allowance trade occurs when a buyer and seller agree to specific commercial terms such as price, volume, and vintage, and then register the transfer of allowance ownership in RGGI COATS.

Financial products include any contracts whereby the buyer and seller agree to exchange funds and/or allowances at some future date under specific conditions. Many financial products are designed to, and eventually result in, the transfer of physical CO_2 allowances in RGGI COATS. Depending on the product and the agreed-to commercial terms, this transfer may occur months or even years after the financial transaction was executed by the buyer and seller. The most commonly traded financial products are forward contracts and futures contracts. In forward contracts, which typically are traded in the over the counter ("OTC") market, parties agree to exchange allowances at a set price and quantity at some future date. Forwards are non-standard contracts transacted outside of an exchange. Futures contracts are standardized, exchange-traded contracts. One futures contract equals 1,000 CO_2 allowances. All allowances, regardless of product, must be transferred from seller to buyer in the COATS registry.

Q. Please describe the historical pricing and volumes that have cleared in the RGGI auctions since 2015.

A. Figure 1 shows the RGGI quarterly auction volume that has cleared through September 2020, as well as projections of auction volume in the next two auctions. Note that the March 2021 auction shows the introduction of Virginia volumes into the quarterly auction for the first time.

Figure 1: RGGI Quarterly Auction Volume (Mar. 2015 to Mar. 2021)

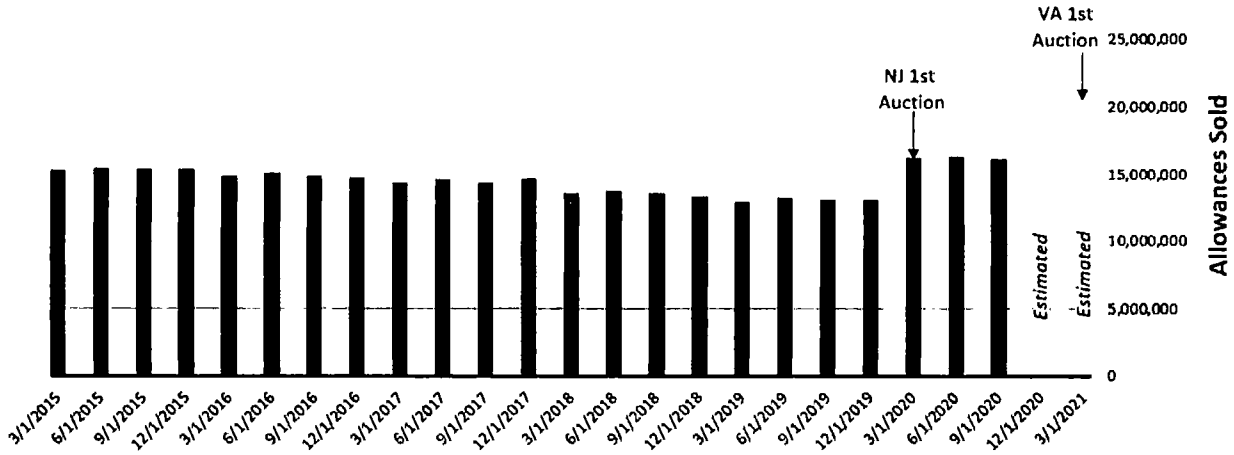

Figure 2 shows the historical prices of RGGI allowances that have cleared through the quarterly auctions as well as the secondary markets. Allowance prices have ranged from $2.53/short ton to $7.50/short ton in the RGGI auctions during this timeframe.

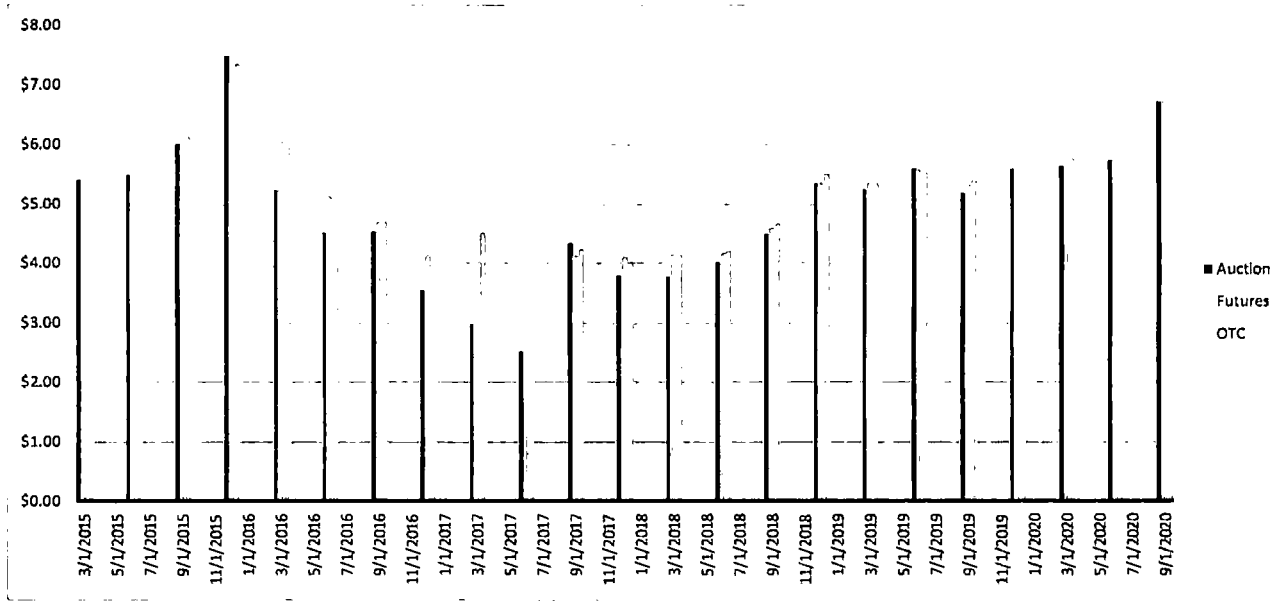
Figure 2: RGGI Quarterly Auction Clearing Price (Mar. 2015 to Sept. 2020)



Q. How many CO_2 allowances does the Company expect to need once Virginia joins RGGI?

A. As supported by Company Witness Compton, the Company estimates it will initially require approximately 19,000,000 CO_2 allowances per year to cover CO_2 emissions from its generation fleet in Virginia during the fifth control period. Based on the projected CO_2 emissions requirements, the Company would need to hold at least 9,500,000 allowances by December 31, 2021, and at least 19,000,000 allowances by December 31, 2022.

Q. Generally, how does the Company plan to meet its obligations under RGGI?

A. In general, the Company intends to follow a programmatic approach by purchasing most of the required allowances in the quarterly auctions and using the secondary market to fill any auction deficiencies. More specifically, Dominion Energy Virginia plans to acquire approximately 25% of the forecasted annual allowance requirement in each of the quarterly auctions. If the Company fails to secure approximately 25% in an auction, the Company will look to purchase allowances in the secondary market. Also, Dominion Energy Virginia will seek to maintain a bank of allowances equal to approximately 10% to 20% of the annual requirement. The purpose of the bank is to protect customers from short-term allowance price volatility.

The Company's compliance strategy is not based on any price outlook. Instead, the Company intends to follow a programmatic, auction-based approach to compliance. The Company may adjust its compliance strategy as needed to adapt to changes in the structure of the RGGI program.

Q. Has the Company started to procure CO_2 allowances to meet its obligations?

A. RGGI Auction 49 occurred in September 2020 with a clearing price of $6.82 per allowance. Dominion Energy Virginia started purchasing small volumes of CO_2 allowances in this auction, purchasing 750,000 allowances. In the secondary market, the Company purchased 250,000 vintage 2020 allowances at $6.73 for September 2020 delivery. While the Company intends to bid on additional allowances in RGGI Auction 50 scheduled for December 2020 and may purchase allowances in the secondary market, the Company does not intend to purchase significant volumes of allowances until the Commonwealth begins selling allowances in the March 2021 auction.

Q. What price for CO_2 allowances has the Company used to calculate the revenue requirement in this proceeding?

A. The Company has assumed a weighted average price of $6.84 per allowance. This assumption is based on the actual clearing pricing in RGGI Auction 49 and actual transactions in the secondary market, combined with the ICF forward price curve as supported by Company Witness Compton. As discussed further by Company Witness John C. Ingram, the revenue requirement will be trued up in future Rider RGGI proceedings based on actual prices paid for CO_2 allowances.

Q. Does this conclude your pre-filed direct testimony?

A. Yes, it does.

20141202

BACKGROUND AND QUALIFICATIONS
OF
C. ERIC MCMILLAN

C. Eric McMillan joined the Company in 2008 as an Associate Financial Analyst in the Generation Financial Services Department. Since then he has held various financial, business development, and renewable operations roles within the power generation business segment of the Company. In 2015, Mr. McMillan was promoted to Manager of Renewable Energy Operations. In October 2019, he assumed his current position of Manager of Power Contracts and Origination. In his current role, Mr. McMillan is responsible for the negotiation, origination, and day-to-day administration of the Company's NUG power contracts.

Mr. McMillan graduated from the Longwood University in 2006 with a Bachelor of Science degree in Business Administration with concentrations in Finance. In 2013, Mr. McMillan obtained a Masters of Science in Finance degree from Virginia Commonwealth University.

20112012

WITNESS DIRECT TESTIMONY SUMMARY

Witness: Shane T. Compton

Title: Manager, Integrated Strategic Planning

Summary:

Company Witness Shane T. Compton provides the forecast of CO_2 emissions from the Company's generation facilities used to determine the projected volume of CO_2 allowances needed to meet the Company's obligations under RGGI. Mr. Compton states that the Company used PLEXOS modeling software to simulate the economic dispatch of the Company's generating units to meet projected load requirements. The projected CO_2 emission production was then pulled for each Company-owned CO_2-emitting resource located in Virginia. Mr. Compton estimates that the Company will initially require approximately 19,000,000 CO_2 allowances per year to cover CO_2 emissions from its Virginia-based generation fleet. Accordingly, by July 31, 2022, the Company expects to need approximately 29,000,000 CO_2 allowances.

2020-0169

DIRECT TESTIMONY
OF
SHANE T. COMPTON
ON BEHALF OF
VIRGINIA ELECTRIC AND POWER COMPANY
BEFORE THE
STATE CORPORATION COMMISSION OF VIRGINIA
CASE NO. PUR-2020-00169

Q. Please state your name, business address, and position with Virginia Electric and Power Company ("Dominion Energy Virginia" or the "Company").

A. My name is Shane T. Compton and I am Manager of Integrated Strategic Planning. My business address is 600 East Canal Street, Richmond, Virginia 23219. A statement of my background and qualifications is attached as Appendix A.

Q. Mr. Compton, what is the purpose of your testimony in this proceeding?

A. I am testifying in support of the Company's petition for approval of a rate adjustment clause ("RAC"), designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia ("Va. Code") to recover projected and actual costs related to the purchase of allowances through the Regional Greenhouse Gas Initiative ("RGGI") market-based trading program for carbon dioxide ("CO_2") emissions. I will support the forecast of CO_2 emissions from the Company's generation facilities.

Q. During the course of your testimony, will you introduce an exhibit?

A. Yes. Company Exhibit No. __, STC, consisting of Schedule 1, was prepared under my supervision and direction, and is accurate and complete to the best of my knowledge and belief. I am also co-sponsoring Filing Schedule 46A, Statements 1 and 2, with Company Witness C. Eric McMillan, which provide information required by Rules 60 and 90 of the Commission's Rules Governing Utility Rate Applications and Annual Informational

Filings. Schedule 46A, Statement 1, provides projected costs associated with Rider RGGI, while Schedule 46A, Statement 2, provides documentation supporting the projected costs.

Q. How did the Company determine the projected volume of CO_2 allowances needed to meet its obligation under RGGI?

A. PLEXOS modeling software was used to simulate the economic dispatch of the Company's generating units to meet projected load requirements. The projected CO_2 emission production was then pulled for each Company-owned CO_2-emitting resource located in Virginia. The Company did not include CO_2 emissions from its units in West Virginia (*i.e.*, Mt. Storm) or North Carolina (*i.e.*, Rosemary). As explained by Company Witness C. Eric McMillan, the Company must obtain and surrender a CO_2 allowance for every short ton of CO_2 emitted from regulated sources.

Q. What is the projected volume of CO_2 allowances that the Company expects to require through the end of the rate year in this proceeding—July 31, 2022?

A. The Company estimates it will initially require approximately 19,000,000 CO_2 allowances per year to cover CO_2 emissions from its Virginia-based generation fleet. Accordingly, by July 31, 2022, the Company expects to need approximately 29,000,000 CO_2 allowances. My Schedule 1 shows the projected CO_2 emissions by month for 2021 and 2022.

Q. Will Virginia joining RGGI affect the dispatch of the Company's generation units?

A. Yes, it will. Regulated sources (*i.e.*, the Company's carbon-emitting generating units that are subject to RGGI) must purchase a CO_2 allowance for every CO_2 short ton emitted

20112000012

during a specific compliance period. All else equal, adding the cost of CO_2 allowances to carbon-emitting generating units that are subject to RGGI will likely result in those units dispatching less. In modeling space, PLEXOS takes this into account by adding a forecasted cost of CO_2 allowances to its generating units in Virginia subject to RGGI. My Schedule 1 shows the projected CO_2 allowance prices used in PLEXOS. As the carbon-emitting generating units dispatch less, PLEXOS replaces the lost generation with market purchases.

Q. Does this conclude your pre-filed direct testimony?

A. Yes, it does.

20112012

BACKGROUND AND QUALIFICATIONS
OF
SHANE T. COMPTON

Shane Compton joined the Company in 2007 as an Hourly Trader in the Energy Marketing group. Since then he has held various financial and planning roles within the power generation and corporate strategic planning segments of the Company. In 2015, Mr. Compton was promoted to Manager of Financial & Business Services. In September 2019, he assumed his current position of Manager of Generation System Planning. In his current role, Mr. Compton is responsible for developing generation portfolio plans to serve the Company's long-term customer capacity and energy needs.

Mr. Compton graduated from Virginia Tech in 2004 with a Bachelor of Science degree in Business Administration with a concentration in Finance. In 2014, Mr. Compton obtained a Master of Business Administration degree from Virginia Commonwealth University.

20212081-2

WITNESS DIRECT TESTIMONY SUMMARY

Witness: John C. Ingram

Title: Director, Regulatory Accounting

Summary:

Company Witness John C. Ingram provides the calculation of the revenue requirement associated with Rider RGGI for the rate year of August 1, 2021 through July 31, 2022 ("Rate Year"). The Company is requesting a total revenue requirement of $168,260,000 for the Rate Year.

Mr. Ingram explains that the Company's RAC revenue requirement in this proceeding includes the Projected Cost Recovery Factor. Beginning with the next RAC filing expected to be made in 2021, the revenue requirement will also include the Actual Cost True-Up Factor. The Projected Cost Recovery Factor calculation results in the operating income necessary for recovery of amortization expense for CO_2 allowances as well as projected financing costs on the unamortized purchased CO_2 allowance balances. In addition, the Projected Cost Recovery Factor includes the amortization of deferred costs, including financing costs, incurred prior to this initial Rate Year. No Actual Cost True-Up Factor is included in this initial proceeding because this filing represents the initial request for cost recovery. It is anticipated that any true-up for calendar year 2020 will be included in a 2021 update filing for implementation during an August 1, 2022 to July 31, 2023 rate year. At that time, and for years beyond, the Actual Cost True-Up Factor will recover from, or credit to, customers any under- or over-recovery of costs from the most recently completed calendar year. Actual revenues recovered during the test year are compared to actual costs incurred during the test year. Any difference in these amounts becomes the Actual Cost True-Up Factor credited to, or recovered from, customers through the total revenue requirement requested for recovery during the rate year.

2021208012

DIRECT TESTIMONY
OF
JOHN C. INGRAM
ON BEHALF OF
VIRGINIA ELECTRIC AND POWER COMPANY
BEFORE THE
STATE CORPORATION COMMISSION OF VIRGINIA
CASE NO. PUR-2020-00169

Q. Please state your name, business address, and position with Virginia Electric and Power Company ("Dominion Energy Virginia" or the "Company").

A. My name is John C. Ingram, and my business address is 120 Tredegar Street, Richmond, Virginia 23219. I am a Director – Regulatory Accounting and am responsible primarily for overseeing regulatory accounting matters and the analysis and development of revenue requirement calculations for the Company. A statement of my background and qualifications is attached as Appendix A.

Q. What is the purpose of your testimony in this proceeding?

A. I am testifying in support of the Company's petition for approval of a rate adjustment clause ("RAC"), designated Rider RGGI, under § 56-585.1 A 5 e ("Subsection A 5 e" or "A 5") of the Code of Virginia ("Va. Code") to recover projected and actual costs related to the purchase of allowances through the Regional Greenhouse Gas Initiative ("RGGI") market-based trading program for carbon dioxide ("CO_2") emissions. I will address the development of the revenue requirement associated with Rider RGGI for the rate year of August 1, 2021 through July 31, 2022 ("Rate Year").

Q. During the course of your testimony, will you introduce an exhibit?

A. Yes. Company Exhibit No. __, JCI, consisting of Schedule 1, was prepared under my supervision and direction, and is accurate and complete to the best of my knowledge and

belief. Also, I am sponsoring Filing Schedule 46B, Statements 1 and 2, which provide information required by the Commission's Rules Governing Utility Rate Applications and Annual Informational Filings. These statements provide revenue requirement information for the proposed RAC and describe all significant accounting procedures and internal controls to identify costs related to RGGI allowances.

Q. Before discussing the revenue requirement, will you give a brief overview of the accounting treatment for RGGI allowances?

A. Purchased CO_2 allowances will be tracked in the aggregate as an intangible asset. As CO_2 emissions are produced each month, this intangible asset will be amortized based on the then-present weighted-average cost per allowance. Based on the timing of allowance auctions and purchase dates, the Company generally expects to carry an intangible asset representing aggregated purchased but unamortized RGGI CO_2 allowances.

Q. What rate of return on common equity ("ROE") is the Company utilizing in this proceeding?

A. The Company has used a ROE of 9.2% for purposes of calculating the Rider RGGI revenue requirement over the Rate Year in this case, consistent with the Final Order in Case No. PUR-2019-00050.

Q. What are the key components of the revenue requirement in this proceeding?

A. The Company's RAC revenue requirement in this proceeding includes the Projected Cost Recovery Factor. Beginning with the next RAC filing expected to be made in 2021, the revenue requirement will also include the Actual Cost True-Up Factor.

20201208E2

The Projected Cost Recovery Factor calculation results in the operating income necessary for recovery of amortization expense for CO_2 allowances as well as projected financing costs on the unamortized purchased CO_2 allowance balances. In addition, the Projected Cost Recovery Factor includes the amortization of deferred costs, including financing costs, incurred prior to this initial Rate Year.

No Actual Cost True-Up Factor is included in this initial proceeding because this filing represents the initial request for cost recovery. It is anticipated that any true-up for calendar year 2020 will be included in a 2021 update filing for implementation during the August 1, 2022 to July 31, 2023 rate year. At that time, and for years beyond, the Actual Cost True-Up Factor will recover from, or credit to, customers any under or over recovery of costs from the most recently completed calendar year. Actual revenues recovered during the test year are compared to actual costs incurred during the test year. Any difference in these amounts becomes the Actual Cost True-Up Factor credited to, or recovered from, customers through the total revenue requirement requested for recovery during the Rate Year.

This request utilizes the end-of-test period capital structure and cost of capital pursuant to Va. Code § 56-585.1 A 10 and is consistent with the Order of the State Corporation Commission of Virginia ("Commission") on Commission Staff's Motion in Limine dated July 14, 2009 in Case No. PUE-2009-00019. For purposes of setting rates during the Rate Year, the end-of-test-period capital structure and cost of capital is the Company's December 31, 2019 year-end capital structure and year-end cost of capital ("Cost of Capital"). The calculation of the end-of-period capital structure and cost of capital excludes certain adjustments to the Company's common equity balance, in accordance

with the Commission's September 4, 2020 Final Order in Case No. PUR-2020-00003. The Company's Cost of Capital applied in this case is shown on page 12 of my Schedule 1.

Q. What deferred costs are being proposed for recovery in this filing?

A. The Company is deferring amortization expense for CO_2 allowances and financing costs on rate base calculated up to the beginning of the initial Rate Year and is proposing to recover them over the Rate Year in this current filing, consistent with past practice for deferred operating costs and rate base items in other Company RACs under Va. Code § 56-585.1 A 5 and A 6.

Q. Mr. Ingram, would you please discuss the Company's current proposal for calculating the Projected Cost Recovery Factor in this filing?

A. Yes. The revenue requirement to be recovered from Virginia Jurisdictional customers through the Projected Cost Recovery Factor is presented in my Schedule 1, page 1, and consists of the projected amortization expense for the CO_2 allowances during the Rate Year, the amortization of deferred costs over the Rate Year, and projected financing costs on purchased CO_2 allowances for the Rate Year (including income taxes on the equity component of the return). CO_2 allowance purchase volumes and prices and amortization volumes included in the revenue requirement calculation are supported by the direct testimony of Company Witnesses C. Eric McMillan and Shane T. Compton.

The financing cost portion of the revenue requirement is the result of multiplying thirteen-month average rate base as of July 31, 2022, by the Company's Cost of Capital. As noted above, the operating cost portion of the revenue requirement consists of

projected amortization expense for CO_2 allowances during the Rate Year and the amortization of deferred costs as previously described in my testimony.

Q. For purposes of this filing, please describe the composition of the rate base as presented in your Schedule 1.

A. Rate base is comprised of month-end unamortized purchased CO_2 allowance balances, cash working capital, and unrecovered deferred costs.

Q. Will any of the expenses requested for recovery in the instant case be requested for recovery in any of the Company's unrelated Virginia rate proceedings or filings such as its base rates, fuel, sales and use tax, or other unrelated rider cases?

A. No. Pursuant to Subsection A 5 e, the Company will only request recovery of those costs and expenses directly associated with the purchase and amortization of CO_2 allowances in Rider RGGI proceedings. Any indirect operating costs, such as broker fees or Dominion Energy Services, Inc. ("DES") costs, will be recovered in the Company's base rates. See Schedule 46B, Statement 2, for a more detailed description of the Company's accounting procedures and internal controls utilized to ensure the purchases and amortization of the CO_2 allowances are segregated for purposes of requesting recovery in the instant proceeding and, conversely, not requested for recovery in other non-related Company proceedings.

Q. What is the total revenue requirement in this filing?

A. As summarized on my Schedule 1, page 1, for the Rate Year beginning August 1, 2021, the Company is requesting recovery of a total revenue requirement of $168,260,000.

20112012

Company Witness Paul B. Haynes's testimony addresses allocation of this revenue requirement among the customer classes.

Q. Does this conclude your pre-filed direct testimony?

A. Yes, it does.

APPENDIX A

BACKGROUND AND QUALIFICATIONS OF JOHN C. INGRAM, CPA

John C. Ingram graduated from the College of William and Mary in 1992 with a Bachelor of Business Administration degree (concentration in Accounting) and received his Certified Public Accountant license in 1994. He performed audit services for a national public accounting firm prior to joining Dominion Energy in 1999. Mr. Ingram has held various positions within Dominion Energy's accounting organization, including SEC reporting, accounting research, and Generation and Gas Infrastructure operating segment support. During his tenure in Generation accounting from 2005 through 2015, he was promoted to Manager in 2006 and Director in 2010. His responsibilities as Director primarily included overseeing personnel responsible for the Company's regulated generation accounting activities. From 2015 through May 2018, Mr. Ingram served as an accounting Director supporting Dominion Energy's Gas Infrastructure operating segment. In May 2018, Mr. Ingram assumed his current role as the Director of Regulatory Accounting where he is responsible for overseeing the analysis and development of revenue requirements for the Company's rate case proceedings.

Mr. Ingram has previously presented testimony and testified before the State Corporation Commission of Virginia.

COMMONWEALTH OF VIRGINIA

STATE CORPORATION COMMISSION

AT RICHMOND, AUGUST 4, 2021

Document Control Center 8/4/21@1:03 PM

PETITION OF

VIRGINIA ELECTRIC AND POWER COMPANY CASE NO. PUR-2020-00169

For approval of a rate adjustment clause,
designated Rider RGGI, under
§ 56-585.1 A 5 e of the Code of Virginia

ORDER APPROVING RATE ADJUSTMENT CLAUSE

On November 9, 2020, Virginia Electric and Power Company ("Dominion" or "Company") filed with the State Corporation Commission ("Commission") a petition ("Petition") for approval of a rate adjustment clause, designated Rider RGGI, pursuant to § 56-585.1 A 5 e of the Code of Virginia ("Code").[1] Through its Petition, Dominion requested approval to recover projected and actual costs related to the purchase of allowances through the Regional Greenhouse Gas Initiative ("RGGI") market-based trading program for carbon dioxide ("CO_2") emissions.[2]

In May 2019, the Virginia Department of Environmental Quality ("DEQ") issued a final rule establishing a state carbon regulation program linked to RGGI (the "DEQ Carbon Rule" or "Rule"). Although the DEQ Carbon Rule was finalized in 2019, language in the state budget bill prohibited DEQ from continued work on the Rule. During its 2020 Regular Session, the General Assembly passed the Clean Energy and Community Flood and Preparedness Act, which authorized Virginia to become a full participant of RGGI and authorized DEQ to implement the DEQ Carbon Rule.[3] The legislation became effective July 1, 2020. With the passage of this

[1] On December 4, 2020, the Company filed an updated Schedule 46, completing its Petition.

[2] Ex. 2 (Petition) at 1.

[3] 2020 Va. Acts Ch. 1219 and 1280.

legislation, DEQ revised the DEQ Carbon Rule to clarify that the Commonwealth will join RGGI in 2021.

The revenue requirement for Rider RGGI in the instant proceeding includes only a Projected Cost Recovery Factor ("Projected Factor").[4] Beginning with the next filing, which the Company expects to make in 2021, the total revenue requirement will include both a Projected Factor and an Actual Cost True-Up Factor ("True-Up Factor"). No True-Up Factor is included in this proceeding because this filing represents the initial request for cost recovery.[5] In this proceeding, the Company seeks approval of a total revenue requirement of $168,260,000 for the rate year of August 1, 2021, to July 31, 2022 ("Rate Year").[6]

If the proposed Rider RGGI for the Rate Year is approved as filed, the impact on customer bills would depend on the customer's rate schedule and usage. According to Dominion, implementation of its proposed Rider RGGI on August 1, 2021, would increase the monthly bill of a residential customer using 1,000 kilowatt-hours per month by approximately $2.39.[7]

On December 11, 2020, the Commission issued an Order for Notice and Hearing that, among other things: docketed the Petition; required the Company to publish notice of the Petition; gave interested persons the opportunity to comment on, or participate in, the proceeding; scheduled public evidentiary hearings to convene on April 27 and 28, 2021; and directed the Commission Staff ("Staff") to investigate the Petition and file testimony and exhibits containing its findings and recommendations. The Virginia Committee for Fair Utility Rates

[5] *Id.*

[6] *Id.*

[7] *Id.* at 6.

("Committee"); Appalachian Voices; the Office of the Attorney General, Division of Consumer Counsel ("Consumer Counsel"); and the Board of Supervisors of Culpeper County filed notices of participation.

On March 11, 2021, the Commission entered an Order appointing a Hearing Examiner to conduct all further proceedings on behalf of the Commission. On March 24, 2021, a Hearing Examiner's Ruling directed that the April 28, 2021 hearing would be convened virtually due to the ongoing COVID-19 emergency.

On April 27, 2021, a hearing was convened to receive public witness testimony telephonically, as scheduled. One member of the public signed up to testify but did not answer his phone to provide testimony.

On April 28, 2021, a hearing to receive the testimony and evidence of the parties and Staff was convened, as scheduled, using Microsoft Teams. The Company, Appalachian Voices, the Committee, Consumer Counsel and Staff participated in the hearing. On May 19, 2021, Dominion, Appalachian Voices, Staff, Consumer Counsel, and the Committee filed post-hearing briefs.

On June 2, 2021, the Report of D. Mathias Roussy, Jr., Hearing Examiner ("Report") was issued. In the Report, the Hearing Examiner recommended that the Company's proposed Rider RGGI be approved, with an initial Rider RGGI rate designed to recover $167.76 million.[8]

The Hearing Examiner made the following additional findings and recommendations:

(1) By the close of the record, Dominion had spent approximately $40 million ($32 million Virginia jurisdictional) to purchase CO_2 allowances that effectively cover the Company's regulated emissions for the first three months of 2021.

[8] Report at 35.

(2) Dominion will need to purchase many more CO_2 allowances through the end of the [R]ate [Y]ear (July 31, 2022), although the exact prices or quantities of such additional purchases cannot be known at this time.

(3) Record evidence, including actual CO_2 allowance prices in 2021, indicates the $6.84 allowance price used to calculate the proposed Rider RGGI revenue requirement could be too low. However, CO_2 allowance prices fluctuate and any price differentials (higher or lower) can be trued-up in future Rider RGGI proceedings.

(4) Dominion's proposed use of weighted averages to calculate the cost of allowance consumption reasonably incorporates the actual prices of CO_2 allowance purchases by Dominion.

(5) Like CO_2 allowance price differentials discussed above, adjustment clause recovery allows any quantity differentials (higher or lower) to be trued-up in future Rider RGGI proceedings.

(6) Dominion will not incur any costs through the end of the [R]ate [Y]ear to build a CO_2 allowance bank. An allowance bank, if implemented temporarily at the end of a control period, generally appears to be a reasonable measure to ensure CO_2 compliance and avoid significant penalties for non-compliance. However, Dominion should provide sufficient support for any cost recovery associated with an allowance bank in any future proceeding in which it seeks to recover such costs.

(7) Dominion will incur financing costs associated with a CO_2 allowance inventory, cash working capital, and deferred balances.

(8) The Commission has previously authorized adjustment clause recovery under Code § 56-585.1 A 5 e for financing costs associated with an emissions allowance inventory, cash working capital, and deferred balances.

(9) Legislation enacted in 2020 does not appear to limit RGGI compliance costs to only the "sticker price" of allowances, but the Commission has not previously interpreted this legislation. Should the Commission interpret this legislation to include such a limitation, approximately $4.95 million (3%) of the proposed $167.76 million revenue requirement request should be recoverable through base rates, rather than Rider RGGI.

(10) It is reasonable for Dominion to obtain CO_2 allowances from both the RGGI auctions and the secondary market.

(11) While Dominion's RGGI compliance approach generally appears to be a reasonable way to manage operational facilities in the short-term, Dominion's Petition was not presented with analysis indicating such short-term compliance is part of a least-cost strategy that integrates the requirements of RGGI and other legal requirements, including new

mandatory [Renewable Energy Portfolio Standards ("RPS")] requirements that could affect CO_2 emissions. The Commission recently directed Dominion to conduct and present this type of analysis in separate proceedings and the instant proceeding offers the Commission the opportunity to provide guidance on whether such analysis should also be presented in Rider RGGI proceedings.

(12) The Commission can approve a projected cost Rider RGGI revenue requirement in the instant case, based largely on projected need and prices forecasted at the outset of a three-year compliance period, without foreclosing the Commission's authority to review, in future Rider RGGI proceedings, the reasonableness or prudence of expenditures once they have actually been incurred and are known.

(13) If RGGI compliance cost recovery is not approved until a future Rider RGGI proceeding, Dominion's ongoing CO_2 allowance costs would accumulate and could result in a significant deferral balance with a larger ratepayer impact.

(14) The energy allocation and rate design for Rider RGGI are reasonable.[9]

NOW THE COMMISSION, having considered this matter, is of the opinion and finds as follows.

The Commission finds that Rider RGGI meets the statutory requirements for approval of a RAC under Code § 56-585.1 A 5 e. The Commission herein approves a revenue requirement, as recommended by the Hearing Examiner, of $167.76 million.

Statutory Authority

Code § 56-585.1 A 5 e states in relevant part as follows:

5. A utility may at any time, after the expiration or termination of capped rates, but not more than once in any 12-month period, petition the Commission for approval of one or more rate adjustment clauses for the timely and current recovery from customers of the following costs:
. . .

e. Projected and actual costs of projects that the Commission finds to be necessary . . . to comply with state or federal environmental laws or regulations applicable to generation facilities used to serve the utility's native load obligations, including the costs of allowances purchased through a market-based trading program for

[9] *Id.* at 34-35.

> [CO_2] emissions. The Commission shall approve such a petition if it finds that such costs are necessary to comply with such environmental laws or regulations;

Allowance Bank

In its Petition, Dominion identified its plan to obtain a quantity of allowances that would be 10% to 20% above the Company's projected annual compliance obligation.[10] According to the Company, the purpose of this planned "bank" is "to protect customers from forecast uncertainty, price volatility, and noncompliance penalties."[11] Appalachian Voices agreed that it is "wise for the Company to develop a banking strategy and to consider the procurement of an appropriate amount of excess allowances as a hedge against market volatility and unexpected increases in demand for energy," but argued that a 10% to 20% level for such bank is unreasonable.[12]

The Hearing Examiner noted that Dominion did not plan to implement an allowance bank during the Rate Year and recommended that the Commission evaluate any banked allowances during future Rider RGGI proceedings.[13]

In its comments on the Hearing Examiner's Report, Appalachian Voices argued that the Company's proposed 10% to 20% allowance bank is not supported by any economic analysis. Appalachian Voices requested that the Commission find that any purchases made to establish an allowance bank are not approved in this case, and the Company must provide detailed economic analysis to support any future request for a bank.[14]

[13] Report at 25.

[14] Appalachian Voices Comments at 13-14.

We agree with the Hearing Examiner and will direct the Company, in any applicable future Rider RGGI proceeding, to identify and provide support for any banked allowances.[15]

Financing Costs

Dominion's Petition requested a revenue requirement, as corrected by Staff, of approximately $168 million. The Hearing Examiner's Report notes that the actual cost of the allowances the Company projects to obtain through the end of the Rate Year is higher than this amount.[16] The proposed revenue requirement instead includes only the costs of allowances that would be both obtained and consumed by the end of the Rate Year, plus the financing of projected allowances that would be purchased but not yet consumed.[17] Dominion proposed to recover the financing costs for purchased allowances through a proposed return on a rate base that consists of: (a) allowance inventory, which is the positive or negative balance of purchased allowances minus required allowances; (b) cash working capital; and (c) deferred costs. The financing costs represent approximately $5 million of the $168 million revenue requirement.[18]

Dominion argued that financing costs are part of "the costs of allowances purchased through a market-based trading program for [CO_2] emissions," and are therefore recoverable as part of Rider RGGI pursuant to Code § 56-585.1 A 5 e.[19]

Staff asserted that the Commission has discretion to decide whether to approve financing costs under Code § 56-585.1 A 5 e and that the statute "neither expressly forbids, nor explicitly

---

[15] *See* Report at 26.

[16] *Id.* at 26. According to the Report, the actual costs of the allowances is approximately $174 million, as estimated in the Petition, or $199 million, based on updated estimates. *Id.* at n.199.

[17] *Id.* at 26-27.

[18] *Id.* at 27; *See, e.g.*, Tr. at 150, 154.

[19] Dominion Post-Hearing Brief at 8-9.

requires, that the costs recovered through a rate adjustment clause related to RGGI participation include the financing costs associated with such participation."[20] Staff noted that the Commission has previously rejected financing costs in cases conducted under Code § 56-585.1 A 4.[21] Consumer Counsel recognized the Commission's discretion in this area and argued that the Commission should exercise this discretion by excluding the financing costs from recovery under Rider RGGI.[22]

The Committee, on the other hand, stated that there is no authority to support Staff's argument that the Commission has discretion to include financing costs, arguing that Code § 56-585.1 A 5 e does not include the terms "carrying cost" or "financing cost" and arguing that the statute does not suggest that "any costs associated with, or even resulting from, an underlying compliance cost were intended to be recovered through a rider such as Rider RGGI."[23]

The Hearing Examiner concluded that "the legal issue of whether allowance financing costs should be approved for recovery in this case does not appear to implicate Commission discretion."[24] The Hearing Examiner further concluded that financing costs of allowances procured are a part of the costs of allowances recoverable under the Code, noting that Code § 56-585.1 A 5 e

> has provided rate adjustment clause recovery of environmental compliance expenses and a return on environmental compliance rate base items. For adjustment clause recovery under this statute, environmental compliance rate base items have included, among other things, environmental allowance inventory, cash working capital, and deferred balances. These and other costs have been considered the "cost of [compliance] projects" upon a finding that they were

[20] Staff Post-Hearing Brief at 2.

[21] Tr. at 160-162.

[22] Consumer Counsel Post-Hearing Brief at 5-7.

[23] Committee Post-Hearing Brief at 3.

[24] Report at 28.

> necessary to comply with environmental laws or regulations, unless the applicant utility failed to demonstrate (1) the actual level of compliance costs, or (2) the prudence or reasonableness of costs.[25]

We agree with Consumer Counsel that nothing in Code § 56-585.1 A 5 e expressly forbids the costs recovered through a rate adjustment clause related to RGGI participation from including the financing costs associated with such participation. We agree with the Hearing Examiner and Staff that these financing costs are "costs of allowances purchased through a market-based trading program for [CO_2] emissions" and are therefore part of the Company's costs of complying with the DEQ Carbon Rule.[26] We will, therefore, approve recovery of the approximately $5 million in financing costs as part of the Rider RGGI revenue requirement.

Statutory Standards

Appalachian Voices requested that the Commission reject the Petition, arguing that the Petition "was not presented with analysis indicating such short-term compliance is part of a least-cost strategy that integrates the requirements of RGGI and other legal requirements, including new mandatory RPS requirements that could affect CO_2 emissions."[27] Appalachian Voices further argued that "[a] sophisticated, vertically-integrated utility like the Company, seeking $167 million from its customers, should be required to perform sophisticated economic analysis to develop and support an optimized procurement strategy."[28]

The Company responded that the focus of this proceeding is short-term. While long-term planning occurs in the Company's Integrated Resource Plan and RPS proceedings, this

[25] *Id.* at 29 (internal footnotes omitted).

[26] *See id.* at 30; Ex. 18 (Carr) at 4.

[27] Ex. 15 (Rábago) at 12; Appalachian Voices Post-Hearing Brief at 8-12.

[28] Appalachian Voices Comments at 15-16.

proceeding is limited to the projected and actual costs of compliance with the DEQ Carbon Rule during the Rate Year, subject to true-up annually.[29]

The Hearing Examiner concluded that "Dominion's RGGI compliance approach, in general, [is] a reasonable way to manage operational facilities in the short-term" but agreed with Appalachian Voices that the Petition did not include analysis that this compliance was part of a long-term, least-cost strategy.[30] The Hearing Examiner recommended that the "instant proceeding offers the Commission the opportunity to provide guidance on whether such analysis should likewise be presented in Rider RGGI proceedings."[31]

We find that the Code provides the standard for review of Rider RGGI costs. In each case, the Company must establish that the costs included in the requested revenue requirement are reasonably and prudently incurred and are "costs of allowances purchased through a market-based trading program for [CO_2] emissions. . . . necessary to comply with [state or federal] environmental laws or regulations."[32] We agree with the Hearing Examiner that the Company's compliance approach, as presented in the record of this case, is "a reasonable way to manage operational facilities in the short-term."[33] Consequently, we find that the costs requested by the Company in this proceeding comply with this statutory requirement. The Company will continue to bear the burden of establishing that this standard has been met in future proceedings.

In addition, the Commission recognizes that Dominion's RGGI compliance is not isolated from its RPS plans, which are also required by statute. Indeed, in Dominion's recent RPS

[33] Report at 31, 35.

proceeding, the Commission expressly directed the Company to include in future RPS filings a least-cost plan that meets applicable carbon regulations, including Virginia's participation in RGGI.[34] Similarly, we herein direct the Company to include in future Rider RGGI filings an analysis of how its RGGI compliance corresponds to its RPS plan filings.

Based on the foregoing, we find that the statutory requirements for a rate adjustment clause under Code § 56-585.1 A 5 e have been met. We further agree with the Hearing Examiner that the revenue requirement for the initial Rate Year should be $167.76 million, subject to actual cost true-up in future cases that may include an evaluation of the reasonableness and prudence of actual allowance costs incurred by the Company.[35]

Accordingly, IT IS ORDERED THAT:

(1) The findings and recommendations set forth in the Hearing Examiner's Report are adopted, as modified herein.

(2) Rider RGGI is approved, as discussed herein, with a revenue requirement of $167,759,000 for the Rate Year.

(3) Rider RGGI, as approved herein, shall be effective for usage on and after September 1, 2021.

(4) The Company forthwith shall file a revised Rider RGGI and supporting workpapers with the Clerk of the Commission and with the Commission's Divisions of Public Utility Regulation and Utility Accounting and Finance, as is necessary to comply with the directives set forth in this Order. The Clerk of the Commission shall retain such filings for public inspection in person and on the Commission's website: scc.virginia.gov/pages/Case-Information.

---

[34] *Commonwealth of Virginia, ex rel. State Corporation Commission, Ex Parte: Establishing 2020 RPS Proceeding for Virginia Electric and Power Company*, Case No. PUR-2020-00134, Doc. Con. Ctr. No. 210440236, Final Order at 6 n.15 (Apr. 30, 2021).

[35] *See* Report at 32-33.

(5) This case is dismissed.

JAGDMANN, Commissioner, concurs:

I agree in all respects with the majority opinion. A least-cost plan for compliance with RGGI and RPS requirements should be included in future Rider RGGI and RPS plan filings. While there may be reasons for a utility's deviation from a least-cost plan for either or both programs, additional information on the cost of compliance with these requirements will be informative.

This discussion, however, raises the question of the need for two separate and distinct modes for achieving carbon reduction. RGGI is a CO_2 emissions cap-and-trade program[36] that currently is expected to cost Dominion's Virginia jurisdictional ratepayers approximately $3 billion through 2045.[37] While there tends to be much discussion of the revenues RGGI "generates" for various programs,[38] RGGI does not create this money. Rather, RGGI directly

[36] Code § 10.1-1329 defines RGGI as "the program to implement the memorandum of understanding between signatory states dated December 20, 2005, and as may be amended, and the corresponding model rule that established a regional carbon dioxide electric power sector cap and trade program." RGGI defines itself as "a cooperative, market-based effort among the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont, and Virginia to cap and reduce CO_2 emissions from the power sector." *See* https://www.rggi.org/.

[37] Report at 13-14 (citing Ex. 18 (Carr) at 5 and Appendix page 12) (showing total Rider RGGI required revenues for the Virginia jurisdiction of approximately $2.946 billion, excluding financing costs). As reported to the General Assembly's Commission on Electric Utility Regulation and others in a report dated August 18, 2020, Dominion identified potential Virginia regulated entity capital investments of $50-59 billion from 2020-2035. While this total includes items outside of the Virginia Clean Economy Act ("VCEA"), 2020 Va. Acts chs. 1193, 1194, the renewable portfolio standard program related categories of solar, onshore wind, offshore wind, and energy storage investments account for $34-43 billion of such investment. *Status Report: Implementation of the Virginia Electric Utility Regulation Act Pursuant to § 56-596 B of the Code of Virginia* at 9-10 (Aug. 18, 2020), available at: https://rga.lis.virginia.gov/Published/2020/RD282/PDF.

[38] Pursuant to Code § 10.1-1330 C: (i) 45% of the revenue is allocated to assisting localities and residents affected by recurrent flooding, sea level rise, and flooding from severe weather events; (ii) 50% of the revenue is allocated to supporting Department of Housing and Community Development ("DHCD") low-income energy efficiency programs, including programs for eligible housing developments; (iii) 3% is used to cover administrative expenses and to carry out statewide climate change planning and mitigation activities; and (iv) the remaining 2% is used by DHCD, in partnership with the Department of Mines, Minerals and Energy ("DMME") to administer and implement the low-income energy efficiency programs.

charges generators, including utilities such as Dominion who in turn bill ratepayers for these very costs.

RGGI requirements and the associated costs are in addition to the requirements and associated costs of the VCEA which, among other things, requires participation by Dominion and Appalachian Power Company ("Appalachian") in RPS programs.[39] For Dominion, the RPS program requirements attach to 14% of total electric energy sales in 2021 (based on the energy sold in the previous calendar year), steadily increasing to 52% in 2033 and continuing to 100% in 2045.[40] The VCEA is highly prescriptive as to how these requirements are to be met. For example:

- By December 31, 2035, Dominion must "petition the Commission for necessary approvals to (i) construct, acquire, or enter into agreements to purchase the energy, capacity, and environmental attributes" of 16,100 megawatts ("MW") of onshore wind and solar generation.[41] There are interim requirements for years 2024, 2027, and 2030 for petitions of, respectively 3,000 MW, another 3,000 MW, and an additional 4,000 MW of such generation.[42]
- By December 31, 2035, Dominion must petition the Commission to construct or purchase one or more offshore wind facilities of up to 5,200 MW capacity.[43]

[39] *See* Code § 56-585.5 C.

[40] *Id.*

[41] Code § 56-585.5 D 2.

[42] Code § 56-585.5 D 2 a. b. and c.

[43] Code § 56-585.5 D 2.

- There is similar language requiring Dominion to petition to construct or acquire 2,700 MW of energy storage capacity.[44]
- If the utility is unable to meet the compliance obligations of the RPS statute or if the cost of renewable energy certificates ("RECs") exceeds $45 per megawatt-hour ("MWh"), utilities shall make $45 per MWh deficiency payments for any shortfall.[45] The deficiency payments go to DMME to administer and direct to job training programs in historically economically disadvantaged communities, energy efficiency measures for public facilities, renewable energy programs located in historically economically disadvantaged communities, and administrative costs.[46]

Utilities subject to VCEA requirements are allowed to pass through the costs of compliance to ratepayers. Several avenues are provided for such cost recovery, namely: (i) dollar-for-dollar recovery of all costs through one or more rate adjustment clauses;[47] (ii) the potential to accelerate cost recovery from customers of the aggregate amount of approved capital investment in solar, onshore wind, or offshore wind generating facilities as a customer credit reinvestment offset in a Triennial Review case;[48] or (iii) the opportunity to recover such costs

[44] Code § 56-585.5 E 2.

[45] Code § 56-585.5 D 5. The deficiency payment is greater, $75 per MWh, "for any shortfall in procuring RECs for solar, wind, or anaerobic digesters located in the Commonwealth" for resources 1 MW and lower. Further, the amount of any deficiency payment increases by one percent annually after 2021. *Id.*

[46] *Id.*

[47] Code § 56-585.1 A 5 d (for recovery of the cost of complying with RPS program requirements not recoverable under Code § 56-585.1 A 6); Code § 56-585.1 A 5 e (for recovery of, among other things, the costs of allowances purchased through a market-based trading program for CO_2 emissions); and Code § 56-585.1 A 6 (for recovery of the costs of, among other things, solar, onshore wind, and offshore wind facilities).

[48] Code §§ 56-585.1 A 6 and A 8 d.

over the lives of the facilities through the utility's base rates.[49] In other words, customers will pay for all the utility's RPS costs, whether through a rate adjustment clause or base rates. As noted above, the cost to ratepayers for VCEA compliance, along with associated necessary transmission and distribution infrastructure builds and upgrades, will be significant.[50]

This is not to question the policy of the General Assembly to achieve specific carbon reductions.[51] Indeed on April 30th of this year, in our Final Orders on the annual RPS plans for both Dominion and Appalachian we stated, "[W]e have exercised the Commission's delegated discretion in a manner that faithfully implements the VCEA requirements that include carbon reduction, while best protecting consumers who expect and deserve reliable and affordable service."[52] It is appropriate, however, to note potential costly duplications that may impede realization of the General Assembly's intent. The VCEA plainly states that the RPS program requirements for Dominion shall be 100% by 2045. Thus, it remains unclear whether the significant cost required for participation in an additional cap-and-trade program – which is

---

[49] Code § 56-585.5 D. Also pursuant to this Code provision, costs related to "the purchase of energy, capacity, or environmental attributes from facilities owned by the persons other than the utility required by the subsection" are recoverable under either base rates or the Company's fuel factor.

[50] *See* n.37, *supra*.

[51] *See Old Dominion Comm. for Fair Util. Rates v. State Corp. Comm'n,* 294 Va. 168, 175 (2017) ("The Commission rejected the public policy arguments against the statute . . . [and] focused instead on the purely legal issue of whether Old Dominion had carried its burden of overcoming the presumption in favor of the statute's constitutionality . . . . Thus, its 'duty in this case,' the Commission explained, 'is to decide the legal question of constitutionality without regard to our public-policy preferences and not to conflate the two.'") (affirming and quoting *Petition of The Old Dominion Committee for Fair Utility Rates v. Appalachian Power Company, For a declaratory judgment and an order requiring biennial review filings*, Case No. PUE-2016-00010, 2016 S.C.C. Ann. Rept. 357, 362, Final Order (July 1, 2016)).

[52] *Commonwealth of Virginia, ex rel. State Corporation Commission, Ex Parte: Establishing 2020 RPS Proceeding for Virginia Electric and Power Company*, Case No. PUR-2020-00134, Doc. Con. Cen. No. 210440236, Final Order at 4 (Apr. 30, 2021); *Commonwealth of Virginia, ex rel. State Corporation Commission, Ex Parte: Establishing 2020 RPS Proceeding for Appalachian Power Company*, Case No. PUR-2020-00135, Doc. Con. Cen. No. 210440238, Final Order at 3 (Apr. 30, 2021).

expected to cost customers billions of dollars – are necessary for Dominion's and Appalachian's ratepayers to bear in order to achieve the General Assembly's carbon reduction objectives.[53]

A COPY hereof shall be sent electronically by the Clerk of the Commission to all persons on the official Service List in this matter. The Service List is available from the Clerk of the Commission.

[53] RGGI extends to more generators than the two utilities (Dominion and Appalachian) required to participate in RPS programs. An option that would move Dominion and Appalachian ratepayers closer to neutral would be for revenues associated with their RGGI compliance to be returned and then credited to ratepayers.

For revision of rate adjustment clause: Rider RGGI, pursuant to § 56-585.1 A 5 e of the Code of Virginia	)	

VIRGINIA ELECTRIC AND POWER COMPANY'S
RIDER RGGI ANNUAL UPDATE FILING

Pursuant to § 56-585.1 A 5 e ("Subsection A 5 e") of the Code of Virginia ("Va. Code") and the State Corporation Commission of Virginia's ("Commission") Rules Governing Utility Rate Applications and Annual Informational Filings (the "Rate Case Rules"),[1] Virginia Electric and Power Company ("Dominion Energy Virginia" or the "Company"), by counsel, hereby submits this annual update filing with respect to its rate adjustment clause ("RAC" or "Rider"), designated Rider RGGI, approved to recover costs related to the purchase of allowances through the Regional Greenhouse Gas Initiative ("RGGI") market-based trading program for carbon dioxide ("CO_2") emissions, a program in which the Company is required to participate. In support of its petition ("Petition"), the Company respectfully shows as follows:

GENERAL INFORMATION

1. Dominion Energy Virginia is a public service corporation organized under the laws of the Commonwealth of Virginia furnishing electric service to the public within its certificated service territory. The Company also supplies electric service to non-jurisdictional customers in Virginia and to the public in portions of North Carolina. The Company is engaged in the business of generating, transmitting, distributing, and selling electric power and energy to

[1] 20 VAC 5-204-10, *et seq.*

2121-2168-4568

the public for compensation. The Company is also a public utility under the Federal Power Act, and certain of its operations are subject to the jurisdiction of the Federal Energy Regulatory Commission. The Company is an operating subsidiary of Dominion Energy, Inc.

2. The Company's address is:

Virginia Electric and Power Company
120 Tredegar Street
Richmond, Virginia 23219

3. The names, addresses, and telephone numbers of the attorneys for the Company are:

(804) 775-1090 (ESR)
(804) 775-1069 (TDP)
(804) 775-1199 (DRB)

BACKGROUND

4. Initiated in 2009, RGGI is the first mandatory market-based program in the United States to reduce greenhouse gas emissions. RGGI is a collaborative effort among the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont, and Virginia to cap and reduce CO_2 emissions from the

power sector. CO_2 allowances are obtained by RGGI participants through quarterly, regional auctions.

5. In May 2019, the Virginia Department of Environmental Quality ("DEQ") issued a final rule establishing a state carbon regulation program linked to RGGI (the "DEQ Carbon Rule" or "Rule"). The DEQ Carbon Rule capped CO_2 emissions for Virginia at 27.1 million short tons for calendar year 2021 and decreases the emissions cap annually by approximately 3% to achieve a 30% reduction from 2020 levels to a level of 19.6 million short tons in 2030. Emission sources subject to the Rule are required to obtain and surrender a CO_2 emission allowance for every short ton of CO_2 emitted during a control period.

6. The Company owns regulated emissions sources, so it must comply with RGGI.

7. Va. Code § 56-585.1 A 5 e permits cost recovery related to compliance with RGGI and establishes the applicable standard of review:

> A utility may at any time, after the expiration or termination of capped rates, but not more than once in any 12-month period, petition the Commission for approval of one or more rate adjustment clauses for the timely and current recovery from customers of . . . [p]rojected and actual costs of projects that the Commission finds to be necessary . . . to comply with state or federal environmental laws or regulations applicable to generation facilities used to serve the utility's native load obligations, including the costs of allowances purchased through a market-based trading program for carbon dioxide emissions. The Commission shall approve such a petition if it finds that such costs are necessary to comply with such environmental laws or regulations.

8. On August 4, 2021, in Case No. PUR-2020-00169 ("2020 Rider RGGI Proceeding"), the Commission issued its Order Approving Rate Adjustment Clause ("Rider RGGI Order"), approving Rider RGGI to be effective for usage on and after September 1, 2021.[2]

[2] *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia*, Case No PUR-2020-00169, Order Approving Rate Adjustment Clause at 11 (Aug. 4, 2021).

2022-0169

Subsequently, the Commission suspended the Rider RGGI Order on August 25, 2021 pending consideration of a Petition for Reconsideration or Clarification. On November 17, 2021, by its Order on Reconsideration, the Commission lifted the suspension of the Rider RGGI Order without modification of its initial order.

RIDER RGGI

9. For the period beginning September 1, 2022 and ending August 31, 2023 (the "Rate Year"), the Company estimates it will require approximately 19 million CO_2 allowances to cover CO_2 emissions from its Virginia-based generation fleet.

10. Generally, to meet its obligations under RGGI, the Company is following a programmatic approach by purchasing most of the required allowances in the RGGI quarterly auctions and using the secondary market to fill any auction deficiencies. More specifically, Dominion Energy Virginia plans to acquire approximately 25% of the forecasted annual allowance requirement in each of the quarterly auctions. If the Company fails to secure approximately 25% in an auction, the Company will look to purchase allowances in the secondary market. The Company's compliance strategy is not based on any price outlook. Instead, the Company intends to follow a programmatic, auction-based approach to compliance. The Company may adjust its compliance strategy as needed to adapt to changes in the structure of the RGGI program.

11. The Company has assumed a weighted average price of $10.53 per allowance. This assumption is based on December ICE futures contracts for 2021 and 2022 and the ICF International, Inc. forward price curve for 2023.

12. The Company's RAC revenue requirement in this proceeding includes the Projected Cost Recovery Factor and an Interim Correction Factor. It is anticipated that the

2021-0306

Actual Cost True-up Factor for calendar year 2021 will not be included as part of the RGGI revenue requirement until the 2022 annual update filing, since the Rider RGGI implementation was delayed due to the Petition for Reconsideration or Clarification in the 2020 Rider RGGI Proceeding. The Projected Cost Recovery Factor calculation results in the operating income necessary for recovery of amortization expense for CO_2 allowances as well as projected financing costs on the unamortized purchased CO_2 allowance balances. The Interim Correction Factor is proposed in this proceeding in an effort to minimize the impacts of carrying costs on future known under-recoveries that resulted from greater than anticipated allowance costs. The Interim Correction Factor will recover from, or credit to, any under/over collection of actual known costs and updated projected allowance usage for the months of September 1, 2020 through July 31, 2022, the end of the initial Rate Year for Rider RGGI. The actual and known costs from September 2020 through September 2021, and the updated projections from October 2021 through July 2022 are compared to the original projected and deferred amounts from the 2020 Rider RGGI filing for the same period. This difference becomes the Interim Correction Factor to be recovered from customers during the proposed September 1, 2022 through August 31, 2023 Rate Year. When the Actual Cost True-Up Factor is included, it will recover from, or credit to, customers any under- or over-recovery of costs from the most recently completed calendar year. Actual revenues recovered during the test year are compared to actual costs incurred during the test year. Any difference in these amounts becomes the Actual Cost True-Up Factor credited to, or recovered from, customers through the total revenue requirement requested for recovery during the rate year.

13. The total revenue requirement requested for recovery in this Rider RGGI Petition for the Rate Year beginning September 1, 2022, is $323,411,000.

14. For purposes of this Petition, and consistent with the Commission's November 18, 2021 Final Order in the Company's triennial review proceeding in Case No. PUR-2021-00058,[3] the Company is utilizing the approved ROE of 9.35% for the period subsequent to the date of that Final Order. For the time periods prior to the Final Order in that case, the Company is utilizing a ROE of 9.2%, as approved by the Commission in Case No. PUR-2019-00050.[4]

15. The implementation of the proposed Rider RGGI on September 1, 2022, will increase the residential customer's monthly bill, based on 1,000 kWh per month, by $1.98. Including the increase associated with this annual update, the total Rider RGGI impact on the typical bill of a residential customer is $4.37.

RGGI COMPLIANCE AND RPS DEVELOPMENT PLAN MODELING

16. In the 2020 Rider RGGI Order, the Commission directed the Company to "include in future Rider RGGI filings an analysis of how its RGGI compliance corresponds to its RPS plan filings."[5] The Company has prepared this analysis and included it as Exhibit 1 to this Petition. Exhibit 1 is sponsored by Company Witness Jeffrey D. Matzen.

SUPPORTING TESTIMONY AND FILING SCHEDULES 3, 4, 5, 8, AND 46

17. The Company's Petition is supported by the pre-filed direct testimonies of Company Witnesses George E. Hitch, Jeffrey D. Matzen, C. Alan Givens, and Paul B. Haynes.

A. Filing Schedules 3, 4, 5, and 8

18. Section 60 of the Rate Case Rules provides that rate adjustment clause

---

[3] *Application of Virginia Electric and Power Company For a 2021 triennial review of the rates, terms and conditions for the provision of generation, distribution and transmission services pursuant to § 56-585.1 A of the Code of Virginia*, Case No. PUR-2021-00058, Final Order (Nov. 18, 2021).

[4] *Application of Virginia Electric and Power Company For the determination of the fair rate of return on common equity pursuant to § 56-585.1:1 C of the Code of Virginia*, Case No. PUR-2019-00050, Final Order (Nov. 21, 2019).

[5] *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia*, Case No PUR-2020-00169, Order Approving Rate Adjustment Clause at 11 (Aug. 4, 2021).

2211211803

"applications requiring an overall cost of capital shall include Schedules 3, 4, 5, and 8." The Company is filing with this Petition, Filing Schedules 3, 4, 5, and 8, as follows. These filing schedules are sponsored by Company Witness Givens.

19. Filing Schedules 3 and 3A provide the capital structure and cost of capital statements applicable to Rider RGGI. Filing Schedule 4 provides schedules of long-term debt, preferred stock, investment tax credits, and other components of ratemaking capital for the filing. Filing Schedule 5 provides the schedule of short-term debt, revolving credit agreements, and similar short-term financing arrangements. Filing Schedule 8 provides the proposed cost of capital statement for Rider RGGI.

B. Filing Schedule 46

20. Rule 60 of the Rate Case Rules provides than an application filed pursuant to Subsection A 5 "shall include Schedule 46 as identified and described in 20 VAC 5-204-90, which shall be submitted with the utility's direct testimony." The Company is filing with this Petition, Filing Schedule 46, as follows:

a. Company Witnesses Hitch and Matzen co-sponsor Schedule 46A, consisting of Statements 1 and 2. Schedule 46A, Statement 1, provides projected costs associated with Rider RGGI, while Schedule 46A, Statement 2, provides documentation supporting the projected costs.

b. Company Witness Givens sponsors Schedule 46B, consisting of Statement 1, which provides the annual revenue requirement information for the proposed rate year, Statement 2, which provides projected revenue requirement information for years 2023-2046, and Statement 3, which provides documentation to support the projected annual revenue requirements.

c. Company Witness Haynes sponsors Schedule 46C, consisting of Statements 1-2, which provide details of the Company's methodology for allocating the Rider RGGI revenue requirement.

COMPLIANCE WITH RULE 10 OF THE RATE CASE RULES

211221@29

21. The Company's Petition for approval of Rider RGGI complies with the requirements contained in Rule 10 of the Rate Case Rules. In accordance with Rule 10 A, the Company filed with the Commission on October 7, 2021, the Company's notice of intent to file this Petition under Va. Code § 56-585.1 A 5. Copies of this Petition, to the extent required by Rule 10 J, along with the additional information required by Rule 10 J, have been served upon the persons addressed in that Rule. A complete copy of this Petition has been served upon the Office of the Attorney General's Division of Consumer Counsel in conformity with Rule 10 J. Also included with and following this Petition, pursuant to Rule 10, is a table of contents of this filing, including testimony and schedules.

22. Beyond the initial Petition, Rate Case Rule 10 J requires the Company to serve copies of certain information related to Dominion Energy Virginia's rate proceedings upon local officials electronically to the extent official email addresses are available, or via first class mail or personal delivery if electronic delivery is not possible. The Company will comply with this requirement in conjunction with the Commission's forthcoming procedural order.

CONCLUSION

WHEREFORE, Dominion Energy Virginia respectfully requests that the Commission (i) approve the proposed Rider RGGI under Va. Code § 56-585.1 A 5 e subject to future Rider RGGI proceedings and true-ups, effective for usage on and after September 1, 2022; (ii) approve the proposed revenue requirement, cost allocation, rate design, and accounting treatment for Rider RGGI for the Rate Year September 1, 2022 through August 31, 2023; and (iii) grant such other relief as deemed appropriate and necessary.

Counsel for Virginia Electric and Power Company

December 6, 2021

Exhibit 1

Dominion Energy Virginia's RGGI Compliance and RPS Development Plan Modeling

I. Background – VCEA

The VCEA—Senate Bill No. 851 and House Bill No. 1526 from the 2020 Regular Session of the Virginia General Assembly—became law in the Commonwealth effective July 1, 2020. Relevant to this proceeding, the VCEA (i) requires the development of renewable energy generation resources; (ii) requires the development of energy storage resources; (iii) requires the submission of an annual plan to meet the development targets; and (iv) institutes a mandatory RPS Program.

Under Va. Code § 56-585.5 D 4, the Company must submit an annual plan outlining how it intends to meet the renewable energy generation and energy storage development targets. This annual filing must contain any request for approval to construct or purchase solar or onshore wind generation under Va. Code § 56-580 D, as well as any associated requests related to cost recovery of such facilities under Va. Code § 56-585.1 A 6. The Commission must determine whether such annual filings are reasonable and prudent, giving due consideration to certain factors: (i) the RPS and carbon dioxide reduction requirements in this section, (ii) the promotion of new renewable generation and energy storage resources within the Commonwealth and associated economic development, and (iii) fuel savings projected to be achieved by the plan.

II. Background – RPS Development Plan

Dominion Energy Virginia submitted its 2020 RPS Development Plan in Case No. PUR-2020-00134 on October 30, 2020. The Commission approved the 2020 RPS Development Plan as reasonable and prudent on April 30, 2021. Subsequently, Dominion Energy Virginia submitted its 2021 RPS Development Plan on September 15, 2021 in Case No. PUR-2021-00146. In that filing, the Company affirms that the 2021 RPS Plan is consistent with Alternative Plan B from the Company's 2021 update to its 2020 Integrated Resource Plan ("2021 IRP Update") filed on September 1, 2021 in Case No. PUR-2021-00201, which is described in more detail in Part IV, below. The Company further affirms that the modeling inputs and assumptions are consistent between the 2021 IRP Update and the 2021 RPS Development Plan. The 2021 RPS Development Plan will (i) support RPS Program compliance; (ii) support carbon dioxide ("CO_2") reductions in the Commonwealth; (iii) promote new renewable energy generation and energy storage resources in the Commonwealth and the associated economic development; and (iv) result in fuel savings while maintaining reliability.

III. Background – Rider RGGI

On November 9, 2020, in Case No. PUR-2020-00169, the Company filed for approval of a rate adjustment clause, designated Rider RGGI, under Va. Code § 56-585.1 A 5 e to recover projected and actual costs related to the purchase of allowances through the Regional Greenhouse Gas Initiative ("RGGI") market-based trading program for CO_2 emissions, a

211211019

program in which the Company is required to participate. In its August 4, 2021 Order Approving Rate Adjustment Clause and its November 17, 2021 Order on Reconsideration, the Commission approved Rider RGGI, finding that the Company's compliance approach is a reasonable way to manage operational facilities in the short-term and that the costs requested in that proceeding complied with the statutory standard. The Commission further directed the Company to include in future Rider RGGI filings an analysis of how its RGGI compliance corresponds to its RPS plan filings. Dominion Energy Virginia herein presents the required analysis as part of its 2021 Annual Update to Rider RGGI.

IV. Analysis

In the 2021 IRP Update, the Company presented three alternative plans ("Alternative Plans"). Alternative Plan A presents a least-cost plan that meets only applicable carbon regulations and the mandatory RPS Program requirements of the VCEA. The Company presented this Alternative Plan for cost comparison purposes only in compliance with prior Commission orders. Notably, Alternative Plan A does not meet the development targets for solar, wind, and energy storage resources in Virginia established through the VCEA. By contrast, Alternative Plan B is consistent with the 2021 RPS Development Plan.[1] Figure 1 presents the results for Alternative Plan A (*i.e.*, the "least-cost plan") and Alternative Plan B.

Figure 1: 2021 IRP Update Results for Alternative Plans A and B

	Plan A	Plan B
NPV Total ($B)	$47.8	$67.9
Approximate CO_2 Emissions from Company in 2046 (Metric Tons)	18 M	2 M
Solar (MW)	820 15-year 2,140 25-year	14,310 15-year 17,790 25-year
Wind (MW)	--- 15-year --- 25-year	5,174 15-year 5,174 25-year
Storage (MW)	--- 15-year --- 25-year	2,713 15-year 2,773 25-year
Natural Gas-Fired (MW)	970 15-year 970 25-year	--- 15-year --- 25-year
Retirements (MW)	2,567 15-year 2,567 25-year	2,561 15-year 4,792 25-year

Through PLEXOS, the Company models reliability at a system level by ensuring that sufficient resources are available to meet customer load based on the hourly profile of both load and resources. Because the Company is a member of PJM Interconnection, LLC ("PJM"), PLEXOS has the option to fill any deficits in any specific hour with market purchases. PLEXOS

[1] Alternative Plan C uses similar assumptions as Plan B but retires all Company-owned carbon-emitting generation by the end of 2045, resulting in zero CO_2 emissions from the Company's fleet beginning in 2046.

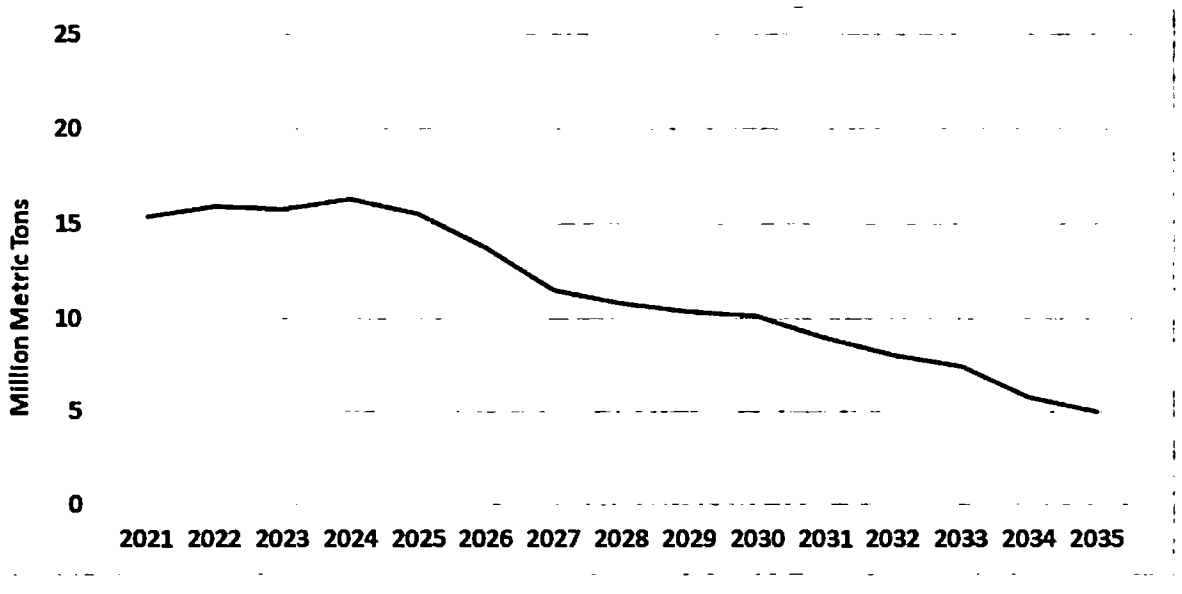
2112160169

does not currently show any reliability issues through 2035 based on the modeling completed for the 2021 RPS Plan proceeding and the 2021 IRP Update.

Importantly for future planning purposes, however, the Company must take other factors into account to ensure reliability in the long term. For example, if other states pursue the same clean energy future as the Company, resulting in significant volumes of intermittent resources with the same operational profiles as the Company's, the Company may not be able to fill any deficits in specific hours with market purchases. Separate from system level planning, planning at the more granular nodal and feeder level is also needed to ensure reliability, which is completed by the Company's transmission and distribution teams. It is at the nodal level that the system reliability and stability may become a concern based on physical transmission and distribution constraints. The Company continues to actively plan for these potential issues, and will continue to do so as the Company transitions to a cleaner fleet as envisioned by the Commonwealth, the Company, and its customers. See the Company's 2021 IRP Update for a further discussion of the Company's evaluation of seasonal concerns and a status of the Company's long-term transmission reliability analyses.

The RPS Development Plan will support CO_2 reductions in the Commonwealth through the development of a significant amount of CO_2-free generation resources that will displace both market purchases and output from other traditional Company-owned generation units that emit CO_2 as a byproduct of combustion. Figure 2 below shows the projected CO_2 output from the Company's fleet in the Commonwealth through 2035. Figure 2 reflects the RPS Development Plan, as well as the tentative retirements of certain generation units as reflected in Alternative Plan B of the Company's 2021 IRP Update.

Figure 2: Virginia CO_2 Output from Company Fleet, with RPS Development Plan



221219169

To date, the Company has followed the RPS Development Plan in developing CO_2-free generation. The Company has also retired certain generation units consistent with the RPS and IRP plans. The Company further endeavors to minimize customer cost while maintaining reliability through prudent dispatch of dispatchable units. As a member of PJM, the Company offers units for dispatch with accurate cost estimates that include RGGI compliance costs. The PJM market clearing process dispatches the fleet economically. In following the RPS Development Plan and including RGGI costs in dispatch decisions, the Company's RGGI compliance corresponds to its RPS plan filings.

For forward RGGI allowance requirements, the Company projects CO_2 emissions by modeling the system dispatch using assumptions that are consistent with both the 2021 IRP Update (Alternative Plan B) and the 2021 RPS Development Plan. The modeling assumes a capacity factor for existing and future solar resources of 21.2%, which is the three-year average of the Company's solar tracking facilities in Virginia. The RGGI modeling was completed using an updated load forecast and an updated commodity price forecast. The Company uses PLEXOS to model the dispatch of the fleet in the PJM energy market. The dispatch of the fleet produces the system's CO_2 emissions. The PLEXOS dispatch logic includes RGGI compliance costs in the same manner that it includes fuel costs. Therefore, a Company-owned fossil unit operates when the compliance cost of RGGI plus other variable costs like fuel are less than the cost of a market power purchase. In following the RPS Development Plan and including RGGI costs in dispatch decisions, the Company's RGGI compliance cost modeling corresponds to its RPS plan filings.

COMMONWEALTH OF VIRGINIA

STATE CORPORATION COMMISSION

PETITION OF	)	
	)	
VIRGINIA ELECTRIC AND POWER COMPANY	)	
	)	Case No. PUR-2021-00281
For revision of rate adjustment clause: Rider RGGI, pursuant to § 56-585.1 A 5 e of the Code of Virginia	)	

VIRGINIA ELECTRIC AND POWER COMPANY'S
MOTION TO WITHDRAW APPLICATION

On December 6, 2021, Virginia Electric and Power Company ("Dominion Energy Virginia" or the "Company") filed with the State Corporation Commission of Virginia (the "Commission") its annual update filing with respect to its rate adjustment clause ("RAC" or "Rider"), designated Rider RGGI, approved to recover costs related to the purchase of allowances through the Regional Greenhouse Gas Initiative ("RGGI") market-based trading program for carbon dioxide ("CO_2") emissions, a program in which the Company is required to participate pursuant to § 56-585.1 A 5 e ("Subsection A 5 e") of the Code of Virginia ("Va. Code"). Pursuant to Rule 110 of the Commission's Rules of Practice and Procedure,[1] 5 VAC 5-20-110, Dominion Energy Virginia moves to withdraw its update Application without prejudice ("Motion"). In support of its Motion, the Company states as follows:

1. On August 4, 2021, in Case No. PUR-2020-00169 ("2020 Rider RGGI Proceeding"), the Commission issued its Order Approving Rate Adjustment Clause ("Rider RGGI Order"), approving Rider RGGI to be effective for usage on and after September 1, 2021.[2]

[1] 5 VAC 5-20-10 *et seq.* (the "Procedural Rules").
[2] *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 e of the Code of Virginia*, Case No PUR-2020-00169, Order Approving Rate Adjustment Clause at 11 (Aug. 4, 2021).

220131693

Subsequently, the Commission suspended the Rider RGGI Order on August 25, 2021 pending consideration of a Petition for Reconsideration or Clarification. On November 17, 2021, by its Order on Reconsideration, the Commission lifted the suspension of the Rider RGGI Order without modification of its initial order. On January 1, 2022, the initial Rider RGGI was implemented, which increased the monthly bill of a residential customer using 1,000 kilowatt-hours per month by approximately $2.39.

2. As set forth in the Company's annual update Application, if approved, the revised Rider RGGI rate would become effective for the rate year commencing September 1, 2022 and would increase the monthly bill of a residential customer using 1,000 kilowatt-hours per month by $1.98. Including the increase associated with the annual update, the total Rider RGGI impact on the typical bill of a residential customer would be $4.37.

3. On December 8, 2021, Governor-elect Glenn Youngkin announced that he intends to withdraw Virginia from RGGI.

4. Due to the uncertainty surrounding the timeline for the Commonwealth's participation in RGGI, as well as the compliance requirements and associated costs for the September 1, 2022 through August 31, 2023 rate year, Dominion Energy Virginia seeks leave to withdraw its Rider RGGI update Application without prejudice. The Company intends to file a new update application to recover its actual and projected RGGI compliance costs informed by these developments at the appropriate time.

5. Good cause exists for the Commission to grant this Motion and allow the Company to withdraw the Application. By granting the Motion, the existing Rider RGGI rate will remain in place to recover past compliance costs already incurred, subject to future true-up, and the Company will be able to better estimate its future compliance costs once the timeline for

the Commonwealth's RGGI participation is more certain. In turn, customers will benefit to the extent they will not bear the burden of increased near-term compliance costs that may not materialize. In the meantime, the Company will continue to meet its compliance obligations under RGGI until the withdrawal is effective.

6. Counsel for the Company has notified Commission Staff of its intention to file this Motion and has been authorized to represent that Staff takes no position on the requested relief.

WHEREFORE, for the reasons set forth in this Motion, the Company respectfully requests that the Commission (i) grant leave for the Company to withdraw the Application without prejudice and deem such Application withdrawn; and (ii) grant such other relief as the Commission deems necessary and appropriate.

Respectfully submitted,

By: */s/ Elaine S. Ryan*

220401027

PETITION OF

VIRGINIA ELECTRIC AND POWER COMPANY

CASE NO. PUR-2021-00281

For approval of a rate adjustment clause,
designated Rider RGGI, under
§ 56-585.1 A 5 e of the Code of Virginia

ORDER GRANTING MOTION

On December 6, 2021, Virginia Electric and Power Company ("Dominion" or "Company") filed with the State Corporation Commission ("Commission") an annual update of the Company's rate adjustment clause, Rider RGGI ("Petition"), pursuant to § 56-585.1 A 5 e of the Code of Virginia. Through its Petition, Dominion seeks to recover projected and actual costs related to the purchase of allowances through the Regional Greenhouse Gas Initiative ("RGGI") market-based trading program for carbon dioxide emissions.[1]

On January 10, 2022, the Company filed a Motion to Withdraw Application ("Motion"), in which the Company requested to withdraw its Petition, without prejudice. The Company's Motion explains that on August 4, 2021, in Case No. PUR-2020-00169, the Commission approved a rate adjustment clause, designated Rider RGGI, for Dominion to recover costs associated with the Company's purchase of RGGI allowances.[2] Further, the Motion states that on January 1, 2022, the Company implemented its initial Rider RGGI, which increased the

[1] Petition at 1.

[2] *Petition of Virginia Electric and Power Company For approval of a rate adjustment clause, designated Rider RGGI, under § 56-585.1 A 5 of the Code of Virginia*, Case No. PUR-2020-00169, Order Approving Rate Adjustment Clause (Aug. 4, 2021).

220057007

monthly bill of a residential customer using 1,000 kilowatt-hours per month by approximately $2.39.

In support of its Motion, the Company states that the December 8, 2021 announcement by then-Governor-elect Glenn Youngkin that he intended to withdraw Virginia from RGGI created uncertainty around the timeline for Virginia's participation in RGGI, as well as the compliance requirements and associated costs for the September 1, 2022 through August 31, 2023 rate year.[3] The Company states that it "intends to file a new update application to recover its actual and projected RGGI compliance costs informed by these developments at the appropriate time."[4] The Company also states that it will continue to meet its RGGI compliance obligations until any withdrawal is effective.[5]

On January 28, 2022, the Office of the Attorney General, Division of Consumer Counsel ("Consumer Counsel") filed a response to the Motion ("Response"). Consumer Counsel stated that it did not oppose the Company's request to withdraw its Petition, but stated that "[f]or customers to truly benefit from the voluntary motion to withdraw, Consumer Counsel urges the Company to confirm, and the Commission to order, that customers will not be asked to bear the burden of any additional carrying costs in a future true-up to Rider RGGI as a result of the Company's withdrawal of the [P]etition."[6]

On February 11, 2022, the Company filed a letter reply ("Reply") to Consumer Counsel's Response. The Company states, "To the extent that the Company incurs incremental financing

---

[3] Motion at 2.

[4] *Id.*

[5] *Id.* at 3.

[6] Consumer Counsel Response at 2-3.

costs due to the voluntary withdrawal of the Update Application, the Company would agree to waive recovery of such costs from customers in a future true-up of Rider RGGI."[7]

NOW THE COMMISSION, upon consideration of this matter, is of the opinion and finds that Dominion's Motion should be granted, as set forth below.

Accordingly, IT IS ORDERED THAT:

(1) This matter is docketed and assigned Case No. PUR-2021-00281.

(2) Dominion's Motion to Withdraw Application is granted without prejudice as set forth herein.

(3) On or about July 1, 2022, the Company shall file a status update on Rider RGGI, including the following: the then current under-/over-recovery position; the projected under-/over-recovery position as of December 31, 2022 and October 31, 2023; and shall include any motion to continue the currently-approved Rider RGGI subject to further review and true-up in the update proceeding ordered below.

(4) To the extent that the Company incurs incremental financing costs due to the voluntary withdrawal of the Petition, the Company shall waive recovery of such costs from customers in future true-ups of Rider RGGI.

(5) On or before January 1, 2023, Dominion shall file with the Commission an update to Rider RGGI in accordance with the Commission's Order Approving Rate Adjustment Clause in Case No. PUR-2020-00169 and § 56-585.1 A 5 e of the Code of Virginia.

(6) This matter is continued.

[7] Company Reply at 2.

APPLICATION OF

APPALACHIAN POWER COMPANY

CASE NO. PUR-2022-00139

To increase its fuel factor pursuant to
§ 56-249.6 of the Code of Virginia

ORDER ESTABLISHING 2022-2023 FUEL FACTOR

On September 15, 2022, Appalachian Power Company ("APCo" or "Company") filed with the State Corporation Commission ("Commission") an application ("Application") pursuant to § 56-249.6 of the Code of Virginia ("Code") seeking to increase its fuel factor. The Company proposes to increase the current fuel factor of 2.300 cents per kilowatt-hour ("¢/kWh") to 4.319¢/kWh, effective for service rendered November 1, 2022, through October 31, 2023 ("Fuel Year").[1] To mitigate its requested rate increase, the Company is proposing to recover its deferred fuel balance as of October 31, 2022, over two fuel years.[2] In addition, APCo seeks Commission approval to establish a new rider, designated Rider DFCC. The Company states that it proposes to implement Rider DFCC at a zero rate, to be updated and trued-up in the future, as an alternative to the recovery of the carrying costs on its deferred fuel balance through base rates.[3]

[1] Ex. 2 (Application) at 1, 6.

[2] *Id.* at 1.

[3] *Id.*

The Company's proposed fuel factor consists of both an in-period component and a prior-period component.[4] APCo's proposed in-period component is designed to recover its estimated Virginia jurisdictional fuel expenses during the Fuel Year of approximately $416,140,161, which includes non-incremental costs associated with APCo's Beech Ridge and Grand Ridge wind contracts; the energy components of the Company's other wind and solar resources; a credit for 75% of projected Off-System Sales ("OSS") margins; PJM Interconnection, L.L.C. ("PJM"), Load Serving Entity transmission losses; PJM congestion charges; 100% of incremental transmission line loss margins; and Financial Transmission Right revenues.[5] The Company proposes an in-period factor component of 3.011¢/kWh.[6]

The prior-period component is a true-up component designed to recover from customers over a two-year period an estimated under-recovered deferred fuel balance as of October 31, 2022, of $361,411,867, or $180,705,934 per year.[7] The Company states that it divided the projected deferred fuel cost balance by the projected Virginia jurisdictional energy sales for the Fuel Year to obtain the prior-period under-recovery component of 1.308¢/kWh.[8]

The Company represents that the combined impact of the Company's proposed fuel factor over the Fuel Year is an annual revenue increase of approximately $279 million.[9] APCo

[7] *Id.* at 6.

[8] *Id.*

[9] Ex. 2 (Application) at 1.

maintains that this proposal would increase the monthly bill of a residential customer using 1,000 kWh of electricity by $20.17.[10]

On October 6, 2022, the Commission entered an Order Establishing 2022-2023 Fuel Factor Proceeding that, among other things, (i) stated "the Company may place its proposed fuel factor into effect on an interim basis for service rendered on and after November 1, 2022;" (ii) scheduled a telephonic hearing for December 13, 2022, to receive the testimony of public witnesses; (iii) scheduled an in-person public evidentiary hearing for December 14, 2022; (iv) directed the Company to provide notice to the public; (v) provided interested persons an opportunity to comment on the Company's Application or to participate as a respondent; and (vi) appointed a Hearing Examiner to conduct all further proceedings in this matter on behalf of the Commission and to file a final report.

The following parties filed notices of participation: Steel Dynamics, Inc. ("SDI"); the Old Dominion Committee for Fair Utility Rates ("Old Dominion Committee"); the VML/VACo APCo Steering Committee ("Steering Committee") and the Office of the Attorney General's Division of Consumer Counsel ("Consumer Counsel"). No respondent filed testimony.

On November 22, 2022, the Commission's Staff ("Staff") filed its direct testimony. On December 1, 2022, APCo filed rebuttal testimony. On December 13, 2022, the Hearing Examiner appointed by the Commission convened the public witness hearing.[11] On December 14, 2022, the Hearing Examiner convened the evidentiary hearing, as scheduled. APCo, SDI, the Steering Committee, the Old Dominion Committee, Consumer Counsel, and Staff participated at the hearing.

---

[10] Ex. 8 (Castle Direct) at 7.

[11] Numerous public comments were also filed opposing APCo's proposed increase to the fuel factor.

On January 18, 2023, the Report of M. Renae Carter, Hearing Examiner ("Report") was issued. The Company, the Steering Committee, the Old Dominion Committee, Consumer Counsel, and Staff subsequently filed comments on the Report.

NOW THE COMMISSION, upon consideration of this matter, is of the opinion and finds as follows.

Code of Virginia

The Company filed its Application pursuant to Code § 56-249.6, which provides in part as follows:

> A.1. Each electric utility . . . shall submit to the Commission its estimate of fuel costs, including the cost of purchased power, for the 12-month period beginning on the date prescribed by the Commission. Upon investigation of such estimates and hearings in accordance with law, the Commission shall direct each company to place in effect tariff provisions designed to recover the fuel costs determined by the Commission to be appropriate for that period, adjusted for any over-recovery or under-recovery of fuel costs previously incurred.
>
> 2. The Commission shall continuously review fuel costs and if it finds that any utility described in subdivision A 1 is in an over-recovery position by more than five percent, or likely to be so, it may reduce the fuel cost tariffs to correct the over-recovery.
>
> 3. Beginning July 1, 2009, . . ., if the Commission approves any increase in fuel factor charges pursuant to this section that would increase the total rates of the residential class of customers of any such utility by more than 20 percent, the Commission, within six months following the effective date of such increase, shall review fuel costs, and if the Commission finds that the utility is, or is likely to be, in an over-recovery position with respect to fuel costs for the 12-month period for which the increase in fuel factor charges was approved by more than five percent, it may reduce the utility's fuel cost tariffs to correct the over-recovery. . . .
>
> D. In proceedings under subsections A and C:
>
> 1. Energy revenues associated with off-system sales of power shall be credited against fuel factor expenses in an amount equal to the

2019-00082

> total incremental fuel factor costs incurred in the production and delivery of such sales. In addition, 75 percent of the total annual margins from off-system sales shall be credited against fuel factor expenses; . . . . For purposes of this subsection, "margins from off-system sales" shall mean the total revenues received from off-system sales transactions less the total incremental costs incurred; and
>
> 2. The Commission shall disallow recovery of any fuel costs that it finds without just cause to be the result of failure of the utility to make every reasonable effort to minimize fuel costs or any decision of the utility resulting in unreasonable fuel costs, giving due regard to reliability of service and the need to maintain reliable sources of supply, economical generation mix, generating experience of comparable facilities, and minimization of the total cost of providing service.

Mitigation Proposal

APCo presents a Mitigation Proposal in this case to moderate the impact of the rate increase on customers. Specifically, APCo proposes to recover its significant under-recovery balance of approximately $361.4 million over two years.[12] As described by Consumer Counsel, the Mitigation Proposal "takes what would be a $33 per month bill increase and reduces it to a[n] increase of $20 per month."[13] In consideration of the magnitude of the increase in this case, the Commission approves the Mitigation Proposal which has been in effect on an interim basis.[14]

Off-System Sales Credits

We further note that pursuant to Code § 56-249.6 D I, the Commission is permitted to credit, at most, 75% of the Company's estimated total annual margins from OSS against fuel

[14] With respect to APCo's request for approval of Rider DFCC to recover carrying costs associated with the deferred fuel balance, we agree with the Hearing Examiner that it should be denied in this limited-issue fuel factor proceeding, without prejudice for the Company to renew its request in a future general rate case such as the Company's next Triennial Review. Report at 24-26, 32.

factor expenses for the benefit of ratepayers. In this proceeding, we have utilized the maximum credit allowed by law – 75% of projected OSS margins – to reduce the fuel rates paid by APCo's Virginia customers.

Fuel Factor

Even with the impacts of the Mitigation Proposal and the OSS credit, we are deeply concerned about the significant rate increase requested in this case, and its impact on customer bills. The impact of the increase is worsened by its introduction during the winter months, which are typically higher usage months, and by other recent APCo rate increases.[15] We are mindful of the numerous public comments and concerns expressed about the impact of such rate increases on APCo's customers and have reviewed this matter carefully. APCo is, however, entitled by law to recover its prudently incurred fuel costs under Code § 56-249.6.[16] The price of fuel that the Company must purchase to generate electricity and that of purchased power have risen significantly. As a result, the Company has materially under-recovered its fuel costs over the last year and its forecasted costs for the coming year have risen markedly. While parties noted

[15] As a result of APCo's appeal of the Commission's decision in APCo's 2020 triennial review and subsequent remand by the Supreme Court of Virginia, APCo's base rates have also increased. In its Order on Remand, the Commission reduced the annual rate increase initially requested by APCo in its remand filing that had been in effect on an interim basis since October 1, 2022. *See Application of Appalachian Power Company, For a 2020 triennial review of its bae rates, terms and conditions pursuant to § 56-585.1 of the Code of Virginia*, Case No. PUR-2020-00015, Doc. Con. Cen. No. 221230186, Order on Remand (Dec. 21, 2022).

[16] *See, e.g., Commonwealth of Virginia, ex rel. State Corp. Commission, Ex Parte: In the matter of establishing Commission policy regarding rate treatment of purchased power capacity charges by electric utilities and cooperatives*, Case No. PUE-1988-00052, 1988 S.C.C. Ann. Rept. 346, 347 (Nov. 10, 1988) (describing the "fuel factor" as "a statutory adjustment mechanism through which all prudently incurred energy costs are recovered, dollar for dollar"). *See also Application of Kentucky Utilities Company t/a Old Dominion Power Company, To revise its fuel factor pursuant to Virginia Code § 56-249.6*, Case No. PUE-1994-00043, 1995 S.C.C. Ann. Rept. 309, 310, Order Establishing 1994/95 Fuel Factor (Jan. 6, 1995) ("Kentucky Utilities Order") (describing that the "fuel factor mechanism . . . gives the Company dollar for dollar recovery for allowable fuel expenses"); *Application of Virginia Electric and Power Company, To revise its fuel factor pursuant to Va. Code § 56-249.6*, Case No. PUE-2008-00039, 2008 S.C.C. Ann. Rept. 533, 534, Order Establishing Fuel Factor (June 27, 2008) ("the fuel factor permits dollar for dollar recovery of prudently incurred fuel costs") (emphasis in original).

concerns with the amount of the proposed increase and its impact on customers, no party or Staff raised issues with the Company's forecasts.[17]

In consideration of this matter, we adopt the findings set forth in the Hearing Examiner's Report, except as modified herein, and find that a revised total fuel factor of 4.319¢/kWh, consisting of an in-period period factor of 3.011¢/kWh and a prior period factor of 1.308¢/kWh is approved for usage on and after November 1, 2022. We note that this is the same total fuel factor that the Company placed into effect on an interim basis for usage on and after November 1, 2022, and therefore, will not result in an additional increase at this time.

In granting this approval, the Commission notes its awareness of the ongoing rise in gas prices, inflation, and other economic pressures that are impacting all utility customers. We are sensitive to the effects of rate increases, especially in times such as these. The Commission, however, must follow the laws applicable to this case, as well as the findings of fact supported by the evidence in the record. This is what we have done herein.

Fuel Audit & Coal Procurement Practices

As explained in prior cases, approval of the fuel factor herein does not represent ultimate approval of the Company's fuel expenses. This approval is based in part upon the Company's estimate of future fuel expenses yet to be incurred. An audit and investigation of the Company's actual booked fuel expenses and OSS margins, among other things, will be conducted by the Staff after the close of the fuel year. The Commission subsequently determines what are, in fact, prudent and, therefore, allowable fuel expenses, as well as the Company's recovery position at the end of the audit period. The Commission has previously described this review as follows:

[17] Report at 22.

2023-00159

> Should the Commission find in its Final Audit Order (1) that any component of the Company's actual fuel expenses or credits has been inappropriately included or excluded, or (2) that the Company has failed to make every reasonable effort to minimize fuel cost or has made decisions resulting in unreasonable fuel cost, the Company's recovery position will be adjusted. This adjustment will be reflected in the recovery position of the Company's next fuel factor. We reiterate that no finding in this order is final, as this matter is continued generally, pending Staff's audit of actual fuel expenses.[18]

Accordingly, no finding in this Order Establishing Fuel Factor is final, as this matter is continued generally, pending audit and investigation of the Company's actual fuel expenses.

The parties and Staff reference an investigation by the West Virginia Public Service Commission into APCo's coal fuel procurement activities related to the Company's Amos and Mountaineer plants which are used in part to serve APCo's Virginia customers. Every party except the Company asked the Commission to undertake a similar investigation, or at a minimum, monitor the proceeding in West Virginia and undertake an investigation if the West Virginia Public Service Commission finds that improper action on APCo's part has driven up the cost of fuel.[19]

We find that Staff should forthwith commence its fuel audit of the January 1, 2019 to December 31, 2022 period.[20] In so finding, we stress that no party to this case, nor Staff, has asserted or concluded that APCo has acted imprudently in its procurement of coal. Rather, we agree with the Hearing Examiner that a review of the reasonableness of APCo's coal

---

[18] Kentucky Utilities Order, 1995 S.C.C. Ann. Rept. at 311.

[19] *See, e.g.,* Report at 27 (citing statements by counsel for SDI, the Steering Committee, the Old Dominion Committee and Consumer Counsel).

[20] In its comments on the Hearing Examiner's Report, Staff indicated that it is capable of conducting such an audit and including the results of the audit in APCo's 2023 Fuel Factor proceeding. Staff Comments on the Hearing Examiner's Report at 1.

procurement practices is appropriate under the circumstances and is consistent with the law and with Commission practice.[21] Specifically, such audit should include a focus on whether APCo has made "every reasonable effort to minimize fuel costs or [has made] any decision[s] . . . resulting in unreasonable fuel costs" consistent with the requirements of Code § 56-249.6 D 2.

As part of its fuel audit, Staff shall investigate and report on, at a minimum, the following with respect to APCo's coal procurement activities, as recommended by the Hearing Examiner:[22]

- Whether APCo complied with its Regulated Fuel Procurement Policy and Procedures Manual;
- The timing and adequacy of APCo's response to market turmoil in mid-2021;
- APCo's actions to obtain performance by contractors with whom APCo had coal supply agreements;
- APCo's ability to maintain coal inventories at minimum target levels; and
- If APCo had the ability to maintain the minimum target levels of coal inventory, what additional generation would have been available to APCo.

Staff shall include the results of such fuel audit in its prefiled testimony in APCo's next fuel factor proceeding.[23]

Further in this regard, for informational purposes, we direct APCo to file in this docket copies of any orders issued by the West Virginia Public Service Commission concerning its investigation of APCo's coal procurement practices[24] and address the status, including any decisions of the West Virginia Public Service Commission, in APCo's next fuel factor

---

[21] *See, e.g.*, Report at 29-30.

[22] *Id.* at 30.

[23] In addition, Staff shall file a copy of such audit report in the docket(s) in which the fuel factor for the applicable audit period was originally approved.

[24] Such proceedings include Case Nos. 21-0339-E-ENEC, 22-0393-E-ENEC and any related dockets.

application. Staff should also monitor these proceedings and report on developments when Staff files testimony in APCo's next fuel factor proceeding.

Information on Payment Assistance

The Commission reiterates its concern regarding the impacts of this significant rate increase on customers. We agree with the Hearing Examiner that APCo should take additional steps to advise its customers of opportunities for payment assistance.[25] We direct APCo, within 60 days from the date of this Order, to remind customers how they may contact the Company for bill assistance and to set up budget billing for their accounts. Such reminder should be provided through social media as well as at least one non-social media outlet such as bill stuffers or a newsletter to reach customers that prefer not to use social media or do not have internet access. APCo shall confirm such reminder has been completed through a filing with the Commission in this docket no later than 70 days following entry of this Order.

Staff to Monitor Deferred Fuel Balance

Finally, we direct the Staff to monitor the Company's fuel cost recovery on a monthly basis. If the Staff finds evidence of a change in the recovery balance that permits the Commission, pursuant to Code § 56-249.6 A 2, to adjust the fuel factor downward during the current period, we will review the matter to determine whether fuel rates should be decreased.

Accordingly, IT IS ORDERED THAT:

(1) The findings and recommendations contained in the Hearing Examiner's Report are adopted except as modified herein.

(2) The Company's fuel factor shall be 4.319¢ per kWh effective for service rendered on and after November 1, 2022.

---

[25] Report at 32.

(3) The Company shall comply with the directives set forth in this Order.

(4) Staff shall forthwith commence its audit of the January 1, 2019 to December 31, 2022 period as further described herein.

(5) Staff shall monitor the Company's fuel cost recovery on a monthly basis and shall notify the Commission if there is evidence of a change in the recovery balance that permits the Commission, pursuant to Code § 56-249.6 A 2, to reduce the fuel factor during the current period.

(6) This matter is continued.

Commissioner Patricia L. West participated in this matter.

A COPY hereof shall be sent electronically by the Clerk of the Commission to all persons on the official Service List in this matter. The Service List is available from the Clerk of the Commission.

PETITION OF

APPALACHIAN POWER COMPANY

For approval of a rate adjustment clause, the E-RAC, for costs to comply with state and federal environmental regulations pursuant to § 56-585.1 A 5 e of the Code of Virginia

CASE NO. PUR-2022-00001

FINAL ORDER

On March 18, 2022, pursuant to Code § 56-585.1 A 5 e, Appalachian Power Company ("APCo") filed with the State Corporation Commission ("Commission") a petition ("Petition") for approval to recover costs through its existing rate adjustment clause (the "E-RAC") related to capital investments and operations and maintenance compliance expenses that, according to APCo, are necessary to comply with state and federal environmental regulations.[1]

On April 21, 2022, the Commission issued an Order for Notice and Hearing that, among other things: docketed the Petition; required service and public notice thereof; granted certain waivers requested by APCo; directed the Commission's Staff ("Staff") to investigate the Petition and to file testimony containing the results of Staff's investigation; provided interested persons opportunities to participate in this proceeding; scheduled an evidentiary hearing; and appointed a Hearing Examiner to conduct all further proceedings on behalf of the Commission.

[1] APCo completed its filing on March 31, 2022, by submitting its Schedule 3 - Capital Structure and Cost of Capital Statement. The Commission's final order in this matter is due within eight (8) months from that date, or by November 30, 2022. Code § 56-585.1 A 7.

The following filed notices of participation: Sierra Club; West Virginia Coal Association, Inc.; Appalachian Voices; and the Office of the Attorney General's Division of Consumer Counsel ("Consumer Counsel").

On September 21, 2022, the evidentiary hearing was convened before Commission Hearing Examiner D. Mathias Roussy, Jr., in the Commission's courtroom. The Hearing Examiner issued his Report in this matter on October 18, 2022 ("Report"). On November 1, 2022, comments on the Report were filed by: APCo; Sierra Club; Appalachian Voices; Consumer Counsel; and Staff.

NOW THE COMMISSION, upon consideration of this matter, is of the opinion and finds as follows.[2]

After analyzing the law and weighing the evidence – and providing a thorough and detailed analysis thereof – the Hearing Examiner made the following recommendations:[3]

> Accordingly, **I RECOMMEND** that the Commission enter an order that:
>
> (1) ***APPROVES*** an approximately $21 million [Effluent Limitation Guidelines ("ELG")] investment in Mountaineer, and an approximately $63.5 million ELG investment in Amos, subject to the condition that APCo not seek from Virginia any costs of uneconomic regulatory dispatch (if required by the [West Virginia Public Service Commission]) and the Commission's ability to implement this commitment through rate ring-fencing;
>
> (2) ***DENIES***, without prejudice, the proposed recovery of Amos dry sorbent injection reconfiguration costs;
>
> (3) ***DENIES***, without prejudice, the proposed recovery of approximately $95,000 of 2021 [Regional Greenhouse Gas Initiative] costs;

[2] The Commission has fully considered the evidence and arguments in the record. *See also Board of Supervisors of Loudoun County v. State Corp. Comm'n*, 292 Va. 444, 454 n.10 (2016) ("We note that even in the absence of this representation by the Commission, pursuant to our governing standard of review, the Commission's decision comes to us with a presumption that it considered all of the evidence of record.") (citation omitted).

[3] Report at 82 (emphases in original).

20221222-3012

(4) ***APPROVES*** a $32,890,000 revenue requirement to revise the E-RAC rates for service to be rendered from December 1, 2022, to November 30, 2023;

(5) ***DIRECTS*** APCo, each time it self-schedules Clinch River, to record the hours of each day that Clinch River self-schedules, the associated megawatts that are self-scheduled, and the reason for each self-scheduling;

(6) ***CLARIFIES*** that the E-RAC rates should be incorporated into the balancing charge associated with the non-renewable generation rate adjustment clauses of APCo's Rider WWS;

(7) ***DIRECTS*** APCo to incorporate a depreciation rate analysis of its E-RAC investment in its next depreciation study, including net salvage considerations and any excess/deficient depreciation accruals on such assets through the date of the study; and

(8) ***DISMISSES*** this case.

Upon consideration of the record in this matter, the Commission concludes that the Hearing Examiner's findings and recommendations are supported by law and the evidence, are imbued with a rational basis, and are adopted herein.[4]

Accordingly, IT IS ORDERED THAT:

(1) The Commission adopts the Hearing Examiner's findings and recommendations as set forth herein.

(2) The Hearing Examiner's recommendations, set forth above, are hereby ordered.

(3) The Company forthwith shall file a revised E-RAC and supporting workpapers with the Clerk of the Commission and shall submit the same to the Commission's Divisions of Public Utility Regulation and Utility Accounting and Finance, as is necessary to comply with the directives set forth in this Order. The Clerk of the Commission shall retain such filings for

[4] *See, e.g.*, Report at 48-82.

public inspection in person and on the Commission's website: scc.virginia.gov/pages/Case-Information.

(4) This matter is dismissed.

A COPY hereof shall be sent electronically by the Clerk of the Commission to all persons on the official Service List in this matter. The Service List is available from the Clerk of the Commission.

Re: Petition of Appalachian Power Company for approval of a rate adjustment clause, the E-RAC, for costs to comply with state and federal environmental regulations pursuant to § 56-585.1 A 5 e of the Code of Virginia Case No. PUR-2022-00001

Dear Mr. Logan:

Please find attached for filing the Petition of Appalachian Power Company for approval of a rate adjustment clause under § 56-585.1 A 5 e to recover costs to comply with state and federal environmental regulations. Please note that the Company is requesting in the Petition a waiver of the Commission's Rate Case Rules that would permit it to file one hard copy of certain confidential and/or voluminous materials, as well as electronic copies of these documents on three compact disks, which are being filed simultaneously by hand with the Commission under separate cover. The Company has also made this information available to Staff.

The Company is also simultaneously filing a Motion for Protective Ruling.

Sincerely,

Noelle J. Coates

STATE CORPORATION COMMISSION

PETITION OF

APPALACHIAN POWER COMPANY

for approval of a rate adjustment clause, the E-RAC, for costs to comply with state and federal environmental regulations pursuant to §§ 56-585.1 A 5 e of the Code of Virginia

Case No. PUR-2022-00001

PETITION AND REQUESTS FOR WAIVER

Appalachian Power Company ("Appalachian" or the "Company"), by counsel, pursuant to Section 56-585.1 A 5 (e) of the Code of Virginia (the "E-RAC Statute") respectfully petitions the State Corporation Commission (the "Commission") for approval to recover costs through its existing rate adjustment clause (the "E-RAC"), related to capital investments and operations and maintenance ("O&M") compliance expenses that are necessary to comply with state and federal environmental regulations. In support of this Petition, the Company respectfully states as follows.

1. Overview and Background

Appalachian is a Virginia public service corporation serving approximately 524,000 customers in Virginia and maintaining an office at 1051 East Cary Street, Suite 1100, Richmond, Virginia 23219. The Company is an incumbent electric utility as defined in Section 56-576 of the Virginia Electric Utility Regulation Act. The contact information for Appalachian's attorneys is stated at the end of the Petition.

With this Petition, the Company is requesting the Commission's approval to recover on a timely basis through its existing E-RAC, which the Commission initially approved in 2021[1]

[1] Order Granting Rate Adjustment Clause, *Petition of Appalachian Power Company For approval of a rate adjustment clause, the E-RAC, for costs to comply with state and federal*

E220290

pursuant to the E-RAC Statute, actual and projected costs to comply with state and federal environmental laws and regulations applicable to generation facilities used to serve the Company's load obligations. Specifically, the Company seeks to recover a revenue requirement $33.6 million during the Rate Year of December 1, 2022 through November 30, 2023 through the E-RAC. This amount, detailed by Company witness Castle, is comprised of the following:

- Actual and projected capital investment incurred to comply with the EPA's Coal Combustion Residuals Rule ("CCR Rule") at the Company's Amos and Mountaineer Plants (the "Plants"), the recovery of which the Commission approved in the 2021 E-RAC Order;
- Actual and projected capital investment incurred to comply with the EPA's Steam Electric Effluent Limitation Guidelines ("ELG Rule") at the Plants (the "ELG Projects"), the recovery of which the Commission denied without prejudice in the 2021 Order (the "ELG Project Costs"), including those incurred up to August 2021 (the "Prerequisite ELG Project Costs");
- New capital investments related to dissolved oxygen levels at the hydroelectric generating units at the Company's Claytor Hydro Project ("Claytor") and the dry sorbent injection system at Amos;
- Actual and projected costs to comply with the regulation that established Virginia as a member of the Regional Greenhouse Gas Initiative ("RGGI") associated with the dispatch of the Company's gas-fired Clinch River Plant, which is located in Carbo, Virginia; and
- Actual and projected Operations and Maintenance ("O&M") compliance costs incurred in complying with State Solid Waste regulation, the National Pollution Discharge Elimination System, and provisions of the Clean Water Act at Appalachian's generation units (the "O&M Compliance Expenses"), the recovery of which the Commission approved in the 2021 E-RAC Order.

2. Procedural History

The Company filed for approval in December 2020 to recover the O&M Compliance Expenses, and costs associated with compliance with the CCR Rule and the ELG Rule at the Plants. In the 2021 E-RAC Order, the Commission approved recovery of the O&M Compliance Expenses and the costs to comply with the CCR Rule, which enabled the Plants to continue to

---

environmental regulations pursuant to § 56-585.1 A 5 e of the Code of Virginia, Case No. PUR-2020-00258, Doc. Con. Cen. No. 210830184 (August 23, 2021) ("2021 E-RAC Order").

220328081

operate for the benefit of Virginia customers. But the Commission denied the costs to comply with the ELG Rule, which is necessary for the Plants to operate past 2028, concluding that Appalachian had "not met its burden of proving the reasonableness and prudence of the proposed ELG investment costs," including the Prerequisite ELG Project Costs.[2] The Commission held that it was "critically important to analyze the overall impact of this investment on both customer rates and reliability," and concluded that Appalachian should be permitted to provide additional analyses and evidence to support the ELG investment, "should APCo conclude circumstances so warrant."

On December 23, 2020, Appalachian also filed a petition with the Public Service Commission of West Virginia ("WVPSC") seeking certificates of convenience and necessity authorizing both the CCR and ELG projects at the Plants, as well as a cost recovery mechanism.[3] The WVPSC approved the requests on August 4, 2021, concluding that the CCR and ELG Projects at the Plants were "prudent, cost effective, and in the best interest of the current and future utility customers."[4] On October 12, 2021, the WVPSC issued another order that confirmed its earlier decision, stating that, due to the 2021 E-RAC Order, "after 2028 West Virginia customers will receive the full capacity and energy capabilities of" the Plants."[5] That

[2] 2021 E-RAC Order at 12.

[3] The petition before the WV PSC also concerned the Mitchell Plant, which does not serve customers in Virginia and thus is not at issue in proceedings before this Commission.

[4] Commission Order at 16, *Application of Appalachian Power Company and Wheeling Power Company, public utilities, for a certificate of public convenience and necessity for the internal modifications at coal fired generating plants necessary to comply with federal environmental regulations and surcharge*, Case No. 20-1040-E-CN (WVPSC, Aug. 4, 2021).

[5] Commission Order at 7, *Application of Appalachian Power Company and Wheeling Power Company, public utilities, for a certificate of public convenience and necessity for the internal modifications at coal fired generating plants necessary to comply with federal environmental regulations and surcharge*, Case No. 20-1040-E-CN (WVPSC, Oct. 12, 2021).

220230001

is: "Given [the 2021 E-RAC Order], Virginia...jurisdictional customers should receive no capacity or energy from the Plants after 2028."[6]

As the Plants will continue to operate past 2028, no matter how the Commission rules on this Petition, the Company concluded that circumstances warrant re-filing its request to recover the costs of the ELG Projects in accordance with the 2021 E-RAC Order. With this Petition, the Company provides a more robust record of the benefits realized, including the impacts of the investments on customer rates and reliability, by keeping the Plants available to serve its Virginia customers.

3. WITNESSES IN SUPPORT OF THE PETITION

The following witnesses testify in support of the Petition:

- **Christian T. Beam**, President and Chief Operating Officer at Appalachian. Mr. Beam describes the outcome of the CCR/ELG proceeding before the WVPSC and how it led Appalachian to make another request for ELG investment cost recovery from APCo's Virginia customers; explains the practical impact of the WVPSC's Order on Virginia customers; and sets out the options available to the Commission and the potential costs that Virginia customers would face if the Commission again denies ELG investment cost recovery from Appalachian's Virginia customers.

- **James F. Martin**, Director of Resource Planning Strategy for American Electric Power Service Corporation ("AEPSC"). Mr. Martin sponsors an economic analysis that he performed for and provided to the Company's management that compares the forecasted Virginia jurisdictional cost of service effects of a scenario in which the costs, energy, and capacity of the Plants continue to benefit Virginia customers after 2028 to scenarios in which they do not. Mr. Martin also explains the importance of the Company's PJM capacity requirement, and how PJM computes capacity credit for the primary alternative resource options that could replace the Plants. He discusses the impact of the Virginia Clean Economy Act ("VCEA") on the evaluation of the merits of the ELG investment, and on the value of continued operation of the Plants in general. Mr. Martin also discusses RGGI compliance at Clinch River.

- **Brian D. Sherrick**, Managing Director of Projects for AEPSC. Mr. Sherrick describes the Plants, and the planning for and status of the CCR/ELG projects. He discusses the costs the CCR/ELG projects, including the reasonableness and prudence of the previously incurred ELG costs. Mr. Sherrick also describes the DSI project at Amos and its cost.

[6] *Id.* at 8.

220328E1

- **Robert A. Gallimore,** Hydroelectric Asset Manager, AEPSC. Mr. Gallimore describes Claytor and the DO project; the costs and current status of the project; and the alternatives that were considered.
- **Gary O. Spitznogle**, Vice President of Environmental Services at AEPSC. Mr. Spitznogle describes the applicable environmental regulations that drive the need and timing for the environmental improvement projects at Appalachian's generation units, and describes the requirements for compliance that result from the WVPSC's orders related to the CCR/ELG projects at the Plants. He outlines the permitting required to install the environmental controls that are the subject of this Petition, and supports the identification of activities undertaken that are required to comply with state and federal environmental laws or regulations applicable to generation facilities used to serve the utility's native load obligations, including the O&M Compliance Expenses as well as new capital investments related to DO levels at Claytor and the DSI system at Amos. Mr. Spitznogle describes RGGI, and how Virginia's participation in RGGI caused the Company to incur costs.
- **Tyler H. Ross,** Director of Regulatory Accounting Services for AEPSC. Mr. Ross reviews the E-RAC over-/under-recovery accounting recorded on the Company's books through December 31, 2021, and provides details of accounting performed to date and proposed recovery and accounting regarding the RGGI costs incurred at Clinch. Mr. Ross provides an overview of costs incurred and forecasted costs related to the ELG Projects at the Plants, to the DSI project at Amos, and to the DO project at Claytor. Finally, Mr. Ross describes the required accounting for costs incurred related to the CCR, ELG, DSI and DO projects.
- **William K. Castle**, Director, Regulatory Services – VA/TN for Appalachian. Mr. Castle provides an overview of the Company's last E-RAC filing. He supports the Virginia jurisdictional revenue requirement of $33.7 million for the E-RAC, and explains the four components of that revenue requirement to be recovered through the Rate Year of December 1, 2022 through November 30, 2023. Mr. Castle explains the allocation factors used to allocate the E-RAC revenue requirement to the Virginia retail jurisdiction and the calculation of the proposed E-RAC rates designed to recover the revenue requirement. Finally, he sponsors the proposed E-RAC tariff sheets.

4. The Requests for Approval in this Petition

The E-RAC Statute allows utilities to request the Commission's approval to recover, through a rate adjustment clause, projected and actual costs to "comply with state or federal environmental laws or regulations applicable to generation facilities used to serve the utility's native load obligations." Such a petition should be approved if the Commission "finds that such costs are necessary to comply with such environmental laws or regulations." Va. Code § 56-585.1 A 5 (e).

A. The Environmental Regulations

The costs that Appalachian requests for recovery in this Petition were or will be incurred to comply with the following state or federal environmental laws or regulations, as detailed in Mr. Spitznogle's testimony.

i. The CCR Rule

In 2015, the United States Environmental Protection Agency ("EPA") published a final rule to regulate the disposal of coal combustion residuals, the CCR Rule, which includes fly ash, bottom ash, and gypsum that may be generated at coal-fired electric generating units. The CCR Rule applies to new and existing CCR landfills and CCR surface impoundments (ponds) at operating coal-based electric generating facilities. Recent revisions to the CCR Rule require that unlined CCR storage ponds must cease operations and initiate closure by April 11, 2021. The EPA can extend the compliance date for the Plants to as late as October 15, 2023.[7]

ii. The ELG Rule

The Steam Electric Effluent Limitations Guidelines, the ELG Rule, establishes discharge limits on flue gas desulfurization wastewater, fly ash and bottom ash transport water, and flue gas mercury control wastewater. Recent revisions to the ELG Rule establish discharge limits that must be achieved as soon as possible between October 13, 2021 and December 31, 2025 based on the renewal of the existing wastewater discharge permit for the facility.

iii. Dissolved Oxygen Requirements

The dissolved oxygen requirements at Claytor were issued by the Federal Energy Regulatory Commission ("FERC") and are designed to improve low dissolved oxygen conditions in accordance with Virginia Department of Water Quality ("DEQ") requirements.

[7] The Company's request for an extension is still pending, as Mr. Spitznogle explains.

2023-00159

iv. Cross-State Air Pollution Rule

Appalachian installed the DSI system at Amos to mitigate emissions of SO_3 that result from the operation of the Selective Catalytic Reduction ("SCR") and Flue Gas Desulfurization ("FGD") systems in tandem. Appalachian installed the SCR and FGD systems to comply with what is now the Cross-State Air Pollution Rule, as well as a consent decree with the EPA and others.

v. RGGI

In 2020, the Virginia General Assembly amended the Clean Energy and Community Flood and Preparedness Act to direct the Virginia DEQ to adopt regulations to establish a cap-and-trade program for carbon dioxide emissions to comply with the RGGI Model Rule. Those regulations became effective in July 2020, and are applicable to Clinch River, which is the Company's only fossil-fuel fired generation facility in the Commonwealth.

vi. Other Applicable Environmental Regulations

The other applicable environmental regulations for which the O&M Compliance Expenses were incurred are provided in APCo Exhibit No. ____ (GOS), Schedule 1, sponsored by Company witness Spitznogle.

5. The Requested Revenue Requirement and Rate Impact

The Company requests the Commission's approval to recover a total revenue requirement of $33.6 million during the Rate Year. Specifically, the Company seeks to recover:

- A Forecast Rate Year Component of $29.6 million
- A Forecast AFUDC Revenue Component of $4.3 million
- A True-up Revenue Component of ($0.5 million)
- An Actual Revenue Component of $0.2 million

Mr. Castle describes these components in greater detail in his testimony.

220220801

If approved, the revenue requirement would be an increase of $6.2 million over that approved in the 2021 E-RAC Order. Appalachian estimates that implementing this revenue requirement would increase a residential customer's monthly bill, based on 1,000 kWh usage per month, by $0.80, or 0.6% when compared to rates effective December 1, 2021.

As described by Mr. Castle, the Company seeks to recover the revenue requirement by allocating costs to the Virginia jurisdiction consistent with the methodology proposed by the Company and adopted by the Commission in the 2021 E-RAC proceeding.

6. Compliance with the 2021 E-RAC Order

The Commission and Senior Hearing Examiner Berkebile concluded that the record in the 2021 E-RAC proceeding was deficient. In this Petition, the Company has attempted to address these deficiencies as follows, with some adjustments given that the Plants will still operate past 2028 regardless of the outcome of this Petition:

- The overall impact of the ELG investment on customer rates is discussed by Mr. Castle, and Mr. Martin's analysis focuses on the impact on Virginia customer rates, should ELG cost recovery be denied.
- The reasonableness and prudence of the Prerequisite ELG Project Costs is discussed by Company witnesses Spitznogle and Sherrick.
- The reasonableness and prudence of the ELG costs from an economic or resource adequacy perspective is discussed by Mr. Martin.
- The impacts of the VCEA on the ELG investment are discussed by Mr. Beam and Mr. Martin.
- The potential stranded costs are discussed by Mr. Ross.
- Mr. Ross sponsors the depreciation costs that would be the responsibility of Appalachian's Virginia customers if they no longer benefitted from the Plants after 2028.
- A detailed analysis of potential transmission cost impacts associated with retiring the Plants in 2028 is not provided because, as Mr. Martin recounts, the Plants will not retire in 2028 and thus there will be no resultant transmission cost impacts. Similarly, the Company did not assess the overall impact of the ELG investment on reliability, because the Plants will continue to operate after 2028.

2021-00236

7. The Reasonableness and Prudence of the Requests

A. The CCR/ELG Projects

The testimony supporting this Petition demonstrates that the CCR and ELG Projects are the most reasonable and prudent means of meeting Appalachian's obligations to its Virginia customers.

As detailed in the 2021 E-RAC proceeding, the Company explored multiple alternative compliance strategies and ultimately determined that the Projects, which are described in detail in the testimony and schedules of Mr. Sherrick, were the most reasonable and prudent means of compliance with the CCR and ELG Rules.

As noted above, in the 2021 E-RAC Order, the Commission found that the Company had not met its burden to demonstrate the reasonableness and prudence of the investment in the ELG Projects.[8] Accordingly, in order to demonstrate that recovery of the costs related to the ELG Projects from Virginia customers is reasonable and prudent, Company witness Martin performed an analysis that compared the investment in the ELG Projects at the Plants to scenarios that assumed that the Plants were no longer available to Virginia customers. That analysis demonstrates clearly that continued operation of the Plants, even if they do not run at all, is less expensive and much less risky for Virginia customers than retiring the Plants early and replacing them. If the roughly 2,100 MW (nameplate) Virginia jurisdictional share of capacity of the Plants is available to Virginia customers, the Company will avoid incurring substantial cost, which will be passed along to the Virginia ratepayers, to obtain some other source of capacity to cover the Virginia portion of the PJM capacity obligation.

[8] 2021 E-RAC Order at 12.

As Mr. Martin and Mr. Beam testify:

- The relatively small $98 million jurisdictional share of the ELG investments and continued use of the Plants will be much less expensive than replacing them with billions of dollars of new resources;
- Replacement capacity costing between $3-4 billion would increase customers' rates by an incremental 17-21% in 2029 over what customers paid in 2021;
- In total, between 2029 and 2040, the net cost of service for the replacement resources would be between $2.8 billion and $3.4 billion, compared to the incremental cost of keeping the Plants operating of $1.0 billion; and
- The above is true even if the Plants do not generate a single MWh of electricity after 2029, due to their capacity value.

Mr. Martin also prepared an estimate of how much wind and solar would be needed to replace the Virginia jurisdictional share of the Plants' PJM-accredited capacity. By his estimation, it would take 8,800 MW (nameplate) to be placed in service by 2028 in order to match the capacity that the Plants provide for the benefit of Virginia customers. This is 17.7 times the amount of wind and solar that is required to be added by the VCEA. This massive investment would be costly (as much as $15 billion) and difficult, given the challenges of siting and constructing renewable facilities. Mr. Martin estimates that the cost of such a portfolio would be four times the incremental cost of keeping the Plants available to Virginia customers through 2040.

In addition to imposing great expense and uncertainty on Virginia customers, the Commission's denial of cost recovery for the ELG investment from Virginia customers would create a practical and regulatory conundrum, as Mr. Beam explains. Appalachian would have to find a way to replace the energy and capacity that the Plants currently provide to its Virginia customers, and, as the Plants will continue to operate past 2028, an equitable – but complicated - arrangement could be made in which Virginia customers compensate West Virginia customers for the capacity provided by the Plants. As Mr. Martin's analysis demonstrates, the other options for replacement capacity are significantly more expensive and uncertain. For replacement

2022-00328-P

energy to serve its Virginia customers, Appalachian could purchase replacement energy from PJM, which would expose them to more energy market volatility.

Importantly, as energy on the PJM market is overwhelmingly generated from fossil fuels, eschewing the energy generated from the Plants in favor of market energy would not materially advance any clean energy goals. Similarly, as the Plants will continue to provide capacity and energy to Appalachian's West Virginia customers no matter how the Commission rules, denying ELG investment cost recovery from Virginia customers will not result in closing the Plants in 2028.

This Petition is thus supported by compelling evidence that the ELG investments are reasonable and prudent, and that the Commission should approve cost recovery from Appalachian's Virginia customers for the ELG investments, so that customers can continue to benefit from the Plants after 2028.

B. Prerequisite ELG Project Costs

Through August 2021, Appalachian incurred approximately $19.5 million and $12.6 million for the ELG Projects at Amos and Mountaineer, respectively. The costs related to project initiation, technology feasibility studies, evaluation of risk balanced technical options, conceptual engineering, permitting, and site investigations (surveying, verifying as-built conditions, and geotechnical investigations), as Company witness Sherrick describes. Appalachian could not avoid incurring these costs before seeking regulatory approval as they were necessary to establish the projects' scope, schedule, and cost estimate, all of which inform the regulatory proceedings, as well as necessary to meet environmental compliance deadlines. No physical construction related to ELG project activities began at the Plants before August 2021. The costs were therefore reasonable, prudent, and necessary.

C. The DO Project at Claytor

The DO Project at Claytor, which is discussed by Company witnesses Spitznogle and Gallimore, is designed to increase dissolved oxygen in the plant's tailwaters, which will improve the water quality, thus reducing impacts to aquatic organisms and angling opportunities. The DO Project involves the installation of auto-venting turbines ("AVT") in two generating units. AVT is the preferred technology for downstream DO improvement by providing the greatest percentage of increased DO concentration. Appalachian expects that the installation of AVT at Claytor will produce an increase in megawatt output of at least 10% per unit. Accordingly, this project is the best, and most reasonable, solution at the plant.

D. The DSI Modification at Amos

As Mr. Spitznogle describes, Amos is equipped with SCR and FGD systems to reduce NO_x and SO_2. When both are operated together, a small portion of the SO_2 is converted to SO_3, which is an acid gas that can cause visible emissions from the stack. The DSI system mitigates those emissions. When it was first installed, the system used trona, but the Company is modifying the system to use hydrated lime, which will reduce O&M costs. Mr. Sherrick explains that the project will reduce corrosion and improve heat rate and the Equivalent Unplanned Outage Rate. It will also help with the long-term protection of the SCR catalyst, air heaters, and precipitators, all of which demonstrate the reasonableness and prudence of the investment.

E. RGGI Costs Related to Clinch River

Clinch River, a gas-fired plant, is located in Virginia, and thus subject to RGGI compliance costs, which have been deferred to date. Clinch River only dispatches when it is economic to do so compared to the other resources that have been offered into PJM. The total price offered into PJM's energy market for Clinch River includes the cost of RGGI allowances. Thus, any RGGI-related costs are offset by energy revenues, which flow back to customers as

220203801

reductions in fuel expense. Appalachian thus incurs the RGGI costs in order to comply with the law, but manages them in a reasonable and prudent way.

8. Compliance with Rate Case Rules and Requests for Waiver

First, Rate Case Rule 60 requires that applications requiring an overall cost of capital include Schedules 3, 4, 5, and 8. Filing Schedules 3 through 5 and 8, sponsored by Mr. Castle, provide this information. The required components of Schedule 46, established by the Rate Case Rules, are sponsored by Company witnesses and are attached to and/or incorporated into their testimonies, as set out in the Index of Schedule 46 Requirements, which is attached to this Petition as Attachment 1.

Second, the Company provided the Commission notice of its intent to file this Petition, pursuant to Rule 10 A, on October 21, 2021.

Third, the Company requests, pursuant to Rule 20VAC5-204-10.E, that the Commission grant a limited waiver, for good cause shown, of the requirement to file the documents that comprise Schedule 46 in hard copy. Due to the size of some of these documents, as well as the current remote conditions under which many of the parties are working, it would be unduly burdensome and impractical to produce them in hard copy. Further, the supporting documentation is confidential, and as such would not be posted to the Commission's online docket for public review. In lieu of a physical production, consistent with the Commission's *Order for Notice and Comment* in Case No. PUR-2021-00066[9] and *Order Granting Limited Reconsideration* in Case No. PUR-2021-00146,[10] the Company requests a limited waiver of this

[9] Order for Notice and Comment at 12, *Petition of Appalachian Power Company For a prudency review, pursuant to § 56-585.1:4 H of the Code of Virginia, with respect to the purchase of the Amherst Solar Facility*, Case No. PUR-2021-00066, Doc. Con. Cen. No. 211210222 (Dec. 7, 2021).

[10] Order Granting Limited Reconsideration, *Petition of Virginia Electric and Power Company for Approval of the RPS Development Plan, approval and certification of the proposed CE-2 Solar Projects pursuant to §§ 56-580 D and 56-46.1 of the Code of Virginia, revision of rate adjustment clause, designated Rider CE, under § 56-585.1 A 6 of the Code of Virginia, and a prudence determination to*

Rule to permit it to file one hard copy of these confidential documents, accompanied by three compact disks containing electronic versions of the documents. In addition, the Company has made available electronic copies of these documents to the Division of Utility Accounting & Finance and the Division of Public Utility Regulation, and will make them available for review by any respondents in an iManage folder established for this proceeding.

Finally, the Company requests, pursuant to Rule 20VAC5-204-10.E, that the Commission grant a limited and ongoing waiver, for good cause shown, of the requirement to file the documents in future petitions on "any changes in projected costs," and permit the Company instead to file all new or changed contracts supporting E-RAC costs that are worth more than $75,000. The Company selected $75,000 as a reasonable cutoff point that would provide Staff the most significant new and changed contracts. The Company will provide Staff with a list of all contracts under $75,000 and will provide copies of any that Staff wishes to review in its entirety. The Commission granted a similar request in Case No. PUR-2021-00047.[11]

WHEREFORE, Appalachian respectfully requests that the Commission 1) approve the Company's request to implement a rate adjustment clause to recover costs that were and will be incurred to comply with state and federal environmental laws or regulations; 2) approve the proposed revenue requirement, cost allocation, rate design, accounting treatment and rate year; and 3) grant the requests for waiver.

---

enter into power purchase agreements pursuant to § 56-585.1:4 of the Code of Virginia, Case No. PUR-2021-00146, Doc. Con. Cen. No. 210830286 (Aug. 26, 2021).

[11] Order for Notice and Hearing at 2, 3 and 13, *Petition of Appalachian Power Company For revision of a rate adjustment clause pursuant to § 56.585.1 A 6 of the Code of Virginia with respect to the Dresden Generating Plant*, Case No. PUR-2021-00047, Doc. Con. Cen. No. 210050009 (June 28, 2021).

220320301

Respectfully submitted,

APPALACHIAN POWER COMPANY

Appalachian Power Company- Virginia PUR-2022-00001					
Schedule 46 - Projected Rate Adjustment Clause Pursuant to § 56-585.1 A 5 e of the Code of Virginia					
Rate Case Rule	**Schedule 46 Index**	**Witness Sponsor**	**Section**	**Statement**	**Description**
20VAC5-204-90 Schedule 46 c 1	i.An updated schedule of all projected and actual costs by type of cost and year and by month to the extent available. The applicant shall provide such information by project if applicable for the specific rate adjustment clause.	BDS	1	1	Amos/Mountaineer
		RAG		1	Claytor Lake
20VAC5-204-90 Schedule 46 c 1	iii. Key documents supporting the projected and actual costs recovered through the rate adjustment clause, such as: economic analyses, support used by senior management for major cost decisions as determined by the applicant, contracts, studies, investigations, results from requests for proposals, cost-benefit analyses, and other items supporting the costs that have not been provided in previous applications.	JFM	2	1	Economic Analysis
		BDS/RAG		2	Documents, contracts, studies, and investigations to support projected costs
20VAC5-204-90 Schedule 46 c 1	ii. Within five business days of the application filing date, the applicant shall provide transaction-level details to facilitate the sampling and audit of such actual costs electronically to the Division to Utility Accounting and Finance in an electronic spreadsheet with all underlying formulas and assumptions. If the rate adjustment clause update includes a true-up, provide such information for costs incurred during the true-up period. If the rate adjustment clause does not include a true-up, provide the information based on most current actual costs available to-date.	THR	3	1	Over/Under Recovery workbooks (October 2021-December 2021)
20VAC5-204-90 Schedule 46 c 1	iv. The annual revenue requirement over the duration of the proposed rate adjustment clause by year and by class on a total company and Virginia jurisdictional basis, including all supporting calculations and assumptions. The applicant shall provide such information by project if applicable for the specific rate adjustment clause.	THR/WKC	4		Revenue Requirement Calculation
20VAC5-204-90 Schedule 46 c 1	v. Detailed information relative to the applicant's methodology for allocating the revenue requirement among rate classes and the design of class rates.	WKC	5		Allocation of Revenue Requirement/Revenue by Class
20VAC5-204-60	Rate adjustment clause filings. An application for a rate adjustment clause filed pursuant to Chapter 23 (§ 56-576 et seq.) of Title 56 of the Code of Virginia shall include Schedule 46 as identified and described in 20VAC5-204-90, which shall be submitted with the utility's direct testimony. Additionally, applications requiring an overall cost of capital shall include Schedules 3, 4, 5, and 8.	WKC	6		Cost of Capital Schedules

CHRISTIAN T. BEAM
Direct Testimony

APCo Exhibit No. __
Witness: CTB

220322001

DIRECT TESTIMONY OF
CHRISTIAN T. BEAM
FOR APPALACHIAN POWER COMPANY
IN VIRGINIA S.C.C. CASE NO. PUR-2022-00001

APCo Exhibit No. __
Witness: CTB

SUMMARY OF DIRECT TESTIMONY OF CHRISTIAN T. BEAM

In my testimony, I

- Describe the outcome of the CCR/ELG proceeding before the WVPSC and how it led APCo to make another request for ELG investment cost recovery from APCo's Virginia customers;
- Explain the practical impact of the WVPSC's Order on Virginia customers; and
- Set out the options available to the Commission and the potential costs that Virginia customers would face if the Commission again denies ELG investment cost recovery from APCo's Virginia customers.

APCo Exhibit No. __
Witness: CTB

DIRECT TESTIMONY OF
CHRISTIAN T. BEAM
FOR APPALACHIAN POWER COMPANY
IN VIRGINIA S.C.C. CASE NO. PUR-2022-00001

Q. PLEASE STATE YOUR NAME, BUSINESS ADDRESS, AND POSITION.

A. My name is Christian T. Beam. My business address is 500 Lee Street, East, Charleston, West Virginia 25301. I am the President and Chief Operating Officer of APCo and WPCo, both operating companies of the AEP System.

Q. PLEASE SUMMARIZE YOUR EDUCATIONAL BACKGROUND AND PROFESSIONAL EXPERIENCE.

A. I earned a Bachelor's Degree in Applied Science, with a focus on project management, from DeVry University. I am a certified Project Management Professional and completed the AEP Leadership Program at The Ohio State University in 2007 and The Executive Program: Strategic Leadership at the University of Virginia's Darden School of Business in 2019. I have held positions of escalating responsibility at AEP companies since I started with Ohio Power Company in 1990. I worked first in the Utility Operations department at the Kammer Plant. In 1997, I moved to the AEP Service Corporation and was named Outage Project Supervisor for the Regional Service Organization serving the Kammer, Mitchell, and Cardinal Plants. In 2000, I assumed a new role as Superintendent for the Regional Service Organization, supporting SWEPCO, and subsequently became Manager - Region Outage Management in 2002. In 2004, I was named Manager for the Flue Gas Desulphurization retrofit project at the Mountaineer Plant. I became Manager - Construction Technology in 2007 and then Director - Construction in 2008. In 2009, I was named the Project Director - Environmental Retrofit Projects. I was named Managing Director Projects and

Construction in November 2010. I assumed the position of Vice-President - Projects, Controls, and Construction in 2013. In January of 2017, I was named President and Chief Operating Officer of APCo and WPCo.

Q. PLEASE BRIEFLY DESCRIBE YOUR DUTIES AND RESPONSIBILITIES AS PRESIDENT OF APCO.

A. I oversee all aspects of APCo, Kingsport, and WPCo, including their day-to-day operations. My primary goals are to see that they are operated in a responsible and efficient manner and to ensure that customers receive safe and reliable electric service at a reasonable price.

Q. HAVE YOU PREVIOUSLY SUBMITTED TESTIMONY AS A WITNESS BEFORE ANY REGULATORY COMMISSION?

A. Yes. I have testified before this Commission on several occasions, most recently in Case No. PUR-2020-00258, APCo's most recent E-RAC proceeding. In addition, I have filed testimony before the Public Service Commission of West Virginia in Case No. 11-0274-E-PC, before the Arkansas Public Service Commission in Docket No. 12-008-U, and before the Public Utility Commission of Texas in Docket Nos. 39708 and 40443.

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?

A. The purpose of my testimony is to:

- Describe the outcome of the CCR/ELG proceeding before the WVPSC and how it led APCo to make another request for ELG investment cost recovery from APCo's Virginia customers;
- Explain the practical impact of the WVPSC's Order on Virginia customers; and
- Set out the options available to the Commission and the potential costs that Virginia customers would face if the Commission again denies ELG investment cost recovery from APCo's Virginia customers.

220320301

I. BACKGROUND

Q. WHY IS THE COMPANY FILING THIS PETITION?

A. The Company files this Petition pursuant to the E-RAC Statute for two central purposes: to seek recovery of costs related to compliance with state and federal environmental laws and regulations that are applicable to the generation facilities APCo uses to serve its native load obligation, as described in the testimony of Company witnesses Spitznogle, Sherrick, and Gallimore; and to ask again the Commission's permission to recover costs from our Virginia customers that are necessary to comply with the ELG Rule at the Amos and Mountaineer Plants. The Company makes this second request pursuant to the 2021 E-RAC Order in which the Commission denied recovery of the ELG costs from Virginia customers without prejudice and stated that the Company could re-file for approval "should circumstances so warrant." I will explain below the current circumstances that necessitate this filing.

Q. PLEASE PROVIDE A BRIEF OVERVIEW OF THE PREVIOUS E-RAC PETITION, AS WELL AS THE REGULATORY FILINGS IN OTHER JURISDICTIONS RELATED TO THE PLANTS.

A. On December 23, 2020, APCo filed a petition for authority to recover through the E-RAC:

- costs of compliance with the CCR Rule at the Plants, which the Commission approved;
- costs of compliance with the ELG Rule at the Plants; which the Commission denied without prejudice; and
- O&M costs related to compliance with rules governing the handling and disposal of fly ash, bottom ash, and FGD by-product, which the Commission approved.

220220001

The Commission's decision regarding the ELG Rule in the 2021 E-RAC Order effectively closed the Plants to Virginia customers the end of 2028, which is the last day the plant may combust coal if it chose to not make necessary modifications for ELG compliance.

On December 23, 2020, APCo also filed a petition with the WVPSC seeking certificates of convenience and necessity that would authorize both the CCR and ELG projects at the Plants, as well as a cost recovery mechanism. The WVPSC approved the requests on August 4, 2021. In the WVPSC August Order, the WVPSC found that the CCR and ELG Projects at the Plants were "prudent, cost effective, and in the best interest of the current and future utility customers." On October 12, 2021, the WVPSC issued another order that affirmed its earlier holdings and concluded that, given the 2021 E-RAC Order, the West Virginia jurisdictional customers would pay for the ELG projects at the Plants, and should also receive the benefit of capacity and energy made possible by the ELG projects starting January 1, 2029.

Q. WHAT IS THE PRACTICAL IMPACT OF THE WVPSC'S ORDERS ON VIRGINIA?

A. Simply put, the Plants will continue to operate and dispatch into PJM past 2028, regardless of the Commission's decision in this proceeding. If the Commission rules that APCo's Virginia customers should not pay for the ELG projects, APCo's West Virginia customers will pay all the costs, and, the WVPSC asserts, APCo's Virginia customers should receive none of the energy or capacity produced by the Plants after 2028. The WVPSC's orders make clear that West Virginia is committed to keeping the Plants operating.

220320301

II. IF THE COMMISSION APPROVES ELG COST RECOVERY

Q. PLEASE DESCRIBE THE IMPACT OF THE COMMISSION'S APPROVAL OF ELG PROJECT COST RECOVERY FROM VIRGINIA CUSTOMERS IN THIS PROCEEDING.

A. If the Commission approves APCo's request in this Petition, nothing will change for its Virginia customers. They will continue to pay for the Virginia jurisdictional share of all investment, including ELG project investment, at the Plants, as well as O&M costs, and will continue to receive the benefit of their energy and capacity after 2028, as long as the Plants continue to run.

Q. PLEASE DESCRIBE THE COSTS THAT VIRGINIA CUSTOMERS WILL BEAR AND AVOID IF THE COMMISSION APPROVES ELG COST RECOVERY IN THIS PROCEEDING.

A. Company witness Martin's analysis shows that, if approved, our Virginia customers will pay approximately $15 million the first year and $150 million in total over the period through 2040 for depreciation and return on their $98 million share of those investments. In exchange, they will continue to benefit from the 2,100 MW (nameplate) jurisdictional share of capacity provided by the Plants, which will continue to operate regardless of the Commission's action in this proceeding. And, absent a complicated interstate, intracompany arrangement that I will discuss more, Virginia customers will avoid:

- Paying $3 or $4 billion for 2,700 MW or more of nameplate replacement capacity to be in place by 2028, which could increase APCo's cost of service by an incremental 17-21% in 2029 over what they paid in 2021.
- Being responsible for a revenue requirement for that replacement capacity in the amount of $1.8 billion to $2.35 billion from 2029-2040, compared to the incremental cost of keeping the Plants operating through 2040 of $1.0 billion.

220220301

This assumes, of course, that APCo could construct and/or procure that much capacity in the pre-2028 timeframe.

- Possibly being subject to the uncertainty and volatility of capacity provided solely by the market (paper capacity).

From my perspective, as the President of APCo, as the person responsible for providing our customers with reliable energy as cost effectively as reasonably possible, approving the ELG project costs and allowing our customers to avoid these astronomical costs and uncertainty seems like the most prudent course of action, especially given the comparatively limited cost and revenue requirement.

Q. WHAT IMPACT WOULD APPROVAL OF ELG PROJECT COST RECOVERY FROM VIRGINIA CUSTOMERS HAVE ON APCO'S COMPLIANCE WITH THE VCEA?

A. None. The Company will continue to comply with the mandates in the Code to seek Commission approval to own renewable facilities, enter into renewable PPAs, and otherwise procure and retire RECs. It is important to note, as Company witness Martin explains, the total UCAP provided by the renewable resources planned for VCEA compliance is less than the amount of capacity needed to offset even the smallest unit at Amos until 2035. In addition, the VCEA does not place energy production restrictions on the Plants. Continued operation of the Plants will not cause APCo to fail to comply with the VCEA's renewable energy mandates, which are based on a percentage of energy load, not energy generation. APCo plans to meet those targets with renewable resources, which will be added with or without the Plants.

220220301

III. IF THE COMMISSION DENIES ELG COST RECOVERY

Q. WHAT HAPPENS IF THE COMMISSION DENIES ELG PROJECT COST RECOVERY FROM VIRGINIA CUSTOMERS?

A. If the Commission denies recovery of the ELG investment, Virginia customers would avoid the O&M expenses and capital investment costs necessary to keep the Plants operating past 2028. But, by not paying its jurisdictional share of an investment necessary to keep the Plants operating past 2028, Virginia will have shifted a disproportional share of costs onto a different jurisdiction.

As APCo would have to find a way to replace the energy and capacity that the Plants have provided to its Virginia customers for decades, an equitable arrangement could be made whereby Virginia customers compensate West Virginia customers for the capacity provided by one or both Plants. This arrangement could take many forms, and would be very complicated, requiring approval in both jurisdictions. For energy, APCo could purchase replacement energy from PJM for its Virginia customers, but they would be more exposed to energy market volatility. Note that energy on the PJM market is overwhelmingly generated from fossil fuels: for example, per PJM, on March 14, 2022 at noon, a relatively clear and sunny day across the PJM, renewables accounted for only 12,324 MW of the 98,829 MW in load. Eschewing the energy generated from the Plants in favor of market energy would not materially advance any clean energy goals. In short, Virginia customers would likely still rely on the Plants for capacity, but in a more convoluted way, and would be more exposed to volatility in the PJM energy market, which is overwhelmingly fossil-based.

2220360017

Q. IF THE COMMISSION DENIES ELG COST RECOVERY IN THIS PROCEEDING, WILL VIRGINIA CUSTOMERS AVOID PAYING ANY COSTS RELATED TO THE PLANTS?

A. No. In addition to possibly making some type of intracompany, inter-jurisdictional capacity payment to West Virginia customers, Virginia customers will continue to be responsible for the undepreciated balance of the Plants for which those customers are responsible. This is both fair and in line with traditional utility practice. Company witness Ross provides APCo's forecasted December 31, 2028 remaining book values of Amos and Mountaineer.

Q. WHAT WOULD BE THE IMPACT IF THE COMMISSION DENIES THE ELG PROJECT COST RECOVERY FROM VIRGINIA CUSTOMERS, AND ALSO DENIES ANY INTERSTATE, INTERCOMPANY ARRANGEMENT THROUGH WHICH VIRGINIA CUSTOMERS COMPENSATE WEST VIRGINIA CUSTOMERS FOR THE PLANTS' CAPACITY?

A. As Company witness Martin's analysis illuminates starkly, these Plants are hugely important to Virginia and our ability to keep rates reasonable: the Plants provide a considerable amount of inexpensive capacity that is not easily replaced. APCo could, theoretically, enter into the PJM market to acquire an equivalent amount of capacity from another source, which would likely be fossil fueled. APCo could also acquire or construct an equivalent amount of renewable resources to replace the Virginia share of jurisdictional capacity, but it is highly unlikely that APCo could accomplish this by 2028, given the time necessary to site, permit, and procure that much capacity. Note that PJM just recently proposed a two-year pause on reviewing projects in order to process a

2023020001

backlog of 1200 proposed projects, mostly solar, which could further complicate the timeline getting replacement capacity built. Moreover, it is unlikely that customers in West Virginia would pay for such an expensive investment, when it is simply not needed to serve them. This significant cost would most likely fall squarely on the shoulders of our Virginia customers, an outcome the Company is trying to avoid with this Petition.

Q. IF THE COMMISSION DENIES RECOVERY OF THE ELG INVESTMENT FROM VIRGINIA CUSTOMERS, WHAT IS THE IMPACT ON THE COMPANY'S CAPACITY POSITION WITH REGARD TO PJM?

A. None, as PJM views APCo as whole. Because the WVPSC affirmed the Plants' ability to operate past 2028, the Plants will continue to be an integral component of the Company's FRR capacity plan. The Plants will continue to dispatch economically, providing energy for the benefit of customers.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

JAMES F. MARTIN
Direct Testimony

220320321

APCo Exhibit No. ____
Witness: JFM

220322001

DIRECT TESTIMONY OF
JAMES F. MARTIN
FOR APPALACHIAN POWER COMPANY
IN VIRGINIA S.C.C. CASE NO. PUR-2022-00001

220220001

APCo Exhibit No. ____
Witness: JFM

SUMMARY OF DIRECT TESTIMONY OF JAMES F. MARTIN

In my testimony, I

- Describe an economic analysis that I provided to APCo management that compares the forecasted Virginia jurisdictional cost of service effects of a scenario in which the costs, energy, and capacity of the Amos and Mountaineer plants (the Plants) continue to benefit Virginia customers after 2028 to scenarios in which they do not. Elements of this analysis include:
    - Calculations of the $84 million average annual incremental cost to Virginia customers of continued operation of the Plants between 2029 and 2040, and an estimate of between $235 and $280 million average annual net cost over that same period of resources that could replace the Plants. Over that 12 year period, customers would pay between $1.8 billion and $2.35 billion more without the Plants than with them.
    - A computation of the 17-21% 2029 cost of service increase versus 2021, and 12-15% sustained average increase over the 2029-2040 period that Virginia customers will experience if they have to pay for new resources that would replace Virginia's jurisdictional share of the Plants in 2028.
- Explain the importance of APCo's PJM capacity requirement, and why that requirement is critical to understanding the economics of possible replacements of the Plants.
- Explain how PJM computes capacity credit for all of the primary alternative resource options that could replace the Plants (wind, solar, gas, and energy storage), in order to identify how many megawatts of capacity would be required to replace them, and I provide estimates of how much that capacity will cost.
- Discuss the impact of the VCEA on the evaluation of the merits of the ELG investment, and on the value of continued operation of the Plants in general.

220360961

DIRECT TESTIMONY OF
JAMES F. MARTIN
FOR APPALACHIAN POWER COMPANY
IN VIRGINIA S.C.C. CASE NO. PUR-2022-00001

Q. PLEASE STATE YOUR NAME, BUSINESS ADDRESS, AND POSITION.

A. My name is James F. Martin. My business address is 1 Riverside Plaza, Columbus, Ohio 43215. I am employed by AEPSC as a Director of Resource Planning Strategy. AEPSC, a wholly-owned subsidiary of AEP, provides centralized professional and other services to subsidiaries of AEP. AEP is the parent company of APCo.

Q. PLEASE SUMMARIZE YOUR EDUCATIONAL AND PROFESSIONAL BACKGROUND.

A. I graduated from The Ohio State University in 1990, receiving a Bachelor of Science in Business Administration (Accounting Major), and again in 2001 receiving a Master's in Business Administration. Between 1990 and 2000, I held various accounting-related positions in private companies and public accounting firms. In 2000, I joined AEPSC as a Senior Accountant in the Corporate Development department. In 2001, I was promoted to Manager of Financial Analysis. In 2003, I became Manager of Strategic Analysis in Corporate Planning and Budgeting. In 2007, I was promoted to Director-Corporate Budgeting and Capital Investments. In August 2010, I became Manager-Regulated Pricing and Analysis in AEP's Regulatory Services department, with responsibility for preparing retail and FERC jurisdictional and class cost of service studies. In 2016, I was promoted to Regulatory Case Manager, with responsibilities including FERC generation and transmission cost

20220201

of service studies, along with support for special projects including wind resource additions. In February 2021 I was promoted to my current position in AEP's Resource Planning group.

Q. WHAT ARE YOUR DUTIES AND RESPONSIBILITIES AS A DIRECTOR OF RESOURCE PLANNING STRATEGY FOR AEPSC?

A. My responsibilities primarily include preparing and reviewing various resource planning analyses, including integrated resource plans (IRPs) for companies in the AEP system, using the Plexos® modeling software and spreadsheet models to evaluate future resource plan costs and benefits at both operating company and individual jurisdictional levels. Other responsibilities include levelized cost of energy analyses, evaluation and rankings of bids submitted into competitive solicitations for capacity and energy resources, and evaluations of costs and benefits of individual generating resources. In addition, I prepare custom financial modeling for special projects such as the economic analysis used in the recent Wind Catcher and North Central wind resource proposals by APCo affiliates Southwestern Electric Power Company and Public Service Company of Oklahoma.

Q. HAVE YOU PREVIOUSLY FILED TESTIMONY OR APPEARED BEFORE ANY ELECTRIC UTILITY COMMISSION OR OTHER REGULATORY BODIES?

A. Yes. I most recently submitted testimony with the Commission on behalf of APCo in support of an economic analysis I prepared supporting investments needed for compliance with both the federal CCR and ELG Rules at the Plants as part of the

220320301

2021 E-RAC Proceeding. I provided similar testimony on behalf of APCo and Wheeling Power Company in the WVPSC CCR/ELG proceeding. I have submitted testimony in FERC Docket Nos. ER15-2114-000, ER17-419-000 and ER17-418-003 in support of the formula rate protocols and cost of service templates for AEP affiliates. I have also testified before the WVPSC in proceedings regarding Wheeling's purchase of a portion of the Mitchell Plant and potential merger with APCo.

In addition, I testified before the Commission on behalf of APCo in Case Nos. PUE-2011-00037 (regarding jurisdictional cost-of-service, revenue allocation, and rate design); PUE-2011-00036 (regarding the Dresden generation rate adjustment clause); and PUE-2011-00001 (regarding demand response programs).

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. The purpose of my testimony is to provide an analysis that compares the investment in the ELG Projects at the Plants to the option of assuming that the Plants are no longer available to Virginia customers. My analysis demonstrates clearly that continued operation of the Plants, even if they do not run at all, is less expensive and much less risky for customers than retiring them early and replacing them. Having the Plants and their 4,200 MW of capacity allows the Company to avoid incurring substantial cost to obtain another source of capacity to cover its PJM capacity obligation. The Virginia share of the ongoing non-fuel costs of operating the Plants is about $84 million annually, or around $100 per MW per day. Annual revenue requirements of replacement resources would cost 2.5-3.5 times that amount.

2023000001

In sum, my analysis demonstrates that:

1. The relatively small $98 million jurisdictional share of the ELG investments and continued use of the Plants will be much less expensive than replacing them with billions of dollars of new resources;
2. Replacement capacity would increase customers' rates by an incremental 17-21% in 2029;
3. In total, between 2029 and 2040, the net cost of service for the replacement resources would be between $2.8 billion and $3.4 billion, compared to the incremental cost of keeping the Plants operating of $1.0 billion; and
4. The above is true even if the Plants don't generate a single MWh of electricity after 2029, due to their capacity value.

Thus, my analysis provides compelling evidence that the Commission should approve cost recovery from APCo's Virginia customers for the ELG investments, so that customers can continue to benefit from the Plants.

Q. ARE YOU SPONSORING ANY SCHEDULES OR EXHIBITS IN THIS PROCEEDING?

A. I am sponsoring the Company's economic analysis included in APCo Schedule 46, Section 2, Statement 1. In addition, I am sponsoring the following schedule, which is attached to my testimony:

- APCo Exhibit No. __ (JFM) Schedule 1 – VCEA Report

Q. PLEASE PROVIDE AN OVERVIEW OF YOUR ANALYSIS.

A. My analysis is comprised of three scenarios. First, I prepared two cases, both of which are VCEA compliant, in which Virginia's half of the Plants were assumed to be replaced with physical resources in 2028, in order to assess if the Plants were more or less expensive than other resource options. Case 1 assumes replacement of the Plants with a mix of renewables and gas-fired resources (the thicker dotted line on

20220901

Figures 1 and 2 below). Case 2 assumes replacement with 100% renewable and energy storage resources, with energy storage being the bulk of the replacement capacity (the thinner dotted line on Figures 1 and 2). I also compared the ongoing cost of operating the Plants to a PJM market capacity price projection (the paper capacity case, which is the combination dashed/dotted line on Figures 1 and 2). I compared the ongoing costs of keeping the Plants operating (the future fixed O&M and capital expenses from 2028 onward) to the other options. Amos is the dashed line, and Mountaineer is the solid line. The Plants are the two lowest lines on both graphs.

Figures 1 and 2 illustrate the results of my analysis in terms of both gross and net capacity costs per MW-Day. In my analysis, "gross capacity costs" are the fixed costs of the capacity other than sunk costs, and "net capacity costs" are the fixed costs minus the energy margin expected from the resource option. For this analysis I didn't count the fact that the Plants would generate energy margin to offset that capacity cost, so the gross and net lines are the same between the two graphs. As the Plants do not need energy margin to provide tremendous value to customers versus other options, I omitted that factor. In reality, the Plants will generate energy margin, so the net line would be lower than the gross line, increasing the cost advantage.

2026-00021

The assumed PJM market capacity option would not come with any energy margin offset, so those lines are also the same on the two graphs. In Figure 2, Cases 1 and 2 have the energy margin deducted.

Figure 1 - Gross Capacity Costs - $/MW-Day

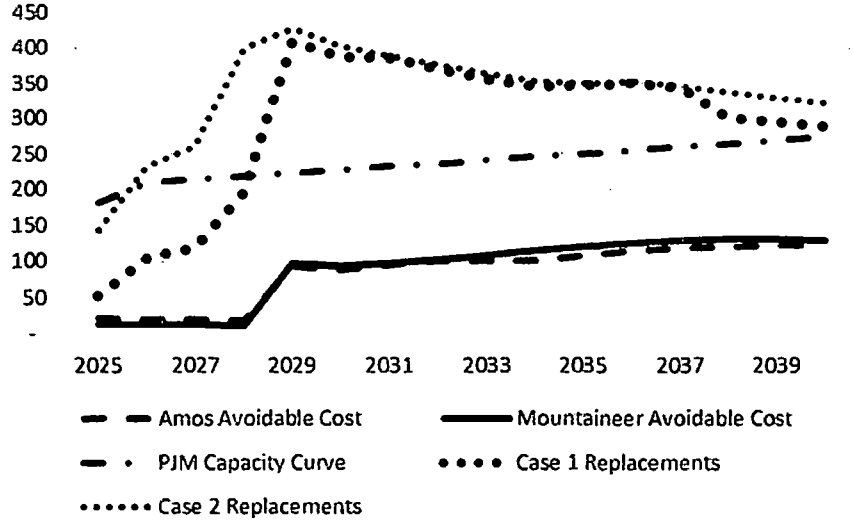

Figure 2 - Net Capacity Costs - $/MW-Day

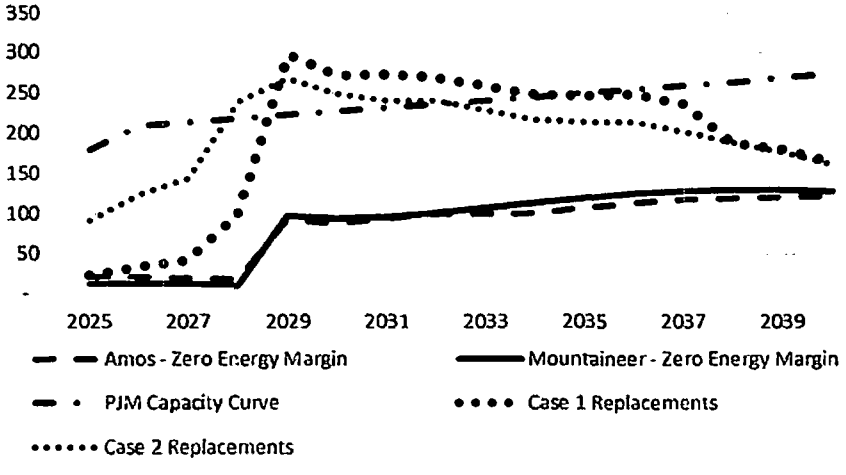

2025000281

Q. PLEASE EXPLAIN WHAT IS PRESENTED IN FIGURES 1 AND 2.

A. Figures 1 and 2 are presented in terms of Dollars per Megawatt-Day ($/MW-Day), which is the unit of measure that PJM uses for its capacity auction price, and is a common measure of the cost of capacity. This metric puts differently sized capacity resources on an apples-to-apples basis as a cost per unit of capacity. The first year presented is 2025, which is the year that most of the new resources to be used for near-term VCEA compliance are projected to come online. The final year presented for purposes of my analysis is 2040, as the WVPSC approved the ELG projects at the Plants and indicated it would provide the Company an opportunity to run the Plants through 2040. Later in my testimony, I provide the underlying costs behind Figures 1 and 2 in millions of dollars of cost of service, which is another way to evaluate capacity cost.

The graphs show that the Plants are far less expensive than the other three options over the entire period through 2040. Figure 2 shows that the net costs of all the capacity options are 2-3 times the cost of the Plants in 2029, the year in which replacement capacity would need to be online to comply with APCo's PJM capacity obligations. Even though the relative cost advantage of the Plants then declines versus the physical resource options in Cases 1 and 2 through the 2030s, the Plants remain the least expensive capacity option through 2040.

The gross capacity cost in Figure 1 is similar to base rate cost of service, containing the incremental fixed costs of each option net of tax credits for the wind and solar resources. Those fixed costs of the replacement resources become sunk

2023020041

costs the minute the investments are made. Customers would need to pay for the replacements regardless of what happens in years after that. It is important to isolate the costs of just those replacement resources for the purpose of evaluating the value of making the ELG investment and operating the Plants beyond 2028.

Q. WHY DOES YOUR ANALYSIS ASSUME THAT THE PLANTS WILL NOT BENEFIT VIRGINIA CUSTOMERS AFTER 2028?

A. As described in the testimony of Company witness Beam, the WVPSC ordered the Company to make the ELG investments at the Plants. Therefore, the Plants will operate beyond the 2028 ELG compliance deadline regardless of the outcome of this proceeding. The WVPSC stated that if the Commission did not approve recovery of the ELG investment from Virginia customers, Virginia customers would not be entitled to the capacity and energy from the Plants, and the West Virginia customers would accept responsibility for the ELG investment and all ongoing operating costs after 2028. If this occurs, Virginia customers would no longer benefit from the capacity and energy of the Plants, despite their continued operation, but the Virginia jurisdiction would continue to be responsible for its share of APCo's overall capacity obligation. As that obligation will be met, in large part, with the Plants, Virginia customers could satisfy their responsibility with an inter-jurisdictional financial agreement or, conceivably, self-supply of the Virginia capacity obligation. Company witness Beam discusses the former, and the latter is the subject of my analysis.

220320301

I. CAPACITY REPLACEMENT ANALYSIS.

Q. PLEASE DISCUSS THE BASIC STRUCTURE OF YOUR ANALYSIS.

A. My analysis compares the incremental cost of service of continued operation of the Plants beyond 2028, the "avoidable costs," to the costs of new resources, net of energy margin, from two portfolios of specific resources that would be needed to replace the Plants. I also compare the Plants to a paper capacity option priced at the forecasted PJM capacity market price. The avoidable costs of the Plants include fixed O&M and all capital expenses after 2028, and the $98 million Virginia share of the ELG capital investments. For the replacement resources, costs and revenues associated with resources added after 2028, such as resources the Company expects to add to comply with the VCEA, or to replace other Company resources when they retire, are irrelevant to the ELG approval decision, as they will come too late to allow customers to avoid paying for the required pre-2028 investments. My analysis eliminates all impacts of separate and unrelated resource additions or retirements occurring after 2028.

Q. HOW MUCH CAPACITY IS REPRESENTED BY VIRGINIA'S SHARE OF THE PLANTS?

A. The nameplate capacity of the Plants is approximately 4,200 MW. For the purpose of using the Plants to comply with the Company's PJM capacity obligation, the UCAP value of the Plants, after a forced outage rate adjustment made under PJM's rules, is expected to be 3,814 MW, as I discuss below. For this analysis, I combined the roughly 3% of APCo's load comprised of the Commonwealth and Public Authorities

220039

customers with the ~47% Virginia retail jurisdiction, because rates for those customers are based on the same cost of service as the retail jurisdiction. Virginia's half of the Plants' PJM accredited capacity would thus be 1,907 MW UCAP. I solved for this amount of replacement capacity for Virginia in my analysis.

Q. WHAT ARE THE AVOIDABLE COSTS?

A. As I discussed in more detail below, I estimate that the Virginia jurisdictional share of the ongoing avoidable costs of the Plants, including avoidance of the ELG investment, would be around $73 million in 2029, and would average $84 million annually from 2029-2040. By 2040 I project that amount to have increased to $95 million due to the cumulative effect of not paying a return on future capital expense. For this analysis, I excluded recovery of the sunk costs of the existing investment in the Plants from Virginia customers, as the Company would recover them in any scenario, either as depreciation should the Plants continue to run, or amortized over a given period, if the Plants are replaced.

Q. HOW DID YOU DETERMINE WHICH REPLACEMENT RESOURCES TO EVALUATE?

A. In Case 1 and 2, I used resources selected by the Plexos model in two of the resource plan scenarios included in the 2021 VCEA RPS Plan, which is attached to my testimony as APCo Exhibit No. ___ (JFM) Schedule 1 (the VCEA Report). In the VCEA Report, six VCEA compliant portfolios were prepared to illustrate various plans to comply with the VCEA's renewable energy requirements under futures with and without the Plants. The fundamental forecasts used in the VCEA analysis

220220021

accounted for the expected build-out of renewables in Virginia and PJM, as well as Virginia's participation in RGGI.

Two of those VCEA Portfolios assumed a 2028 retirement of the Plants, and showed that retiring them in 2028 would be more costly than the VCEA Portfolios that kept the Plants running through 2040. I used the resources added up through 2028 in these VCEA Portfolios as the basis for the inputs to my two cases in this proceeding: Case 1 is based on VCEA Portfolio 3, which replaced the Plants with a mixture of renewables and gas-fired resources; and Case 2 is based on VCEA Portfolio 4, which relies on 100% renewable resources and energy storage. The full resource plans for those VCEA Portfolios, with both nameplate and firm (UCAP) capacity, is presented in Tables 26 and 27 in the VCEA Report.

In addition, I also evaluated what it would cost to replace the Plants with market purchase (paper capacity). This option would leave the Company heavily exposed to both market energy and capacity price risks that would be mitigated with ownership of actual resources.

Q. HOW DID YOU ALLOCATE THESE RESOURCES TO VIRGINIA IN YOUR TWO CASES?

A. Both of these VCEA Portfolios were prepared as if all of the Plants' 4,200 MW of capacity was retired and replaced. For this analysis, to better isolate the effects on Virginia, I only extracted enough resources from those VCEA Portfolios to replace Virginia's half of the Plants by making the following assumptions:

220329E01

1. If approved, the mixture of owned and PPA wind and solar projects that were selected from the 2021 RFP's totaling 498 MW[1] pending before the Commission in the 2021 VCEA Proceeding will come online at various dates between 2023 and 2025. I assumed that both Virginia and West Virginia would approve the projects, and Virginia would thus be allocated half.
2. The next group of resources added between 2025 and 2028 were assumed to be fully allocated to the Company's Virginia jurisdiction to meet the VCEA requirements. Between steps 1 and 2, all of the resources required by the VCEA prior to 2028 have been brought in to the analysis, reducing the replacement capacity that would otherwise be required to replace the Plants.
3. The "plug" to fully replace the remaining portion of Virginia's half of the Plants' UCAP capacity was then taken from the large resource added to replace the retiring coal plants in the two VCEA portfolios in 2028. This is a gas combined cycle in Case 1, and energy storage in Case 2.

Q. WHAT DO THESE PORTFOLIOS LOOK LIKE IN TERMS OF CAPACITY BY RESOURCE TYPE AND COST?

A. The capacity by resource type and costs for the Company's Virginia jurisdictional customers are presented in Tables 1 and 2. The capacity is presented in both nameplate (ICAP) and UCAP megawatts, which is what governs PJM capacity obligation compliance. For example, 200 MW of wind would give APCo 22 MW of PJM accredited capacity due to its intermittent nature under PJM's capacity market construct. Both Cases add up to 1,907 UCAP MW (half of the UCAP of the Plants). Cost amounts are presented in millions of dollars.

[1] See VCEA Report Table 2.

2023-00301

The 2,686 MW (nameplate) of resources required in Case 1 (Table 1) to replace Virginia's half of the Plants' capacity would cost $3.2 billion. This assumes approximately 1,420 MW of the capacity is replaced by gas. In Case 2 (Table 2), 3,535 MW (nameplate) of resources costing $4.2 billion would be needed to replace half of the Plants with 100% renewables, with 1,711 MW of energy storage as the primary replacement resource.

I presented the Virginia jurisdictional cost of service in 2029 in the two Tables, which is the first year all of the revenue requirements of all of the new resources are fully included in cost of service. This year illustrates the immediate cost of service impact of replacing the Plants, costing Virginia ratepayers $291 million dollars that year if a combined cycle plant replaces the bulk of the capacity. This amount would be $346 million in 2029 if energy storage is the primary replacement resource. Both of these amounts are net of fuel savings customers would expect to receive from all new resources.

Q. HOW MUCH WOULD THE 2029 SINGLE YEAR COST OF SERVICE INCREASE BE UNDER THESE SCENARIOS?

A. These new resource costs would be offset by the avoided ongoing costs at the Plants, which I estimate will be $73 million in 2029. I did not include any energy margin the Plants might generate, in order to make my analysis as conservative as possible. The resultant net increase in 2029 cost of service would be $218 million in Case 1 and $273 million in Case 2, even if the Plants do not generate a single megawatt hour of energy. In comparison, Virginia customers paid a total of $1.3 Billion for regulated

2022000301

electric service (generation, transmission and distribution) from APCo in calendar year 2021. This incremental cost would amount to a customer rate increase of between 17 and 21% in 2029 above what they paid in 2021.

Q. WHAT WOULD THE TOTAL AND AVERAGE COST OF SERVICE INCREASE BE OVER THE 2029-2040 PERIOD?

A. See Table 3 below. In total, over the period between 2029 and 2040, the net cost of service for these replacement resource options would be $2.8 billion in Case 1 and $3.4 billion in Case 2. The paper capacity option would cost $2.3 billion during that period. In contrast, the incremental cost of keeping the Plants operating would be $1.0 billion. The annual average revenue requirement of the replacement resources included in these 12-year totals, net of fuel savings, is expected to be $235 million in Case 1 and $280 million in Case 2. These amounts are 2.8 to 3.3 times higher, respectively, than the $84 million average annual cost to keep the Plants operating during that period.

2026026001

Table 3 - 2029-2040 Cost of Service Impacts

Line	Dollars In Millions	NPV of 2029-2040	Nominal Total 2029-2040
1	**Amos and Mountainer incremental capacity cost**	$647	$1,003
	Replacement Capacity Costs, net of Energy Margin		
2	Case 1 - Gas CC and Renewable Replacements	$1,935	$2,825
3	Case 2 - Storage and Renewable Replacements	$2,290	$3,356
4	Paper Capacity - PJM Market	$1,486	$2,280
	Replacement Cost Percentage of Amos/Mountaineer	2029-2040 Average % Increase	2029-2040 Average $(Millions) Increase
5	Case 1 - Gas CC and Renewable Replacements	290%	$152
6	Case 2 - Storage and Renewable Replacements	344%	$196
7	Paper Capacity - PJM Market	229%	$106

Additional details supporting Table 3 in the form of the annual gross and net cost of service over the 2029-2040 period are shown in Schedule 46, Section 2, Statement 1, which I sponsor in this proceeding.

II. PJM CAPACITY REQUIREMENTS

Q. PLEASE DESCRIBE THE REQUIREMENTS APPLICABLE TO PJM MEMBER COMPANIES LIKE APCO.

A. PJM utilities such as APCo and the AEP system companies are required to provide enough capacity to cover their summer peak loads plus a reserve margin. This requirement is forecasted to be 14.9% on an ICAP or nameplate basis, or around 8.6% on an UCAP basis. The difference between the two is due primarily to two downward adjustments that PJM makes. First, each resource's nameplate capacity is reduced by an assumed forced outage rate. Second, for renewable resources, PJM

20032681

uses a methodology called Effective Load Carrying Capability (ELCC) to determine how much credit each resource gets. These ELCC adjustments in my analysis are reflected in Tables 1 and 2 in the differences between the nameplate and UCAP columns.

A utility must maintain reserve capacity (Capacity – Peak Load) of at least 8.6% of UCAP above its peak load. For example, if a utility has a capacity of 1,086 UCAP MW and a peak load of 1,000 MW, then its reserve margin reserve would be 8.6% ((1,086 -1,000)/1,000).

Q. HOW MUCH CAPACITY DOES EACH POSSIBLE REPLACEMENT RESOURCE PROVIDE?

A. The PJM capacity market rules determine how much capacity credit each type of resource is given towards a capacity obligation, which varies widely based on each resource's ability to contribute dependable output during high load hours. RTOs plan for how much capacity is needed for peak load conditions, plus a reserve margin, in order to make sure enough resources are available to reliably serve load at those times. Looking at how much energy a given resource can be counted on to produce in those high load hours is how RTOs determine how much capacity credit each resource should be given. The ELCC method does this calculation for the intermittent resource types. In general, fossil fueled resources like gas and coal provide more capacity value due to their dispatchability than intermittent resources like wind and solar. If APCo found itself needing this much capacity, this assumption would be critically important.

2023200301

This is illustrated for PJM in Table 4. That table shows how much capacity credit each major resource type is expected to get in PJM, compared to Virginia's half of the Plants. Wind, for example, would get 231 MW of credit for its 2,100 MW nameplate capacity. It would take 17,336 MW of wind to equal the Plants 1,907 MW of UCAP.

Table 4 - PJM Capacity Credit By Resource Type

	Nameplate Capacity	2028 PJM Capacity credit %	PJM Accredited UCAP Capacity	Capacity to Match Amos / Mountaineer UCAP
50% of Amos and Mountaineer	2,100	91%	1,907	
Wind	2,100	11%	231	17,336
Solar (Tracking)	2,100	39%	819	4,890
Storage - 4 hour	2,100	70%	1,470	2,724
Solar Plus 4 hour Storage	2,100	72%	1,512	2,649
Gas CT or CC	2,100	96%	2,016	1,986

III. RESOURCE COST ASSUMPTIONS

Q. WHAT IS THE COST OF SERVICE OF THE ELG COMPLIANCE INVESTMENTS?

A. Virginia's share of the ELG investments at the Plants is approximately $98 million. The annual revenue requirement (depreciation and return on investment) that Virginia customers would pay is $15 million in the year the ELG investments go in service. This assumes the depreciation rates approved by the Commission in the 2021 R-RAC proceeding for the CCR investments are also adopted for the ELG investments. This will drop to $2 million per year for Mountaineer in 2034, as the Amos ELG is assumed to be fully depreciated in 2033. Over the full period between 2022 and 2040 I would estimate the Virginia share of the nominal revenue requirement will be

220036301

approximately $150 million. The present value of this cost of service will be approximately $93 million. I included these values in the incremental ongoing cost of operating the Plants.

Q. WHAT ASSUMPTIONS DID YOU MAKE ABOUT FUTURE INCREMENTAL CAPITAL COSTS OF THE PLANTS?

A. In both cases, all of the ongoing capital expense forecasts, excluding the ELG costs, were included through 2035. From 2036 to 2040, I used a "glide path" capital expense forecast, which reduced that maintenance capital in those years. I applied a levelized carrying charge to that capital expense starting in 2029 in order to determine what the cost of service savings would be by avoiding that capital.

Q. WHAT ASSUMPTIONS DID YOU MAKE REGARDING THE FUTURE OPERATIONS AND MAINTENANCE COSTS OF THE PLANTS?

A. The analysis assumed that the currently forecasted level of O&M through 2030. In years after that, O&M was projected to decline, commensurate with expected lower capacity factors if a national carbon tax is enacted. Reduced capacity factors would mean less maintenance and waste disposal costs, and thus O&M was assumed to be 75% of the 2030 forecast between 2031 and 2040. All of the fixed O&M was assumed to be avoidable starting in 2029.

I also prepared a forecast of taxes that could be avoided if Virginia customers were no longer benefitting from the Plants, including property taxes and a tax levied on generating plants in West Virginia called the Business & Occupation (B&O) tax. APCo is expected to pay about $10 million per year in property taxes and about $36

2023-00381

million annual in B&O tax towards the end of this decade. Virginia's half of these two taxes is expected to be about $23 million annually in 2028 and beyond.

Q. HOW WERE THE COSTS OF THE REPLACEMENT RESOURCES COMPUTED?

A. I used a spreadsheet model to compute a forecast of the annual revenue requirement on the new resource additions using customary ratemaking principles. For the owned resources, this included forecasting rate base declining over time, return on rate base at a weighted average cost of capital, depreciation, O&M, production tax credits over the first 10 years on the wind assets, and normalization of the investment tax credits on the solar assets over the 35 year lifetimes. I used the PPA costs for those resources.

Q. WHAT WERE THE SOURCES OF THE COST OF REPLACEMENT RESOURCES?

A. I used the actual resource costs for the portion of replacement capacity provided by the Virginia half of the 498 MW of the currently proposed VCEA compliant projects which are currently pending before the Commission in Case No. PUR-2021-00206. The gross cost of service of the 498 MW is projected to average about $42 million per year for Virginia customers through 2040. Those resources are summarized here in Table 5.

220230001

TABLE 5 – Near Term Planned Resources					
Facility	**Nameplate Capacity MW**	**Owned / PPA**	**State**	**Resource Type**	**Operation**
Firefly	150.0	Owned	Virginia	Solar	July 2024-June 2059
Amherst*	4.9	Owned	Virginia	Solar	Jan 2023 - Dec 2057
Horsepen	20.0	PPA	Virginia	Solar	Jan 2025 - Dec 2054
Dogwood*	18.9	PPA	Virginia	Solar	Jan 2025 - Dec 2054
Sun Ridge	50.0	PPA	Virginia	Solar	Jan 2025 - Dec 2054
Virginia Domiciled	**243.8**				
Top Hat	204.0	Owned	Illinois	Wind	Jan 2025 - Dec 2054
Bedington	50.0	Owned	West Virginia	Solar	Oct 2023 - Sep 2058
TOTAL	**498**				

*Distribution Resource

The remaining generic resource costs, including construction cost and fixed O&M for owned resources and PPA costs, were sourced as described in section 4 of the VCEA Report. The generic wind and solar resource costs were aligned with the average of the bids received by APCo in the RFPs it issued for both owned and PPA resources in 2021. All new wind and solar resource costs are based on actual market information available at the time the analysis was performed.

Q. HOW MUCH WIND AND SOLAR WOULD BE REQUIRED TO REPLACE THE PLANTS, AND WHAT WOULD IT COST, IF ALL OTHER RESOURCE TYPES WERE EXCLUDED?

A. The proposed portfolio in the 2021 VCEA Filing of 204 MW of wind and 294 MW of solar is projected to provide a total of 108 MW of UCAP capacity in 2028. Based on current ELCC capacity credit expectations (as illustrated in Table 4), it would take 17.7 times that amount of wind and solar to replace Virginia's half of the Plants'

2023-00237

1,907 MW of UCAP: that equals 8,800 MW of resources needed by 2028. Based on the actual costs of these resources, replacing the Plants with this mix of 40% wind and 60% solar would cost close to $15 billion. An investment of this size in such a short period of time would be unprecedented in scope and scale for APCo, especially given the uncertainty around whether siting, constructing, and financing such a portfolio is achievable.

This group of seven proposed new resources selected from the 2021 RFP's amounting to 498 MW is projected to cost roughly $19 million per year on average through 2040 after deducting the expected energy revenue that will reduce customer fuel costs. As it would take 17.7 times this amount of resources to replace the UCAP of these plants, such a mix of wind and solar would equate to about $338 million per year in annual average net cost of service through 2040, which would be four times the incremental cost of the Plants over that period.

Q. HOW MUCH DO APCO'S NEW RESOURCES COST PER MEGAWATT-HOUR OF ENERGY?

A. When the projected annual revenue requirements of the ten new assets, net of tax credits, are divided by the energy they are expected to produce, the average cost to customers per MWh over the 17 years between 2024 and 2040 is expected to be $53/MWh. The lowest cost year in that period is projected to be $47/MWh.

The ten new assets are: the seven resources obtained through the 2021 RFPs set out in Table 5, plus three other PPA resources that went online in 2021 or that will go online in 2022: the 20 MW Wytheville, 20 MW Leatherwood, and the 15 MW

220035

Depot solar facilities. A diverse portfolio such as this would be representative of what APCo would expect if it sought a large amount of renewable capacity needed to replace some or all of the Plants' capacity (assuming it could even find and get approval for that amount of capacity by 2028, which is doubtful).

Q. DOES RENEWABLE ENERGY CERTIFICATE VALUE INFLUENCE NEW RESOURCE COSTS, INCLUDING PPA COSTS?

A. Yes, and the magnitude of that influence is growing of late. All of these ten renewable assets come with renewable energy certificates (RECs), which have cash value in REC trading markets in addition to the value of the energy itself. PJM Tier 1 RECs traded as high as $24.50/MWh in January 2022. In the two VCEA portfolios on which I based my analysis in this proceeding, RECs were assumed to be priced at between $27 and $32 per MWh between 2023 and 2031 (VCEA Report Figure 8).

In recent years, many PJM states and neighboring states in the Northeast have established renewable energy mandates, and corporations are making substantial renewable energy pledges. This has created high demand for renewables and their RECs, which has led to difficulty getting resources sited, interconnected, approved, and built in time to meet growing compliance targets. In February 2022, PJM publicly acknowledged the backlog it is facing in getting new projects moved through the interconnection queue, and announced it was seeking to implement a two-year moratorium on new interconnection requests. All of the above has driven up REC prices and PPA prices.

220003

APCo has a requirement to either self-generate or purchase and retire RECs in order to comply with the VCEA, and thus RECs are required by APCo when it seeks new resources. For the PPA assets, this REC value can push up the PPA price to an amount well above the cost the developer incurs to build and operate the assets themselves. RECs are separately priced in some renewable PPAs, and buried in a combined energy/REC price in others, so it isn't always clear what the REC value is, but it's clearly a factor developers consider in pricing assets offered into RFPs for both owned assets and PPAs. Either way, the REC value that rational profit seeking developers attempt to capture in pricing their product will cause the price of new resources to be higher than the cost of asset itself.

IV. IMPACTS OF THE VCEA ON THE PLANTS

Q. DOES THE VCEA REQUIRE THE PLANTS TO RETIRE?

A. No. The Plants are located outside of Virginia, and thus are not required to be retired by any certain date by the VCEA.

Q. WHAT IMPACT DO THE VCEA'S NEW RESOURCE PETITION REQUIREMENTS HAVE ON THE ANALYSIS OF THE ECONOMICS OF THE ELG INVESTMENT AND THE PLANTS' CONTINUED OPERATIONS?

A. The VCEA resource petition mandates have very little impact on an evaluation of the ELG investment, or the need for the Plants in general. The law states that APCo must meet RPS requirements and petition the Commission for approval of certain resources. The petition requirements that are applicable in time to impact the ELG decision are 400 MW of wind or solar by 2027 and 25 MW of storage by 2025. The

220220301

next interim petition requirement after the 2027 requirement is 200 additional MW of wind or solar by 2030 and 125 additional MW of storage by 2030. Any resources added for VCEA compliance after the 2027 requirement would be irrelevant to the decision regarding how to replace the Plants' capacity, as that decision would have already been made.

Table 21 in the VCEA Report shows the UCAP provided by the additions that APCo plans to add to achieve VCEA compliance through 2040. In that VCEA portfolio, only the minimum resources needed for VCEA compliance (assuming they are cheaper than RECs) were added. The Company is not projected to need capacity to maintain compliance with the PJM capacity requirement until 2040. That resource plan included an assumed amount of distributed generation (labeled New DG) built on the APCo system, which is not mandated by the VCEA. As shown in the 2028 column on the line labeled Total Additions (Firm and Degraded), the total UCAP added by 2028 from all resources is expected to be 298 MW, which is less than half of the UCAP capacity of the smallest unit at Amos, which is 742 MW. Looking further out, it takes until 2035 for the total UCAP of all resources planned for VCEA compliance to total more than 742 MW. This demonstrates that capacity provided by the new resources planned for VCEA compliance are less than the amount of capacity needed to offset even the smallest unit of the Plants until 13 years from now.

220320001

Q. DO THE VCEA'S RENEWABLE ENERGY REQUIREMENTS HAVE AN IMPACT ON THE ANALYSIS OF THE ECONOMICS OF THE ELG INVESTMENT, OR THE VALUE OF THE PLANTS IN GENERAL?

A. The economics of the Plants are impacted by the VCEA requirements as reflected in the Company's Fundamental forecasts, which assume a full build-out of VCEA resources in PJM and Virginia's participation in RGGI. Regarding APCo specifically, the renewable energy targets in the VCEA mandate that a percentage of the Company's Virginia jurisdictional energy load be met from qualifying resources or RECs. That percentage increases through time before reaching 100% by 2050. As the requirement is a percentage of load, not a percentage of energy generated by the Company's resources, the law does not restrict how much the Plants can run. As long as the Company has enough of a combination of REC purchases and qualifying renewable generation to meet the percent of Virginia load targets, the Company will be in compliance, regardless of how much or how little its fossil plants run. Even if the VCEA compliance requirement was qualifying energy or RECs of 100% of Virginia load at some point before the Plants retire, any generation produced by the Plants will be sold off-system into the PJM market, generating value for customers despite not being needed to serve internal load.

220220001

V. TRANSMISSION CONSIDERATIONS

Q. COULD RETIREMENT OF THE PLANTS CREATE THE NEED TO INVEST IN THE BULK HIGH VOLTAGE TRANSMISSION SYSTEM?

A. Yes. AEP's transmission planning organization performed high level studies while the Company was initially evaluating whether to make the CCR and ELG investments at the Plants. Those studies indicated that retiring the Plants in 2028 could result in the need for between $100-$200 million of upgrades to the high voltage transmission system to prevent violations to both thermal and voltage reliability standards. This was factored into the economic analysis that supported making the investments.

Q. DID YOU INCLUDE POTENTIAL TRANSMISSION COSTS IN THE ANALYSIS SUPPORTING THIS PETITION?

A. No, I did not include transmission costs in this analysis because the Plants will not be retiring in 2028. I also did not include an assumption of interconnection costs in the cost of the replacement assets, beyond routine interconnection costs assumed in the generic resources. Based on the interconnection costs of adding the 498 MW of resources currently under development, the costs of getting enough transmission for the thousands of nameplate MW needed to replace Virginia's half of the Plants could be $50-$100 million depending on the locations of replacement capacity. This would raise the costs of replacing the Plants above what I have presented here.

VI. CLINCH RIVER RGGI COMPLIANCE

Q. PLEASE DESCRIBE THE RGGI COMPLIANCE COSTS RELATED TO THE CLINCH RIVER PLANT.

A. Clinch River is located in Virginia, and thus is subject to RGGI compliance costs due to Virginia's participation in RGGI. As discussed in her testimony, Company witness Castle has included an estimate of these compliance costs in his calculation of the revenue requirement of the E-RAC rider. These costs have been deferred (not collected from customers) to date. As a generator located in PJM, Clinch River only dispatches when it is economic compared to the other resources that have been offered into PJM to meet load in a given hour. When APCo offers the unit for sale into the PJM energy market, the offered price includes the cost of any RGGI allowances that APCo would need to purchase to allow Clinch River to run. PJM would only dispatch Clinch if its offer price was lower than the marginal energy price. As a result, any RGGI-related costs are offset by energy revenues received when the energy is sold. Customers have already received the fuel cost of service reduction from these revenues, and therefore it is appropriate for APCo to recover those costs in the E-RAC revenue requirement.

Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes.

Re: Petition of Appalachian Power Company
For approval of its 2021 RPS Plan
under § 56-585.5 of the Code of Virginia
and related requests
Case No. PUR-2021-00206

Dear Mr. Logan:

Enclosed for filing is Corrected Attachment 1, the 2021 RPS Plan, to the Petition that was filed in the above-referenced case on December 30, 2021. After the filing of the 2021 RPS Plan, the Company noted that Tables 22 and 23 contained incorrect information, which has been corrected in this version. In addition, the Plan's original Appendix B had two tables numbered 29, which has also been corrected and all tables past Table 29 have been renumbered. Lastly, the information in Appendix C has been removed, as it was inadvertently included in the report.

Sincerely,

Noelle J. Coates

1.0 Virginia Clean Economy Act Compliance Plan Overview

Consistent with the requirements of Virginia Code Section 56.585.5.D.4, Appalachian Power Company (Appalachian, APCo, or the Company) submits the second of its annual plans to meet the requirements in the Virginia Clean Economy Act (VCEA).

This year's report includes six separate VCEA compliant plans for informational purposes. Descriptions of the six Portfolios are provided in Table 1. Four of the plans, Portfolios 1-4, assume only the minimum level of renewable resources needed to meet the annual VCEA energy targets are added. These plans were prepared under varying scenarios in which the Company's two coal plants were retired in either 2028 or 2040, and replaced with either a combination of renewable and gas fired resources or 100% renewable resources. The fifth plan (Portfolio 5) was prepared under the assumption that 1,000 MW of additional wind above the minimum VCEA requirements is available and can be added based on favorable economics in time to capture production tax credits before they expire in 2026. The sixth plan (Portfolio 6) is a sensitivity case prepared as a result of a requirement in the Commission's order on the Company's 2020 VCEA filing,[1] in which future wind resources are assumed to have a capacity factor that is consistent with the Company's current wind PPA resources.

TABLE 1: PORTFOLIO DESCRIPTIONS

Portfolios					
1	**2**	**3**	**4**	**5**	**6**
RGGI Only CO2 2040 AM & MNTR Ret. Gas Options Available	RGGI to $15 CO2 2040 AM & MNTR Ret. No Gas Option Available	RGGI Only CO2 2028 AM & MNTR Ret. Gas Options Available	RGGI to $15 CO2 2028 AM & MNTR Ret. No Gas Option Available	RGGI to $15 CO2 2040 AM & MNTR Ret. No Gas Option Available Higher Wind Limits	RGGI to $15 CO2 2040 AM & MNTR Ret. No Gas Option Available Current Wind Project Cap Factors

For the purposes of this report, the Company's base case assumption is that the coal plants will operate through 2040 and fossil fueled resources will not be used to replace them at that time. Portfolio 2 presents that scenario and will be referred to in this report as the VCEA Plan or the Plan. Nevertheless, APCo intends to issue Request for Proposals (RFPs) in the near

[1] Final Order at 5, *Commonwealth of Virginia, ex rel. State Corporation Commission Ex Parte: Establishing 2020 RPS Proceeding for Appalachian Power Company*, Case No. PUR-2020-00135, Doc. Con. Cen. No. 210440238 (April 30, 2021) ("Order on 2020 Filing").

term based on Portfolio 5, and seek approval of those resources based on the results of APCo's economic analyses. The Company's 2021 VCEA Plan includes a geographically varied portfolio of storage, solar and wind resources, both Company and third party owned, as well as market REC purchases. In the filing associated with this Plan, the Company is seeking a prudency determination of the acquisition of one 150 MW solar facility and the agreements to purchase the output of three solar facilities via power purchase agreements (PPAs) totaling approximately 89 MW; approval to recover the costs of 50 MW of owned West Virginia solar and 204 MW of Illinois wind resources. In addition, APCo is seeking cost recovery for RECs associated with 40 MW of Virginia solar contracted through its Cogen/SPP rate schedule; 15 MW of contracted solar located in Virginia; 5 MW owned solar in Virginia; as well as market REC purchases necessary for annual compliance.

The Company developed these VCEA compliant plans in a way that is similar to how Integrated Resource Plans are developed, using the same general methods, commodity price forecasts, optimization software, load forecasts, and resource cost assumptions. The amount and timing of the resource additions were determined with Plexos® optimization software, adjusted as needed to include resource additions that were necessary to meet certain annual requirements associated with energy efficiency targets and Virginia-domiciled renewable and storage.

In addition to determining the type and timing of resource additions, this report provides an estimate for the rate impacts associated with compliance, consistent with the Commission's requirement in the Order on the 2020 Filing.

1.1 VCEA Expected Resource Additions

APCo issued a series of RFPs for renewable resources and RECs in 2021 to meet the VCEA requirements and is seeking approval in both Virginia and West Virginia for several projects that resulted from that process. It is assumed for purposes of this Plan that both Virginia and West Virginia commissions will approve those investments and that each retail jurisdiction will receive its allocated share of costs and attributes. All other identified renewable resource additions are assumed to accrue exclusively to Virginia retail customers.

In the short term, APCo expects to acquire or contract for 498 MW of resources. These specific resources, which are the subject of the petition filed simultaneously with this report, are shown in Table 2.

TABLE 2 APCO PLANNED NEAR-TERM RESOURCE ADDITIONS

Facility	Nameplate Capacity MW	Owned / PPA	State	Resource Type	Operation
Firefly	150.0	Owned	Virginia	Solar	July 2024-June 2059
Amherst*	4.9	Owned	Virginia	Solar	Jan 2023 - Dec 2057
Horsepen	20.0	PPA	Virginia	Solar	Jan 2025 - Dec 2054
Dogwood*	18.9	PPA	Virginia	Solar	Jan 2025 - Dec 2054
Sun Ridge	50.0	PPA	Virginia	Solar	Jan 2025 - Dec 2054
Virginia Domiciled	**243.8**				
Top Hat	204.0	Owned	Illinois	Wind	Jan 2025 - Dec 2054
Bedington	50.0	Owned	West Virginia	Solar	Oct 2023 - Sep 2058
TOTAL	**498**				

*Distribution Resource

In addition, the Company expects the Depot (15 MW) and Wytheville (20 MW) solar facilities to be operational in late 2021-early 2022. The Leatherwood (20 MW) solar facility was placed in-service in September 2021. All of the renewable attributes of the Leatherwood and Wytheville facilities, which are PURPA projects, are being attributed to Virginia. Finally, the Company is proposing to add approximately 8 MW of energy storage for the purposes of improving reliability along its Glade Station – White Top circuit.

The RFP issued for RECs in May 2021 resulted in one bid. The Company elected not to pursue this bid based on its economic analysis, and will continue to issue RFPs for RECs from time to time to evaluate the cost effectiveness and level of availability of REC contracts as a compliance option.

As shown in Table 3 below, the Company will satisfy the 2023 interim wind and solar requirements of Section 56-585.5 D.1 by petitioning the Commission for approval to acquire approximately 155 MW of owned Virginia-domiciled solar facilities (Firefly and Amherst), and approximately 144 MW of contracted, third-party owned, Virginia-domiciled solar facilities (Wytheville, Leatherwood, Depot, Horsepen, Sun Ridge, and Dogwood). Progress towards the Virginia-domiciled resources that will be used for compliance with the 2023 petition requirement are listed in Table 3.

TABLE 3: APCO PROGRESS TOWARDS 56-585.5 D. WIND/SOLAR REQUIREMENTS

56-585.5.D Requirement	PPA	Owned	Total
YE 2023	70	130	200
YE 2027	140	260	400
YE 2030	210	390	600
2021 Plan	144	155	299

The VCEA section 56-585.5 E also contains interim storage resource requirements. See Table 4 for the Company's Progress towards these requirements. The Company expects to solicit bids for qualifying storage resources in a future RFP in 2022.

TABLE 4: APCO PROGRESS TOWARDS 56-585.5 E. STORAGE REQUIREMENTS

56-585.5.E Requirement	PPA	Owned	Total
YE 2025	9	16	25
YE 2030	53	98	150
YE 2035	140	260	400
2021 Plan	0	0	0

1.2 Virginia Clean Economy Act Near-Term Compliance

The Company met the RPS requirements of Section 56-585.5 C for 2021 largely with its current supply of renewable resources. In Table 5, the Company has prepared a projection of its expected position in terms of VCEA qualifying energy production versus each year's energy targets through 2025. Given the assumed production of the existing and planned energy resources, the Company projects a deficit in each year. It is anticipated this deficit will be addressed through the tactical purchase of RECs, when market conditions are favorable.

TABLE 5: APCO NEAR TERM VCEA ENERGY COMPLIANCE

Projected REC production and forecast requirments (MWh)

	2021	2022	2023	2024	2025

1.3 APCo's Coal Units

The Company is required to make certain environmental investments in its two coal plants (2,930 MW Amos, St. Albans, WV; 1,336 MW Mountaineer, New Haven, WV) in order for them to operate past 2028. In Case No. PUR-2020-00258, the Virginia SCC did not approve cost recovery for the Virginia jurisdictional share of the investment necessary to comply with the Effluent Limitation Guidelines (ELG) rule. As a result, the Company modeled two sets of scenarios: one with the two plants retiring at the end of 2028 and one with the plants retiring in 2040. During the performance of the analyses in this report, the Public Service Commission of West Virginia (WVPSC) ordered (Case No. 20-1040-E-CN) APCo to proceed with the investments necessary to keep the plants operational past 2028 and held that West Virginia customers will, if necessary, pay for the entire investment. There are unresolved issues associated with the sharing of capacity and energy benefits of these plants between the states if the Virginia SCC ultimately denies cost recovery of the ELG investment and the coal plants remain operational past 2028. For the purposes of discussion of the VCEA Plan (Portfolio 2) in this report, it is assumed that Virginia will continue to have the benefit of the two coal plants through 2040.

1.4 Environmental Justice

Appalachian is committed to the tenets of the Commonwealth's Policy on Environmental Justice and considers it in all prospective transactions for renewable resources. Identification and remediation of potential concerns are made during the RFP process, as discussed in the petition. Because Environmental Justice is specific to the communities immediately surrounding resources, meaningful screening can only be accomplished once potential sites have been identified. The Plexos® selected resource additions identified in this Plan are generic in nature and are not site specific and thus cannot be evaluated for potential Environmental Justice issues.

1.5 Reliability Impacts

Through Plexos®, the Company models reliability at a system level by ensuring that sufficient resources are available to meet customer load based on the hourly profile of both load and resources. Because the Company is a member of PJM, Plexos® has the option to fill energy deficits in any specific hour with market purchases. At this time, the Company expects that supply of energy from PJM will be available through at least 2030 when needed with pricing

based upon scarcity. The Company will continue to evaluate and identify potential reliability concerns and mitigation as renewable penetration increases in APCo's service territory, Virginia, and PJM.

2.0 VCEA Summary

In 2020, the General Assembly passed the VCEA, which was signed into law by Governor Northam. The VCEA is a transformative law that seeks to end carbon dioxide emissions from the electric utility industry in Virginia.[2]

2.1 VCEA Requirements

There are four primary requirements of the VCEA related to resource acquisition:

1. Annual RPS requirement. For APCo, this requirement is reproduced in Table 6 and begins at 6% in 2021 and escalates to 100% by 2050.

TABLE 6: APCO VCEA RPS REQUIREMENTS BY YEAR

Year	APCo RPS Requirement (%)	Year	APCo RPS Requirement (%)
2021	6	2036	53
2022	7	2037	53
2023	8	2038	57
2024	10	2039	61
2025	14	2040	65
2026	17	2041	68
2027	20	2042	71
2028	24	2043	74
2029	27	2044	77
2030	30	2045	80
2031	33	2046	84
2032	36	2047	88
2033	39	2048	92
2034	42	2049	96
2035	45	2050 and thereafter	100%

2. Development of Virginia domiciled solar and wind resources. APCo is required to petition the Commission for 600 MW solar or wind resources by December 31, 2030, with interim targets beginning December 31, 2023; 35% of those resources are required to be contracted via PPA. The Company is using nameplate capacity to determine compliance with these requirements.

[2] Appalachian is a "Phase I" utility as defined in Section 56.585.1. A.1. of the Code of Virginia. As such, this report will refer to the requirements in the VCEA that only apply to Appalachian.

3. Development of Energy Storage resources. By December 31, 2035, the VCEA requires APCo to have petitioned the Commission for necessary approvals to construct or acquire 400 MW of energy storage capacity, or more with Commission approval. These resources must meet the same 35% PPA requirement that applies to the Virginia domiciled solar and wind resources. Further, 10% of the battery installations are required to be behind the meter (BTM) installations.

   The Commission opened Case No. PUR-2020-00120 to establish rules and regulations for the required addition of storage and subsequently issued regulations to determine the appropriate timing of storage additions on December 18, 2020. The Company is working to identify the preferred location and size of storage resources, and will issue an RFP in 2022 for storage resources. See Table 7 for those interim storage addition minimums[3].

TABLE 7: VCEA REQUIRED STORAGE ADDITIONS

Date	New Storage Additions (MW)	Cumulative Storage Additions (MW)
12-31-2025	25	25
12-31-2030	125	150
12-31-2035	250	400

4. Energy Efficiency requirement. APCo must implement energy efficiency measures that achieve energy savings equivalent to at least 2% of the Company's 2019 retail sales by 2025. The VCEA also specifies that the Commission shall establish new EE requirements for the period of 2026 to 2028, and for every three year period thereafter. Due to the uncertain nature of any future proceeding regarding the efficacy or cost-effectiveness of additional EE, the amount of EE requirements set by the Commission was assumed to remain constant beyond 2025, with any additional EE in future years only being selected for economic purposes.

[3] Order for Notice and Comment, *Commonwealth of Virginia, ex rel., State Corporation Commission Ex Parte: In the matter of establishing rules and regulations pursuant to §56-585.5 E 5 of the Code of Virginia related to the deployment of energy storage*, Case No. PUR-2020-00120, Doc. Con. Cen. No. 200910238 (Sept. 11, 2020).

2.1.1 Commission Filing Requirements

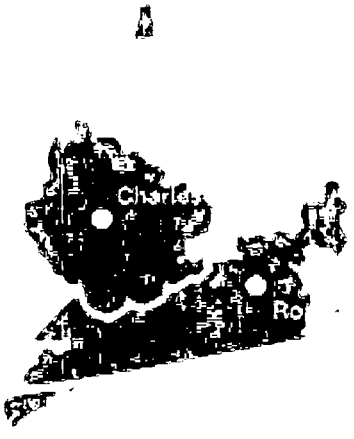
In the Attachment to its July 10, 2020 *Order Establishing 2020 RPS Proceedings*, the Commission set forth certain filing requirements. In addition, in the Order on the 2020 Filing, the Commission imposed certain requirements for this 2021 VCEA filing. The requirements of each of these orders, along with a description of where they are addressed in this report, are contained in Appendix E.

3.0 APCo Company Summary and Assumptions Overview

3.1 Overview of APCo

APCo's customers are retail and sales-for-resale (wholesale) customers located in the states of Virginia, West Virginia and Tennessee (see Figure 1). Currently, APCo serves nearly 1 million customers, with nearly 540,000 of those customers being in Virginia. The peak load requirement of APCo's total retail and wholesale customers is seasonal in nature, with distinctive peaks occurring in the summer and winter seasons. APCo's all-time highest recorded peak demand was 8,708 MW, which occurred in February 2015, and the highest recorded summer peak was 6,755 MW, which occurred in August 2007. The most recent (summer 2021 and winter 2020/21) actual APCo summer and winter peak demands were 5,348 MW and 5,975 MW, occurring on August 24, 2021 and February 8, 2021, respectively.

FIGURE 1: APCO'S SERVICE TERRITORY



3.2 APCo's existing resources

APCo serves its customers through owned generation resources and PPAs for renewable resources. See Table 8 and Table 9 for a summary of these owned and contracted resources, respectively.

TABLE 8: APCO OWNED GENERATION RESOURCES

Plant	Capacity [MW[1]]	No. of Units	Location	Fuel	First Unit Commissioned	Retirement Date
John E. Amos	2930	3	Winfield, WV	Coal	1971	2040*

3.3 Key Modeling Assumptions

Key assumptions included in the VCEA Plan

1. Appalachian Power operates in both Virginia and West Virginia and is subject to regulation in both states, with resource acquisition determinations made by regulators

in both states and resource costs allocated between the jurisdictions. The Company assumes, for the purposes of this Plan, that all of the specific resources in Table 4 will be approved by both Virginia and West Virginia. Subsequent renewable resources will accrue entirely to Virginia retail customers. There is not currently a renewable portfolio standard in place in West Virginia.

2. The Company's base case assumption is that Amos and Mountaineer coal-fired plants will run through 2040 consistent with the WVPSC's order in Case No. 20-1040-E-CN. After 2040, the Company has assumed, in the VCEA Plan, that capacity shortfalls will be met with a combination of renewable generators and energy storage. In other cases where the Company modeled fossil additions for informational purposes, it is understood that those resources would necessarily be located outside of Virginia.
3. The Company will sell the REC bank that it accumulated through the end of the Voluntary RPS in 2020 during 2021 for the benefit of customers that were subject to the voluntary RPS. As a consequence, the Company's starting REC position for the VCEA is zero.
4. RECs were made available to the Plexos® model as a resource option that could be selected if they were a less costly VCEA compliance option than other renewable resources, based on an assumed REC price curve. Projected RECs in excess of any one year's VCEA energy requirement were assumed to be sold the following year in order to reduce overall compliance costs.
5. Any capacity additions resulting in excess capacity above the Company's minimum PJM UCAP capacity requirement were modeled to be sold to either the PJM capacity market or to a third party under a bilateral purchased power agreement beginning in 2026, at the Company's fundamental PJM capacity price forecast.
6. The Company's existing renewable resources are contributing to the VCEA renewable energy goals. Existing renewable resources are allocated based on the ratio of APCo Virginia retail load (including Public Authority and Commonwealth customers) to total company load, which is estimated to be 50.1%. Existing contracts are modeled as ending on their expiration date and are not expected to be renewed.

3.4 APCo Load Forecast

The APCo load forecast was developed by the American Electric Power Service Corporation (AEPSC) Economic Forecasting organization and completed in June 2021.[4] The load forecast is the culmination of a series of underlying forecasts that build upon each other. The economic forecast provided by Moody's Analytics is used to develop the customer forecast,

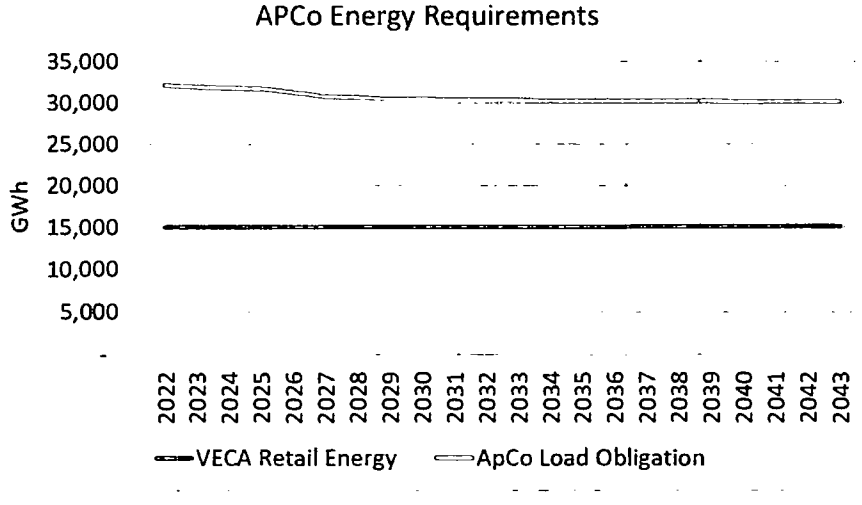
[4] The load forecasts (as well as the historical loads) integral to this Plan reflect the traditional concept of internal load, i.e., the load that is directly connected to the utility's transmission and distribution system and that is provided with bundled generation and transmission service by the utility. Such load serves as the starting point for the load forecasts used for generation planning. Internal load is a subset of *connected load*, which also includes directly connected load for which the utility serves only as a transmission provider. Connected load serves as the starting point for the load forecasts used for transmission planning.

which is then used to develop the sales forecast, which is ultimately used to develop the peak load and internal energy requirements forecast.

Over the next 15-year period (2022-2036),[5] APCo's service territory is expected to see population to decline at 0.3% per year and non-farm employment growth 0.3% per year, and APCo is projected to see its customer count decline by 0.1% over this period. Over the same forecast period, APCo's retail sales are projected to decline at 0.2% per year, with growth expected from the industrial class (+0.2% per year) while the residential class is projected to decline at a compounded annual growth rate (CAGR) of 0.4% per year. Finally, APCo's internal energy is expected to decline by 0.4% per year and peak demand is expected to decline by 0.6% per year through 2036. For this forecast, it has been assumed that APCo's current wholesale customers will not renew their contracts beyond the current contract expiration dates, resulting in removal of their load from the forecast.

Figure 2 shows both the total load forecast for APCo and the Virginia retail sales applicable to the VCEA. The Company understands "retail" as defined in the Code to include the Public Authority and Commonwealth customers in Virginia, for the purposes of determining VCEA RPS requirements. These forecasted retail sales along with the annual VCEA energy targets provided a key input into the development of the proposed VCEA Plan.

FIGURE 2: APCO ENERGY REQUIREMENTS



3.5 The Fundamentals Forecast

The Fundamentals Forecast is a long-term, weather-normalized commodity market forecast principally based upon the assumptions contained in the Energy Information Administration's Annual Energy Outlook (AEO). It is provided to AEPSC and all AEP operating companies for purposes such as resource planning, capital improvement analyses, fixed asset impairment accounting, and others. These projections cover the electricity market within the Eastern Interconnect, the Electric Reliability Council of Texas, and the Western Electricity Coordinating Council. The Fundamentals Forecast includes, among other factors: 1) hourly, monthly and annual regional power prices (in both nominal and real dollars); 2) prices for various qualities of coals; 3) monthly and annual locational natural gas prices, including the benchmark Henry Hub; 4) nuclear fuel prices; 5) SO_2, NO_x, and CO_2 burden values; 6) locational implied heat rates; 7) electric generation capacity values; 8) renewable energy subsidies; and 9) inflation factors; 10) VCEA compliance for Virginia utilities among others.

Table 10 below describes the Fundamentals Forecast components, which are sourced directly from the EIA AEO, from third party energy consultancies, or were sourced internally. As the EIA AEO does not provide the granularity for most regulatory applications, the Aurora energy market simulation model was utilized to create a reasonable proxy for the EIA AEO while providing the level of detail necessary for downstream consumption.

TABLE 10: FUNDAMENTALS FORECAST COMPONENTS

Forecast Components	EIA	Other	Source

Transmission/links between Zones		✓	AEP Fundamentals

The Fundamentals Forecasts incorporates requirements of the Virginia Clean Energy Act and the Regional Greenhouse Gas Initiative (RGGI) for both APCo and Dominion:

- Including Virginia in the RGGI, applying RGGI CO_2 prices through 2027 before switching to an assumption of a higher $15/metric ton national standard in 2028
- Applying the Virginia RPS program to Phase I and Phase II utilities within the state
- Retiring all fossil units named in the VCEA law by stated retirement dates
- Retiring all remaining Phase I fossil units by 2050 and Phase II fossil units by 2045
- Including the resource additions required for Dominion under the VCEA based upon the Company's understanding of those requirements

The Aurora model iteratively generates zonal, but not company-specific, long-term capacity expansion plans, annual energy dispatch, fuel burns and emission totals from inputs including fuel, load, emissions, and capital costs, among others. Ultimately, Aurora creates a weather-normalized, long-term forecast of the market in which a utility would be operating. AEPSC also has ample energy market research information available for its reference, which includes third-party consultants, industry groups, governmental agencies, trade press, investment community, AEP-internal expertise, various stakeholders, and others. The Aurora model is widely used by utilities for integrated resource and transmission planning, power cost analysis

and detailed generator evaluation. The database includes approximately 25,000 electric generating facilities in the contiguous United States, Canada, and Baja Mexico. These generating facilities include wind, solar, biomass, nuclear, coal, natural gas, and oil. A licensed online data provider, ABB Velocity Suite, provides up-to-date information on markets, entities and transactions along with the operating characteristics of each generating facility, which are subsequently exported to the Aurora model.

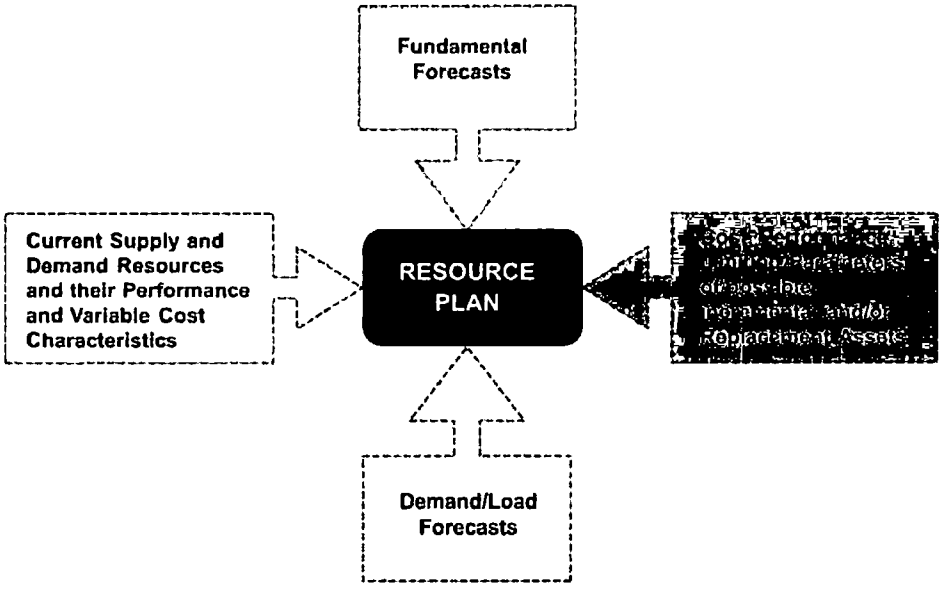
The annual results from each scenario developed are shown in Appendix A and include on-peak and off-peak energy prices, natural gas prices, coal prices, CO_2 prices and capacity prices.

3.6 Determining Compliant VCEA Plans

For the purposes of modeling compliance with the VCEA, APCo used a process nearly identical to its typical IRP process, which used the Plexos® model to address the gap between resource needs and current resources, while also including minimums related to the requirements established under the VCEA for energy from renewable resources, energy savings from energy efficiency resources and capacity from energy storage resources.

Given the cost and performance parameters around sets of potentially available proxy resources–both supply and demand side–and a scenario of economic conditions that include long-term fuel prices, capacity costs, energy costs, emission-based pricing proxies including CO_2, as well as projections of energy usage and peak demand, Plexos® will return the optimal suite of proxy resources (portfolio) that meet the resource need. Portfolios created under similar pricing scenarios may be ranked on the basis of cost, or the net present value of the resulting stream of revenue requirements. The least cost option is considered the optimum portfolio for that unique input parameter scenario.

FIGURE 3: RESOURCE PLANNING DIAGRAM



4.0 Supply- and Demand-side Resource Options

Supply-side resource options including natural gas base/intermediate and peaking generating technologies and intermittent renewable resources including large-scale solar, wind and battery storage were selectively made available in different scenarios to develop compliant plans.[6] To reduce the computational problem size within Plexos®, the number of alternatives explicitly modeled was reduced through an economic screening process that analyzed various supply options and developed a quantitative comparison levelized over technologies life cycle. It is important to note that alternative technologies with comparable cost and performance characteristics, subject to limitations included in Section 56-585.5, can ultimately be substituted, should technological or market-based profile changes warrant.

Table 11 includes a summary of the technologies made available to the model, depending upon scenario, and their associated performance parameters. These generation technologies were intended to represent reasonable proxies for each capacity type (base-load, intermediate, peaking). Subsequent substitution of specific technologies could occur in any later plan, based on emerging economic or non-economic factors not yet identified.

Other generation resource technologies were not made available to Plexos® due to their respective costs, and to improve modeling process time. Technologies such as natural gas resources with carbon capture and storage, hydrogen-capable combustion turbines, long duration storage, and small modular nuclear reactors were evaluated and found not to be competitive on cost when compared to the resource types shown in Table 11 which were made available to Plexos®, APCo will continue to monitor developments in these and other technologies and including cost, availability, and the availability of federal tax credits, which could make these resources more attractive options in the future.

[6] The Company referred to the EIA ANNUAL ENERGY OUTLOOK 2020 report (https://www.eia.gov/outlooks/aeo/pdf/aeo2020.pdf) and the associated EIA Capital Cost and Performance Characteristic Estimate for Utility Scale Electric Power Generating Technologies (https://www.eia.gov/analysis/studies/powerplants/capitalcost/pdf/capital_cost_AEO2020.pdf) to inform the analysis process.

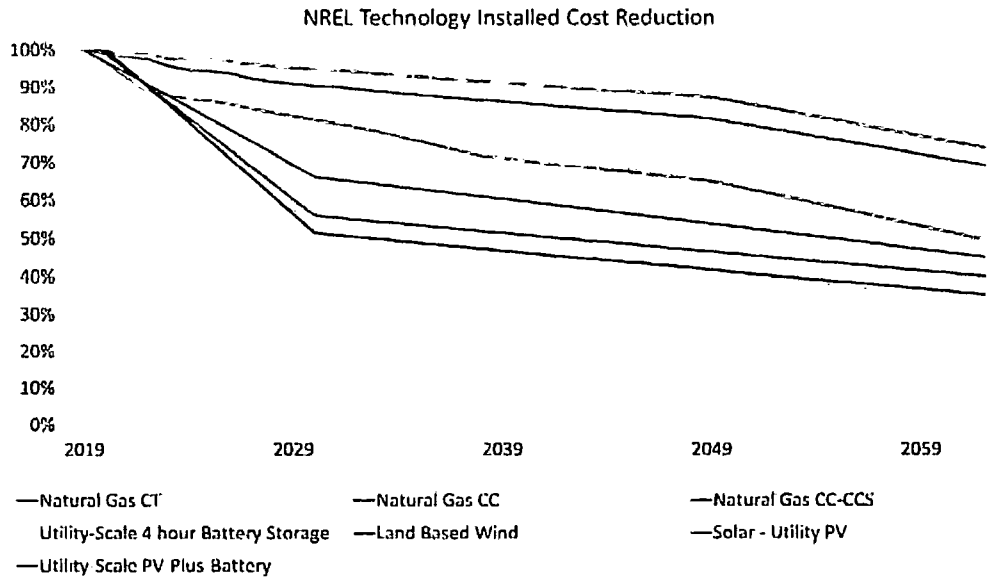
(b) Installed cost, capability and heat rate numbers have been rounded
(c) All costs in 2021 dollars, except as noted. Costs adjustments made based on EIA report Cost and Performance Characteristics of New Generating Technologies, Annual Energy Outlook 2020 - Region 11 (PJMW)
(d) $/kW costs are based on summer capability
(e) All Capabilities adjusted by the Performance Adjustment Factors defined in the reference report (a)
(f) Total Plant Investment Cost w/AFUDC (AEP rate of 6.41%,site rating $/kW)
(g) Levelized cost of energy based on capacity factors shown in table
(h) Dollars are in 2023 informed by ApCo RFP
(i) Dollars are in 2023 informed by Bloomberg New Energy Finance's (BNEF) 2H 2020 U.S. Renewable Energy Market Outlook

For this analysis, the Company adopted "learning curve" forecasts published by the National Renewable Energy Laboratory (NREL) in its 2021 Annual Technology Baseline (ATB)[7] for capital costs for all resource types and for wind and solar O&M costs. The notion behind learning curve forecasts is that over time real costs will come down due to economies of scale, technology improvements, manufacturing improvements, and other factors. NREL forecasts that overnight installed capital costs will decline over time for all of these resource options. These effects of the cost reduction rates as a percentage of 2019 price are illustrated in Figure 4 and applied to the technology installed cost forecasts used in the Plexos® modeling. For a table of the overnight installed cost per technology in 2019 real dollar terms with the NREL learning rates, please see Appendix E: Overnight Installed Cost of Technologies in 2019 Real Dollars ($/kW) The Company then applied a forecasted inflation rate to these real dollar

[7] https://atb.nrel.gov/

amounts to convert them to the nominal dollars over the 30 year forecast period, for the purposes of determining the actual future installation costs for each resource type.

FIGURE 4: NREL CAPITAL COST LEARNING CURVES (2019$)



4.1 Power Purchase Agreement (PPA) Options

Consistent with the requirements in Section 56-585.5.D.4, the Plan reflects, in the aggregate and over its duration, a 35% PPA – 65% ownership split for the Virginia jurisdictional share of new Solar and Wind resources. The modeling attempted to maintain approximately this ownership to PPA ratio over a period of years, not in each individual year. In practice, the amount of PPA versus owned wind and solar added in any one year will be the result of competitive solicitations subject to regulatory approval.

PPA resource costs were informed from the results of the RFPs APCo issued in 2021. The PPA bids in response to those RFPs were on average 8% less expensive than owned asset bids. This difference was used as an initial proxy for this analysis to determine the levelized PPA costs relative to levelized owned costs for solar, wind and hybrid solar resources and are not reflective of long-term pricing differences including tax credit effects. This does not necessarily reflect the results of future RFPs and does not include other factors both explicit and implicit regarding ownership benefits. Actual owned and PPA resource costs will be identified in future solicitations for specific resources and may depend on multiple factors including federal tax policy.

4.2 Baseload & Peaking Resource Options

For Baseload resources, the Company modeled two natural gas combined cycle configurations shown in Table 11, the multi-shaft 1,100 MW resource and the single shaft, 430 MW resource. For Peaking resource options, the Company modeled the three resources including a 240 MW combustion turbine (CT), a 105 MW aero-derivative engine (AD) and a 20 MW Reciprocating Internal Combustion Engine (RICE).

4.3 Intermittent and Renewable Resource Options

Various intermittent and renewable generating technologies were available for selection by the model, with constraints for each year equivalent to the requirements of the VCEA for Scenarios 1-4. Development of these resources continue to grow as advancements in both solar photovoltaics and wind turbine manufacturing have reduced both installed and ongoing costs.

Renewable energy resources, because of their intermittent nature, typically provide more energy value than capacity value, and PJM continues to refine its guidance on the Effective Load Carrying Capability (ELCC) for intermittent resources. In general, under the current PJM draft guidance, as intermittent resources continue to increase in relation to the total of all PJM resources, the planning capacity credit of new renewable resources added to the system will decline. The Company referred to PJM's July 2021 ELCC Report[8] to inform the plan for intermittent resource contributions to the Company's capacity obligations. A summary chart of the ELCC levels assumed in this plan is shown in Figure 5. PJM's July 2021 ELCC Report did not produce projections beyond 2031. For the Company's analysis, the 2031 ELCC values were held constant until the end of the planning horizon.

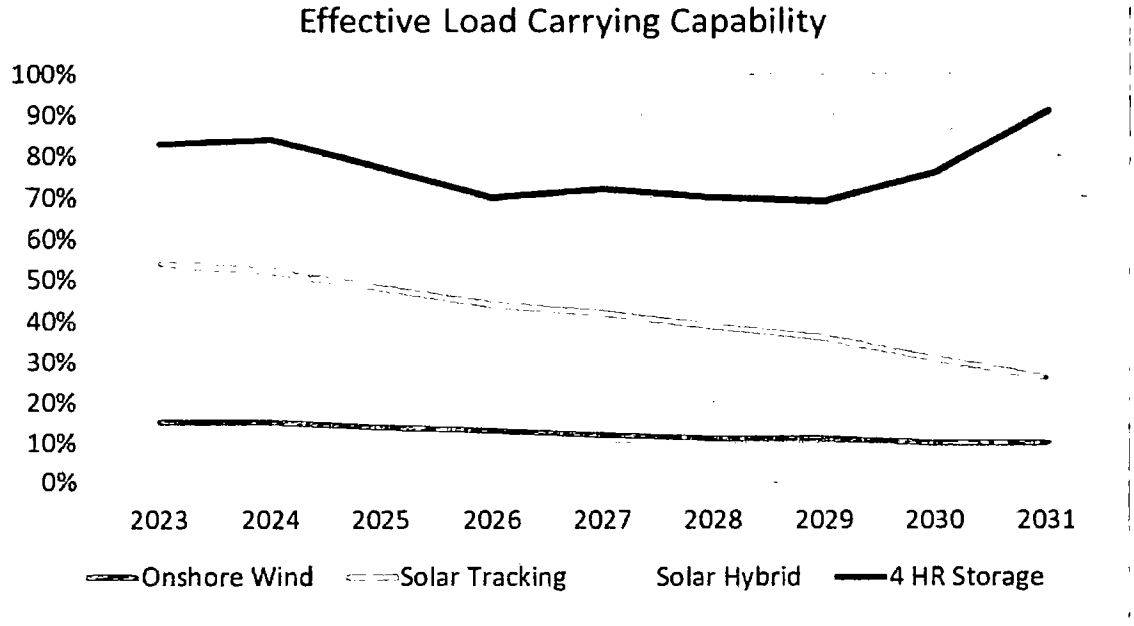
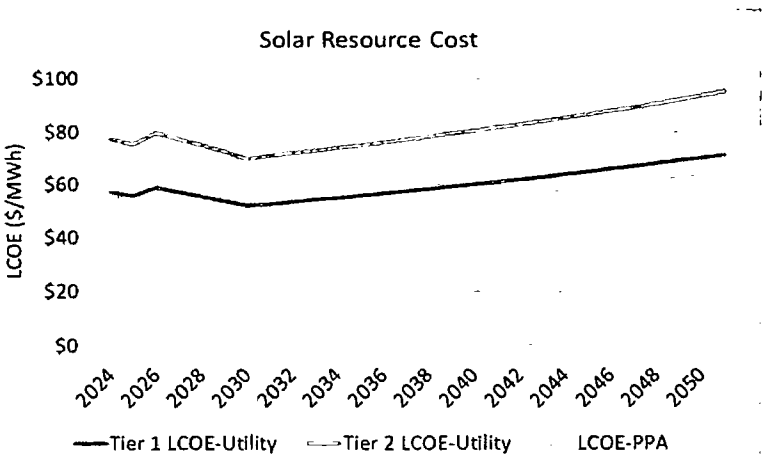
FIGURE 5: PJM EFFECTIVE LOAD CARRYING CAPABILITY (ELCC)



4.3.1 Solar

Large-scale solar resources were available starting in 2025. The Company relied on information from the RFP of owned assets for APCo to model prospective owned solar costs for assets to be placed in service in early 2025. Tier 1 build cost was based upon the top bid in the RFP and Tier 2 based upon the average of bids excluding winning bid. Figure 6 illustrates the forecasted Utility Tier 1, Tier 2, and PPA Solar levelized cost of energy (LCOE) through time. The costs included in these estimates include all costs that would be expected, including a return on rate base, depreciation, land leases, operations and maintenance expense, property taxes, insurance, asset retirement costs, and normalization of the solar investment tax credit (ITC). The property tax and land lease assumptions are tailored to this analysis based on the Company's experience with tax rates in its service territory, and from evaluating specific resources located in both Virginia and in other PJM states.

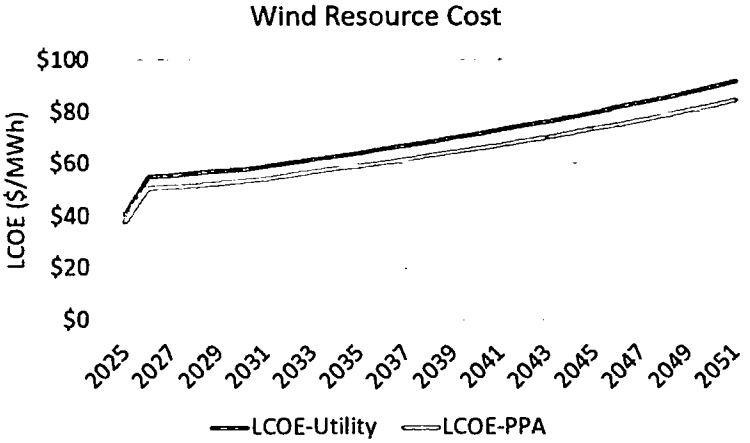
FIGURE 6: SOLAR RESOURCE LCOE



4.3.2 Large-Scale Wind

For Portfolios 1-5, the Company assumed a 35% capacity factor for the new wind resource. Additionally, the Company prepared Portfolio 6 in which the wind capacity factors were assumed to be equivalent to historical 30.4% capacity factor of APCo's existing wind resources. The build cost was based on Bloomberg New Energy Finance's (BNEF) 2H 2020 U.S. Renewable Energy Market Outlook. Figure 7 illustrates the forecasted Utility and PPA Wind LCOEs. The increase from 2025 to 2026 in this figure is due to the expiration of the currently available wind Federal production tax credits. Increases after 2026 are inflation driven.

FIGURE 7: WIND RESOURCE LCOE



4.3.3 Energy Storage

The stand-alone Energy Storage resource modeled in this plan is a Lithium-ion storage technology and has a nameplate rating of 50 MW/200 MWh, with a round trip efficiency of

82.3%. The modeling of Energy Storage utilized the values shown in Table 12, with the nameplate rating adjusted from 50 MW to 25 MW to align with the storage levels in the Commission's order regarding the interim requirements. A Storage PPA option was not modeled as separate resource from an owned storage resource, under the assumption that the cost of the solar resource included in the model represents a blend of owned and PPA. Both PPA and owned storage resources will be considered in future RFPs.

4.3.4 Hybrid Solar / Storage

Hybrid Solar systems include a Solar PV plant with a 4 hour closed loop battery storage system associated with it. For this analysis, a 150 MW_{ac} solar plant was modeled, coupled with a 50 MW (200 MWh) Li-Ion Battery Energy Storage system.

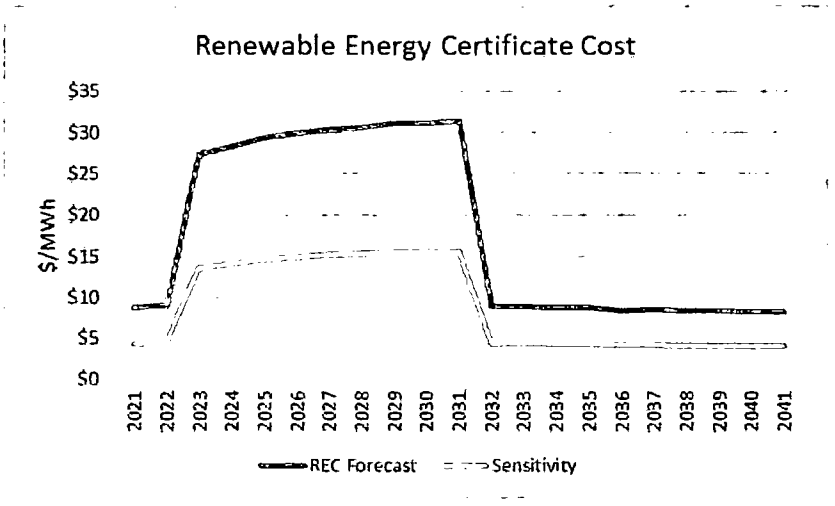
4.3.5 Renewable Energy Certificates (RECs)

The Company included RECs as a RPS energy compliance option in the Plexos® modeling, allowing the model to choose whether to build physical resources or purchase RECs based on economics. In this analysis a 150 MW block of utility solar with an assumed ~350 GWh set the size for a single REC addition in the model. The first year when RECs could be added was assumed to be 2025. A third party forecast provided by S&P Global[9], as shown in Figure 8, was used for the base REC price forecast in all portfolios. The number of RECs selected by the model in each portfolio is presented in Appendix B. Higher and lower priced REC sensitivity cases were also prepared.

A lower priced REC sensitivity case was also prepared, based on an assumption that RECs would be available of 50% of the cost of the base REC forecast curve. That price curve is also shown in Figure 8. The results of that sensitivity analysis are presented in Section 5.

[9] S&P Global, SPGlobalMI_RECForecast_2021Q2_06302031, available by subscription.

FIGURE 8: REC PRICE FORECAST



4.3.6 Annual and Cumulative Resource Limits

For each portfolio, annual and cumulative intermittent and renewable resource limits were determined based on simultaneous consideration of multiple regulatory requirements. All six portfolios are VCEA-compliant. Different limits were necessarily applied to each portfolio based on the unique assumptions of each portfolio, such as the assumed retirement date of Amos and Mountaineer, as well as whether gas-fired options were available. Table 12 contains a summary of the limits for the wind, solar, storage, and REC options included in the modeling for each portfolio.

TABLE 12: NEW RESOURCE LIMITATIONS

New Resource Assumptions							
Resource Type	**First Year Available**	**Life**	**Portfolio 1,2,6**	**Portfolio 3 &4**	**Portfolio 5**	**Individual Technology Total**	**Cumulative Technology Total**
Solar PPA	1/1/2025	35 years	150 MW/yr	300 MW/yr	150 MW/yr	900 MW	3,150 MW
Solar Utility T1		35 years	300 MW/yr	600 MW/yr	300 MW/yr	2,100 MW	
Solar Utility T2		35 years	150 MW/yr	300 MW/yr	150 MW/yr		
Solar Hybrid		35 years	150 MW Block 450 MW/yr			1,050 MW	
Wind PPA Limits	1/1/2026	30 years	100 MW/yr	300 MW/yr	100 MW/yr	350 MW Total	950 MW
Wind Owned Limits	1/1/2026	30 years	200 MW/yr	600 MW/yr	-	600 MW Total	
Wind Owned Limits	1/1/2026	30 years	- - - - -	- - - - -	2026 1,200 MW 2028 2,600 MW 2030 3,600 MW 2032 4,600 MW 2035 5,000 MW	5,000 MW Total	5,350 MW
Renewable Energy Certificates	1/1/2025	5 years	20 Blocks/yr			~7,000 GWh	~7,000 GWh
Stand Alone Storage	1/1/2025	10 years	2,500 MW/yr			12,500 MW	12,500 MW
NG 240 MW Combustion Turbine	1/1/2026	30 years	P1 unlimited P2 N/A	P3 unlimited P4 N/A	N/A	Unlimited	Unlimited
NG 1,100 MW Combined Cycle	1/1/2026	30 years	P1 unlimited P2 N/A	P3 unlimited P4 N/A	N/A	Unlimited	Unlimited

The primary regulatory constraints considered in setting the annual and cumulative resource limits were 1) PJM minimum capacity requirements; 2) VCEA annual Virginia-jurisdictional renewable energy targets; 3) VCEA 35% wind and solar PPA requirements; and 4) near term (prior to 2030) VCEA wind, solar, and storage new resource requirements. All of these constraints must be applied simultaneously. Compliance with the minimum obligations under any one of these requirements, such as the VCEA annual energy targets, could and did lead to substantial over-compliance with other requirements, such as PJM's minimum capacity requirement, in some portfolios. In addition, to the extent possible, the Company spread out resource additions gradually over time, rather than all at once, to help mitigate near-term rate increases that can result from adding required resources. This can result in the addition of resources earlier than the year in which one of these regulatory obligations requires them. Finally, there are practical limits regarding the absolute levels of cost-effective renewable capacity that are available in Virginia and more broadly across PJM.

The timing of the assumed retirement of Amos and Mountaineer also impacted the resource limitations. This resulted in higher annual wind and solar limits in Portfolios 3 and 4 than in Portfolios 1 and 2 in order to allow more resources to be constructed during the period prior to Amos and Mountaineer retiring in 2028. This constraint also resulted in a high annual limit for storage resources in all portfolios in order to allow enough storage to be selected for its capacity to replace a substantial share of the capacity that would be lost when Amos and

Mountaineer retire. This also drives a high cumulative lifetime storage limit, if storage is selected again at the end of its 10-year useful life, if the model deemed it to be the most economic option available.

Lastly, the near-term availability of Virginia domiciled wind and solar resources was considered. Based on the numbers of bids received of each resource type in the two RFP's issued in 2021, solar resources are expected to be more widely available than wind, and the quantity of wind MW available in Virginia could be quite limited. As a result, higher limits were allowed for solar than wind.

By choosing these limits for the various scenarios, the Company is not expressing an opinion regarding whether these levels of resources are in fact available, or whether adding that level of a given resource is desired. The assumption that 2,500 MW of storage could be added to a Company the size of APCo in any one year, or even cumulatively prior to 2030, is particularly aggressive. These limits are simply an attempt to give the model enough available capacity and energy options to meet the necessary PJM and VCEA requirements in all years of the analysis from a portfolio of all of the available resource types under each scenario.

4.4 Demand-Side Resource Options

4.4.1 Energy Efficiency

The Company included both Residential and Commercial/Industrial energy efficiency bundles as demand-side resource options to consider. Table 13 shows the Residential Bundles cost and potential by year, and Table 14 shows the Commercial/Industrial Bundles included in the model.

TABLE 13: RESIDENTIAL EE BUNDLES

Bundle	Installed Cost ($/kWh)	Yearly Potential Savings (MWh) 2022-2026	Yearly Potential Savings (MWh) 2027-2031	Yearly Potential Savings (MWh) 2032-2036	Yearly Potential Savings (MWh) 2037-2041	Bundle Life
Thermal Shell - AP	$0.21	6,621	2,794	3,120	2,824	10
Thermal Shell - HAP	$0.31	20,514	54	0	0	10
Heating/Cooling - AP	$0.68	49,323	7,365	0	0	18

Outdoor Lighting - AP	$0.38	3,946	567	0	0	15
Outdoor Lighting - HAP	$0.57	4,384	0	0	0	15

4.4.2 Demand Response

The Company included one Demand Response resource option to be considered, which is based on a Residential Bring-Your-Own-Thermostat program. Table 15 shows the characteristics of this resource.

TABLE 15: APCO DEMAND RESPONSE

Sector	Participants	Demand Savings (kW)	Energy Savings (kWh)	Enrollment Cost	Annual Cost	Total First Year Cost	Service Life (Years)
Residential	2,500	3,375	70,000	$165,000	$950,500	$1,115,500	7

4.4.3 Volt VAR Optimization

The Company included Volt VAR Optimization (VVO), which represents a form of voltage control that allows the grid to operate more efficiently as a resource option. VVO sensors and intelligent controllers monitor load flow characteristics and direct controls on capacitor and voltage regulating equipment in order to optimize power factor and voltage levels. Power factor is the ratio of real or active power (MW) to apparent power (MVA), and is a characteristic of electric power flow that is controlled to optimize power flow on an electric network. Power factor optimization also improves energy efficiency by reducing losses on the system. VVO enables Conservation Voltage Reduction (CVR) on a utility's system. CVR is a process by which the utility systematically reduces voltages in its distribution network, resulting in a proportional reduction of load on the network. Voltage optimization can allow a reduction of system voltage that still maintains minimum levels needed by customers, thereby allowing customers to use less energy without any changes in behavior or appliance efficiencies.

Although there are no "embedded" incremental VVO load reduction impacts implicit in the load forecast, VVO has been modeled as a unique EE resource. Table 16 below shows the resource characteristics of the VVO resources made available to the model in all portfolios.

TABLE 16: VVO RESOURCES

Tranche	No. of Circuits	Capital Investment	Annual O&M	Demand Reduction (kW)	Energy Reduction (MWh)
1	36	$12,600,000	$378,000	11,172	45,996
2	36	$12,600,000	$378,000	9,639	39,684
3	36	$12,600,000	$378,000	8,799	36,227
4	36	$12,600,000	$378,000	8,298	34,163
5	36	$12,600,000	$378,000	7,826	32,222
6	36	$12,600,000	$378,000	7,458	30,705
7	36	$12,600,000	$378,000	7,126	29,340
8	36	$12,600,000	$378,000	6,884	28,343
9	36	$12,600,000	$378,000	6,629	27,292
10	36	$12,600,000	$378,000	6,435	26,493
11	36	$12,600,000	$378,000	6,186	25,470
12	36	$12,600,000	$378,000	5,909	24,329
13	36	$12,600,000	$378,000	5,849	24,081
14	36	$12,600,000	$378,000	5,473	22,532

4.4.4 Distributed Generation

The Company included both the capacity and energy associated with Distributed Generation in all six portfolios. Figure 9 shows the cumulative nameplate DG MW forecasted to be installed. For capacity planning purposes, the Company referred to the PJM ELCC report discussed in Section 4.3, beginning at 38% of the nameplate value in 2023. The associated energy produced from this customer-owned DG was assumed to not be part of the Company's achievement of the VCEA RPS requirement.

Attachment 81

VIRGINIA ACTS OF ASSEMBLY — CHAPTER

An Act to amend and reenact §§ 56-581, 56-585.1, 56-585.1:4, and 56-599 of the Code of Virginia and to amend the Code of Virginia by adding a section numbered 56-249.6:1, relating to Virginia Electric Utility Regulation Act; financing for certain deferred fuel costs; review proceedings; rates; return on common equity; rate adjustment clauses; capitalization ratio.

[H 1770]

Approved

Be it enacted by the General Assembly of Virginia:

1. That §§ 56-581, 56-585.1, 56-585.1:4, and 56-599 of the Code of Virginia are amended and reenacted and that the Code of Virginia is amended by adding a section numbered 56-249.6:1 as follows:

§ 56-249.6:1. Financing for certain deferred fuel costs.

A. Notwithstanding the provisions of § 56-249.6 or Chapter 3 (§ 56-55 et seq.), an electric utility, on or before July 1, 2024, may petition the Commission for a financing order and the Commission shall either issue (i) such financing order or (ii) an order rejecting the petition, no more than four months from the date of filing such petition and in accordance with the requirements of subdivision 2.

1. The petition shall include (i) an estimate of the total amount of deferred fuel costs that the electric utility has incurred over the time period noted in the petition; (ii) an indication of whether the electric utility proposes to finance all or a portion of the deferred fuel costs using one or more series or tranches of deferred fuel cost bonds; (iii) an estimate and details of the financing costs related to the deferred fuel costs to be financed through the deferred fuel cost bonds; (iv) an estimate of the deferred fuel cost charges necessary to recover the deferred fuel costs and all financing costs and the proposed period for recovery of such costs; (v) a description of any benefits expected to result from the issuance of deferred fuel cost bonds, including the avoidance of or significant mitigation of abrupt and significant increases in rates to the electric utility's customers for the applicable time period; and (vi) direct testimony and exhibits supporting the petition. If the electric utility proposes to finance a portion of the deferred fuel costs, the electric utility shall identify in the petition the specific amount of deferred fuel costs for the applicable time period to be financed using deferred fuel cost bonds. By electing not to finance a portion of the deferred fuel costs for an applicable time period using deferred fuel cost bonds, an electric utility shall not be deemed to waive its right to recover such costs pursuant to a separate proceeding with the Commission.

2. a. If an electric utility petitions the Commission for a financing order pursuant to this section, following notice and an opportunity for hearing, the Commission shall either issue (i) a financing order or (ii) an order rejecting the petition, not more than four months from the date of filing such petition.

b. A financing order issued by the Commission pursuant to this section shall include:

(1) The amount of deferred fuel costs to be financed using deferred fuel cost bonds. The Commission shall describe and estimate the amount of financing costs that may be recovered through deferred fuel cost charges. The financing order shall also specify the period over which deferred fuel costs and financing costs may be recovered and whether the deferred fuel cost bonds may be offered and issued in one or more series or tranches during a fixed period not to exceed one year after the date of the financing order;

(2) A finding that the proposed issuance of deferred fuel cost bonds is in the public interest and the associated deferred fuel cost charges are just and reasonable;

(3) A finding that the structuring and pricing of the deferred fuel cost bonds are reasonably expected to result in reasonable deferred fuel cost charges consistent with market conditions at the time the deferred fuel cost bonds are priced and the terms set forth in such financing order;

(4) A requirement that, for so long as the deferred fuel cost bonds are outstanding and until all financing costs have been paid in full, the imposition and collection of deferred fuel cost charges authorized under a financing order shall be non-bypassable and paid by all retail customers of the electric utility, irrespective of the generation supplier of such customer, except for an exempt retail access customer;

(5) A formula-based true-up mechanism for making annual adjustments to the deferred fuel cost charges that customers are required to pay pursuant to the financing order and for making any adjustments that are necessary to correct for any overcollection or undercollection of the charges or to otherwise ensure the timely payment of deferred fuel cost bonds and financing costs and other required amounts and charges payable in connection with the deferred fuel cost bonds;

(6) The deferred fuel cost property that is, or shall be, created in favor of an electric utility or its successors or assignees and that shall be used to pay or secure deferred fuel cost bonds and all financing costs;

(7) The authority of the electric utility to establish the terms and conditions of the deferred fuel cost bonds, including repayment schedules, expected interest rates, the issuance in one or more series or tranches with different maturity dates, and other financing costs;

(8) A finding that the deferred fuel cost charges shall be allocated among customer classes in accordance with the methodology approved in the electric utility's last fuel factor proceeding;

(9) A requirement that after the final terms of an issuance of deferred fuel cost bonds have been established and before the issuance of deferred fuel cost bonds, the electric utility determines the resulting initial deferred fuel cost charge in accordance with the financing order and that such initial deferred fuel cost charge be final and effective upon the issuance of such deferred fuel cost bonds without further Commission action so long as such initial deferred fuel cost charge is consistent with the financing order;

(10) A method of tracing funds collected as deferred fuel cost charges, or other proceeds of deferred fuel cost property, and a requirement that such method be the method of tracing such funds and determining the identifiable cash proceeds of any deferred fuel cost property subject to the financing order under applicable law; and

(11) Any other conditions not otherwise inconsistent with this section that the Commission determines are appropriate.

c. A financing order issued to an electric utility may provide that creation of the electric utility's deferred fuel cost property is conditioned upon, and simultaneous with, the sale or other transfer for the deferred fuel cost property to an assignee and the pledge of the deferred fuel cost property to secure deferred fuel cost bonds.

d. If the Commission issues a financing order, the Commission shall establish a protocol for the electric utility to annually file a petition or, in the Commission's discretion, a letter setting out application of the formula-based mechanism and, based on estimates of consumption for each rate class and other mathematical factors, requesting administrative approval to make applicable adjustments. The review of the filing shall be limited to determining whether there are any mathematical or clerical errors in the application of the formula-based mechanism relating to the appropriate amount of any overcollection or undercollection of deferred fuel cost charges and the amount of an adjustment. The adjustments shall ensure the recovery of revenues sufficient to provide for the payment of principal, interest, acquisition, defeasance, financing costs, or redemption premium and other fees, costs, and charges in respect of deferred fuel cost bonds approved under the financing order. Within 30 days after receiving an electric utility's request pursuant to this subdivision d, the Commission shall either approve the request or inform the electric utility of mathematical or clerical errors in its calculation. If the Commission informs the electric utility of mathematical or clerical errors in its calculation, the electric utility may correct its error and refile its request. The time frames previously described in this subdivision d shall apply to a refiled request.

e. Subsequent to the transfer of deferred fuel cost property to an assignee or the issuance of deferred fuel cost bonds authorized thereby, whichever is earlier, a financing order shall be irrevocable and, except for changes made pursuant to the formula-based mechanism authorized in this section, the Commission shall not amend, modify, or terminate the financing order by any subsequent action or reduce, impair, postpone, terminate, or otherwise adjust deferred fuel cost charges approved in the financing order. After the issuance of a financing order, the electric utility shall retain sole discretion regarding whether to assign, sell, or otherwise transfer deferred fuel cost property or to cause deferred fuel cost bonds to be issued, including the right to defer or postpone such assignment, sale, transfer, or issuance.

3. At the request of an electric utility, the Commission may commence a proceeding and issue a subsequent financing order that provides for refinancing, retiring, or refunding deferred fuel cost bonds issued pursuant to the original financing order if the Commission finds that the subsequent financing order satisfies all of the criteria specified in this section for a financing order. Effective upon retirement of the refunded deferred fuel cost bonds and the issuance of new deferred fuel cost bonds, the Commission shall adjust the related deferred fuel cost charges accordingly.

4. a. A financing order shall remain in effect and deferred fuel cost property under the financing order shall continue to exist until deferred fuel cost bonds issued pursuant to the financing order have been paid in full or defeased and, in each case, all Commission-approved financing costs of such deferred fuel cost bonds have been recovered in full.

b. A financing order issued to an electric utility shall remain in effect and unabated notwithstanding the reorganization, bankruptcy or other insolvency proceedings, merger, or sale of the electric utility or its successors or assignees.

B. 1. The Commission shall not, in exercising its powers and carrying out its duties regarding any matter within its authority pursuant to this chapter, and notwithstanding any other provision of law, consider the deferred fuel cost bonds issued pursuant to a financing order to be the debt of the electric utility other than for federal income tax purposes, consider the deferred fuel cost charges paid under the financing order to be the revenue of the electric utility for any purpose, or consider the deferred fuel costs or financing costs specified in the financing order to be the costs of the electric utility, nor shall the Commission determine any action taken by an electric utility which is consistent with the financing order to be unjust or unreasonable.

2. The Commission shall not order or otherwise directly or indirectly require an electric utility to use deferred fuel cost bonds to finance any project, addition, plant, facility, extension, capital improvement, equipment, or any other expenditure. After the issuance of a financing order, the electric utility shall retain sole discretion regarding whether to cause the deferred fuel cost bonds to be issued, including the right to defer or postpone such sale, assignment, transfer, or issuance. Nothing shall prevent the electric utility from abandoning the issuance of deferred fuel cost bonds under the financing order by filing with the Commission a statement of abandonment and the reasons therefor. The Commission shall not deny an electric utility its right to recover deferred fuel costs as otherwise provided in this section, or refuse or condition authorization or approval of the issuance and sale by an electric utility of securities or the assumption by the electric utility of liabilities or obligations, solely because of the potential availability of deferred fuel cost bond financing.

C. The electric bills of an electric utility that has obtained a financing order and caused deferred fuel cost bonds to be issued shall comply with the provisions of this subsection; however, the failure of an electric utility to comply with this subsection does not invalidate, impair, or affect any financing order, deferred fuel cost property, deferred fuel cost charge, or deferred fuel cost bonds. The electric utility shall:

1. Explicitly reflect that a portion of the charges on any electric bill represents deferred fuel cost charges approved in a financing order issued to the electric utility and, if the deferred fuel cost property has been transferred to an assignee, such bill shall include a statement to the effect that the assignee is the owner of the rights to deferred fuel cost charges and that the electric utility or another entity, if applicable, is acting as a collection agent or servicer for the assignee. The tariff applicable to customers must indicate the deferred fuel cost charge and the ownership of the charge; and

2. Include the deferred fuel cost charge on each customer's bill as a separate line item and include both the rate and the amount of the charge on each bill.

D. 1. The following provisions shall be applicable to deferred fuel cost property:

a. All deferred fuel cost property that is specified in a financing order shall constitute an existing, present intangible property right or interest therein, notwithstanding that the imposition and collection of deferred fuel cost charges depends on the electric utility, to which the financing order is issued, performing its servicing functions relating to the collection of deferred fuel cost charges and on future electricity consumption. The deferred fuel cost property shall exist (i) regardless of whether or not the revenues or proceeds arising from the deferred fuel cost property have been billed, have accrued, or have been collected and (ii) notwithstanding the fact that the value or amount of the deferred fuel cost property is dependent on the future provision of service to customers by the electric utility or its successors or assignees and the future consumption of electricity by customers;

b. Deferred fuel cost property specified in a financing order shall exist until deferred fuel cost bonds issued pursuant to the financing order are paid in full and all financing costs and other costs of such deferred fuel cost bonds have been recovered in full;

c. All or any portion of deferred fuel cost property specified in a financing order issued to an electric utility may be transferred, sold, conveyed, or assigned to a successor or assignee that is wholly owned, directly or indirectly, by the electric utility and created for the limited purpose of acquiring, owning, or administering deferred fuel cost property or issuing deferred fuel cost bonds under the financing order. All or any portion of deferred fuel cost property may be pledged to secure deferred fuel cost bonds issued pursuant to the financing order, amounts payable to financing parties and to counterparties under any ancillary agreements, and other financing costs. Any transfer, sale, conveyance, assignment, grant of a security interest in or pledge of deferred fuel cost property by an electric utility, or an affiliate of the electric utility, to an assignee, to the extent previously authorized in a financing order, shall not require the prior consent and approval of the Commission;

d. If an electric utility defaults on any required payment of charges arising from deferred fuel cost property specified in a financing order, a court, upon application by an interested party, and without limiting any other remedies available to the applying party, shall order the sequestration and payment of the revenues arising from the deferred fuel cost property to the financing parties or their assignees. Any such financing order shall remain in full force and effect notwithstanding any reorganization, bankruptcy, or other insolvency proceedings with respect to the electric utility or its successors or

assignees;

e. The interest of a transferee, purchaser, acquirer, assignee, or pledgee in deferred fuel cost property specified in a financing order issued to an electric utility, and in the revenue and collections arising from that property, shall not be subject to setoff, counterclaim, surcharge, or defense by the electric utility or any other person or in connection with the reorganization, bankruptcy, or other insolvency of the electric utility or any other entity;

f. Any successor to an electric utility, whether pursuant to any reorganization, bankruptcy, or other insolvency proceeding or whether pursuant to any merger or acquisition, sale, or other business combination, or transfer by operation of law, as a result of electric utility restructuring or otherwise, shall perform and satisfy all obligations of, and have the same rights under a financing order as, the electric utility under the financing order in the same manner and to the same extent as the electric utility, including collecting and paying to the person entitled to receive the revenues, collections, payments, or proceeds of the deferred fuel cost property. Nothing in this subdivision f is intended to limit or impair any authority of the Commission concerning the transfer or succession of interests of public utilities; and

g. Deferred fuel cost bonds shall be nonrecourse to the credit or any assets of the electric utility other than the deferred fuel cost property as specified in the financing order and any rights under any ancillary agreement.

2. The following provisions shall be applicable to security interests:

a. The creation, perfection, and enforcement of any security interest in deferred fuel cost property to secure the repayment of the principal and interest and other amounts payable in respect of deferred fuel cost bonds; amounts payable under any indenture, ancillary agreement, or other financing documents in respect of the deferred fuel costs; and other financing costs shall be governed by this subsection and not by the provisions of the Uniform Commercial Code (Titles 8.1A through 8.9A);

b. A security interest in deferred fuel cost property shall be created and enforceable when all of the following have occurred: (i) a financing order is issued, (ii) value is received by the debtor or seller for such deferred fuel cost property, (iii) the debtor or seller has rights in such deferred fuel cost property or the power to transfer rights in such deferred fuel cost property, and (iv) a security agreement granting such security interest is executed and delivered by the debtor or seller. The description of deferred fuel cost property in a security agreement shall be sufficient if the description refers to this section and the financing order creating the deferred fuel cost property;

c. A security interest shall attach without any physical delivery of collateral or other act and, upon the filing of a financing statement with the Commission, the lien of the security interest shall be valid, binding, and perfected against all parties having claims of any kind in tort, contract, or otherwise against the person granting the security interest, regardless of whether the parties have notice of the lien. Also upon this filing, a transfer of an interest in the deferred fuel cost property shall be perfected against all parties having claims of any kind, including any judicial lien or other lien creditors or any claims of the transferor or creditors of the transferor, and shall have priority over all competing claims other than any prior security interest, ownership interest, or assignment in the property previously perfected in accordance with this section;

d. The Commission shall maintain any financing statement filed to perfect any security interest under this section in the same manner that the Commission maintains financing statements filed by transmitting utilities under the Uniform Commercial Code (Titles 8.1A through 8.9A). The filing of a financing statement under this section shall be governed by the provisions regarding the filing of financing statements in the Uniform Commercial Code (Titles 8.1A through 8.9A);

e. The priority of a security interest in deferred fuel cost property shall not be affected by the commingling of deferred fuel cost charges with other amounts. Any pledgee or secured party shall have a perfected security interest in the amount of all deferred fuel cost charges that are deposited in any cash or deposit account of the qualifying utility in which deferred fuel cost charges have been commingled with other funds and any other security interest that may apply to those funds shall be terminated when they are transferred to a segregated account for the assignee or a financing party;

f. No application of the formula-based adjustment mechanism as provided in this section shall affect the validity, perfection, or priority of a security interest in or transfer of deferred fuel cost property; and

g. If a default or termination occurs under the deferred fuel cost bonds, the financing parties or their representatives may foreclose on or otherwise enforce their lien and security interest in any deferred fuel cost property as if they were secured parties with a perfected and prior lien under the Uniform Commercial Code (Titles 8.1A through 8.9A), and the Commission may order that amounts arising from deferred fuel cost charges be transferred to a separate account for the financing parties' benefit, to which their lien and security interest shall apply. On application by or on behalf of the financing parties, the Commission shall order the sequestration and payment to them of revenues arising from the deferred fuel cost charges.

3. a. Any sale, assignment, or other transfer of deferred fuel cost property shall be an absolute transfer and true sale of and not a pledge of, or secured transaction relating to, the transferor's right, title, and interest in, to, and under the deferred fuel cost property if the documents governing the transaction expressly state that the transaction is a sale or other absolute transfer other than for federal and state income tax purposes. For all purposes other than federal and state income tax purposes, the parties' characterization of a transaction as a sale of an interest in deferred fuel cost property shall be conclusive that the transaction is a true sale and that ownership has passed to the party characterized as the purchaser, regardless of any fact or circumstance that might support characterization of the transfer as a secured transaction. A transfer of an interest in deferred fuel cost property shall occur only when all of the following have occurred: (i) the financing order creating the deferred fuel cost property has become effective, (ii) the documents evidencing the transfer of deferred fuel cost property have been executed by the transferor and delivered to the assignee, and (iii) value is received by the transferor for the deferred fuel cost property. After such a transaction, the deferred fuel cost property shall not be subject to any claims of the transferor or the transferor's creditors, other than creditors holding a prior security interest in the deferred fuel cost property perfected in accordance with subdivision 2.

b. The characterization of the sale, assignment, or other transfer as an absolute transfer and true sale and the corresponding characterization of the interest of the assignee as an ownership interest, shall not be affected or impaired by the occurrence of any of the following factors:

(1) Commingling of deferred fuel cost charges with other amounts;

(2) The retention by the seller of (i) a partial or residual interest, including an equity interest, in the deferred fuel cost property, whether direct or indirect, or whether subordinate or otherwise, or (ii) the right to recover costs associated with taxes, franchise fees, or license fees imposed on the collection of deferred fuel cost charges;

(3) Any recourse that the assignee may have against the seller;

(4) Any right or obligation that the seller may have to repurchase the deferred fuel cost charges;

(5) Any indemnification obligations of the seller;

(6) The obligation of the seller to collect deferred fuel cost charges on behalf of the assignee;

(7) The transferor acting as the servicer of the deferred fuel cost charges or the existence of any contract that authorizes or requires the electric utility, to the extent that any interest in deferred fuel cost property is sold or assigned, to agree with the assignee or any financing party that it will continue to operate its system to provide service to its customers, will collect amounts in respect of the deferred fuel cost charges for the benefit and account of such assignee or financing party, and will account for and remit such amounts to or for the account of such assignee or financing party;

(8) The treatment of the sale, conveyance, assignment, or other transfer for tax, financial reporting, or other purposes;

(9) The granting or providing to bondholders of a preferred right to the deferred fuel cost property or credit enhancement by the electric utility or its affiliates with respect to the deferred fuel cost bonds; or

(10) Any application of the formula-based adjustment mechanism as provided in this section.

c. Any right that an electric utility has in the deferred fuel cost property before its pledge, sale, or transfer or any other right created under this section or created in the financing order and assignable under this section or assignable pursuant to a financing order shall be property in the form of a contract right or a chose in action. Transfer of an interest in deferred fuel cost property to an assignee shall be enforceable only when all of the following have occurred: (i) a financing order is issued, (ii) value is received by the transferor for such deferred fuel cost property, (iii) the transferor has rights in such deferred fuel cost property or the power to transfer rights in such deferred fuel cost property, and (iv) transfer documents in connection with the issuance of deferred fuel cost bonds are executed and delivered by the transferor. An enforceable transfer of an interest in deferred fuel cost property to an assignee shall be perfected against all third parties, including subsequent judicial or other lien creditors, when a notice of that transfer has been given by the filing of a financing statement in accordance with subdivision 2 c. The transfer shall be perfected against third parties as of the date of filing.

d. The Commission shall maintain any financing statement filed to perfect any sale, assignment, or transfer of deferred fuel cost property under this section in the same manner that the Commission maintains financing statements filed by transmitting utilities under the Uniform Commercial Code (Titles 8.1A through 8.9A). The filing of any financing statement under this section shall be governed by the provisions regarding the filing of financing statements in the Uniform Commercial Code (Titles 8.1A through 8.9A). The filing of such a financing statement shall be the only method of perfecting a transfer of deferred fuel cost property.

e. The priority of a transfer perfected under this section shall not be impaired by any later

modification of the financing order or deferred fuel cost property or by the commingling of funds arising from deferred fuel cost property with other funds. Any other security interest that may apply to those funds, other than a security interest perfected under subdivision 2, shall be terminated when they are transferred to a segregated account for the assignee or a financing party. If deferred fuel cost property has been transferred to an assignee or financing party, any proceeds of that property shall be held in trust for the assignee or financing party.

f. The priority of the conflicting interests of assignees in the same interest or rights in any deferred fuel cost property shall be determined as follows:

(1) Conflicting perfected interests or rights of assignees shall rank according to priority in time of perfection. Priority shall date from the time a filing covering the transfer is made in accordance with subdivision 2 c;

(2) A perfected interest or right of an assignee shall have priority over a conflicting unperfected interest or right of an assignee; and

(3) A perfected interest or right of an assignee shall have priority over a person who becomes a lien creditor after the perfection of such assignee's interest or right.

E. The description of deferred fuel cost property being transferred to an assignee in any sale agreement, purchase agreement, or other transfer agreement, granted or pledged to a pledgee in any security agreement, pledge agreement, or other security document, or indicated in any financing statement, shall only be sufficient if such description or indication refers to the financing order that created the deferred fuel cost property and states that the agreement or financing statement covers all or part of the property described in the financing order. This section shall apply to all purported transfers of, and all purported grants or liens or security interests in, deferred fuel cost property, regardless of whether the related sale agreement, purchase agreement, other transfer agreement, security agreement, pledge agreement, or other security document was entered into, or any financing statement was filed.

F. All financing statements referenced in this section shall be subject to Part 5 of Title 8.9A (§ 8.9A-501 et seq.) of the Uniform Commercial Code, except that the requirement as to continuation statements shall not apply.

G. The laws of the Commonwealth shall govern the validity, enforceability, attachment, perfection, priority, and exercise of remedies with respect to the transfer of an interest or right or the pledge or creation of a security interest in any deferred fuel cost property.

H. Neither the Commonwealth nor its political subdivisions shall be liable on any deferred fuel cost bonds, and the bonds shall not be a debt or a general obligation of the Commonwealth or any of its political subdivisions, agencies, or instrumentalities, nor shall they be special obligations or indebtedness of the Commonwealth or any of its agencies or political subdivisions. An issue of deferred fuel cost bonds shall not, directly, indirectly, or contingently, obligate the Commonwealth or any agency, political subdivision, or instrumentality of the Commonwealth to levy any tax or make any appropriation for payment of the deferred fuel cost bonds, other than in their capacity as consumers of electricity. All deferred fuel cost bonds shall contain on the face thereof a statement to the following effect: "NEITHER THE FULL FAITH AND CREDIT NOR THE TAXING POWER OF THE COMMONWEALTH IS PLEDGED TO THE PAYMENT OF THE PRINCIPAL OF, OR INTEREST ON, THIS BOND."

I. All of the following entities may legally invest any sinking funds, moneys, or other funds in deferred fuel cost bonds:

1. Subject to applicable statutory restrictions on state or local investment authority, the Commonwealth, units of local government, political subdivisions, public bodies, and public officers, except for members of the Commission;

2. Banks and bankers, savings and loan associations, credit unions, trust companies, savings banks and institutions, investment companies, insurance companies, insurance associations, and other persons carrying on a banking or insurance business;

3. Personal representatives, guardians, trustees, and other fiduciaries; and

4. All other persons authorized to invest in bonds or other obligations of a similar nature.

J. 1. The Commonwealth and its agencies, including the Commission, pledge and agree with bondholders, the owners of the deferred fuel cost property, and other financing parties that the Commonwealth and its agencies shall not take any action listed in this subdivision. This subsection does not preclude limitation or alteration if full compensation is made by law for the full protection of the deferred fuel cost charges collected pursuant to a financing order and of the bondholders and any assignee or financing party entering into a contract with the electric utility. The Commonwealth and its agencies, including the Commission, shall not:

a. Alter the provisions of this section that authorize the Commission to create an irrevocable contract right or chose in action by the issuance of a financing order, to create deferred fuel cost

property, and to make the deferred fuel cost charges imposed by a financing order irrevocable, binding, or nonbypassable charges;

b. Take or permit any action that impairs or would impair the value of deferred fuel cost property or the security for the deferred fuel cost bonds or revises the deferred fuel costs for which recovery is authorized;

c. In any way impair the rights and remedies of the bondholders, assignees, and other financing parties; or

d. Except for changes made pursuant to the formula-based adjustment mechanism authorized under this section, reduce, alter, or impair deferred fuel cost charges that are to be imposed, billed, charged, collected, and remitted for the benefit of the bondholders, any assignee, and any other financing parties until any and all principal, interest, premium, financing costs and other fees, expenses, or charges incurred, and any contracts to be performed, in connection with the related deferred fuel cost bonds have been paid and performed in full.

2. Any person that issues deferred fuel cost bonds may include the language specified in subdivision 1 in the deferred fuel cost bonds and related documentation.

K. An assignee or financing party shall not be considered an electric utility or person providing electric service by virtue of engaging in the transactions described in this section.

L. If there is a conflict between this section and any other law regarding the attachment, assignment, or perfection, or the effect of perfection, or priority of, assignment or transfer of, or security interest in deferred fuel cost property, this section shall govern.

M. In making determinations under this section, the Commission may engage an outside consultant and counsel.

N. If any provision of this section is held invalid or is invalidated, superseded, replaced, repealed, or expires for any reason, that occurrence shall not affect the validity of any action allowed under this section which is taken by an electric utility, an assignee, a financing party, a collection agent, or a party to an ancillary agreement, and any such action shall remain in full force and effect with respect to all deferred fuel cost bonds issued or authorized in a financing order issued under this section before the date that such provision is held invalid or is invalidated, superseded, replaced, or repealed, or expires for any reason.

O. As used in this section:

"Ancillary agreement" means a bond, insurance policy, letter of credit, reserve account, surety bond, interest rate lock or swap arrangement, hedging arrangement, liquidity or credit support arrangement, or other financial arrangement entered into in connection with deferred fuel cost bonds.

"Assignee" means a legally recognized entity to which an electric utility assigns, sells, or transfers, other than as a security, all or a portion of its interest in or right to deferred fuel cost property. "Assignee" includes a corporation, limited liability company, general partnership or limited partnership, public authority trust, financing entity, or other entity to which an assignee assigns, sells, or transfers, other than as a security, all or a portion of its interest in or right to deferred fuel cost property.

"Bondholder" means a person who holds a deferred fuel cost bond.

"Deferred fuel cost bonds" means bonds debentures, notes, certificates of participation, certificates of beneficial interest, certificates of ownership, or other evidences of indebtedness or ownership that are issued in one or more series or tranches by an electric utility or its assignee pursuant to a financing order, the proceeds of which are used directly or indirectly to recover, finance, or refinance Commission-approved deferred fuel costs and financing costs, and that are secured by or payable from deferred fuel cost property. If certificates of participation or ownership are issued, references in this section to principal, interest, or premium shall be construed to refer to comparable amounts under those certificates.

"Deferred fuel cost charge" means the nonbypassable charges authorized by the Commission to repay, finance, or refinance deferred fuel costs and financing costs (i) imposed on and part of all retail customer bills, except those of exempt retail access customers; (ii) collected by an electric utility or its successor or assignees, or a collection agent, in full, separate and apart from the electric utility's base rates; and (iii) paid by all retail customers of the electric utility, irrespective of the generation supplier of such customer, except for an exempt retail access customer.

"Deferred fuel cost property" includes:

1. All rights and interests of an electric utility or successor or assignee of the electric utility under a financing order, including the right to impose, bill, charge, collect, and receive deferred fuel cost charges authorized under the financing order and to obtain periodic adjustments to such charges as provided in the financing order; and

2. All revenues, collections, claims, rights to payments, payments, money, or proceeds arising from the rights and interests specified in the financing order, regardless of whether such revenues, collections, claims, rights to payment, payments, money, or proceeds are imposed, billed, received,

collected, or maintained together with or commingled with other revenues, collections, rights to payment, payments, money, or proceeds.

"Deferred fuel costs" means the unrecovered amounts of previously incurred costs of fuel used to generate electricity, including the costs of purchased power, that have been deferred by an electric utility for future recovery from the utility's customers, along with financing costs on the utility's fuel deferral balance.

"Electric utility" means a Phase II Utility.

"Exempt retail access customer" means a retail customer of an electric utility that, pursuant to the provisions of § 56-577 or 56-577.1, purchased electric energy exclusively from a supplier of electric energy licensed to sell retail electric energy exclusively within the Commonwealth other than the electric utility for the entire period between July 1, 2021, and June 30, 2023.

"Financing costs" means:

1. Interest and any premium, including any acquisition, defeasance, or redemption premium, payable on deferred fuel cost bonds;

2. Any payment required under any indenture, ancillary agreement, or other financing documents pertaining to deferred fuel cost bonds and any amount required to fund or replenish a reserve account or other accounts established under the terms of any indenture, ancillary agreement, or other financing documents pertaining to deferred fuel cost bonds;

3. Any other costs related to structuring, offering, issuing, supporting, repaying, refunding, servicing, and complying with deferred fuel cost bonds, including service fees, accounting and auditing fees, trustee fees, legal fees, consulting fees, structuring adviser fees, administrative fees, placement and underwriting fees, independent director and manager fees, capitalized interest, rating agency fees, stock exchange listing and compliance fees, security registration fees, filing fees, information technology programming costs, and any other costs necessary to otherwise ensure the timely payment of deferred fuel cost bonds or other amounts or charges payable in connection with the bonds, including costs related to obtaining the financing order;

4. Any taxes and license fees or other fees imposed on the revenues generated from the collection of deferred fuel cost charges or otherwise resulting from the collection of deferred fuel cost charges, in any such case whether paid, payable, or accrued;

5. Any state and local taxes, franchise, gross receipts, and other taxes or similar charges, including regulatory assessment fees, whether paid, payable, or accrued;

6. Any costs incurred by the Commission for any outside consultants or counsel retained in connection with the securitization of deferred fuel costs; and

7. Any financing costs on the utility's fuel deferral balance prior to issuance of any fuel cost bonds, calculated at the utility's approved weighted average cost of capital.

"Financing order" means an order that authorizes the issuance of deferred fuel cost bonds; the imposition, collection, and periodic adjustments of a deferred fuel cost charge; the creation of deferred fuel cost property; the sale, assignment, or transfer of deferred fuel cost property to an assignee and any other actions necessary or advisable to take actions described in the financing order.

"Financing party" means bondholders and trustees, collateral agents, any party under an ancillary agreement, or any other person acting for the benefit of bondholders.

"Financing statement" has the same meaning as provided in § 8.9A-102 of the Uniform Commercial Code.

"Phase II Utility" has the same meaning as provided in subdivision A 1 of § 56-585.1.

"Pledgee" means a financing party to which an electric utility or its successors or assignees mortgages, negotiates, pledges, or creates a security interest or lien on all or any portion of its interest in or right to deferred fuel cost property.

§ 56-581. Regulation of rates subject to Commission's jurisdiction.

A. ~~After the expiration or termination of capped rates except as provided in § 56-585.1, the~~ *The* Commission shall regulate the rates of investor-owned incumbent electric utilities for the transmission of electric energy, to the extent not prohibited by federal law, and for the generation of electric energy and the distribution of electric energy to retail customers pursuant to *this section and* § 56-585.1.

B. In any proceeding to review base rates for a Phase I Utility that commences after July 1, 2023, if the Commission determines in its sole discretion that the utility's existing base rates will, on a going-forward basis, either produce (i) revenues in excess of the utility's authorized rate of return or (ii) revenues below the utility's authorized rate of return, then, notwithstanding any provision of law governing rate proceedings, the Commission shall order any reductions or increases, as applicable and necessary, to such base rates that it deems appropriate to ensure the resulting base rates (a) are just and reasonable and (b) provide the utility an opportunity to recover its costs of providing services over the rate period ending on December 31 of the year of the utility's succeeding review and earn a fair rate of return authorized pursuant to the provisions governing such review proceeding. Such

determination shall be limited to the Phase I Utility's base rates and shall not consider the costs or revenues recovered in any rate adjustment clause authorized pursuant to this chapter.

C. In any proceeding to review base rates for a Phase II Utility that commences after July 1, 2023, if the Commission determines in its sole discretion that the utility's existing base rates will, on a going-forward basis, either produce (i) revenues in excess of the utility's authorized rate of return or (ii) revenues below the utility's authorized rate of return, then, notwithstanding any provision of subdivision A 8 of § 56-585.1, the Commission shall order any reductions or increases, as applicable and necessary, to such base rates that it deems appropriate to ensure the resulting base rates (a) are just and reasonable and (b) provide the utility an opportunity to recover its costs of providing services over the rate period ending on December 31 of the year of the utility's succeeding review and earn a fair rate of return on its base rates as determined in subdivision A 2 of § 56-585.1. Such determination shall be limited to the Phase II Utility's base rates and shall not consider the costs or revenues recovered in any rate adjustment clause authorized pursuant to subdivision A 6 of § 56-585.1 that has not been combined with the utility's base rates. The Commission shall use the most recently ended 12-month test period, along with normalization of nonrecurring test period costs and annualized adjustments for future costs, as the basis for determining the appropriateness of any rate adjustment. In any such filing to review base rates, a Phase II Utility shall separately project future costs over each 12-month period ending on December 31 of the year of the utility's succeeding review period. The Commission may, to the extent it finds such action aligns with the utility's projected cost of service, direct that any reduction or increase to the utility's rates for generation and distribution services be implemented on a staggered basis at the commencement and midpoint of the succeeding rate period.

~~B.~~ *D.* Beginning July 1, 1999, and thereafter, no cooperative that was a member of a power supply cooperative on January 1, 1999, shall be obligated to file any rate rider as a consequence of an increase or decrease in the rates, other than fuel costs, of its wholesale supplier, nor must any adjustment be made to such cooperative's rates as a consequence thereof.

~~C.~~ *E.* Except for the provision of default services under § 56-585 or emergency services in § 56-586, nothing in this chapter shall authorize the Commission to regulate the rates or charges for electric service to the Commonwealth and its municipalities.

F. As used in this section:

"Base rates" means rates for generation and distribution services.

"Phase I Utility" has the same meaning as provided in subdivision A 1 of § 56-585.1.

"Phase II Utility" has the same meaning as provided in subdivision A 1 of § 56-585.1.

§ 56-585.1. Generation, distribution, and transmission rates after capped rates terminate or expire.

A. During the first six months of 2009, the Commission shall, after notice and opportunity for hearing, initiate proceedings to review the rates, terms and conditions for the provision of generation, distribution and transmission services of each investor-owned incumbent electric utility. Such proceedings shall be governed by the provisions of Chapter 10 (§ 56-232 et seq.), except as modified herein. In such proceedings the Commission shall determine fair rates of return on common equity applicable to the generation and distribution services of the utility. In so doing, the Commission may use any methodology to determine such return it finds consistent with the public interest, but such return shall not be set lower than the average of the returns on common equity reported to the Securities and Exchange Commission for the three most recent annual periods for which such data are available by not less than a majority, selected by the Commission as specified in subdivision 2 b, of other investor-owned electric utilities in the peer group of the utility, nor shall the Commission set such return more than 300 basis points higher than such average. The peer group of the utility shall be determined in the manner prescribed in subdivision 2 b. The Commission may increase or decrease such combined rate of return by up to 100 basis points based on the generating plant performance, customer service, and operating efficiency of a utility, as compared to nationally recognized standards determined by the Commission to be appropriate for such purposes. In such a proceeding, the Commission shall determine the rates that the utility may charge until such rates are adjusted. If the Commission finds that the utility's combined rate of return on common equity is more than 50 basis points below the combined rate of return as so determined, it shall be authorized to order increases to the utility's rates necessary to provide the opportunity to fully recover the costs of providing the utility's services and to earn not less than such combined rate of return. If the Commission finds that the utility's combined rate of return on common equity is more than 50 basis points above the combined rate of return as so determined, it shall be authorized either (i) to order reductions to the utility's rates it finds appropriate, provided that the Commission may not order such rate reduction unless it finds that the resulting rates will provide the utility with the opportunity to fully recover its costs of providing its services and to earn not less than the fair rates of return on common equity applicable to the generation and distribution services; or (ii) to direct that 60 percent of the amount of the utility's earnings that were more than 50 basis points above

the fair combined rate of return for calendar year 2008 be credited to customers' bills, in which event such credits shall be amortized over a period of six to 12 months, as determined at the discretion of the Commission, following the effective date of the Commission's order and be allocated among customer classes such that the relationship between the specific customer class rates of return to the overall target rate of return will have the same relationship as the last approved allocation of revenues used to design base rates. Commencing in 2011, the Commission, after notice and opportunity for hearing, shall conduct reviews of the rates, terms and conditions for the provision of generation, distribution and transmission services by each investor-owned incumbent electric utility, subject to the following provisions:

1. Rates, terms and conditions for each service shall be reviewed separately on an unbundled basis, and such reviews shall be conducted in a single, combined proceeding. Pursuant to subsection A of § 56-585.1:1, the Commission shall conduct a review for a Phase I Utility in 2020, utilizing the three successive 12-month test periods beginning January 1, 2017, and ending December 31, 2019. Thereafter, reviews for a Phase I Utility will be on a triennial basis with subsequent proceedings utilizing the three successive 12-month test periods ending December 31 immediately preceding the year in which such review proceeding is conducted. Pursuant to subsection A of § 56-585.1:1, the Commission shall conduct a review for a Phase II Utility in 2021, utilizing the four successive 12-month test periods beginning January 1, 2017, and ending December 31, 2020, with subsequent reviews on a ~~triennial~~ *biennial* basis *commencing in 2023, with such proceedings* utilizing the ~~three~~ *two* successive 12-month test periods ending December 31 immediately preceding the year in which such review proceeding is conducted. ~~All such reviews occurring after December 31, 2017, shall be referred to as triennial reviews.~~ For purposes of this section, a Phase I Utility is an investor-owned incumbent electric utility that was, as of July 1, 1999, not bound by a rate case settlement adopted by the Commission that extended in its application beyond January 1, 2002, and a Phase II Utility is an investor-owned incumbent electric utility that was bound by such a settlement.

2. Subject to the provisions of subdivision 6, the fair rate of return on common equity applicable separately to the generation and distribution services of such utility, and for the two such services combined, and for any rate adjustment clauses approved under subdivision 5 or 6, shall be determined by the Commission during each such ~~triennial~~ review, as follows:

a. The Commission may use any methodology to determine such return it finds consistent with the public interest~~, but~~. *However, for a Phase I Utility,* for applications received by the Commission on or after January 1, 2020, such return shall not be set lower than the average of either (i) the returns on common equity reported to the Securities and Exchange Commission for the three most recent annual periods for which such data are available by not less than a majority, selected by the Commission as specified in subdivision 2 b, of other investor-owned electric utilities in the peer group of the utility subject to such triennial review or (ii) the authorized returns on common equity that are set by the applicable regulatory commissions for the same selected peer group, nor shall the Commission set such return more than 150 basis points higher than such average.

b. ~~In~~ *For a Phase I Utility, in* selecting such majority of peer group investor-owned electric utilities for applications received by the Commission on or after January 1, 2020, the Commission shall first remove from such group the two utilities within such group that have the lowest reported or authorized, as applicable, returns of the group, as well as the two utilities within such group that have the highest reported or authorized, as applicable, returns of the group, and the Commission shall then select a majority of the utilities remaining in such peer group. In its final order regarding such triennial review, the Commission shall identify the utilities in such peer group it selected for the calculation of such limitation. ~~For~~ *With respect to a Phase I Utility, for* purposes of this subdivision *2*, an investor-owned electric utility shall be deemed part of such peer group if (i) its principal operations are conducted in the southeastern United States east of the Mississippi River in either the states of West Virginia or Kentucky or in those states south of Virginia, excluding the state of Tennessee, (ii) it is a vertically-integrated electric utility providing generation, transmission, and distribution services whose facilities and operations are subject to state public utility regulation in the state where its principal operations are conducted, (iii) it had a long-term bond rating assigned by Moody's Investors Service of at least Baa at the end of the most recent test period subject to such ~~triennial~~ review, and (iv) it is not an affiliate of the utility subject to such ~~triennial~~ review *or a utility whose fair rate of return on common equity is determined by the Commission*.

c. The Commission may~~, consistent with its precedent for incumbent electric utilities prior to the enactment of Chapters 888 and 933 of the Acts of Assembly of 2007,~~ increase or decrease the utility's combined rate of return ~~based on the Commission's consideration of the utility's performance~~ *for generation and distribution services by up to 50 basis points based on factors that may include, reliability, generating plant performance, customer service, operating efficiency of a utility, and load forecasting. Any such adjustment to the combined rate of return for generation and distribution services*

shall include consideration of nationally recognized standards determined by the Commission to be appropriate for such purposes.

d. In any Current Proceeding, the Commission shall determine whether the Current Return has increased, on a percentage basis, above the Initial Return by more than the increase, expressed as a percentage, in the United States Average Consumer Price Index for all items, all urban consumers (CPI-U), as published by the Bureau of Labor Statistics of the United States Department of Labor, since the date on which the Commission determined the Initial Return. If so, the Commission may conduct an additional analysis of whether it is in the public interest to utilize such Current Return for the Current Proceeding then pending. A finding of whether the Current Return justifies such additional analysis shall be made without regard to any enhanced rate of return on common equity awarded pursuant to the provisions of subdivision 6. Such additional analysis shall include, but not be limited to, a consideration of overall economic conditions, the level of interest rates and cost of capital with respect to business and industry, in general, as well as electric utilities, the current level of inflation and the utility's cost of goods and services, the effect on the utility's ability to provide adequate service and to attract capital if less than the Current Return were utilized for the Current Proceeding then pending, and such other factors as the Commission may deem relevant. If, as a result of such analysis, the Commission finds that use of the Current Return for the Current Proceeding then pending would not be in the public interest, then the lower limit imposed by subdivision 2 a on the return to be determined by the Commission for such utility shall be calculated, for that Current Proceeding only, by increasing the Initial Return by a percentage at least equal to the increase, expressed as a percentage, in the United States Average Consumer Price Index for all items, all urban consumers (CPI-U), as published by the Bureau of Labor Statistics of the United States Department of Labor, since the date on which the Commission determined the Initial Return. For purposes of this subdivision:

"Current Proceeding" means any proceeding conducted under any provisions of this subsection that require or authorize the Commission to determine a fair combined rate of return on common equity for a utility and that will be concluded after the date on which the Commission determined the Initial Return for such utility.

"Current Return" means the minimum fair combined rate of return on common equity required for any Current Proceeding by the limitation regarding a utility's peer group specified in subdivision 2 a.

"Initial Return" means the fair combined rate of return on common equity determined for such utility by the Commission on the first occasion after July 1, 2009, under any provision of this subsection pursuant to the provisions of subdivision 2 a.

e. In addition to other considerations, in setting the return on equity within the range allowed by this section, the Commission shall strive to maintain costs of retail electric energy that are cost competitive with costs of retail electric energy provided by the other peer group investor-owned electric utilities.

f. The determination of such returns shall be made by the Commission on a stand-alone basis, and specifically without regard to any return on common equity or other matters determined with regard to facilities described in subdivision 6.

g. If the combined rate of return on common equity earned by the generation and distribution services is no more than 50 basis points above or below the return as so determined or, for any test period commencing after December 31, 2012, for a Phase II Utility and after December 31, 2013, for a Phase I Utility, such return is no more than 70 basis points above or below the return as so determined, such combined return shall not be considered either excessive or insufficient, respectively. However, for any test period commencing after December 31, 2012, for a Phase II Utility, and after December 31, 2013, for a Phase I Utility, if the utility has, during the test period or periods under review, earned below the return as so determined, whether or not such combined return is within 70 basis points of the return as so determined, the utility may petition the Commission for approval of an increase in rates in accordance with the provisions of subdivision 8 a as if it had earned more than 70 basis points below a fair combined rate of return, and such proceeding shall otherwise be conducted in accordance with the provisions of this section. The provisions of this subdivision are subject to the provisions of subdivision 8.

h. Any amount of a utility's earnings directed by the Commission to be credited to customers' bills pursuant to this section shall not be considered for the purpose of determining the utility's earnings in any subsequent ~~triennial~~ review.

3. Each such utility shall make a triennial filing by March 31 of every third year, with such filings commencing for a Phase I Utility in 2020, and such filings commencing for a Phase II Utility in 2021~~, consisting of the schedules contained in the Commission's rules governing utility rate increase applications~~ *and terminating thereafter*. Such filing shall encompass the three successive 12-month test periods ending December 31 immediately preceding the year in which such proceeding is conducted, except that the filing for a Phase II Utility in 2021 shall encompass the four successive 12-month test periods ending December 31, 2020. *After 2021, each Phase II Utility shall make a biennial filing by*

March 31 of every second year, except that the 2023 filing for a Phase II Utility shall be made on or after July 1, 2023. All biennial filings shall encompass the two successive 12-month test periods ending December 31 immediately preceding the year in which such review proceeding is conducted. All such filings shall consist of the schedules contained in the Commission's rules governing utility rate increase applications, and in every such case the filing for each year shall be identified separately and shall be segregated from any other year encompassed by the filing. *In a filing under this subdivision that does not result in an overall rate change, a utility may propose an adjustment to one or more tariffs that are revenue neutral to the utility.*

If the Commission determines that rates should be revised or credits be applied to customers' bills pursuant to subdivision 8 or ~~9~~ *10*, any rate adjustment clauses previously implemented related to facilities utilizing simple-cycle combustion turbines described in subdivision 6, shall be combined with the utility's costs, revenues, and investments until the amounts that are the subject of such rate adjustment clauses are fully recovered. The Commission shall combine such clauses with the utility's costs, revenues, and investments only after it makes its initial determination with regard to necessary rate revisions or credits to customers' bills, and the amounts thereof, but after such clauses are combined as ~~herein~~ specified *in this paragraph*, they shall thereafter be considered part of the utility's costs, revenues, and investments for the purposes of future ~~triennial~~ review proceedings. ~~In a triennial filing under this subdivision that does not result in an overall rate change a utility may propose an adjustment to one or more tariffs that are revenue neutral to the utility.~~

As of July 1, 2023, a Phase II Utility shall select a subset of rate adjustment clauses previously implemented pursuant to subdivision 5 or 6 having a combined annual revenue requirement, as of July 1, 2023, of at least $350 million and combine such rate adjustment clauses with the utility's costs, revenues, and investments for generation and distribution services. After such rate adjustment clauses are combined as specified in this paragraph, such rate adjustment clauses shall be considered part of the utility's costs, revenues, and investments for the purposes of future biennial review proceedings, and the combination of such rate adjustment clauses shall be specifically subject to audit by the Commission in the utility's 2023 biennial review filing. Notwithstanding the provisions of subsection C of § 56-581, such combination shall not serve as the basis for an increase in a Phase II Utility's rates for generation and distribution services in its 2023 biennial proceeding.

4. (Expires December 31, 2023) The following costs incurred by the utility shall be deemed reasonable and prudent: (i) costs for transmission services provided to the utility by the regional transmission entity of which the utility is a member, as determined under applicable rates, terms and conditions approved by the Federal Energy Regulatory Commission; (ii) costs charged to the utility that are associated with demand response programs approved by the Federal Energy Regulatory Commission and administered by the regional transmission entity of which the utility is a member; and (iii) costs incurred by the utility to construct, operate, and maintain transmission lines and substations installed in order to provide service to a business park. Upon petition of a utility at any time after the expiration or termination of capped rates, but not more than once in any 12-month period, the Commission shall approve a rate adjustment clause under which such costs, including, without limitation, costs for transmission service; charges for new and existing transmission facilities, including costs incurred by the utility to construct, operate, and maintain transmission lines and substations installed in order to provide service to a business park; administrative charges; and ancillary service charges designed to recover transmission costs, shall be recovered on a timely and current basis from customers. Retail rates to recover these costs shall be designed using the appropriate billing determinants in the retail rate schedules.

4. (Effective January 1, 2024) The following costs incurred by the utility shall be deemed reasonable and prudent: (i) costs for transmission services provided to the utility by the regional transmission entity of which the utility is a member, as determined under applicable rates, terms and conditions approved by the Federal Energy Regulatory Commission, and (ii) costs charged to the utility that are associated with demand response programs approved by the Federal Energy Regulatory Commission and administered by the regional transmission entity of which the utility is a member. Upon petition of a utility at any time after the expiration or termination of capped rates, but not more than once in any 12-month period, the Commission shall approve a rate adjustment clause under which such costs, including, without limitation, costs for transmission service, charges for new and existing transmission facilities, administrative charges, and ancillary service charges designed to recover transmission costs, shall be recovered on a timely and current basis from customers. Retail rates to recover these costs shall be designed using the appropriate billing determinants in the retail rate schedules.

5. A utility may at any time, after the expiration or termination of capped rates, but not more than once in any 12-month period, petition the Commission for approval of one or more rate adjustment clauses for the timely and current recovery from customers of the following costs:

a. Incremental costs described in clause (vi) of subsection B of § 56-582 incurred between July 1,

2004, and the expiration or termination of capped rates, if such utility is, as of July 1, 2007, deferring such costs consistent with an order of the Commission entered under clause (vi) of subsection B of § 56-582. The Commission shall approve such a petition allowing the recovery of such costs that comply with the requirements of clause (vi) of subsection B of § 56-582;

b. Projected and actual costs for the utility to design and operate fair and effective peak-shaving programs or pilot programs. The Commission shall approve such a petition if it finds that the program is in the public interest, provided that the Commission shall allow the recovery of such costs as it finds are reasonable;

c. Projected and actual costs for the utility to design, implement, and operate energy efficiency programs or pilot programs. Any such petition shall include a proposed budget for the design, implementation, and operation of the energy efficiency program, including anticipated savings from and spending on each program, and the Commission shall grant a final order on such petitions within eight months of initial filing. The Commission shall only approve such a petition if it finds that the program is in the public interest. If the Commission determines that an energy efficiency program or portfolio of programs is not in the public interest, its final order shall include all work product and analysis conducted by the Commission's staff in relation to that program that has bearing upon the Commission's determination. Such order shall adhere to existing protocols for extraordinarily sensitive information.

Energy efficiency pilot programs are in the public interest provided that the pilot program is (i) of limited scope, cost, and duration and (ii) intended to determine whether a new or substantially revised program would be cost-effective.

Prior to January 1, 2022, the Commission shall award a margin for recovery on operating expenses for energy efficiency programs and pilot programs, which margin shall be equal to the general rate of return on common equity determined as described in subdivision 2. Beginning January 1, 2022, and thereafter, if the Commission determines that the utility meets in any year the annual energy efficiency standards set forth in § 56-596.2, in the following year, the Commission shall award a margin on energy efficiency program operating expenses in that year, to be recovered through a rate adjustment clause, which margin shall be equal to the general rate of return on common equity determined as described in subdivision 2. If the Commission does not approve energy efficiency programs that, in the aggregate, can achieve the annual energy efficiency standards, the Commission shall award a margin on energy efficiency operating expenses in that year for any programs the Commission has approved, to be recovered through a rate adjustment clause under this subdivision, which margin shall equal the general rate of return on common equity determined as described in subdivision 2. Any margin awarded pursuant to this subdivision shall be applied as part of the utility's next rate adjustment clause true-up proceeding. The Commission shall also award an additional 20 basis points for each additional incremental 0.1 percent in annual savings in any year achieved by the utility's energy efficiency programs approved by the Commission pursuant to this subdivision, beyond the annual requirements set forth in § 56-596.2, provided that the total performance incentive awarded in any year shall not exceed 10 percent of that utility's total energy efficiency program spending in that same year.

The Commission shall annually monitor and report to the General Assembly the performance of all programs approved pursuant to this subdivision, including each utility's compliance with the total annual savings required by § 56-596.2, as well as the annual and lifecycle net and gross energy and capacity savings, related emissions reductions, and other quantifiable benefits of each program; total customer bill savings that the programs produce; utility spending on each program, including any associated administrative costs; and each utility's avoided costs and cost-effectiveness results.

Notwithstanding any other provision of law, unless the Commission finds in its discretion and after consideration of all in-state and regional transmission entity resources that there is a threat to the reliability or security of electric service to the utility's customers, the Commission shall not approve construction of any new utility-owned generating facilities that emit carbon dioxide as a by-product of combusting fuel to generate electricity unless the utility has already met the energy savings goals identified in § 56-596.2 and the Commission finds that supply-side resources are more cost-effective than demand-side or energy storage resources.

As used in this subdivision, "large general service customer" means a customer that has a verifiable history of having used more than one megawatt of demand from a single site.

Large general service customers shall be exempt from requirements that they participate in energy efficiency programs if the Commission finds that the large general service customer has, at the customer's own expense, implemented energy efficiency programs that have produced or will produce measured and verified results consistent with industry standards and other regulatory criteria stated in this section. The Commission shall, no later than June 30, 2021, adopt rules or regulations (a) establishing the process for large general service customers to apply for such an exemption, (b) establishing the administrative procedures by which eligible customers will notify the utility, and (c) defining the standard criteria that shall be satisfied by an applicant in order to notify the utility,

including means of evaluation measurement and verification and confidentiality requirements. At a minimum, such rules and regulations shall require that each exempted large general service customer certify to the utility and Commission that its implemented energy efficiency programs have delivered measured and verified savings within the prior five years. In adopting such rules or regulations, the Commission shall also specify the timing as to when a utility shall accept and act on such notice, taking into consideration the utility's integrated resource planning process, as well as its administration of energy efficiency programs that are approved for cost recovery by the Commission. Savings from large general service customers shall be accounted for in utility reporting in the standards in § 56-596.2.

The notice of nonparticipation by a large general service customer shall be for the duration of the service life of the customer's energy efficiency measures. The Commission may on its own motion initiate steps necessary to verify such nonparticipant's achievement of energy efficiency if the Commission has a body of evidence that the nonparticipant has knowingly misrepresented its energy efficiency achievement.

A utility shall not charge such large general service customer for the costs of installing energy efficiency equipment beyond what is required to provide electric service and meter such service on the customer's premises if the customer provides, at the customer's expense, equivalent energy efficiency equipment. In all relevant proceedings pursuant to this section, the Commission shall take into consideration the goals of economic development, energy efficiency and environmental protection in the Commonwealth;

d. Projected and actual costs of compliance with renewable energy portfolio standard requirements pursuant to § 56-585.5 that are not recoverable under subdivision 6. The Commission shall approve such a petition allowing the recovery of such costs incurred as required by § 56-585.5, provided that the Commission does not otherwise find such costs were unreasonably or imprudently incurred;

e. Projected and actual costs of projects that the Commission finds to be necessary to mitigate impacts to marine life caused by construction of offshore wind generating facilities, as described in § 56-585.1:11, or to comply with state or federal environmental laws or regulations applicable to generation facilities used to serve the utility's native load obligations, including the costs of allowances purchased through a market-based trading program for carbon dioxide emissions. The Commission shall approve such a petition if it finds that such costs are necessary to comply with such environmental laws or regulations;

f. Projected and actual costs, not currently in rates, for the utility to design, implement, and operate programs approved by the Commission that accelerate the vegetation management of distribution rights-of-way. No costs shall be allocated to or recovered from customers that are served within the large general service rate classes for a Phase II Utility or that are served at subtransmission or transmission voltage, or take delivery at a substation served from subtransmission or transmission voltage, for a Phase I Utility; and

g. Projected and actual costs, not currently in rates, for the utility to design, implement, and operate programs approved by the Commission to provide incentives to (i) low-income, elderly, and disabled individuals or (ii) organizations providing residential services to low-income, elderly, and disabled individuals for the installation of, or access to, equipment to generate electric energy derived from sunlight, provided the low-income, elderly, and disabled individuals, or organizations providing residential services to low-income, elderly, and disabled individuals, first participate in incentive programs for the installation of measures that reduce heating or cooling costs.

Any rate adjustment clause approved under subdivision 5 c by the Commission shall remain in effect until the utility exhausts the approved budget for the energy efficiency program. The Commission shall have the authority to determine the duration or amortization period for any other rate adjustment clause approved under this subdivision.

6. To ensure the generation and delivery of a reliable and adequate supply of electricity, to meet the utility's projected native load obligations and to promote economic development, a utility may at any time, after the expiration or termination of capped rates, petition the Commission for approval of a rate adjustment clause for recovery on a timely and current basis from customers of the costs of (i) a coal-fueled generation facility that utilizes Virginia coal and is located in the coalfield region of the Commonwealth as described in § 15.2-6002, regardless of whether such facility is located within or without the utility's service territory, (ii) one or more other generation facilities, (iii) one or more major unit modifications of generation facilities, including the costs of any system or equipment upgrade, system or equipment replacement, or other cost reasonably appropriate to extend the combined operating license for or the operating life of one or more generation facilities utilizing nuclear power, (iv) one or more new underground facilities to replace one or more existing overhead distribution facilities of 69 kilovolts or less located within the Commonwealth, (v) one or more pumped hydroelectricity generation and storage facilities that utilize on-site or off-site renewable energy resources as all or a portion of their power source and such facilities and associated resources are located in the coalfield region of the

Commonwealth as described in § 15.2-6002, regardless of whether such facility is located within or without the utility's service territory, or (vi) one or more electric distribution grid transformation projects; however, subject to the provisions of the following sentence, the utility shall not file a petition under clause (iv) more often than annually and, in such petition, shall not seek any annual incremental increase in the level of investments associated with such a petition that exceeds five percent of such utility's distribution rate base, as such rate base was determined for the most recently ended 12-month test period in the utility's latest review proceeding conducted pursuant to subdivision 3 and concluded by final order of the Commission prior to the date of filing of such petition under clause (iv). In all proceedings regarding petitions filed under clause (iv) or (vi), the level of investments approved for recovery in such proceedings shall be in addition to, and not in lieu of, levels of investments previously approved for recovery in prior proceedings under clause (iv) or (vi), as applicable. As of December 1, 2028, any costs recovered by a utility pursuant to clause (iv) shall be limited to any remaining costs associated with conversions of overhead distribution facilities to underground facilities that have been previously approved or are pending approval by the Commission through a petition by the utility under this subdivision. Such a petition concerning facilities described in clause (ii) that utilize nuclear power, facilities described in clause (ii) that are coal-fueled and will be built by a Phase I Utility, or facilities described in clause (i) may also be filed before the expiration or termination of capped rates. A utility that constructs or makes modifications to any such facility, or purchases any facility consisting of at least one megawatt of generating capacity using energy derived from sunlight and located in the Commonwealth and that utilizes goods or services sourced, in whole or in part, from one or more Virginia businesses, shall have the right to recover the costs of the facility, as accrued against income, through its rates, including projected construction work in progress, and any associated allowance for funds used during construction, planning, development and construction or acquisition costs, life-cycle costs, costs related to assessing the feasibility of potential sites for new underground facilities, and costs of infrastructure associated therewith, plus, as an incentive to undertake such projects, an enhanced rate of return on common equity calculated as specified below; however, in determining the amounts recoverable under a rate adjustment clause for new underground facilities, the Commission shall not consider, or increase or reduce such amounts recoverable because of (a) the operation and maintenance costs attributable to either the overhead distribution facilities being replaced or the new underground facilities or (b) any other costs attributable to the overhead distribution facilities being replaced. Notwithstanding the preceding sentence, the costs described in clauses (a) and (b) thereof shall remain eligible for recovery from customers through the utility's base rates for distribution service. A utility filing a petition for approval to construct or purchase a facility consisting of at least one megawatt of generating capacity using energy derived from sunlight and located in the Commonwealth and that utilizes goods or services sourced, in whole or in part, from one or more Virginia businesses may propose a rate adjustment clause based on a market index in lieu of a cost of service model for such facility. A utility seeking approval to construct or purchase a generating facility that emits carbon dioxide shall demonstrate that it has already met the energy savings goals identified in § 56-596.2 and that the identified need cannot be met more affordably through the deployment or utilization of demand-side resources or energy storage resources and that it has considered and weighed alternative options, including third-party market alternatives, in its selection process.

The costs of the facility, other than return on projected construction work in progress and allowance for funds used during construction, shall not be recovered prior to the date a facility constructed by the utility and described in clause (i), (ii), (iii), or (v) begins commercial operation, the date the utility becomes the owner of a purchased generation facility consisting of at least one megawatt of generating capacity using energy derived from sunlight and located in the Commonwealth and that utilizes goods or services sourced, in whole or in part, from one or more Virginia businesses, or the date new underground facilities are classified by the utility as plant in service. In any application to construct a new generating facility, the utility shall include, and the Commission shall consider, the social cost of carbon, as determined by the Commission, as a benefit or cost, whichever is appropriate. The Commission shall ensure that the development of new, or expansion of existing, energy resources or facilities does not have a disproportionate adverse impact on historically economically disadvantaged communities. The Commission may adopt any rules it deems necessary to determine the social cost of carbon and shall use the best available science and technology, including the Technical Support Document: Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866, published by the Interagency Working Group on Social Cost of Greenhouse Gases from the United States Government in August 2016, as guidance. The Commission shall include a system to adjust the costs established in this section with inflation.

Such enhanced rate of return on common equity shall be applied to allowance for funds used during construction and to construction work in progress during the construction phase of the facility and shall thereafter be applied to the entire facility during the first portion of the service life of the facility. The

first portion of the service life shall be as specified in the table below; however, the Commission shall determine the duration of the first portion of the service life of any facility, within the range specified in the table below, which determination shall be consistent with the public interest and shall reflect the Commission's determinations regarding how critical the facility may be in meeting the energy needs of the citizens of the Commonwealth and the risks involved in the development of the facility. After the first portion of the service life of the facility is concluded, the utility's general rate of return shall be applied to such facility for the remainder of its service life. As used herein, the service life of the facility shall be deemed to begin on the date a facility constructed by the utility and described in clause (i), (ii), (iii), or (v) begins commercial operation, the date the utility becomes the owner of a purchased generation facility consisting of at least one megawatt of generating capacity using energy derived from sunlight and located in the Commonwealth and that utilizes goods or services sourced, in whole or in part, from one or more Virginia businesses, or the date new underground facilities or new electric distribution grid transformation projects are classified by the utility as plant in service, and such service life shall be deemed equal in years to the life of that facility as used to calculate the utility's depreciation expense. Such enhanced rate of return on common equity shall be calculated by adding the basis points specified in the table below to the utility's general rate of return, and such enhanced rate of return shall apply only to the facility that is the subject of such rate adjustment clause. Allowance for funds used during construction shall be calculated for any such facility utilizing the utility's actual capital structure and overall cost of capital, including an enhanced rate of return on common equity as determined pursuant to this subdivision, until such construction work in progress is included in rates. The construction of any facility described in clause (i) or (v) is in the public interest, and in determining whether to approve such facility, the Commission shall liberally construe the provisions of this title. The construction or purchase by a utility of one or more generation facilities with at least one megawatt of generating capacity, and with an aggregate rated capacity that does not exceed 16,100 megawatts, including rooftop solar installations with a capacity of not less than 50 kilowatts, and with an aggregate capacity of 100 megawatts, that use energy derived from sunlight or from onshore wind and are located in the Commonwealth or off the Commonwealth's Atlantic shoreline, regardless of whether any of such facilities are located within or without the utility's service territory, is in the public interest, and in determining whether to approve such facility, the Commission shall liberally construe the provisions of this title. A utility may enter into short-term or long-term power purchase contracts for the power derived from sunlight generated by such generation facility prior to purchasing the generation facility. The replacement of any subset of a utility's existing overhead distribution tap lines that have, in the aggregate, an average of nine or more total unplanned outage events-per-mile over a preceding 10-year period with new underground facilities in order to improve electric service reliability is in the public interest. In determining whether to approve petitions for rate adjustment clauses for such new underground facilities that meet this criteria, and in determining the level of costs to be recovered thereunder, the Commission shall liberally construe the provisions of this title.

The conversion of any such facilities on or after September 1, 2016, is deemed to provide local and system-wide benefits and to be cost beneficial, and the costs associated with such new underground facilities are deemed to be reasonably and prudently incurred and, notwithstanding the provisions of subsection C or D, shall be approved for recovery by the Commission pursuant to this subdivision, provided that the total costs associated with the replacement of any subset of existing overhead distribution tap lines proposed by the utility with new underground facilities, exclusive of financing costs, shall not exceed an average cost per customer of $20,000, with such customers, including those served directly by or downline of the tap lines proposed for conversion, and, further, such total costs shall not exceed an average cost per mile of tap lines converted, exclusive of financing costs, of $750,000. A utility shall, without regard for whether it has petitioned for any rate adjustment clause pursuant to clause (vi), petition the Commission, not more than once annually, for approval of a plan for electric distribution grid transformation projects. Any plan for electric distribution grid transformation projects shall include both measures to facilitate integration of distributed energy resources and measures to enhance physical electric distribution grid reliability and security. In ruling upon such a petition, the Commission shall consider whether the utility's plan for such projects, and the projected costs associated therewith, are reasonable and prudent. Such petition shall be considered on a stand-alone basis without regard to the other costs, revenues, investments, or earnings of the utility; without regard to whether the costs associated with such projects will be recovered through a rate adjustment clause under this subdivision or through the utility's rates for generation and distribution services; and without regard to whether such costs will be the subject of a customer credit offset, as applicable, pursuant to subdivision 8 d. The Commission's final order regarding any such petition for approval of an electric distribution grid transformation plan shall be entered by the Commission not more than six months after the date of filing such petition. The Commission shall likewise enter its final order with respect to any petition by a utility for a certificate to construct and operate a generating facility or facilities utilizing energy derived

from sunlight, pursuant to subsection D of § 56-580, within six months after the date of filing such petition. The basis points to be added to the utility's general rate of return to calculate the enhanced rate of return on common equity, and the first portion of that facility's service life to which such enhanced rate of return shall be applied, shall vary by type of facility, as specified in the following table:

Type of Generation Facility	Basis Points	First Portion of Service Life
Nuclear-powered	200	Between 12 and 25 years
Carbon capture compatible, clean-coal powered	200	Between 10 and 20 years
Renewable powered, other than landfill gas powered	200	Between 5 and 15 years
Coalbed methane gas powered	150	Between 5 and 15 years
Landfill gas powered	200	Between 5 and 15 years
Conventional coal or combined-cycle combustion turbine	100	Between 10 and 20 years

Only those facilities as to which a rate adjustment clause under this subdivision has been previously approved by the Commission, or as to which a petition for approval of such rate adjustment clause was filed with the Commission, on or before January 1, 2013, shall be entitled to the enhanced rate of return on common equity as specified in the above table during the construction phase of the facility and the approved first portion of its service life.

Thirty percent of all costs of such a facility utilizing nuclear power that the utility incurred between July 1, 2007, and December 31, 2013, and all of such costs incurred after December 31, 2013, may be deferred by the utility and recovered through a rate adjustment clause under this subdivision at such time as the Commission provides in an order approving such a rate adjustment clause. The remaining 70 percent of all costs of such a facility that the utility incurred between July 1, 2007, and December 31, 2013, shall not be deferred for recovery through a rate adjustment clause under this subdivision; however, such remaining 70 percent of all costs shall be recovered ratably through existing base rates as determined by the Commission in the test periods under review in the utility's next review filed after July 1, 2014. Thirty percent of all costs of a facility utilizing energy derived from offshore wind that the utility incurred between July 1, 2007, and December 31, 2013, and all of such costs incurred after December 31, 2013, may be deferred by the utility and recovered through a rate adjustment clause under this subdivision at such time as the Commission provides in an order approving such a rate adjustment clause. The remaining 70 percent of all costs of such a facility that the utility incurred between July 1, 2007, and December 31, 2013, shall not be deferred for recovery through a rate adjustment clause under this subdivision; however, such remaining 70 percent of all costs shall be recovered ratably through existing base rates as determined by the Commission in the test periods under review in the utility's next review filed after July 1, 2014.

In connection with planning to meet forecasted demand for electric generation supply and assure the adequate and sufficient reliability of service, consistent with § 56-598, planning and development activities for a new utility-owned and utility-operated generating facility or facilities utilizing energy derived from sunlight or from onshore or offshore wind are in the public interest.

Notwithstanding any provision of Chapter 296 of the Acts of Assembly of 2018, construction, purchasing, or leasing activities for a new utility-owned and utility-operated generating facility or facilities utilizing energy derived from sunlight or from onshore wind with an aggregate capacity of 16,100 megawatts, including rooftop solar installations with a capacity of not less than 50 kilowatts, and with an aggregate capacity of 100 megawatts, together with a utility-owned and utility-operated generating facility or facilities utilizing energy derived from offshore wind with an aggregate capacity of not more than 3,000 megawatts, are in the public interest. Additionally, energy storage facilities with an aggregate capacity of 2,700 megawatts are in the public interest. To the extent that a utility elects to recover the costs of any such new generation or energy storage facility or facilities through its rates for generation and distribution services and does not petition and receive approval from the Commission for recovery of such costs through a rate adjustment clause described in clause (ii), the Commission shall, upon the request of the utility in a ~~triennial~~ review proceeding, provide for a customer credit reinvestment offset, as applicable, pursuant to subdivision 8 d with respect to all costs deemed reasonable and prudent by the Commission in a proceeding pursuant to subsection D of § 56-580 or in a ~~triennial~~ review proceeding.

Electric distribution grid transformation projects are in the public interest. To the extent that a utility elects to recover the costs of such electric distribution grid transformation projects through its rates for generation and distribution services, and does not petition and receive approval from the Commission for recovery of such costs through a rate adjustment clause described in clause (vi), the Commission shall, upon the request of the utility in a ~~triennial~~ review proceeding, provide for a customer credit reinvestment offset, as applicable, pursuant to subdivision 8 d with respect to all costs deemed reasonable and prudent by the Commission in a proceeding for approval of a plan for electric

distribution grid transformation projects pursuant to subdivision 6 or in a ~~triennial~~ review proceeding.

Neither generation facilities described in clause (ii) that utilize simple-cycle combustion turbines nor new underground facilities shall receive an enhanced rate of return on common equity as described herein, but instead shall receive the utility's general rate of return during the construction phase of the facility and, thereafter, for the entire service life of the facility. No rate adjustment clause for new underground facilities shall allocate costs to, or provide for the recovery of costs from, customers that are served within the large power service rate class for a Phase I Utility and the large general service rate classes for a Phase II Utility. New underground facilities are hereby declared to be ordinary extensions or improvements in the usual course of business under the provisions of § 56-265.2.

As used in this subdivision, a generation facility is (1) "coalbed methane gas powered" if the facility is fired at least 50 percent by coalbed methane gas, as such term is defined in § 45.2-1600, produced from wells located in the Commonwealth, and (2) "landfill gas powered" if the facility is fired by methane or other combustible gas produced by the anaerobic digestion or decomposition of biodegradable materials in a solid waste management facility licensed by the Waste Management Board. A landfill gas powered facility includes, in addition to the generation facility itself, the equipment used in collecting, drying, treating, and compressing the landfill gas and in transmitting the landfill gas from the solid waste management facility where it is collected to the generation facility where it is combusted.

For purposes of this subdivision, "general rate of return" means the fair combined rate of return on common equity as it is determined by the Commission for such utility pursuant to subdivision 2.

Notwithstanding any other provision of this subdivision, if the Commission finds during the triennial review conducted for a Phase II Utility in 2021 that such utility has not filed applications for all necessary federal and state regulatory approvals to construct one or more nuclear-powered or coal-fueled generation facilities that would add a total capacity of at least 1500 megawatts to the amount of the utility's generating resources as such resources existed on July 1, 2007, or that, if all such approvals have been received, that the utility has not made reasonable and good faith efforts to construct one or more such facilities that will provide such additional total capacity within a reasonable time after obtaining such approvals, then the Commission, if it finds it in the public interest, may reduce on a prospective basis any enhanced rate of return on common equity previously applied to any such facility to no less than the general rate of return for such utility and may apply no less than the utility's general rate of return to any such facility for which the utility seeks approval in the future under this subdivision.

Notwithstanding any other provision of this subdivision, if a Phase II utility obtains approval from the Commission of a rate adjustment clause pursuant to subdivision 6 associated with a test or demonstration project involving a generation facility utilizing energy from offshore wind, and such utility has not, as of July 1, 2023, commenced construction as defined for federal income tax purposes of an offshore wind generation facility or facilities with a minimum aggregate capacity of 250 megawatts, then the Commission, if it finds it in the public interest, may direct that the costs associated with any such rate adjustment clause involving said test or demonstration project shall thereafter no longer be recovered through a rate adjustment clause pursuant to subdivision 6 and shall instead be recovered through the utility's rates for generation and distribution services, with no change in such rates for generation and distribution services as a result of the combination of such costs with the other costs, revenues, and investments included in the utility's rates for generation and distribution services. Any such costs shall remain combined with the utility's other costs, revenues, and investments included in its rates for generation and distribution services until such costs are fully recovered.

7. Any petition filed pursuant to subdivision 4, 5, or 6 shall be considered by the Commission on a stand-alone basis without regard to the other costs, revenues, investments, or earnings of the utility. Any costs incurred by a utility prior to the filing of such petition, or during the consideration thereof by the Commission, that are proposed for recovery in such petition and that are related to subdivision 5 a, or that are related to facilities and projects described in clause (i) of subdivision 6, or that are related to new underground facilities described in clause (iv) of subdivision 6, shall be deferred on the books and records of the utility until the Commission's final order in the matter, or until the implementation of any applicable approved rate adjustment clauses, whichever is later. Except as otherwise provided in subdivision 6, any costs prudently incurred on or after July 1, 2007, by a utility prior to the filing of such petition, or during the consideration thereof by the Commission, that are proposed for recovery in such petition and that are related to facilities and projects described in clause (ii) or clause (iii) of subdivision 6 that utilize nuclear power, or coal-fueled facilities and projects described in clause (ii) of subdivision 6 if such coal-fueled facilities will be built by a Phase I Utility, shall be deferred on the books and records of the utility until the Commission's final order in the matter, or until the implementation of any applicable approved rate adjustment clauses, whichever is later. Any costs prudently incurred after the expiration or termination of capped rates related to other matters described

in subdivision 4, 5, or 6 shall be deferred beginning only upon the expiration or termination of capped rates, provided, however, that no provision of this act shall affect the rights of any parties with respect to the rulings of the Federal Energy Regulatory Commission in PJM Interconnection LLC and Virginia Electric and Power Company, 109 F.E.R.C. P 61,012 (2004). A utility shall establish a regulatory asset for regulatory accounting and ratemaking purposes under which it shall defer its operation and maintenance costs incurred in connection with (i) the refueling of any nuclear-powered generating plant and (ii) other work at such plant normally performed during a refueling outage. The utility shall amortize such deferred costs over the refueling cycle, but in no case more than 18 months, beginning with the month in which such plant resumes operation after such refueling. The refueling cycle shall be the applicable period of time between planned refueling outages for such plant. As of January 1, 2014, such amortized costs are a component of base rates, recoverable in base rates only ratably over the refueling cycle rather than when such outages occur, and are the only nuclear refueling costs recoverable in base rates. This provision shall apply to any nuclear-powered generating plant refueling outage commencing after December 31, 2013, and the Commission shall treat the deferred and amortized costs of such regulatory asset as part of the utility's costs for the purpose of proceedings conducted (a) with respect to ~~triennial~~ filings under subdivision 3 made on and after July 1, 2014, and (b) pursuant to § 56-245 or the Commission's rules governing utility rate increase applications as provided in subsection B. This provision shall not be deemed to change or reset base rates.

The Commission's final order regarding any petition filed pursuant to subdivision 4, 5, or 6 shall be entered not more than three months, eight months, and nine months, respectively, after the date of filing of such petition. If such petition is approved, the order shall direct that the applicable rate adjustment clause be applied to customers' bills not more than 60 days after the date of the order, or upon the expiration or termination of capped rates, whichever is later. *At any time, the Commission may, in its discretion, for a Phase II Utility, upon petition by a such a utility or upon its own initiated proceeding, direct the consolidation of any one or more subsets of rate adjustment clauses previously implemented pursuant to subdivision 5 or 6 in the interest of judicial economy, customer transparency, or other factors the Commission determines to be appropriate. Any subset of rate adjustment clauses so consolidated shall continue to be considered by the Commission without regard to the other costs, revenues, investments, or earnings of the utility and remain as a cost recovery mechanism independent from the utility's rates for generation and distribution services pursuant to this subdivision and subdivisions 5 and 6, but will be combined as a single rate adjustment clause for cost recovery and review purposes. Any rate adjustment clause or subset of rate adjustment clauses so consolidated shall be named in a manner, as determined by the Commission, that reasonably informs customers as to the nature of the costs recovered by the consolidated rate adjustment clause.*

8. In any ~~triennial~~ review proceeding, for the purposes of reviewing earnings on the utility's rates for generation and distribution services, the following utility generation and distribution costs not proposed for recovery under any other subdivision of this subsection, as recorded per books by the utility for financial reporting purposes and accrued against income, shall be attributed to the test periods under review and deemed fully recovered in the period recorded: costs associated with asset impairments related to early retirement determinations made by the utility for utility generation facilities fueled by coal, natural gas, or oil or for automated meter reading electric distribution service meters; costs associated with projects necessary to comply with state or federal environmental laws, regulations, or judicial or administrative orders relating to coal combustion by-product management that the utility does not petition to recover through a rate adjustment clause pursuant to subdivision 5 e; costs associated with severe weather events; and costs associated with natural disasters. Such costs shall be deemed to have been recovered from customers through rates for generation and distribution services in effect during the test periods under review unless such costs, individually or in the aggregate, together with the utility's other costs, revenues, and investments to be recovered through rates for generation and distribution services, result in the utility's earned return on its generation and distribution services for the combined test periods under review to fall more than 50 basis points below the fair combined rate of return authorized under subdivision 2 for such periods or, for any test period commencing after December 31, 2012, for a Phase II Utility and after December 31, 2013, for a Phase I Utility, to fall more than 70 basis points below the fair combined rate of return authorized under subdivision 2 for such periods. In such cases, the Commission shall, in such ~~triennial~~ review proceeding, authorize deferred recovery of such costs and allow the utility to amortize and recover such deferred costs over future periods as determined by the Commission. The aggregate amount of such deferred costs shall not exceed an amount that would, together with the utility's other costs, revenues, and investments to be recovered through rates for generation and distribution services, cause the utility's earned return on its generation and distribution services to exceed the fair rate of return authorized under subdivision 2, less 50 basis points, for the combined test periods under review or, for any test period commencing after December 31, 2012, for a Phase II Utility and after December 31, 2013, for a Phase I Utility, to exceed

the fair rate of return authorized under subdivision 2 less 70 basis points. *Notwithstanding the prior sentence, the aggregate amount of actual and reasonable costs associated with severe weather events eligible for such deferral shall not exceed an amount that would, together with the utility's other costs, revenues, and investments to be recovered through rates for generation and distribution services, cause the utility's earned return on its generation and distribution services to exceed the fair rate of return authorized for the combined test periods under review. For the purposes of determining any amount of costs that are associated with severe weather events, the Commission shall consider nationally recognized standards such as those published by the Institute of Electrical and Electronics Engineers (IEEE).* Nothing in this section shall limit the Commission's authority, pursuant to the provisions of Chapter 10 (§ 56-232 et seq.), including specifically § 56-235.2, following the review of combined test period earnings of the utility in a ~~triennial~~ review, for normalization of nonrecurring test period costs and annualized adjustments for future costs, in determining any appropriate increase or decrease in the utility's rates for generation and distribution services pursuant to subdivision 8 a or 8 c.

If the Commission determines as a result of ~~such~~ *any* triennial review *initiated prior to July 1, 2023* that:

a. Revenue reductions related to energy efficiency measures or programs approved and deployed since the utility's previous triennial review have caused the utility, as verified by the Commission, during the test period or periods under review, considered as a whole, to earn more than 50 basis points below a fair combined rate of return on its generation and distribution services or, for any test period commencing after December 31, 2012, for a Phase II Utility and after December 31, 2013, for a Phase I Utility, more than 70 basis points below a fair combined rate of return on its generation and distribution services, as determined in subdivision 2, without regard to any return on common equity or other matters determined with respect to facilities described in subdivision 6, the Commission shall order increases to the utility's rates for generation and distribution services necessary to recover such revenue reductions. If the Commission finds, for reasons other than revenue reductions related to energy efficiency measures, that the utility has, during the test period or periods under review, considered as a whole, earned more than 50 basis points below a fair combined rate of return on its generation and distribution services or, for any test period commencing after December 31, 2012, for a Phase II Utility and after December 31, 2013, for a Phase I Utility, more than 70 basis points below a fair combined rate of return on its generation and distribution services, as determined in subdivision 2, without regard to any return on common equity or other matters determined with respect to facilities described in subdivision 6, the Commission shall order increases to the utility's rates necessary to provide the opportunity to fully recover the costs of providing the utility's services and to earn not less than such fair combined rate of return, using the most recently ended 12-month test period as the basis for determining the amount of the rate increase necessary. However, in the first triennial review proceeding conducted after January 1, 2021, for a Phase II Utility, the Commission may not order a rate increase, and in all triennial reviews of a Phase I or Phase II utility, the Commission may not order such rate increase unless it finds that the resulting rates are necessary to provide the utility with the opportunity to fully recover its costs of providing its services and to earn not less than a fair combined rate of return on both its generation and distribution services, as determined in subdivision 2, without regard to any return on common equity or other matters determined with respect to facilities described in subdivision 6, using the most recently ended 12-month test period as the basis for determining the permissibility of any rate increase under the standards of this sentence, and the amount thereof; and provided that, solely in connection with making its determination concerning the necessity for such a rate increase or the amount thereof, the Commission shall, in any triennial review proceeding conducted prior to July 1, 2028, exclude from this most recently ended 12-month test period any remaining investment levels associated with a prior customer credit reinvestment offset pursuant to subdivision d.

b. The utility has, during the test period or test periods under review, considered as a whole, earned more than 50 basis points above a fair combined rate of return on its generation and distribution services or, for any test period commencing after December 31, 2012, for a Phase II Utility and after December 31, 2013, for a Phase I Utility, more than 70 basis points above a fair combined rate of return on its generation and distribution services, as determined in subdivision 2, without regard to any return on common equity or other matters determined with respect to facilities described in subdivision 6, the Commission shall, subject to the provisions of subdivisions 8 d and 9, direct that 60 percent of the amount of such earnings that were more than 50 basis points, or, for any test period commencing after December 31, 2012, for a Phase II Utility and after December 31, 2013, for a Phase I Utility, that 70 percent of the amount of such earnings that were more than 70 basis points, above such fair combined rate of return for the test period or periods under review, considered as a whole, shall be credited to customers' bills. Any such credits shall be amortized over a period of six to 12 months, as determined at the discretion of the Commission, following the effective date of the Commission's order, and shall be allocated among customer classes such that the relationship between the specific customer

class rates of return to the overall target rate of return will have the same relationship as the last approved allocation of revenues used to design base rates; or

c. ~~In any triennial review proceeding conducted after January 1, 2020, for a Phase I Utility or after January 1, 2021, for a Phase II Utility in which the~~ *The* utility has, during the test period or test periods under review, considered as a whole, earned more than 50 basis points above a fair combined rate of return on its generation and distribution services or, for any test period commencing after December 31, 2012, for a Phase II Utility and after December 31, 2013, for a Phase I Utility, more than 70 basis points above a fair combined rate of return on its generation and distribution services, as determined in subdivision 2, without regard to any return on common equity or other matter determined with respect to facilities described in subdivision 6, and the combined aggregate level of capital investment that the Commission has approved other than those capital investments that the Commission has approved for recovery pursuant to a rate adjustment clause pursuant to subdivision 6 made by the utility during the test periods under review in that triennial review proceeding in new utility-owned generation facilities utilizing energy derived from sunlight, or from wind, and in electric distribution grid transformation projects, as determined pursuant to subdivision 8 d, does not equal or exceed 100 percent of the earnings that are more than 70 basis points above the utility's fair combined rate of return on its generation and distribution services for the combined test periods under review in that triennial review proceeding, the Commission shall, subject to the provisions of subdivision ~~9~~ *10* and in addition to the actions authorized in subdivision b, also order reductions to the utility's rates it finds appropriate. However, in the first triennial review proceeding conducted after January 1, 2021, for a Phase II Utility, any reduction to the utility's rates ordered by the Commission pursuant to this subdivision shall not exceed $50 million in annual revenues, with any reduction allocated to the utility's rates for generation services, and in each triennial review of a Phase I or Phase II Utility, the Commission may not order such rate reduction unless it finds that the resulting rates will provide the utility with the opportunity to fully recover its costs of providing its services and to earn not less than a fair combined rate of return on its generation and distribution services, as determined in subdivision 2, without regard to any return on common equity or other matters determined with respect to facilities described in subdivision 6, using the most recently ended 12-month test period as the basis for determining the permissibility of any rate reduction under the standards of this sentence, and the amount thereof; and

d. (Expires July 1, 2028) In any ~~triennial~~ review proceeding conducted after December 31, 2017, upon the request of the utility, the Commission shall determine, prior to directing that 70 percent of earnings that are more than 70 basis points above the utility's fair combined rate of return on its generation and distribution services for the test period or periods under review be credited to customer bills pursuant to subdivision 8 b, the aggregate level of prior capital investment that the Commission has approved other than those capital investments that the Commission has approved for recovery pursuant to a rate adjustment clause pursuant to subdivision 6 made by the utility during the test period or periods under review in both (i) new utility-owned generation facilities utilizing energy derived from sunlight, or from onshore or offshore wind, and (ii) electric distribution grid transformation projects, as determined by the utility's plant in service and construction work in progress balances related to such investments as recorded per books by the utility for financial reporting purposes as of the end of the most recent test period under review. Any such combined capital investment amounts shall offset any customer bill credit amounts, on a dollar for dollar basis, up to the aggregate level of invested or committed capital under clauses (i) and (ii). The aggregate level of qualifying invested or committed capital under clauses (i) and (ii) is referred to in this subdivision as the customer credit reinvestment offset, which offsets the customer bill credit amount that the utility has invested or will invest in new solar or wind generation facilities or electric distribution grid transformation projects for the benefit of customers, in amounts up to 100 percent of earnings that are more than 70 basis points above the utility's fair rate of return on its generation and distribution services, and thereby reduce or eliminate otherwise incremental rate adjustment clause charges and increases to customer bills, which is deemed to be in the public interest. If 100 percent of the amount of earnings that are more than 70 basis points above the utility's fair combined rate of return on its generation and distribution services, as determined in subdivision 2, exceeds the aggregate level of invested capital in new utility-owned generation facilities utilizing energy derived from sunlight, or from wind, and electric distribution grid transformation projects, as provided in clauses (i) and (ii), during the test period or periods under review, then 70 percent of the amount of such excess shall be credited to customer bills as provided in subdivision 8 b in connection with the ~~triennial~~ review proceeding. The portion of any costs associated with new utility-owned generation facilities utilizing energy derived from sunlight, or from wind, or electric distribution grid transformation projects that is the subject of any customer credit reinvestment offset pursuant to this subdivision shall not thereafter be recovered through the utility's rates for generation and distribution services over the service life of such facilities and shall not thereafter be included in the utility's costs, revenues, and investments in future ~~triennial~~ review proceedings conducted

pursuant to subdivision 2 and shall not be the subject of a rate adjustment clause petition pursuant to subdivision 6. The portion of any costs associated with new utility-owned generation facilities utilizing energy derived from sunlight, or from wind, or electric distribution grid transformation projects that is not the subject of any customer credit reinvestment offset pursuant to this subdivision may be recovered through the utility's rates for generation and distribution services over the service life of such facilities and shall be included in the utility's costs, revenues, and investments in future ~~triennial~~ review proceedings conducted pursuant to subdivision 2 until such costs are fully recovered, and if such costs are recovered through the utility's rates for generation and distribution services, they shall not be the subject of a rate adjustment clause petition pursuant to subdivision 6. Only the portion of such costs of new utility-owned generation facilities utilizing energy derived from sunlight, or from wind, or electric distribution grid transformation projects that has not been included in any customer credit reinvestment offset pursuant to this subdivision, and not otherwise recovered through the utility's rates for generation and distribution services, may be the subject of a rate adjustment clause petition by the utility pursuant to subdivision 6.

The Commission's final order regarding such ~~triennial~~ review shall be entered not more than eight months after the date of filing, and any revisions in rates or credits so ordered shall take effect not more than 60 days after the date of the order. The fair combined rate of return on common equity determined pursuant to subdivision 2 in such ~~triennial~~ review shall apply, for purposes of reviewing the utility's earnings on its rates for generation and distribution services, to the entire *two or* three, *as applicable,* successive 12-month test periods ending December 31 immediately preceding the year of the utility's subsequent ~~triennial~~ review filing under subdivision 3 and shall apply to applicable rate adjustment clauses under subdivisions 5 and 6 prospectively from the date the Commission's final order in the ~~triennial~~ review proceeding, utilizing rate adjustment clause true-up protocols as the Commission in its discretion may determine.

9. *a. In any biennial review for a Phase II Utility filed on or prior to December 31, 2023, if the Commission determines that the utility has during the test period or test periods under review, considered as a whole, earned more than 70 basis points above a fair combined rate of return on its generation and distribution services previously authorized by the Commission, as determined in subdivision 2, without regard to any return on common equity or other matters determined with respect to facilities described in subdivision 6, which have not been combined with the utility's costs, revenues, and investments for generation and distribution services, the Commission shall direct that 85 percent of the amount of such earnings that were more than 70 basis points above such fair combined rate of return for the test period or periods under review, considered as a whole, be credited to customers' bills. Any such credits shall be amortized over a period of six to 12 months, as determined at the discretion of the Commission, following the effective date of the Commission's order, and shall be allocated among customer classes such that the relationship between the specific customer class rates of return to the overall target rate of return will have the same relationship as the last approved allocation of revenues used to design base rates.*

b. In any biennial review for a Phase II Utility filed on or after January 1, 2024, if the Commission determines that the utility has during the test period or test periods under review, considered as a whole, earned above its fair combined rate of return on its generation and distribution services previously authorized by the Commission, as determined in subdivision 2, without regard to any return on common equity or other matters determined with respect to facilities described in subdivision 6, which have not been combined with the utility's costs, revenues, and investments for generation and distribution services, the Commission shall direct that 85 percent of the amount of such earnings above such fair combined rate of return for the test period or periods under review, considered as a whole, be credited to customers' bills. Further, if the Commission determines that during the test period or test periods under review, considered as a whole, a Phase II Utility earned more than 150 basis points above a fair combined rate of return on its generation and distribution services previously authorized by the Commission, without regard to any return on common equity or other matters determined with respect to facilities described in subdivision 6, which have not been combined with the utility's costs, revenues, and investments for generation and distribution services, the Commission shall direct that all such earnings that were more than 150 basis points above such fair combined rate of return for the test period or periods under review, considered as a whole, be credited to customers' bills. Any such credits shall be amortized over a period of six to 12 months, as determined at the discretion of the Commission, following the effective date of the Commission's order, and shall be allocated among customer classes such that the relationship between the specific customer class rates of return to the overall target rate of return will have the same relationship as the last approved allocation of revenues used to design base rates.

10. If, as a result of a triennial review required under this subsection and conducted with respect to any test period or periods under review ending later than December 31, 2010 (or, if the Commission has

elected to stagger its biennial reviews of utilities as provided in subdivision 1, under review ending later than December 31, 2010, for a Phase I Utility, or December 31, 2011, for a Phase II Utility), the Commission finds, with respect to such test period or periods considered as a whole, that (i) any utility has, during the test period or periods under review, considered as a whole, earned more than 50 basis points above a fair combined rate of return on its generation and distribution services or, for any test period commencing after December 31, 2012, for a Phase II Utility and after December 31, 2013, for a Phase I Utility, more than 70 basis points above a fair combined rate of return on its generation and distribution services, as determined in subdivision 2, without regard to any return on common equity or other matters determined with respect to facilities described in subdivision 6, and (ii) the total aggregate regulated rates of such utility at the end of the most recently ended 12-month test period exceeded the annual increases in the United States Average Consumer Price Index for all items, all urban consumers (CPI-U), as published by the Bureau of Labor Statistics of the United States Department of Labor, compounded annually, when compared to the total aggregate regulated rates of such utility as determined pursuant to the review conducted for the base period, the Commission shall, unless it finds that such action is not in the public interest or that the provisions of subdivisions 8 b and c are more consistent with the public interest, direct that any or all earnings for such test period or periods under review, considered as a whole that were more than 50 basis points, or, for any test period commencing after December 31, 2012, for a Phase II Utility and after December 31, 2013, for a Phase I Utility, more than 70 basis points, above such fair combined rate of return shall be credited to customers' bills, in lieu of the provisions of subdivisions 8 b and c, provided that no credits shall be provided pursuant to this subdivision in connection with any triennial review unless such bill credits would be payable pursuant to the provisions of subdivision 8 d, and any credits under this subdivision shall be calculated net of any customer credit reinvestment offset amounts under subdivision 8 d. Any such credits shall be amortized and allocated among customer classes in the manner provided by subdivision 8 b. For purposes of this subdivision:

"Base period" means (i) the test period ending December 31, 2010 (or, if the Commission has elected to stagger its biennial reviews of utilities as provided in subdivision 1, the test period ending December 31, 2010, for a Phase I Utility, or December 31, 2011, for a Phase II Utility), or (ii) the most recent test period with respect to which credits have been applied to customers' bills under the provisions of this subdivision, whichever is later.

"Total aggregate regulated rates" shall include: (i) fuel tariffs approved pursuant to § 56-249.6, except for any increases in fuel tariffs deferred by the Commission for recovery in periods after December 31, 2010, pursuant to the provisions of clause (ii) of subsection C of § 56-249.6; (ii) rate adjustment clauses implemented pursuant to subdivision 4 or 5; (iii) revisions to the utility's rates pursuant to subdivision 8 a; (iv) revisions to the utility's rates pursuant to the Commission's rules governing utility rate increase applications, as permitted by subsection B, occurring after July 1, 2009; and (v) base rates in effect as of July 1, 2009.

~~10.~~ *11.* For purposes of this section, the Commission shall regulate the rates, terms and conditions of any utility subject to this section on a stand-alone basis utilizing the actual end-of-test period capital structure and cost of capital of such utility, excluding any debt associated with securitized bonds that are the obligation of non-Virginia jurisdictional customers, unless the Commission finds that the debt to equity ratio of such capital structure is unreasonable for such utility, in which case the Commission may utilize a debt to equity ratio that it finds to be reasonable for such utility in determining any rate adjustment pursuant to subdivisions 8 a and c, and without regard to the cost of capital, capital structure, revenues, expenses or investments of any other entity with which such utility may be affiliated. In particular, and without limitation, the Commission shall determine the federal and state income tax costs for any such utility that is part of a publicly traded, consolidated group as follows: (i) such utility's apportioned state income tax costs shall be calculated according to the applicable statutory rate, as if the utility had not filed a consolidated return with its affiliates, and (ii) such utility's federal income tax costs shall be calculated according to the applicable federal income tax rate and shall exclude any consolidated tax liability or benefit adjustments originating from any taxable income or loss of its affiliates.

B. Nothing in this section shall preclude an investor-owned incumbent electric utility from applying for an increase in rates pursuant to § 56-245 or the Commission's rules governing utility rate increase applications; however, in any such filing, a fair rate of return on common equity shall be determined pursuant to subdivision A 2. Nothing in this section shall preclude such utility's recovery of fuel and purchased power costs as provided in § 56-249.6.

C. Except as otherwise provided in this section, the Commission shall exercise authority over the rates, terms and conditions of investor-owned incumbent electric utilities for the provision of generation, transmission and distribution services to retail customers in the Commonwealth pursuant to the provisions of Chapter 10 (§ 56-232 et seq.), including specifically § 56-235.2.

D. The Commission may determine, during any proceeding authorized or required by this section, the reasonableness or prudence of any cost incurred or projected to be incurred, by a utility in connection with the subject of the proceeding. A determination of the Commission regarding the reasonableness or prudence of any such cost shall be consistent with the Commission's authority to determine the reasonableness or prudence of costs in proceedings pursuant to the provisions of Chapter 10 (§ 56-232 et seq.). In determining the reasonableness or prudence of a utility providing energy and capacity to its customers from renewable energy resources, the Commission shall consider the extent to which such renewable energy resources, whether utility-owned or by contract, further the objectives of the Commonwealth Clean Energy Policy set forth in § 45.2-1706.1, and shall also consider whether the costs of such resources is likely to result in unreasonable increases in rates paid by customers.

E. Notwithstanding any other provision of law, the Commission shall determine the amortization period for recovery of any appropriate costs due to the early retirement of any electric generation facilities owned or operated by any Phase I Utility or Phase II Utility. In making such determination, the Commission shall (i) perform an independent analysis of the remaining undepreciated capital costs; (ii) establish a recovery period that best serves ratepayers; and (iii) allow for the recovery of any carrying costs that the Commission deems appropriate.

F. *The Commission shall include in its report required by subsection B of § 56-596 any information concerning the reliability impacts of generation unit additions and retirement determinations by a Phase I or Phase II Utility, along with the potential impact on the purchase of power from generation assets outside the Virginia jurisdiction used to serve the utility's native load, utilizing information from the respective utility's integrated resource plan or information from the respective utility's plan filed pursuant to subsection D of § 56-585.5.*

G. The Commission shall promulgate such rules and regulations as may be necessary to implement the provisions of this section.

§ 56-585.1:4. Development of solar and wind generation and energy storage capacity in the Commonwealth.

A. Prior to January 1, 2024, (i) the construction or purchase by a public utility of one or more solar or wind generation facilities located in the Commonwealth or off the Commonwealth's Atlantic shoreline, each having a rated capacity of at least one megawatt and having in the aggregate a rated capacity that does not exceed 5,000 megawatts, or (ii) the purchase by a public utility of energy, capacity, and environmental attributes from solar facilities described in clause (i) owned by persons other than a public utility is in the public interest, and the Commission shall so find if required to make a finding regarding whether such construction or purchase is in the public interest.

B. Prior to January 1, 2024, (i) the construction or purchase by a public utility of one or more solar or wind generation facilities located in the Commonwealth or off the Commonwealth's Atlantic shoreline, each having a rated capacity of less than one megawatt, including rooftop solar installations with a capacity of not less than 50 kilowatts, and having in the aggregate a rated capacity that does not exceed 500 megawatts, or (ii) the purchase by a public utility of energy, capacity, and environmental attributes from solar facilities described in clause (i) owned by persons other than a public utility is in the public interest, and the Commission shall so find if required to make a finding regarding whether such construction or purchase is in the public interest.

C. The aggregate cap of 5,000 megawatts of rated capacity described in clause (i) of subsection A, the aggregate cap of 500 megawatts of rated capacity described in clause (i) of subsection B, and the aggregate cap of 200 megawatts of rated capacity described in subsection I are separate and independent from each other. The capacity of facilities in subsection B shall not be counted in determining the capacity of facilities in subsection A or I; the capacity of facilities in subsection A shall not be counted in determining the capacity of facilities in subsection B or I; and the capacity of facilities in subsection I shall not be counted in determining the capacity of facilities in subsection A or B.

D. Twenty-five percent of the solar generation capacity placed in service on or after July 1, 2018, located in the Commonwealth, and found to be in the public interest pursuant to subsection A or B shall be from the purchase by a public utility of energy, capacity, and environmental attributes from solar facilities owned by persons other than a public utility. The remainder shall be construction or purchase by a public utility of one or more solar generation facilities located in the Commonwealth. All of the solar generation capacity located in the Commonwealth and found to be in the public interest pursuant to subsection A or B shall be subject to competitive procurement, provided that a public utility may select solar generation capacity without regard to whether such selection satisfies price criteria if the selection of the solar generating capacity materially advances non-price criteria, including favoring geographic distribution of generating capacity, areas of higher employment, or regional economic development, if such non-price solar generating capacity selected does not exceed 25 percent of the utility's solar generating capacity.

E. Construction, purchasing, or leasing activities for a test or demonstration project for a new

utility-owned and utility-operated generating facility or facilities utilizing energy derived from offshore wind with an aggregate capacity of not more than 16 megawatts are in the public interest.

F. Prior to January 1, 2035, (i) the construction by a public utility of one or more energy storage facilities located in the Commonwealth, having in the aggregate a rated capacity that does not exceed 2,700 megawatts, or (ii) the purchase by a public utility of energy storage facilities described in clause (i) owned by persons other than a public utility or the capacity from such facilities is in the public interest, and the Commission shall so find if required to make a finding regarding whether such construction or purchase is in the public interest.

G. At least 35 percent of the energy storage capacity placed in service on or after July 1, 2020, located in the Commonwealth and found to be in the public interest pursuant to subsection F shall be from the purchase by a public utility of energy storage facilities owned by persons other than a public utility or the capacity from such facilities. All of the energy storage facilities located in the Commonwealth and found to be in the public interest pursuant to subsection F shall be subject to competitive procurement, provided that a public utility may select energy storage facilities without regard to whether such selection satisfies price criteria if the selection of the energy storage facilities materially advances non-price criteria, including favoring geographic distribution of generating facilities, areas of higher employment, or regional economic development, if such energy storage facilities selected for the advancement of non-price criteria do not exceed 25 percent of the utility's energy storage capacity.

H. A utility may elect to petition the Commission, outside of a triennial *or biennial* review proceeding conducted pursuant to § 56-585.1, at any time for a prudency determination with respect to the construction or purchase by the utility of one or more solar or wind generation facilities located in the Commonwealth or off the Commonwealth's Atlantic Shoreline or the purchase by the utility of energy, capacity, and environmental attributes from solar or wind facilities owned by persons other than the utility. The Commission's final order regarding any such petition shall be entered by the Commission not more than three months after the date of the filing of such petition.

I. Prior to January 1, 2024, (i) the construction or purchase by a public utility of one or more solar or wind generation facilities located on a previously developed project site in the Commonwealth having in the aggregate a rated capacity that does not exceed 200 megawatts or (ii) the purchase by a public utility of energy, capacity, and environmental attributes from solar facilities described in clause (i) owned by persons other than a public utility, is in the public interest.

§ 56-599. Integrated resource plan required.

A. Each electric utility shall file an updated integrated resource plan by July 1, 2015. Thereafter, each electric utility shall file an updated integrated resource plan by May 1, in each year immediately preceding the year the utility is subject to a triennial *or biennial* review filing. A copy of each integrated resource plan shall be provided to the Chairman of the House Committee on Labor and Commerce, the Chairman of the Senate Committee on Commerce and Labor, and to the Chairman of the Commission on Electric Utility Regulation. All updated integrated resource plans shall comply with the provisions of any relevant order of the Commission establishing guidelines for the format and contents of updated and revised integrated resource plans. Each integrated resource plan shall consider options for maintaining and enhancing rate stability, energy independence, economic development including retention and expansion of energy-intensive industries, and service reliability.

B. In preparing an integrated resource plan, each electric utility shall systematically evaluate and may propose:

1. Entering into short-term and long-term electric power purchase contracts;

2. Owning and operating electric power generation facilities;

3. Building new generation facilities;

4. Relying on purchases from the short term or spot markets;

5. Making investments in demand-side resources, including energy efficiency and demand-side management services;

6. Taking such other actions, as the Commission may approve, to diversify its generation supply portfolio and ensure that the electric utility is able to implement an approved plan;

7. The methods by which the electric utility proposes to acquire the supply and demand resources identified in its proposed integrated resource plan;

8. The effect of current and pending state and federal environmental regulations upon the continued operation of existing electric generation facilities or options for construction of new electric generation facilities;

9. The most cost effective means of complying with current and pending state and federal environmental regulations, including compliance options to minimize effects on customer rates of such regulations;

10. Long-term electric distribution grid planning and proposed electric distribution grid

transformation projects;

11. Developing a long-term plan for energy efficiency measures to accomplish policy goals of reduction in customer bills, particularly for low-income, elderly, and disabled customers; reduction in emissions; and reduction in carbon intensity; and

12. Developing a long-term plan to integrate new energy storage facilities into existing generation and distribution assets to assist with grid transformation.

C. As part of preparing any integrated resource plan pursuant to this section, each utility shall conduct a facility retirement study for owned facilities located in the Commonwealth that emit carbon dioxide as a byproduct of combusting fuel and shall include the study results in its integrated resource plan. Upon filing the integrated resource plan with the Commission, the utility shall contemporaneously disclose the study results to each planning district commission, county board of supervisors, and city and town council where such electric generation unit is located, the Department of Energy, the Department of Housing and Community Development, the Virginia Employment Commission, and the Virginia Council on Environmental Justice. The disclosure shall include (i) the driving factors of the decision to retire and (ii) the anticipated retirement year of any electric generation unit included in the plan. Any electric generating facility with an anticipated retirement date that meets the criteria of § 45.2-1701.1 shall comply with the public disclosure requirements therein.

D. The Commission shall analyze and review an integrated resource plan and, after giving notice and opportunity to be heard, the Commission shall make a determination within nine months after the date of filing as to whether such an integrated resource plan is reasonable and is in the public interest.

2. That in any biennial review initiated by a Phase II Utility, as that term is defined in subdivision A 1 of § 56-585.1 of the Code of Virginia, as amended by this act, on or prior to December 31, 2023, the State Corporation Commission shall set the combined fair rate of return at 9.70 percent, which is based on the simple average of the authorized returns for vertically integrated electric utilities by the applicable regulatory commissions in the peer group jurisdictions of Florida, Georgia, Texas, Tennessee, West Virginia, Kentucky, and North Carolina. Such combined fair rate of return on common equity shall be applicable separately to the generation and distribution services of such utility, and for the two such services combined, and for any rate adjustment clauses approved under subdivision A 5 or 6 of § 56-585.1 of the Code of Virginia, as amended by this act. For any review initiated by such a utility after December 31, 2023, the Commission may use any methodology to determine such return it finds consistent with the public interest pursuant to its authority under subdivision A 2 a of § 56-585.1 of the Code of Virginia, as amended by this act.

3. That a Phase II Utility, as that term is defined in subdivision A 1 of § 56-585.1 of the Code of Virginia, as amended by this act, shall, through December 31, 2024, undertake reasonable efforts to maintain, subject to audit by the State Corporation Commission, its common equity capitalization to total capitalization ratio at a level equal to 52.10 percent.

4. That a Phase II Utility, as that term is defined in subdivision A 1 of § 56-585.1 of the Code of Virginia, as amended by this act, in connection with any financing order petition filed with the State Corporation Commission (the Commission) prior to December 31, 2023, pursuant to § 56-249.6:1 of the Code of Virginia, as created by this act, shall permit any retail customer that is receiving electric supply service from the utility and whose demand exceeded five megawatts during the calendar year prior to such petition to opt out of financing its pro rata obligation for deferred fuel cost charges through deferred fuel cost bonds. The utility shall notify such eligible customers of their eligibility to opt out of the deferred fuel cost financing through its annual petition with the Commission pursuant to § 56-249.6 of the Code of Virginia, and any election to opt out of the deferred fuel cost financing by an eligible customer shall be provided in writing to the utility within 30 days of the filing of such petition. Upon such election, the eligible customer shall fully satisfy its pro rata obligation for the deferred fuel cost charges subject to financing, as determined based on its electric usage over the period that such charges were incurred, over the 12-month period prescribed by subsection C of § 56-249.6 of the Code of Virginia that is associated with such annual petition. In the event of such election, any deferred fuel cost charges approved for recovery through deferred fuel cost bonds shall not include the obligations of eligible customers opting out of the deferred fuel cost financing.

5. That for purposes of considering future performance-based adjustments to the combined rate of return in accordance with subdivision A 2 c of § 56-585.1 of the Code of Virginia, as amended by this act, the State Corporation Commission (the Commission), before December 31, 2023, shall direct the initiation of a proceeding to review and determine the appropriate protocols and standards applicable to implementing any such performance-based adjustments. The protocols and standards established as a result of such a proceeding shall apply to biennial review filings occurring on or after January 1, 2025. However, if the Commission determines that the public

interest would be better served by implementing such protocols and standards for biennial review filings occurring on or after January 1, 2027, then such performance standards and protocols shall be applicable to all biennial rate review filings made on or after January 1, 2027. Until such standards and protocols are applicable, the Commission shall have the authority, consistent with its precedent for incumbent electric utilities prior to the enactment of Chapters 888 and 933 of the Acts of Assembly of 2007, to increase or decrease the utility's combined rate of return based on the Commission's consideration of the utility's performance.+

ENERGY + ENVIRONMENT
GENERAL ASSEMBLY 2023

General Assembly deal sets Dominion profits for two years while overhauling regulatory system

Gov. Glenn Youngkin calls legislation ‘a big step forward on behalf of all Virginians’

By: Charlie Paullin - February 25, 2023 6:27 pm

The Virginia General Assembly. (Sarah Vogelsong / Virginia Mercury)

The decision came down to the wire, but on Saturday afternoon Gov. Glenn Youngkin’s office and the General Assembly reached a deal on sweeping legislation to adjust Dominion Energy’s profit margin and reform the state’s system of electric utility regulation.

The bills, carried by Senate Majority Leader Dick Saslaw, D-Fairfax, and House Majority Leader Terry Kilgore, R-Scott, passed the Senate on a unanimous vote, with only one vote in the House — from Del. Dave LaRock, R-Clarke — opposing it.

The final language of the bill, which has been under negotiation all session, will set Dominion’s profit margin at 9.7% for two years. After that, the State Corporation Commission, which in Virginia oversees electric utilities, will have the authority to set the profit margin at its discretion.

Dominion’s current profit margin — the amount it is allowed to earn in addition to the costs of providing service to regulated ratepayers in Virginia — is 9.35%.

Kilgore said the reason for the two-year bump was to ensure Dominion would be in a better position to go to the bond market to seek capital to build new generation as well as provide stability to the company before the SCC takes “unfettered” control.

Among other provisions, the bill resets rate reviews from every three years to two starting this summer and will roll into base rates $350 million worth of rate adjustment clauses, or extra charges for specific projects added onto customers’ bills. The SCC has estimated the latter change will lower the average monthly residential bill by $6 to $7.

Dominion will gain the ability to issue about $1.6 billion in bonds to pay for fuel upfront and recover those costs over a 10-year period. The move, known as fuel securitization, is designed to cushion customers from the impacts of spiking fuel costs that could lead to a $17 monthly bill increase for residential customers.

The final version no longer includes language that alters the plant closure schedule set by the Virginia Clean Economy Act, a 2020 law requiring the utilities to decarbonize by midcentury. Instead, it asks the SCC to report on concerns about the reliability of new generation units and retirement determinations.

The legislation also changes the percentage of excess earnings Dominion is allowed to keep. Currently, if the SCC determines that Dominion overearned, the utility is still allowed to keep 30% of those earnings. The bill decreases that number to 15% for the 2023 rate case and removes for future rate cases a complex legislative framework that prescribes by statute a range of profits within which the company is allowed to earn.

Minority Leader Tommy Norment, R-Williamsburg, said he couldn't recall a piece of legislation that was "more negotiated" and involved "more participants."

Both parties praised the final version. Kilgore called it a "well-rounded, good deal for Virginians." Del. Rip Sullivan, D-Arlington, said, "I'm glad that we took the time we did."

Youngkin, who has railed against high energy costs and intervened in the negotiations, said the measure was "a big step forward on behalf of all Virginians."

"I applaud the legislators who took the lead on writing and negotiating this landmark bill, which will save customers money on their monthly bills, restore the independent oversight of the State Corporation Commission, and support the long-term stability of Virginia's largest electric utility," he said.

Dominion too said it supported the bill.

"This legislation is a win for consumers and regulatory oversight," said Dominion spokesperson Aaron Ruby in a statement. "It will lower electricity bills for our customers, reduce the impact of rising fuel costs and strengthen SCC oversight."

The reaction varied among environmental and ratepayer groups.

"For far too long, Dominion Energy has wielded its political influence and contributions to write the rules of its own regulation. This year's legislative session has shown definitively that this era of self-regulation has come to an end," said Brennan Gilmore, executive director of Clean Virginia, a group created by Charlottesville millionaire Michael Bills explicitly to oppose Dominion's influence in the General Assembly.

Albert Pollard, a lobbyist for the Virginia Poverty Law Center, took a more lukewarm approach, criticizing a provision that sets Dominion's debt-to-equity ratio but saying he thought it was worth accepting with the restoration of SCC oversight after two years.

The Sierra Club of Virginia switched its position from opposing the bill to taking a neutral stance after the removal of the provision changing the plant closure schedule set by the Virginia Clean Economy Act. Although some of Dominion's coal and oil plants are already scheduled to retire within the next few years, some environmental groups were concerned that altering the timeline would slow efforts to transition to renewable energy.

Despite the bill's passage, the House and Senate have still not resolved a disagreement over appointments to fill two vacancies on the SCC. With only one remaining member on the body, keeping the seats vacant could prevent the SCC from having a necessary quorum in the future.

"None of this works unless we can reach that compromise," said Sen. Scott Surovell, D-Fairfax.

COMMONWEALTH OF VIRGINIA
STATE CORPORATION COMMISSION

PETITION OF

APPALACHIAN POWER COMPANY **CASE NO. PUR-2022-00001**

For approval of a rate adjustment clause, the E-RAC, for costs to comply with state and federal environmental regulations pursuant to § 56-585.1 A 5 e of the Code of Virginia

2022 OCT 18 P 1:47

REPORT OF D. MATHIAS ROUSSY, JR., HEARING EXAMINER

October 18, 2022

This State Corporation Commission ("Commission") case involves a proposal by Appalachian Power Company ("APCo" or "Company") to recover certain costs through a rate adjustment clause available for the costs of complying with environmental laws and regulations.

Three issues are contested. First, APCo seeks Commission approval of Effluent Limitations Guidelines ("ELG") compliance costs at Amos and Mountaineer, which the *2021 E-RAC Order*[1] denied without prejudice after APCo failed to carry its burden of proof. The West Virginia Public Service Commission ("WVPSC") has decided that West Virginia will pay up to 100% of the ELG costs, meaning these two coal-fired power plants will continue to operate beyond the December 31, 2028 compliance deadline, regardless of the Commission's decision in the instant case. Amos and Mountaineer are, by far, APCo's largest capacity resources. Additionally, when these plants are dispatched economically, they provide APCo's customers access to their generated electricity or, when it is less expensive, market electricity. Based on the economic analyses in this case, I find APCo established that it would likely be beneficial for Virginia to help pay for compliance at Mountaineer and, to a lesser extent, Amos, subject to ratemaking conditions to protect Virginia from a risk of uneconomic regulatory dispatch identified in the record. However, if the Commission assigns more weight to this risk or less weight to market risk, the record could support a decision for Virginia not to pay for ELG compliance at Amos or, to a lesser extent, Mountaineer.

Second, I recommend that the Commission deny rate adjustment recovery of one project that the record indicates is not necessary for environmental compliance. Any such denial should be without prejudice as it appears this project would be eligible for recovery through base rates.

Third, I recommend that the Commission deny without prejudice a small portion of emission allowance costs proposed by APCo.

Based on these recommendations, I recommend a $32.9 million revenue requirement for service to be rendered beginning December 1, 2022, which is $0.7 million lower than proposed.

---

[1] *Petition of Appalachian Power Company, For approval of a rate adjustment clause, the E-RAC, for costs to comply with state and federal environmental regulations pursuant to § 56-585.1 A 5 e of the Code of Virginia*, Case No. PUR-2020-00258, 2021 S.C.C. Ann. Rep. 330, Order Granting Rate Adjustment Clause (Aug. 23, 2021) ("*2021 E-RAC Order*" or "2021 E-RAC Case," as applicable).

2022-00082

PROCEDURAL HISTORY

On March 18, 2022, APCo filed a Petition with the Commission seeking approval to recover costs through an existing rate adjustment clause, the "E-RAC", pursuant to § 56-585.1 A 5 e of the Code of Virginia ("Code").[2] According to APCo, the costs the Petition seeks to recover relate to capital investments and operations and maintenance ("O&M") compliance expenses that are necessary to comply with state and federal environmental regulations. APCo filed public and confidential versions of its Petition, accompanied by a Motion for Protective Ruling.

On April 21, 2022, the Commission issued an Order for Notice and Hearing that, among other things, docketed the Petition; granted certain waivers requested by APCo, as set forth therein; directed the Commission's Staff ("Staff") to investigate the Petition and to file testimony containing the results of Staff's investigation; established a procedural schedule, including a telephonic hearing on September 20, 2022, to receive the testimony of public witnesses and a hearing on September 21, 2022, to receive the evidence of the parties and Staff; provided interested persons opportunities to participate in this proceeding; and appointed a Hearing Examiner to conduct all further proceedings on behalf of the Commission.

On May 10, 2022, a Hearing Examiner's Protective Ruling was issued.

On May 24, 2022, APCo filed its Motion for Additional Protective Treatment for Extraordinarily Sensitive Information ("Second Protective Motion"). In its Second Protective Motion, APCo sought heightened protective treatment of two attachments to the Company's responses to discovery requests. On June 1, 2022, the Hearing Examiner's Protective Ruling Providing Additional Protective Treatment for Extraordinarily Sensitive Information was issued.

On June 7, 2022, APCo filed proof of notice and service.[3]

Notices of participation in this proceeding were filed by: the Sierra Club;[4] West Virginia Coal Association, Inc. ("Coal Association");[5] Appalachian Voices;[6] and the Office of the Attorney General's Division of Consumer Counsel ("Consumer Counsel").

On June 9, 2022, Sierra Club filed a Motion to Compel Discovery. On June 30, 2022, APCo filed its Response in Opposition to Sierra Club's Motion to Compel Discovery. On July 6, 2022, Sierra Club filed its Reply. A Hearing Examiner's Ruling issued on July 13, 2022, granted in part and denied in part Sierra Club's Motion to Compel Discovery.

---

[2] On March 31, 2022, APCo filed Schedule 3 to the Petition. On May 17, 2022, APCo filed a page of Company witness Martin's testimony that was inadvertently omitted from the initial filing.
[3] Exhibit ("Ex.") 3.
[4] On April 22, 2022, Sierra Club filed a Motion for Admission *Pro Hac Vice* of Dorothy E. Jaffe, which was granted by a Hearing Examiner's Ruling issued on May 26, 2022.
[5] On June 7, 2022, the Coal Association filed Motions for Admission *Pro Hac Vice* of Jacob C. Altmeyer and H. Brann Altmeyer, which were granted by a Hearing Examiner's Ruling issued on June 14, 2022.
[6] On August 2, 2022, Appalachian Voices filed a Motion for Admission *Pro Hac Vice* of Rachel James, which was granted by a Hearing Examiner's Ruling issued on August 3, 2022.

One public comment was filed on May 31, 2022, by the Tazewell County Board of Supervisors ("Tazewell Board"). The Tazewell Board requested that the rate increase proposed in this case and in Case No. PUR-2022-00014 both be denied in light of the impact on Tazewell County residents. The comments stressed, among other things, the relatively low median household income in the County and the high poverty rate. The financial and social hardships in the County have been compounded by rampant inflation.

The public witness portion of the evidentiary hearing was cancelled because no one signed up to testify.

On September 21, 2022, the hearing was conducted, as scheduled, in the Commission's courtroom. Noelle J. Coates, Esquire, Daniel Summerlin, Esquire, and April M. Jones, Esquire, appeared on behalf of APCo. Evan Dimond Johns, Esquire, and Dorothy E. Jaffe, Esquire, appeared on behalf of Sierra Club. Neil S. Talegaonkar, Esquire, appeared on behalf of the Coal Association. William C. Cleveland, Esquire, and Rachel James, Esquire, appeared on behalf of Appalachian Voices. C. Meade Browder, Jr., Esquire, and R. Scott Herbert, Esquire, appeared on behalf of Consumer Counsel. Frederick D. Ochsenhirt, Esquire, appeared on behalf of Staff.

SUMMARY OF THE RECORD

APCo – Direct

In support of its Petition, APCo presented the direct testimonies of **Christian T. Beam**, President and Chief Operating Officer of APCo; **James F. Martin**, Director of Resource Planning Strategy for American Electric Power Service Corporation ("AEPSC"); **Brian D. Sherrick**, Vice President of Generation Shared Services for AEPSC;[7] **Robert A. Gallimore**, Hydroelectric Asset Manager for AEPSC; **Gary O. Spitznogle**, Vice President of Environmental Services at AEPSC; **Tyler H. Ross**, Director of Regulatory Accounting Services for AEPSC; and **William K. Castle**, Director, Regulatory Services - VA/TN for APCo.

As discussed further by the Company's witnesses, the Petition summarized the applicable state or federal environmental regulations as follows below.[8]

> *i. The CCR Rule*[9]
> In 2015, the United States Environmental Protection Agency ("EPA") published a final rule to regulate the disposal of coal combustion residuals [("CCR")], the CCR Rule, which includes fly ash, bottom ash, and gypsum that may be generated at coal-fired electric generating units. The CCR Rule applies to new and existing CCR landfills and CCR surface impoundments (ponds) at operating coal-based electric generating facilities. Recent revisions to the CCR Rule require that unlined CCR storage ponds must cease operations and initiate closure by

[7] Mr. Sherrick assumed this position in July 2022. Tr. at 62 (Sherrick).
[8] Ex. 4 (Petition) at 6-7.
[9] Ex. 9 (Spitznogle direct) at attached Sched. 1 (citing the CCR Rule as 40 C.F.R. 257.50(b)).

April 11, 2021. The EPA can extend the compliance date for [Amos and Mountaineer] to as late as October 15, 2023.

ii. The ELG Rule[10]
The Steam Electric Effluent Limitations Guidelines, the ELG Rule, establishes discharge limits on flue gas desulfurization wastewater, fly ash and bottom ash transport water, and flue gas mercury control wastewater. Recent revisions to the ELG Rule establish discharge limits that must be achieved as soon as possible between October 13, 2021 and December 31, 2025 based on the renewal of the existing wastewater discharge permit for the facility.

iii. Dissolved Oxygen Requirements[11]
The dissolved oxygen requirements at Claytor were issued by the Federal Energy Regulatory Commission ("FERC") and are designed to improve low dissolved oxygen conditions in accordance with Virginia Department of [Environmental] Quality ("DEQ") requirements.

iv. Cross-State Air Pollution Rule[12]
[APCo] installed the [dry sorbent injection system] at Amos to mitigate emissions of [sulfur trioxide ("SO_3")] that result from the operation of the Selective Catalytic Reduction ("SCR") and Flue Gas Desulfurization ("FGD") systems in tandem. [APCo] installed the SCR and FGD systems to comply with what is now the Cross-State Air Pollution Rule, as well as a consent decree with the EPA and others.

v. [Regional Greenhouse Gas Initiative ("RGGI")][13]
In 2020, the Virginia General Assembly amended the Clean Energy and Community Flood and Preparedness Act to direct the Virginia DEQ to adopt regulations to establish a cap-and-trade program for carbon dioxide [("CO_2")] emissions to comply with the RGGI Model Rule. Those regulations became effective in July 2020, and are applicable to Clinch River, which is the Company's only fossil-fuel fired generation facility in the Commonwealth.

vi. Other Applicable Environmental Regulations
The other applicable environmental regulations for which the O&M Compliance Expenses were incurred are provided in ... Schedule 1 [attached to the direct testimony of] Company witness Spitznogle.

[10] *Id.* (citing the ELG Rule as 40 C.F.R. 423).
[11] *Id.* (citing 18 C.F.R. 4 and VA DEQ § 401).
[12] *Id.* (citing 85 Fed. Reg. 23,054).
[13] *Id.* (citing Code § 10.1-1330 and 9 VAC 5-140).

Mr. Beam identified two central purposes of the Petition:

1. To seek recovery of costs related to compliance with state and federal environmental laws and regulations that are applicable to the generation facilities APCo uses to serve its native load obligation; and

2. To ask again the Commission's permission to recover costs from Virginia customers that are necessary to comply with the ELG Rule at Amos and Mountaineer.[14]

According to Mr. Beam, APCo's second request for ELG Rule cost recovery is pursuant to the *2021 E-RAC Order*, which denied recovery of ELG costs from Virginia customers without prejudice and stated that the Company could re-file for approval "should circumstances so warrant."[15] In Mr. Beam's view, the *2021 E-RAC Order* effectively closed Amos and Mountaineer to Virginia customers at the end of 2028, which is the latest these power plants could combust coal, if the necessary modifications for ELG compliance were not made.[16]

Mr. Beam updated the Commission on the outcome of a WVPSC proceeding concerning APCo's CCR and ELG projects. On August 4, 2021, the WVPSC approved APCo's requests for certificates of public convenience and necessity authorizing the CCR and ELG projects at Amos and Mountaineer, as well as a cost recovery mechanism. On October 12, 2021, the WVPSC issued another order that affirmed its earlier holdings and concluded that, given the *2021 E-RAC Order*, West Virginia jurisdictional customers would pay for these ELG projects, and should also receive the benefit of capacity and energy made possible by the ELG projects starting January 1, 2029.[17] Due to the WVPSC rulings and because PJM looks at APCo as a whole for its fixed resource requirement ("FRR") capacity plan, Amos and Mountaineer will continue to be an integral part of APCo's FRR plan and will continue to operate and dispatch past 2028, regardless of the Commission's decision in the instant case.[18] Mr. Beam confirmed that physical construction of the ELG projects did not begin until after the WVPSC's decision.[19]

Mr. Beam described what he believes would be the impact of two alternative outcomes from the instant Commission proceeding – one in which the Commission approves ELG cost recovery and another in which the Commission denies such recovery.

According to Mr. Beam, if the Commission *approves* ELG cost recovery, nothing will change for Virginia customers. Virginia customers would continue to pay for the Virginia jurisdictional share of all investments, including ELG project investments, as well as O&M costs, for Amos and Mountaineer and would continue to receive the benefit of their energy and capacity as long as the plants continue to run. APCo initially estimated the cost Virginia customers would pay for their share of ELG investment is approximately $15 million the first

[16] *Id.* at 4.
[17] *Id.* at 3-4 (citing Exs. 17, 18).
[18] Ex. 11 (Beam direct) at 4, 9. For purposes of APCo's capacity position, PJM Interconnection, LLC ("PJM") views APCo as a whole. *Id.* at 9; Tr. at 94 (Beam).
[19] Tr. at 89 (Beam)

year and $150 million in total through 2040 for depreciation and return.[20] Absent a complicated interstate and intracompany arrangement, the Company estimated that Virginia customers would avoid:

- Paying $3 billion or $4 billion for 2,700 megawatts ("MW") or more of nameplate replacement capacity to be in place by 2028, which could increase APCo's cost of service by an incremental 17-21% in 2029 over 2021 payments;

- Being responsible for a revenue requirement for that replacement capacity in the amount of $1.8 billion to $2.35 billion from 2029-2040, compared to a $1.0 billion incremental cost of keeping Amos and Mountaineer operating through 2040. This assumes that APCo could construct and/or procure that much capacity in the pre-2028 timeframe; and

- Possibly being subject to the uncertainty and volatility of capacity provided solely by the market (paper capacity).[21]

Mr. Beam concluded that approval of ELG project cost recovery from Virginia customers would have no effect on APCo's compliance with the Virginia Clean Economy Act ("VCEA").[22] APCo will continue to comply with statutory mandates to seek Commission approval to own renewable facilities, enter into renewable power purchase agreements ("PPAs"), and otherwise procure and retire renewable energy certificates ("RECs"). He stressed that the VCEA places no restrictions on Amos and Mountaineer's energy production and that the VCEA's renewable energy mandates are based on a percentage of energy load (not generation). He also pointed out that until 2035 the total unforced capacity ("UCAP") provided by the renewable resources planned for VCEA compliance is less than the amount of capacity needed to offset even the smallest Amos unit.[23]

According to Mr. Beam, if the Commission instead *denies* ELG cost recovery, Virginia customers would avoid the O&M expenses and capital investment necessary for operations beyond 2028.[24] However, he believes Virginia customers would be more exposed to volatility in the PJM energy market, which is overwhelmingly fossil-based, and would likely still rely on Amos and Mountaineer for capacity, but in a more convoluted way.[25] He believes an equitable arrangement could be made whereby Virginia customers pay for the capacity provided by one or both of these plants. This arrangement could take many forms, would be complicated, and would require approval in West Virginia and Virginia.[26] In addition to the costs for such a

---

[20] Ex. 11 (Beam direct) at 5. Mr. Beam's estimate was based on projected total company ELG costs of approximately $197 million combined for Amos and Mountaineer. This estimate was subsequently updated to $169 million. Ex. 8 (Sherrick direct) at 9; Tr. at 63-64 (Sherrick).

[21] Ex. 11 (Beam direct) at 5-6.

[22] 2020 Va. Acts chs. 1193, 1194.

[23] Ex. 11 (Beam direct) at 6.

[24] *Id.* at 7. He believes this would shift a disproportionate share of costs to West Virginia. *Id.*

[25] *Id.* Mr. Beam noted that at noon on March 14, 2022, which he indicated was a relatively clear and sunny day across PJM, renewables accounted for only 12,324 MW of the 98,829 MW of load. *Id.*

[26] *Id.*

2025-00035

potential transaction, Mr. Beam believes it would be fair, and in line with traditional utility practice, for Virginia customers to continue to be responsible for the undepreciated balance of Amos and Mountaineer.[27] He indicated that the Commission has approved the investments that comprise this net book value in the past and if the Commission decides to cease to invest in these assets, APCo would view the remaining Virginia jurisdictional net book value of Amos and Mountaineer as a "stranded cost" for which Virginia customers would be responsible.[28]

Mr. Beam acknowledged that APCo could "theoretically" buy an equivalent amount of capacity from the PJM market, which he indicated would likely be fossil-fueled. He found the acquisition or construction of an equivalent amount of renewable resources to replace the Virginia jurisdictional share of capacity an option that is unlikely to be accomplished by 2028, given the time needed to site, permit, and procure that amount of capacity. This option is complicated by PJM's recent proposal for a two-year pause in reviewing generator interconnection projects due to a backlog of 1,200 proposed projects (mostly solar). In his opinion, these replacement capacity options would involve significant cost to Virginia customers, as West Virginia is unlikely to pay for investment not needed to serve them.[29]

Mr. Martin provided an analysis comparing investment in the ELG projects to an option that assumes Amos and Mountaineer are not available to Virginia customers beyond 2028. He believes his analysis demonstrates that continued operation of Amos and Mountaineer, even if they do not run at all, is less expensive and much less risky for customers than retiring them early and replacing them. He summarized the results of his analysis as follows:

1. The relatively small $98 million[30] jurisdictional share of the ELG investments and continued use of Amos and Mountaineer will be much less expensive than replacing them with billions of dollars of new resources;

2. Replacement capacity would increase customers' rates by an incremental 17-21% in 2029;

3. In total, between 2029 and 2040, the net cost of service for the replacement resources would be between $2.8 billion and $3.4 billion, compared to a $1.0 billion incremental cost of keeping Amos and Mountaineer operating; and

4. The above is true even if Amos and Mountaineer do not generate a single megawatt-hour ("MWh") of electricity after 2028.[31]

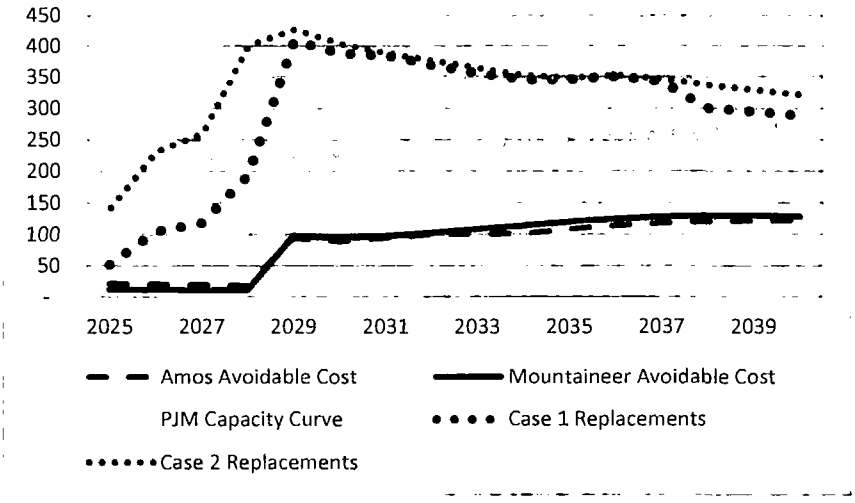
---

[27] *Id.* at 8. As discussed below, Company witness Ross provided projected book values for such balances.
[28] Tr. at 98-99 (Beam). *See also* Ex. 12 (APCo's responses to Consumer Counsel discovery request nos. 1-04, 1-06).
[29] Ex. 11 (Beam direct) at 8-9.
[30] The $98 million share amount was based on projected total company ELG costs of approximately $197 million combined for Amos and Mountaineer. The $197 million estimate was subsequently updated to $169 million. Tr. at 63-64 (Sherrick).
[31] Ex. 13 (Martin direct) at 3-4. While this page of Mr. Martin's testimony references electricity after 2029, his analysis assumed no energy margin after 2028. *Id.* at 14.

Mr. Martin's analysis in this case took the outputs of analysis APCo conducted in the VCEA renewable portfolio standard ("RPS") Proceeding[32] in the fall of 2021, then adapted those outputs to this case shortly before the Petition was filed.[33] He compared the continued operation of Amos and Mountaineer (future fixed O&M and capital expenses) against two different "cases" of replacement resources – Case 1, which assumes a mix of renewables and gas-fired resources; and Case 2, which assumes 100% renewable and energy storage resources – and also against a projected PJM capacity market price.[34] More specifically, the Case 1 and Case 2 resources used in Mr. Martin's analysis are resources selected by PLEXOS modeling in two of the resource plan scenarios included in the Company's 2021 RPS Plan.[35] He added up the resources through 2028 in the two resource portfolios included in APCo's 2021 RPS Plan that assumed a 2028 retirement of Amos and Mountaineer.[36] His Case 1 in the instant proceeding corresponds to RPS Portfolio 3, while his Case 2 corresponds to RPS Portfolio 4.[37]

Mr. Martin presented the "gross capacity costs" and "net capacity costs" for these alternatives using dollars per megawatt-day ("$/MW-day") as the Y-axis for the figures below.[38]

Figure 1 - Gross Capacity Costs - $/MW-Day



[32] *Petition of Appalachian Power Company, For approval of its 2021 RPS Plan under § 56-585.5 of the Code of Virginia and related requests*, Case No. PUR-2021-00206, Final Order on Petition and Associated Requests, and Order Bifurcating Proceeding (July 15, 2022) ("2021 RPS Proceeding").

[33] Tr. at 104-05 (Martin).

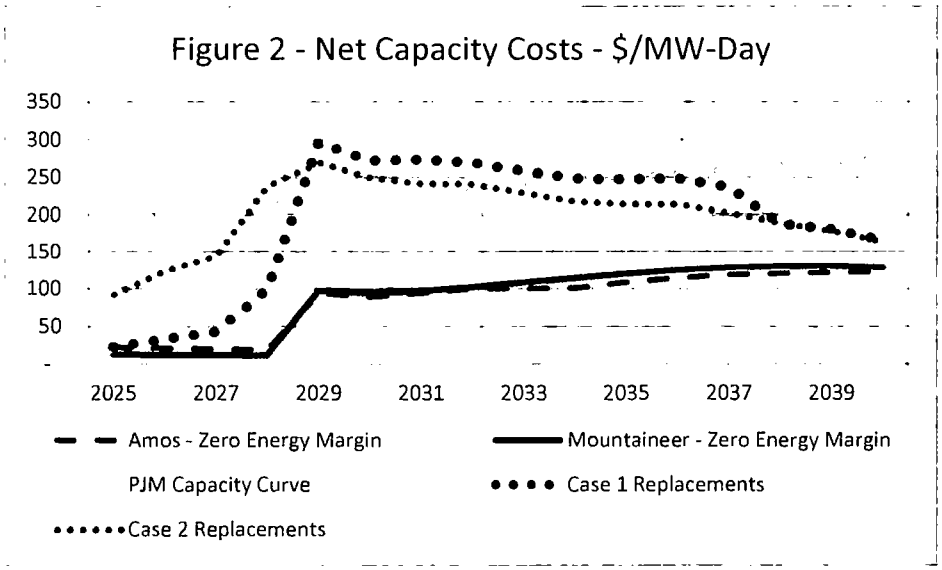
[34] Ex. 13 (Martin direct) at 4-5.

[35] *Id.* at 10. He attached the Company's 2021 RPS Plan to his direct testimony. *Id.* at attached Sched. 1. While the record identifies this plan and its portfolios as "RPS," "VCEA," or "VCEA RPS" plans/portfolios, this Report refers to such as "RPS Plan(s)" or "RPS Portfolio(s)" for consistency.

[36] *Id.* at 11. APCo's 2021 RPS Plan presented six VCEA-compliant portfolios. *Id.* at 10.

[37] *Id.* at 11. These plans show resource additions through 2040. *Id.* at attached Sched. 1, Tables 26 and 27.

[38] *Id.* at 5-6. Mr. Martin testified that the $/MW-Day metric is a common measure of the cost of capacity that puts differently sized capacity resources "on an apples-to-apples" basis as a cost per unit of capacity. *Id.* at 7.



The first year shown on the above figures is 2025, which is the year most of the new resources used for near-term VCEA compliance are projected to come online. The last year shown is 2040, the year through which the WVPSC indicated the ELG projects would provide Amos and Mountaineer an opportunity to run.[39] The difference between Figures 1 and 2 shown above is that Figure 2 deducts an energy margin from the costs of the Case 1 and Case 2 resources. While Mr. Martin indicated that Amos and Mountaineer will generate energy margin, meaning their lines in Figure 2 would be lower if such margins were included, he did not deduct any energy margin for these two plants in Figure 2.[40] He likened the "gross capacity cost" in Figure 1 to base rate cost of service, containing the incremental fixed costs of each option net of tax credits for wind and solar resources.[41]

According to Mr. Martin, the Virginia jurisdiction continues to be responsible for its share of APCo's overall capacity obligation. As that overall obligation will continue to be met, in large part, with Amos and Mountaineer (which would continue to operate beyond 2028 regardless of the outcome of this proceeding), Virginia customers could satisfy their responsibility with an interjurisdictional financial agreement, or conceivably, self-supply of the Virginia capacity obligation.[42]

Mr. Martin provided additional details on his comparative economic analysis. His analysis eliminated all impacts of separate and unrelated resource additions or retirements occurring after 2028. For the replacement resources, he believes the costs and revenues associated with resources added after 2028 are irrelevant to the ELG approval, because they will "come too late to avoid paying for the required pre-2028 investments."[43] Additionally, he assumed 1,907 MW UCAP as the replacement capacity for Virginia. He calculated this amount

[39] *Id.* at 7.
[40] *Id.* at 5. He indicated the assumed PJM market capacity option would not come with any energy margin offset. *Id.* at 6.
[41] *Id.* at 7.
[42] *Id.* at 8.
[43] *Id.* at 9.

by: (1) adjusting the combined 4,200 MW nameplate capacity of Amos and Mountaineer to a 3,814 MW UCAP figure, to account for a forced outage rate; and (2) then taking 50% of the 3,814 MW UCAP figure (approximately 3% Commonwealth and Public Authorities customers added to the approximately 47% Virginia retail jurisdiction).[44] He estimated the Virginia jurisdictional share of ongoing avoidable costs of Amos and Mountaineer, including the ELG projects, combined would average $84 million annually, from 2029-2040.[45] His analysis excluded recovery of sunk costs of the existing investment in these plants from Virginia customers, because he believes such costs would be recovered in any scenario.[46]

To meet the 1,907 MW UCAP his analysis in the instant case assumes APCo would need to replace the Virginia jurisdictional share of Amos and Mountaineer, he made the following assumptions:

1. If approved, the mixture of owned and PPA wind and solar projects that were selected from the 2021 RFP totaling 498 MW proposed in the 2021 RPS Proceeding will come online at various dates between 2023 and 2025. He assumed both Virginia and West Virginia would approve the projects, and Virginia would thus be allocated half;

2. The next group of resources added between 2025 and 2028 were assumed to be fully allocated to APCo's Virginia jurisdiction to meet the VCEA requirements. Between steps 1 and 2, all of the resources required by the VCEA prior to 2028 have been brought into the analysis, reducing the replacement capacity that would otherwise be required to replace Amos and Mountaineer; and

3. The "plug" to fully replace the remaining portion of Virginia's half of Amos and Mountaineer's UCAP capacity was then taken from the large resource added to replace these plants in 2028. This is a gas combined cycle plant in Case 1 and energy storage in Case 2.[47]

He presented tables showing the resource composition and costs of Cases 1 and 2 in his analysis.[48] Both tables are included below in Section I of this Report's Analysis.

Mr. Martin also analyzed a "paper capacity" alternative of purchasing capacity at a forecasted PJM market price, which is identified in the record as his "Case 3." He testified that this approach would leave APCo heavily exposed to both market energy and capacity price risks that would be mitigated with ownership of actual resources.[49]

---

[44] *Id.* at 9-10.
[45] *Id.* at 10. He estimated $73 million of avoidable costs in 2029 increasing to $95 million in 2040. *Id.*; Ex. 4 (Petition) at Filing Sched. 46, Section 2, Statement 1.
[46] Ex. 13 (Martin direct) at 10. He believes such costs would either be: (a) recovered as depreciation should Amos and Mountaineer continue to run; or (b) amortized over a given period if these plants are replaced. *Id.*
[47] *Id.* at 12.
[48] *Id.* at 13.
[49] *Id.* at 9, 11.

Mr. Martin sponsored Filing Schedule 46, Section 2, Statement 1, which displays the results of his economic analysis for each year, from 2029 to 2040. Mr. Martin summarized the results of his economic analysis over the entire period using the following table.[50]

Table 3 - 2029-2040 Cost of Service Impacts

Line	Dollars In Millions	NPV of 2029-2040	Nominal Total 2029-2040
1	**Amos and Mountainer incremental capacity cost**	$647	$1,003
	Replacement Capacity Costs, net of Energy Margin		
2	Case 1 - Gas CC and Renewable Replacements	$1,935	$2,825
3	Case 2 - Storage and Renewable Replacements	$2,290	$3,356
4	Paper Capacity - PJM Market	$1,486	$2,280
	Replacement Cost Percentage of Amos/Mountaineer	2029-2040 Average % Increase	2029-2040 Average $(Millions) Increase
5	Case 1 - Gas CC and Renewable Replacements	290%	$152
6	Case 2 - Storage and Renewable Replacements	344%	$196
7	Paper Capacity - PJM Market	229%	$106

Mr. Martin detailed some of the assumptions in his economic analysis. For Amos and Mountaineer, he used an approximately $98 million Virginia share of ELG investments[51] to calculate a $15 million annual revenue requirement paid by Virginia customers when the ELG investments go in service, dropping to $2 million per year in 2034.[52] Over the entire period between 2022 and 2040, he estimated the Virginia share of the nominal revenue requirement will total approximately $150 million, with an approximately $93 million present value of this cost-of-service estimate.[53]

For both cases, Mr. Martin included all future non-ELG capital investment at Amos and Mountaineer forecasted through 2035. From 2036 to 2040, he used a "glide path" capital expense forecast with reduced maintenance capital. Starting in 2029, he applied a levelized

[50] *Id.* at 16.
[51] Mr. Martin's $98 million Virginia share assumption was based on projected total company ELG costs of approximately $197 million combined for Amos and Mountaineer. This estimate was subsequently updated to $169 million. Tr. at 63-64 (Sherrick).
[52] Ex. 13 (Martin direct) at 18. He assumed the Amos ELG is fully depreciated in 2033, with the remaining depreciation related to Mountaineer ELG. *Id.*
[53] *Id.* at 18-19.

carrying charge to this capital expense to determine the cost-of-service savings from avoiding that capital.[54]

His analysis assumed the currently forecasted level of O&M through 2030. After 2030, O&M was assumed to decline to 75% of the 2030 forecast, due to lower capacity factors, if a national carbon tax is enacted. All of the fixed O&M was assumed to be avoidable starting in 2029.[55]

He also prepared a forecast of taxes that could be avoided if Virginia customers no longer benefit from Amos and Mountaineer. APCo is expected to pay approximately $10 million in property taxes and $36 million in West Virginia business and occupation taxes annually towards the end of this decade. Virginia's half of these two taxes would be approximately $23 million annually in 2028 and beyond.[56]

For the replacement resources, he used a spreadsheet to calculate a forecast of the annual revenue requirement on the new resource additions using customary ratemaking principles. For owned resources, he used a forecasted rate base that declines over time, return on rate base at a weighted average cost of capital, depreciation, O&M, production tax credits over the first ten years of the wind assets, and normalization of investment tax credits on solar assets over a 35-year life. He used PPA costs for PPAs. He used actual resource costs for the portion of replacement capacity provided by the Virginia half of the 498 MW of the VCEA-compliant projects proposed in the 2021 RPS Proceeding. According to Mr. Martin, the gross cost of service for this 498 MW is projected to average approximately $42 million per year for Virginia customers through 2040.[57] He summarized these resources with the following table.[58]

TABLE 5 – Near Term Planned Resources

Facility	Nameplate Capacity MW	Owned / PPA	State	Resource Type	Operation
Firefly	150.0	Owned	Virginia	Solar	July 2024-June 2059
Amherst*	4.9	Owned	Virginia	Solar	Jan 2023 - Dec 2057
Horsepen	20.0	PPA	Virginia	Solar	Jan 2025 - Dec 2054
Dogwood*	18.9	PPA	Virginia	Solar	Jan 2025 - Dec 2054
Sun Ridge	50.0	PPA	Virginia	Solar	Jan 2025 - Dec 2054
Virginia Domiciled	**243.8**				
Top Hat	204.0	Owned	Illinois	Wind	Jan 2025 - Dec 2054
Bedington	50.0	Owned	West Virginia	Solar	Oct 2023 - Sep 2058
TOTAL	**498**				

*Distribution Resource

For the remaining replacement resources, Mr. Martin used generic resource costs, including wind and solar costs aligned with the average of the bids received by APCo in RFPs it

[54] *Id.* at 19.
[55] *Id.* at 19.
[56] *Id.* at 19-20.
[57] *Id.* at 20.
[58] *Id.* at 21.

issued for both owned and PPA resources in 2021. As such, all new wind and solar resource costs are based on actual market information available when the analysis was performed.[59]

Mr. Martin testified that PJM utilities like APCo are required to provide enough capacity to cover their summer peak loads plus a reserve margin forecasted to be 14.9% on an installed capacity or nameplate basis, or approximately 8.6% on a UCAP basis.[60]

Mr. Martin explained that PJM assigns capacity values lower than nameplate ratings. In addition to adjusting each resources' nameplate capacity downward for an assumed forced outage rate, the capacity credit of intermittent, renewable resources is based on the effective load carrying capability ("ELCC") methodology.[61] He provided the following table to illustrate how much more nameplate capacity is required for intermittent resources to match the UCAP value of Amos and Mountaineer.[62]

Table 4 - PJM Capacity Credit By Resource Type

	Nameplate Capacity	2028 PJM Capacity credit %	PJM Accredited UCAP Capacity	Capacity to Match Amos / Mountaineer UCAP
50% of Amos and Mountaineer	2,100	91%	1,907	
Wind	2,100	11%	231	17,336
Solar (Tracking)	2,100	39%	819	4,890
Storage - 4 hour	2,100	70%	1,470	2,724
Solar Plus 4 hour Storage	2,100	72%	1,512	2,649
Gas CT or CC	2,100	96%	2,016	1,986

As shown, for example, approximately 4,890 MW of nameplate solar (tracking) or 17,336 MW of nameplate wind is equivalent to the 2,100 MW nameplate capacity of 50% of Amos and Mountaineer.

Based on current ELCC expectations, and a mix of 40% wind and 60% solar, 8,800 MW of such resources would be needed by 2028 to replace the 1,907 MW of UCAP for the Virginia share of Amos and Mountaineer, at a cost close to $15 billion.[63] For these replacement resources, Mr. Martin calculated an approximately $338 million annual average net cost of service through 2040 by assuming the cost of the generic resources would be the same as the expected cost of the 498 MW proposed in the 2021 RPS Proceeding, after deducting expected energy revenue that will reduce customer fuel costs. The 8,800 MW of replacement resources needed by 2028, according to his calculations, is 17.7 times the 498 MW proposed in the 2021 RPS Proceeding. Mr. Martin multiplied the $19 million per year average cost estimated for

[63] *Id.* at 22.

the 498 MW times 17.7 to calculate his $338 million annual average net cost of service for 8,800 MW of replacement resources.[64]

Mr. Martin also calculated projected annual and average costs per MWh energy of ten new resources, including the seven resources proposed in the 2021 RPS Proceeding plus three other PPA resources that went online in 2021 or that will go online in 2022.[65] He calculated the cost of these ten resources to average $53/MWh over the 17 years between 2024 and 2040.[66]

Mr. Martin described the growing influence of REC values on new resource costs. He reported that PJM REC prices traded as high as $24.50 in January 2022. In the two RPS Portfolios on which his Case 1 and Case 2 analysis is based, REC prices were assumed to be between $27 and $32 between 2023 and 2031.[67] He explained that state renewable energy mandates and corporate renewable pledges have created a high demand for renewables and RECs, leading to difficulty getting resources sited, interconnected, approved, and constructed in time to meet growing compliance targets. He recognized that PJM is seeking to implement a two-year moratorium on new interconnection requests due to its interconnection queue backlog. All of this has driven up REC prices and PPA prices, according to Mr. Martin.[68]

To comply with the VCEA, APCo must self-generate or purchase and retire RECs. For PPAs, Mr. Martin indicated the REC value can push up the PPA price to an amount "well above" the cost of the underlying asset. In his opinion, the REC value that rational profit-seeking developers attempt to capture in pricing their product will increase a new resource price above the cost of the asset itself.[69]

While APCo must meet REC/RPS requirements and petition the Commission for approval of certain resources, Mr. Martin recognized that the VCEA does not require the retirement of Amos or Mountaineer, which are located outside of Virginia. He indicated the petition requirements applicable in time to impact the ELG decision are 400 MW of wind or solar by 2027 and 25 MW of storage by 2025. He does not believe any resources added for VCEA compliance after the 2027 requirement are relevant to the decision regarding how to replace Amos and Mountaineer's capacity, as that decision would have already been made.[70]

Mr. Martin explained that APCo is not projected to need capacity to maintain compliance with PJM capacity requirements until 2040 and APCo plans to add only the minimum resources needed for VCEA compliance (assuming they are cheaper than RECs). The total UCAP

---

2021-00035

provided by all the new resources APCo plans to add for VCEA compliance by 2028 is 298 MW, which is less than half of the 742 MW UCAP capacity of the smallest unit at Amos.[71]

Mr. Martin indicated that the VCEA requirements do impact the economics of Amos and Mountaineer. However, as the VCEA's REC/RPS requirement is a percentage of Virginia jurisdictional load, the VCEA does not restrict how much Amos and Mountaineer can operate.[72]

As for potential transmission costs, APCo's decision to make CCR and ELG investments factored in a high-level estimate of approximately $100-$200 million in needed transmission upgrades if Amos and Mountaineer were retired. However, Mr. Martin's economic analysis in the instant case includes no transmission costs because Amos and Mountaineer will not retire in 2028. He also did not add interconnection costs beyond routine interconnection costs assumed in the generic resources. However, he maintained that based on the interconnection costs of adding the 498 MW of resources currently under development, the transmission costs for the thousands of nameplate MW needed to replace Virginia's half of Amos and Mountaineer could be $50-$100 million, depending on the location of replacement capacity. Such costs, if included, would raise the replacement cost calculated in his analysis.[73]

Turning to the gas-fired Clinch River power plant, Mr. Martin explained that RGGI compliance costs are required because Clinch River is located in Virginia. Such costs have been deferred to date, and Company witness Castle included an estimate of such costs in the proposed revenue requirement in the instant case. Mr. Martin testified that RGGI cost recovery is appropriate since customers have already received a fuel cost-of-service reduction from the energy revenues received when Clinch River's energy was economically dispatched. He testified that when APCo offers Clinch River for sale into the PJM energy market, the offered price includes the cost of any RGGI allowances that APCo would need to purchase to allow Clinch River to run.[74]

While Mr. Martin testified that he knows a cost of RGGI allowances is included in APCo's offers into the PJM energy market, he did not know how APCo develops the number that is incorporated into the offer. He testified that his view of "economic dispatch" involves "blocks" of time (not necessarily individual hours) when the energy market price is higher than a unit's dispatch cost bid by APCo.[75] Discovery responses he provided to Appalachian Voices indicated that APCo uses RGGI CO_2 allowance prices published in Argus Air Daily to estimate the costs of RGGI allowances when preparing Clinch River's hourly offer curves.[76]

Mr. Martin also provided discovery responses about the self-scheduling of Clinch River that were admitted into the record, which are discussed further in Section III of this Report's Analysis.

Mr. Sherrick sponsored most of Sections 1 and 2 of Filing Schedule 46.[77]

Mr. Sherrick described the CCR/ELG projects at Amos and Mountaineer. He explained that all four units at these plants (three units at Amos and one at Mountaineer) are equipped with an electrostatic precipitator for control of particulate matter, an FGD system for sulfur dioxide control, both SCR technology and low-nitrogen oxygen ("NOx") burners for control of NOx emissions, and a dry fly ash handling system. All four units currently transport bottom ash and miscellaneous wastewater streams to a pond system where the bottom ash is later dredged and trucked to a permitted landfill. The bottom ash transport water and miscellaneous wastewater streams are then discharged to the Kanawha (Amos) and Ohio (Mountaineer) Rivers through a national pollution discharge elimination ("NPDES") permitted outfall.[78]

Mr. Sherrick explained that the *2021 E-RAC Order* approved cost recovery for CCR projects for Amos and Mountaineer. He described the CCR/ELG project scopes and how APCo determined them through collaboration with several departments of AEPSC.[79] For Amos to operate in compliance with the CCR/ELG requirements requires:

(i) removing ash from the Bottom Ash 1A and 1B, Reclaim, and Clearwater ponds;
(ii) closing pond 1A and grading and seeding to establish natural drainage;
(iii) lining the existing Reclaim and Clearwater ponds;
(iv) constructing a new Lined Wastewater pond in place of Bottom Ash Pond 1B;
(v) installing a chemical treatment system for non-CCR wastewater streams;
(vi) modifications to the bottom ash handling systems to no longer allow the discharge of bottom ash transport water, including the installation of submerged grind conveyor systems;
(vii) installation of two new ash bunkers;
(viii) retrofitting economizer ash handling systems on Units 1 and 2; and
(ix) installation of a new FGD Biological Treatment System with Ultrafiltration.[80]

For Mountaineer to operate in compliance with CCR/ELG requirements requires:

(i) removing ash from the east and west Bottom Ash ponds;
(ii) lining the cleaned east and west ponds to create east and west Wastewater Settling ponds;
(iii) installing a chemical treatment system for non-CCR wastewater streams;

[77] Mr. Gallimore sponsored one page. Ex. 4 (Petition) at Filing Sched. 46, Section 1, Statement 1 – Claytor DO Project Cost Estimate. Mr. Martin sponsored a one-page summary for his economic analysis. *Id.* at Filing Sched. 46, Section 2, Statement 1.
[78] Ex. 8 (Sherrick direct) at 3.
[79] *Id.* at 3-4.
[80] *Id.* at 4.

(iv) potentially installing ground water remediation equipment;
(v) modifications to the bottom ash handling system to no longer allow discharge of bottom ash transport water, including installation of a submerged grind conveyor system;
(vi) installation of a new ash bunker; and
(vii) retrofit of a new Ultrafiltration system onto the existing FGD Biological Treatment System.[81]

According to Mr. Sherrick, AEPSC evaluated different vendor options to convert the wet bottom ash handling systems to dry systems and to treat the FGD wastewater streams. AEPSC also evaluated closed loop recycle systems for Amos. The project teams selected the technically feasible, least life-cycle-cost option for APCo's customers.[82]

Mr. Sherrick described AEP's process for planning and constructing environmental projects, including AEPSC's project schedule management process.[83] He sponsored the schedules for the Amos and Mountaineer compliance plans.[84]

Mr. Sherrick described the cost estimates for the CCR/ELG projects he supplied to Company witness Martin for his economic analysis. Cost estimates were developed by an independent engineering firm with inputs and oversight from AEPSC,[85] and updated at the hearing to reflect project completion as of August 2022 based on the close of the July business month.[86] At Amos, the current total estimated cost is $179 million, of which approximately $127 million is associated with only ELG compliance. At Mountaineer, the current total estimated cost is $79 million, of which approximately $42 million is associated with only ELG compliance.[87]

Mr. Sherrick explained that APCo's current cost estimates for the Amos and Mountaineer CCR component are $7 million and $19 million higher, respectively, than the estimates provided in the 2021 E-RAC Case. He attributed increased estimates to quantity increases from preliminary to detailed engineering and design, material price changes due to the coronavirus pandemic, and contractor unit prices that were higher than estimated. Before decreased estimates were identified at the hearing, APCo's cost estimates for the Amos and Mountaineer

The $179 million total cost estimate for Amos includes $160 million in capital, $6.3 million in other charges, and $13 million in asset retirement obligation ("ARO") costs. *Id.* at 9; Tr. at 63 (Sherrick). The $79 million total cost estimate for Mountaineer includes $71 million in capital, $4.8 million in other charges, and $3.4 million in ARO costs. *Id.* at 9-10; Tr. at 64 (Sherrick). *See also* Ex. 4 (Petition) at Filing Sched. 46, Section 1, Statement 1, Amos Project Cost Estimate, p. 1, and Mountaineer Project Cost Estimate, p. 1.

ELG component were $16.4 million and $4.4 million higher, respectively, than the estimates provided in the 2021 E-RAC Case.[88]

Mr. Sherrick provided an update on the status of the CCR and ELG projects. At the time the Petition was filed, construction of the Amos CCR system was ongoing, with removal of bottom ash and closure by removal of existing pond 1B. Construction of the Mountaineer CCR system began in March 2022.[89] Through August 2021, the Amos and Mountaineer ELG projects incurred approximately $19.5 million and $12.6 million, respectively, in ELG costs for Stages 1 through 3 activities. Mr. Sherrick asserted that incurrence of these costs prior to regulatory approval was unavoidable as they were necessary to establish the projects' scope, schedule, and cost estimates to inform the regulatory process.[90] Costs incurred after August 2021 included costs to finish the permitting process, install dry bottom ash and wastewater treatment equipment, and startup and commission installed systems. Mr. Sherrick indicated these activities are required to meet environmental compliance deadlines.[91]

Mr. Sherrick also described the Amos Units 1 & 2 dry sorbent injection project, which would reconfigure the existing system to handle hydrated lime more efficiently, at an estimated cost of $9.4 million. This project would reduce issues related to corrosion, improve heat rate, improve equivalent unplanned outage rate, lower minimum load, and help with the long-term protection of the SCR catalyst, air heaters, and precipitators.[92] The system is scheduled to be retrofitted during fall 2022 unit outages.[93]

At the time of the hearing, Mr. Sherrick reported that all of the relevant projects were either in the construction phase or the startup and commissioning phase.[94]

Mr. Gallimore described the dissolved oxygen project at Claytor, APCo's four-unit hydroelectric facility on the New River in Radford, Virginia.[95] As approved by FERC and the Virginia DEQ, APCo would replace current turbines with auto-venting turbines in two of the four generating units. Each of these two units would independently meet the dissolved oxygen requirements, which provides redundancy – a factor Mr. Gallimore indicated was key to the Company's selection of this compliance option.[96] Auto-venting technology is a proven, reliable technology that provides the greatest percentage of increased dissolved oxygen concentration,

and is expected to increase the MW output of each unit by at least 10% because of the turbine design.[97]

Mr. Gallimore explained that the auto-venting turbine project was selected after receiving bids from vendors in response to a request for information. Construction on the first unit is scheduled to begin in 2022, with a planned in-service date of November 2023. Construction on the second unit is scheduled to begin in 2023, with a planned in-service date of November 2024. The total estimated cost of the project is $12.4 million.[98]

According to Mr. Gallimore, APCo worked with an independent engineering firm to evaluate dissolved oxygen enhancement options for Claytor. One alternative option was to install a line diffuser in the forebay (upstream) pond of Claytor. This option would require oxygen storage and additional oxygen generation equipment to be installed on site, with on-site storage needed as a backup. This option would require annual maintenance, which would increase the annual cost to operate and maintain the line diffuser. Additionally, the diffuser would be subject to damage and blockage from lake debris, which would prevent the enhancement to dissolved oxygen levels while the system is out of service.[99] Mr. Gallimore asserted that the auto-venting turbine project is the best, most reliable solution available.[100]

Mr. Spitznogle described the environmental regulations that drive the need and timing for the environmental improvement projects at APCo's generation facilities. He also supported the identification of activities: (i) related to the handling and disposal of the byproducts of coal combustion necessary for state or federal legal compliance; (ii) undertaken at Claytor to comply with dissolved oxygen requirements issued by FERC; (iii) undertaken at Amos to optimize the dry sorbent injection system used to mitigate acid gas emissions; and (iv) to comply with RGGI.[101]

Mr. Spitznogle provided a list of compliance activities to Company witness Ross to identify the environmental compliance costs associated with those activities.[102] Mr. Spitznogle cited the federal or state law(s) or regulation(s) applicable to each environmental project.[103] He used detailed accounting reports that included actual 2021 activities associated with environmental compliance for January through November during that year to identify activities associated with specific pieces of equipment and systems.[104] Mr. Spitznogle believes the level of environmental activity for these eleven months is representative of ongoing levels during the projected period.[105]

He described the CCR Rule, which regulates the handling and storage of CCR material – including fly ash, bottom ash, and gypsum – generated at coal-fired generation facilities. The CCR Rule applies to new and existing CCR landfills and surface impoundments (ponds) at operating coal-fired generation facilities. Some requirements of the CCR Rule, including applicable compliance dates, have been revised by the EPA since the initial 2015 regulation. The most recent revisions were finalized in August 2020.[106] In November 2020, APCo filed with the EPA a request to extend the CCR compliance date. At the time of the Petition, the EPA had not ruled on APCo's request.[107]

According to Mr. Spitznogle, activities associated with CCR handling and disposal include, but are not limited to, items such as bottom ash pumps and transportation equipment, economizer ash handling equipment, fly ash handling equipment and disposal activities, gypsum handling and disposal equipment and systems, ponds, and landfills.[108]

Mr. Spitznogle described the ELG Rule, which established discharge limits on FGD wastewater, transport water used for fly ash and bottom ash handling, and other wastewaters at steam-electric generation facilities. The ELG Rule's requirements were revised after the initial 2015 regulation, with the most recent revisions finalized in October 2020. The revised rule eliminated the discharge of most ash transport waters and requires enhanced treatment of FGD wastewaters. These requirements are implemented through modifications to the existing state wastewater discharge (NPDES) permit at each facility.[109] The ELG Rule requires that discharge limits be achieved as soon as possible before December 31, 2025, pursuant to a schedule that will be included in each facility's NPDES permit. New bioreactors would bring Amos to full ELG compliance by the end of 2023 and an upgraded bioreactor would bring Mountaineer into ELG compliance by the end of 2023.[110] Options for compliance with the ELG Rule that APCo did not choose – installation of advanced membrane technology, dispatching at very low capacity factors, or plant retirement – had a 2028 compliance deadline.[111]

Mr. Spitznogle testified that, to expedite compliance, APCo developed coordinated activities needed to comply with the requirements of the ELG Rule and CCR Rule.[112]

Mr. Spitznogle confirmed that the EPA has issued a notice of proposed rulemaking that would require more stringent ELG standards for FGD wastewater. The EPA's proposal references the potential to require advanced membrane technology for FGD wastewater.[113]

Mr. Spitznogle identified the dry sorbent reconfiguration at Amos as an additional environmental compliance project that APCo proposed to include in the E-RAC. He recognized that SCR and FGD systems were installed to comply with NOx and sulfur dioxide ("SO_2") limits under various environmental regulations. The FGD systems at Amos included the addition of a

[113] Tr. at 73-74 (Spitznogle).

dry sorbent injection system to mitigate emissions of SO_3, an acid gas that can cause visible stack emissions as a result of operating the SCR and FGD systems together.[114] Whereas Amos's original dry sorbent injection system was designed to use trona, the system would be modified to use hydrated lime. This modification will result in reduced O&M costs, while continuing to mitigate the emission of acid gas.[115] Mr. Spitznogle clarified that while reconfiguring the dry sorbent system is not required by a specific environmental regulation, reconfiguration will allow for more economic compliance with the regulation that required construction of the dry sorbent injection system.[116]

Mr. Spitznogle discussed the regulations necessitating the dissolved oxygen project at Claytor. Virginia water quality standards include minimum concentration and daily average concentration standards for dissolved oxygen. In 2019, FERC requested that APCo prepare and file a redefined plan to improve low dissolved oxygen conditions at Claytor, given the lack of progress in enhancing water quality conditions over the past seven years. Virginia DEQ recommended APCo explore alternative measures for improving dissolved oxygen concentrations during the June through September periods. In 2020, FERC and Virginia DEQ separately approved APCo's redefined plan providing for such measures at Claytor, including the installation of two auto-venting turbines to aerate water flow by injection of air into the unit discharge.[117]

Mr. Spitznogle discussed the RGGI regional cap, allowances, and auctions used by participating states to regulate CO_2 emissions.[118] He identified the statute that directed the Virginia DEQ to adopt regulations resulting in Virginia's membership in RGGI. He explained that Clinch River – a two-unit, 484 MW gas-fired plant – is APCo's only carbon-emitting generation facility located in Virginia. APCo is required to purchase one CO_2 allowance for each ton of CO_2 emitted from Clinch River.[119]

Mr. Ross testified in support of APCo's accounting treatment for the ash pond updates at Amos and Mountaineer, the dry sorbent injection project at Amos, and the dissolved oxygen project at Claytor. He explained APCo's proposed regulatory accounting and cost recovery for accumulated funds used during construction ("AFUDC"), return on construction work in progress ("CWIP"), plant-in-service, and depreciation expense.[120]

Mr. Ross summarized APCo's total net E-RAC under-recovery as of December 31, 2021, with the following table.[121]

---

[114] Ex. 9 (Spitznogle direct) at 10-11. With the addition of the FGD system, Amos began to consume a fuel with higher sulfur content, and a small portion of the resulting SO_2 is converted to SO_3 in the SCR. *Id.* at 11.

APCo E-RAC Under-Recovery – December 31, 2021	
Account 1823618 – VA Unamortized CCR O&M Compliance Expense Deferral	$12,647,325
Account 1823645 – VA Unamortized AFUDC on CCR Construction Expenditures	194,772
Account 1823647 – VA E-RAC Under-Recovery	233,682
Net APCo Virginia E-RAC Under-Recovery – December 31, 2021	**$13,075,779**

Mr. Ross explained that APCo excluded the unamortized balances of Accounts 1823618 and 1823645 (the first two figures in the above table) because those costs will be fully recovered when APCo updates E-RAC rates in December 2022.[122]

According to Mr. Ross, the CCR investments for wastewater pond upgrades at Amos and Mountaineer are expected to be placed in service in October 2023 and December 2023. Once in service, APCo will incur depreciation and return on net assets placed in-service, ARO asset depreciation expense, and ARO liability accretion expense, all of which Mr. Ross indicated would be included in APCo's future monthly E-RAC over-/under-recovery. Mr. Ross also requested Commission approval to prospectively recover property tax expense incurred related to APCo's Virginia retail jurisdictional CCR CWIP and electric plant-in-service balances.[123] As approved in the *2021 E-RAC Order*, APCo will use initial depreciation rates of 9.52% for Amos and 5.71% for Mountaineer for CCR assets that are placed in service, based on average in-service dates of the CCR/ELG projects at these plants.[124]

Mr. Ross reported that APCo began incurring RGGI costs associated with Clinch River in 2021 and had deferred $340,981 of Virginia jurisdictional RGGI costs through December 31, 2021.[125] APCo's proposed E-RAC includes this amount, in addition to forecasted RGGI expense amounts of $158,159 for January 2022 through November 2022 and $300,390 for December 2022 through November 2023.[126] He testified that if actual RGGI costs are less than forecasted RGGI costs, APCo will record the difference and include it in a future E-RAC petition.[127] Mr. Ross indicated that energy revenues referenced in the Company's Petition are credited to the fuel factor, but APCo has not netted any revenues against the deferred RGGI costs.[128]

For ELG investments, APCo proposes recovering AFUDC on CWIP incurred up to December 2022, return on CWIP from December 2022 through the in-service date, depreciation and return on net assets placed in service, and property taxes on CWIP and electric plant-in-

---

[122] *Id.* at 5.
[123] *Id.* at 5-7. Mr. Ross indicated that APCo mistakenly omitted requesting recovery of such property tax expense in the 2021 E-RAC Case. *Id.* at 7.
[124] *Id.* at 16. While these proposed depreciation rates do not include a component for net salvage, APCo will request a net salvage factor in future depreciation studies filed by the Company. *Id.*
[125] *Id.* at 7.
[126] *Id.* at 8.
[127] Tr. at 83-84 (Ross)
[128] Tr. at 82 (Ross).

service.[129] APCo currently expects the Amos dry ash handling system and water biological treatment system with ultrafiltration will go in service in December 2022 and September 2023, respectively. APCo expects the Mountaineer dry ash handling system and upgraded water biological treatment system with ultrafiltration will go in service in May 2022 and June 2023, respectively.[130] Once in service, APCo proposes using the same depreciation rates for ELG assets as proposed for CCR assets (*i.e.*, 9.52% for Amos and 5.71% for Mountaineer).[131]

If the Commission rejects recovery of Amos and Mountaineer ELG investments in the instant case, APCo would propose changes to existing depreciation and recovery of the remaining base generating units. Current depreciation and recovery are based on APCo's 2019 Virginia depreciation study, as modified and approved by the Commission in the 2020 Triennial Review.[132] This study established depreciation rates using estimated retirement dates of 2032 for Amos Units 1 and 2, 2033 for Amos Unit 3, and 2040 for Mountaineer.[133] As of December 31, 2021, APCo projected December 31, 2028 total company Amos and Mountaineer book values of approximately $582 million and $474 million, respectively. Mr. Ross clarified that these forecasted balances: (a) were determined using APCo Virginia retail ratemaking adjustments consistent with prior APCo Virginia base case filings; (b) include CCR investments; (c) exclude ELG investments; and (d) exclude other Amos and Mountaineer base generating unit capital expenditures for the period 2022 through 2028.[134]

If the Commission rejects recovery of ELG investments, APCo requests recovery of approximately $15.3 million of CWIP and $0.5 million of AFUDC on ELG CWIP balances through August 2021, when the *2021 E-RAC Order* was entered.[135]

Mr. Ross indicated that APCo is currently incurring construction costs for the dry sorbent injection project at Units 1 and 2 of Amos and the dissolved oxygen project at Claytor, which he described as new environmental costs. The forecasted in-service date for the dry sorbent injection project is December 2022. The forecasted in-service dates for the dissolved oxygen projects are November 2023 and November 2024.[136]

For the dry sorbent injection project, APCo proposes the recovery of AFUDC on CWIP from January 2022 through November 2022. For the dry sorbent injection and dissolved oxygen projects, APCo proposes recovery of a return on CWIP from December 2022 through the in-service date; depreciation and return on net assets placed in service; and property taxes.[137] To depreciate dry sorbent injection and dissolved oxygen investment, APCo proposes using the

existing generation depreciation rates (4.63% and 3.64%, respectively), as approved for the applicable generation facilities in the 2020 Triennial Review.[138]

Mr. Ross does not currently expect any incremental O&M expenses associated with the CCR, ELG, dissolved oxygen, or dry sorbent injection investments he described.[139] He asserted that E-RAC capital investment, revenues, and expenses will be excluded from any other rider recovery and future APCo triennial earnings reviews through the use of unique projects and work orders to identify and track such costs.[140]

Mr. Castle sponsored the E-RAC tariff sheets that APCo proposed to become effective for service rendered on and after December 1, 2022.[141] He also sponsored bill impact calculations illustrating the customer impact of the proposed E-RAC.[142] As shown, the bill for a residential customer using 1,000 kWh per month would increase by $0.80, from $123.33 to $124.13.[143] Mr. Castle testified that the Company's pending fuel factor and triennial review proposals would increase such a customer's monthly bill by an additional $28 to $29.[144]

According to Mr. Castle, Commission denial of APCo's ELG investment in the instant proceeding would result in "sizable jurisdictional balances that must be recovered from Virginia customers who will not be receiving the capacity and energy benefits from the plants after 2028, absent an inter-jurisdictional agreement."[145] The impact of any such agreement on Virginia rates would depend on the agreement, as well as the timeframe for recovery of the Virginia jurisdictional share of plant balances.[146] If the Commission denied ELG recovery, Mr. Castle viewed the remaining net book value as a "stranded cost" even if Amos and Mountaineer continued to operate beyond 2028. He questioned whether APCo could compel West Virginia "to pick up that tab" based on a decision by the Commission.[147]

Mr. Castle confirmed that the proposed rate year in this proceeding is December 1, 2022, through November 30, 2023.[148] He summarized the costs included to develop APCo's proposed revenue requirement as of December 31, 2021, January 2022 through November 2022, and the rate year.[149] As shown, the Petition's proposed revenue requirement of approximately $33.6 million consists of: (1) an actual revenue component of $0.2 million; (2) a true-up revenue component of ($0.5) million; (3) a forecast AFUDC revenue component of $4.3 million; and (4) a forecast revenue component of $29.6 million. The proposed $33.6 million revenue

requirement is $6.2 million higher than the $27.4 million going-level revenue requirement approved in the *2021 E-RAC Order*.[150]

According to Mr. Castle, the rate base for the forecasted revenue component includes Virginia jurisdictional rate base components projected through November 30, 2023, the end of the proposed rate year.[151] The proposed O&M expenses are an annual level of Virginia jurisdictional O&M compliance expenses, as discussed by APCo witness Ross. For RGGI expenses, APCo proposes to recover both an annual rate year level of such expenses and a one-year amortization of a deferred amount of such expenses projected through November 30, 2022.[152] APCo calculated the proposed revenue requirement using a 6.817% after-tax rate of return on rate base and a December 31, 2020 capital structure. The rate of return components, include the 9.20% return on equity authorized by the Commission in APCo's 2020 Triennial Review.[153]

The forecast AFUDC revenue component consists of the recovery of AFUDC associated with ELG and dry sorbent injection projects APCo calculated for the period July 2020 through November 2022, the month immediately preceding the proposed rate year. APCo proposed a one-year amortization of the AFUDC balance calculated by the Company.[154]

Mr. Castle testified that the Petition's proposed jurisdictional allocation of E-RAC costs is consistent with the allocation approved in the *2021 E-RAC Order*. Demand-related costs were allocated to the Virginia jurisdiction using a twelve coincident peak methodology for the year ended December 31, 2021, while energy-related costs were allocated based on actual energy usage for the year ended December 31, 2021. Mr. Castle proposed an energy allocation for RGGI expenses, based on projected CO_2 emissions at Clinch River.[155]

As for the allocation of Virginia jurisdictional costs to the Company's customer classes, Mr. Castle testified that this proposed allocation is also consistent with the *2021 E-RAC Order*, with the proposed energy and demand allocation factors updated using 2019 data. The demand allocation factors were developed using a six coincident peak methodology based on a growth-adjusted 2019 calendar year. The energy allocation factors were developed using growth-adjusted 2019 calendar year energy usage.[156]

For rate design, APCo proposed to use the billing determinants provided in the 2020 Triennial Review. The billing units exclude APCo's open access distribution ("OAD") tariff customers who solely pay distribution rates. The E-RAC would continue to apply to the Company's FRR-OAD tariff customers.[157] For billing purposes, APCo requested a rate effective

date for usage on December 1, 2022, or the first day of the month that is at least 15 calendar days following the date of any Order of the Commission.[158]

Mr. Castle asserted that the E-RAC rates should be incorporated into the balancing charge associated with the non-renewable generation rate adjustment clauses of APCo's Rider WWS. He believes Commission guidance confirming his opinion would benefit APCo[159] by providing clarity on the appropriate language in the tariff.[160] He testified that Commission guidance would not affect the amounts charged to Rider WWS participants or non-participants.[161]

Sierra Club

Sierra Club offered the testimony of **Shelley Kwok**, an Associate with Synapse Energy Economics, Inc. ("Synapse"). Ms. Kwok presented the results of an alternative modeling analysis, using her own EnCompass model. She described EnCompass as an industry standard capacity expansion and production cost model to develop an optimal replacement resource portfolio.[162] She compared the following four scenarios and one fuel price sensitivity:

> (1a) a scenario that includes ELG investments at Amos and Mountaineer and assumes APCo operates these facilities at an annual 69% capacity factor through 2040. The model was set up to add the same new resource portfolio as APCo's RPS Portfolio 1 ("WVPSC Preferred");
>
> (1b) a sensitivity to scenario (1a) that incorporates a coal price that is 2% to 12% higher than scenario (1a) ("WVPSC Preferred, high coal price sensitivity");
>
> (2) a scenario that includes ELG investments at Amos and Mountaineer and is set up the same way as scenario (1a), but assumes APCo operates Amos and Mountaineer economically through 2040 ("APCo Preferred");
>
> (3) a scenario that operates Amos and Mountaineer economically until December 31, 2028, then removes them from APCo's Virginia rate base. APCo then meets Virginia's system needs with a combination of solar PV, wind, battery storage, and market purchases based on what the model selected as optimal. After this first stage of modeling, this scenario was re-run with the full capacity of Amos and Mountaineer while locking in the same builds from the first stage to represent a future where West Virginia customers take 100% ownership of [Amos and Mountaineer] in 2029 and run them at a 69% capacity factor, while Virginia customers' energy and capacity needs are met with alternatives. ("Synapse Full Coal Removal"); and

---

[158] Ex. 7 (Castle direct) at 11.
[159] *Id.*
[160] Tr. at 57 (Castle).
[161] Tr. at 56-57 (Castle).
[162] Ex. 23 (Kwok) at 2, 5, 11-12.

(4) a scenario that uses the same two-step process as scenario (3), except that it removes only Amos from APCo's Virginia rate base on December 31, 2028. This scenario also assumes Mountaineer operates at an annual 69% capacity factor through 2040 ("Synapse Partial Coal Removal").[163]

For each of the above scenarios, Ms. Kwok identified, by year, the amounts of each resource type that are added and the net amount of capacity purchased or sold.[164]

Ms. Kwok indicated that she set up her modeling using APCo's own input values, with one key exception for capacity market prices.[165] She pointed out that APCo's forecast includes prices of $100/MW-day to $151/MW-day for 2023 and 2024, which are three to four times higher than the actual auction clearing price of $34.14/MW-day she believes was relevant for PJM's 2023/2024 delivery year.[166] She further indicated that APCo's capacity forecast was prepared in July 2021, before significant changes to the PJM capacity market.[167] While she acknowledged there is a lot of uncertainty around future PJM capacity prices, she believes her alternative capacity price input values are a plausible future for prices and are more up-to-date and representative of current market conditions than APCo's forecast.[168] She testified that her capacity value inputs are a blend of a May 2022 S&P forecast and APCo's July 2021 forecast.[169] She illustrated her capacity input values, as well as the S&P forecast and APCo's forecast, using a figure included in Section I of the Analysis in this Report.[170]

For some of her modeling, as identified above, she modified generation assumptions to incorporate a 69% capacity factor for Amos and Mountaineer that she indicated is based on a WVPSC order.[171]

For the sensitivity Scenario (1b) above, Ms. Kwok asserted that APCo acknowledged it may not be able to secure the approximately 10 million tons of coal needed to operate at a 69% capacity factor at the current price.[172] Her high coal price sensitivity increase was calculated by increasing APCo's forecasted coal costs by the percentage difference between the reference case for EIA's 2020 Annual Energy Outlook (which APCo used for its forecast) and its low oil and gas supply case.[173] She assumed that if APCo needed to purchase more coal, the Company may have to go to more expensive sources to obtain it.[174]

[174] Tr. at 185-86 (Kwok).

She asserted that her modeling demonstrates it is uneconomic, and not in the best interests of Virginia ratepayers, for APCo to invest in ELG compliance costs at Amos. Compared to the WVPSC Preferred Scenario, her results show a $202 million net present value ("NPV") savings from removing Amos from Virginia rate base beginning in 2029, while operating Mountaineer at a 69% capacity factor, and a $12 million NPV cost from removing both Amos and Mountaineer.[175] She summarized the results of her modeling with the following table, showing the NPV results and the resource mix for each of the four scenarios she modeled.[176]

Table 1. Summary of Synapse Modeling Results in 2040, Virginia Jurisdiction

	WV PSC Preferred	APCo Preferred	Full Coal Removal from Rate Base	Partial Coal Removal from Rate Base
NPVRR* (2022-2040, $ Millions)	$5,915	$5,743	$5,927	$5,713
Solar (MW)	2,929	2,929	3,507	3,507
Wind (MW)	855	855	524	524
Battery Storage (MW)	625	625	476	476
Gas (MW)	512	512	512	512
Coal (MW)	2,295	2,295	167	823
Net capacity exchange (MW)	-1,369	-1,639	310	-285

* *Note: NPVRR numbers do not account for the additional costs caused by REC deficits observed in Scenarios 1 and 2.*

As shown above, the Synapse Partial Coal Removal Scenario has the lowest NPV revenue requirement, followed by the APCo Preferred Scenario. Ms. Kwok believes the Commission should use the WVPSC Preferred Scenario, rather than the APCo Preferred Scenario, as the baseline for comparison to the other two scenarios since she views the 69% capacity factor as a mandate of the WVPSC by which APCo must abide.[177] Ms. Kwok acknowledged that these results – without consideration of other factors, discussed below – indicate that leaving Mountaineer in service is $214 million more economic than removing both Amos and Mountaineer.[178]

---

[175] Ex. 23 (Kwok) at 6, 22.

[176] *Id.* at 7. The negative figures in the net capacity exchange row represent exports, while the positive figure represents import. *Id.*

[177] Tr. at 158-59 (Kwok).

[178] Tr. at 189 (Kwok) (discussing, in the context of another table, the difference between the $5.927 billion and $5.713 billion amounts that are also shown in Table 1 above).

Ms. Kwok conducted further analysis that incorporated APCo's higher forecasted capacity price. She summarized the results of this analysis using the following table.[179]

Table 5. NPVRR Results for Scenarios Using APCo's Capacity Price

Scenario	Revenue Requirement for APCo's Virginia Ratepayers, using a higher capacity price forecast		
	NPVRR* ($Millions)	Delta from West Virginia PSC Preferred ($Millions)	Delta from APCo Preferred ($Millions)
1a. West Virginia PSC Preferred	$5,757	N/A	$173
1b. West Virginia PSC Preferred, high coal price	$5,931	$174	$346
2. APCo Preferred	$5,585	-$173	N / A
3. Full Coal Removal	$6,030	$273	$455
4. Partial Coal Removal	$5,720	-$38	$135

** Note: NPVRR numbers do not account for the additional costs caused by REC deficits observed in Scenarios 1 and 2.*

As shown above, her APCo Preferred Scenario has the lowest NPV revenue requirement, followed by her Partial Coal Removal Scenario. Although these results show removing both Amos and Mountaineer did not result in net savings, she stressed that this modeling assumed an unrealistically high capacity price forecast and conservative assumptions, including no future carbon pricing on coal generation during the next eighteen years.[180] She also indicated there are risks associated with higher fuel prices, some of which she quantified in her Scenario (1b).[181]

Ms. Kwok indicated that cost savings of her Full and Partial Coal Removal Scenarios are likely conservative because her modeling results do not include the costs associated with a REC shortfall that APCo projects under Scenarios (1) and (2). She calculated the costs associated with such REC shortfalls using a $45/MWh compliance penalty, which she recognized is the upper bound of the potential risk of RPS non-compliance.[182] Adding the non-compliance penalty, as described above, increased her results for Scenarios (1) and (2) (but not 3 or 4) by $153 million.[183] Ms. Kwok testified that the $153 million amount includes $35 million she attributed to an error in APCo's modeling of APCo's Buck and Byllesby hydroelectric plants.[184]

[179] Ex. 23 (Kwok) at 23.

[181] Tr. at 159, 201-02 (Kwok).
[182] Ex. 23 (Kwok) at 26-27.
[183] *Id.* at 26.
[184] *Id.*; Tr. at 203 (Kwok).

Ms. Kwok testified that if the Commission does not approve ELG costs, Virginia ratepayers will avoid paying for the ELG investment as well as future capital expenditures, fixed operation and maintenance costs, and taxes required to maintain Amos and Mountaineer beyond 2028. She provided a table of annual avoidable fixed costs based on a document APCo provided in discovery, with such combined amounts (*i.e.*, for both plants) ranging from annual costs of approximately $12 million to $95 million.[185]

In addition, Ms. Kwok provided figures illustrating the amount of energy each resource type of APCo's would produce through 2040 under each of her scenarios. These figures also illustrate the periods when her results show APCo would be a net importer or exporter of energy.[186] Ms. Kwok does not view relying on the PJM energy market as a negative strategy, because this market is well-established, liquid, and competitive. She also believes passage of the Inflation Reduction Act[187] might decrease market prices in the future as more zero-variable cost resources are built in PJM.[188] She also believes that information APCo filed in its 2022 integrated resource plan ("IRP") indicating that a hybrid plan would rely on net energy imports for up to 56% of load requirements in certain years suggests that APCo has found it acceptable to rely on the market to a certain extent.[189]

Ms. Kwok asserted that it is reasonable for APCo to rely on the PJM market for energy and capacity needs. She indicated that the "Rest of RTO" zone in which APCo is located generally is the lowest-priced.[190] She further indicated, among other things, that reliance on the capacity market in her coal removal scenarios steadily declines over time as renewable and storage resources are built.[191] Her Full Coal Removal Scenario shows a capacity market purchase of 1,416 MW in 2029 (when removal occurs) that gradually decreases to a purchase amount of 310 MW by 2040.[192] Her Partial Coal Removal Scenario shows a capacity market purchase of 821 MW in 2029 that gradually decreases until 2038, when APCo would have capacity to sell.[193] She testified that, assuming APCo remains an FRR entity, depending on bilateral capacity markets for changing amounts of capacity to replace Amos and/or Mountaineer would subject APCo to variances in the short-term market.[194]

Ms. Kwok recognized that APCo cannot currently purchase capacity from PJM's market because APCo is an FRR entity. However, she testified that FRR status is a choice made by APCo, which has a responsibility to closely analyze whether its ratepayers would benefit from such participation, especially given how low auction prices have fallen in recent years.[195] Ms. Kwok confirmed that PJM's rules allow APCo to terminate its FRR election.[196] Ms. Kwok

[185] Ex. 23 (Kwok) at 28 (citation to workpaper as source omitted).

indicated that in discovery APCo identified high-level benefits of the FRR vs. PJM's capacity auctions, but did not quantify any of the costs or benefits of either option. She believes such an analysis is particularly important right now, given recent changes to PJM's rules that have driven auction prices down.[197] Ms. Kwok acknowledged that there are some benefits from FRR status, including a lower reserve requirement that produces cost savings of some significance and a broader ability to avoid or mitigate non-performance charges.[198]

According to Ms. Kwok, a recent report by PJM's market monitor indicated approximately 12,000 MW of capacity that was offered in the capacity auction for 2023/2024 did not clear. This indicates to her that there is surplus capacity available to be purchased. Additionally, she indicated that a $34 per MW-day clearing price suggests that surplus capacity could be purchased competitively.[199]

Ms. Kwok testified that the passage of the Inflation Reduction Act could result in less reliance on the market than shown in her analysis, especially if the law results in APCo procuring more of its own renewables and storage.[200]

Ms. Kwok believes her analysis shows that (1) removing Amos from the Virginia rate base in 2028 is the least-cost scenario and is in the best interests of Virginia ratepayers because it saves more than $202 million (compared to the WVPSC Preferred Scenario) between 2022 and 2040, and (2) the benefits of removing Amos and Mountaineer from the Virginia rate base increase substantially after accounting for the impact of recent PJM policies lowering capacity market prices, the risk of REC deficiencies and VCEA non-compliance, as well as future carbon policies that could make coal generation even less economic.[201]

In Ms. Kwok's opinion, APCo's analysis is oversimplified and does not sufficiently support the Petition. She expressed concern that APCo's spreadsheet analysis overstates the amount of capacity the Company would need to acquire to replace Amos and Mountaineer because the Company did not account for the firm capacity contributions from the rest of the generating units in its resource portfolio, both existing and planned. In her view, APCo would only need to replace the amount of firm capacity required to satisfy its reserve margin.[202] While her analysis assumes a 14.9% reserve margin, she identified years when APCo's analysis shows a higher margin. She emphasized APCo's 39.8% projected reserve margin in 2039, which suggests to her that ratepayers "are paying twice as much as what they need."[203] She also believes APCo overstated the amount of replacement capacity by 386 MW because it used the nameplate capacity, rather than firm capacity.[204] She indicated that APCo's analysis also did not

[197] Tr. at 169-70 (Kwok).
[198] Tr. at 196-97 (Kwok), 202-03 (Kwok).
[199] Tr. at 170 (Kwok).
[200] Tr. at 171 (Kwok).
[201] Ex. 23 (Kwok) at 35.
[202] She reproduced a table from APCo's RPS Plan showing APCo's projected reserve margin in 2029 exceeds its 14.9% reserve requirement, indicating to her that APCo will have a capacity surplus in a future where both Amos and Mountaineer remain in service. *Id.* at 11 (showing projected reserve margins exceeding 14.9% from 2025 through 2039).
[203] Tr. at 175-76, 199 (Kwok); Ex. 23 (Kwok) at 11.
[204] Ex. 23 (Kwok) at 9-10.

optimize the timing of replacement capacity in Case 1 or 2 to account for the falling price of renewables over time, nor did it include a scenario that allowed a combination of renewable resources and firm capacity purchases to replace the coal capacity.[205] While she described setting up a model for a Virginia-specific optimized analysis as a tricky exercise, Ms. Kwok indicated that she was able to do it. She believes APCo's reliance on the results from a prior analysis creates a bias in its analysis in the instant case towards the continued operation of Amos and Mountaineer.[206]

Ms. Kwok pointed out that APCo's analysis did not consider the impact that uneconomic coal generation could have on energy costs or revenues. She called this "a large oversight," given the WVPSC order that she believes required APCo to run Amos and Mountaineer at a 69% capacity factor.[207] Ms. Kwok provided data and illustrations showing that from 2017 to 2021 the Amos units have operated at annual capacity factors between 31% to 57% and Mountaineer has operated at annual capacity factors between 49% to 71%.[208] Ms. Kwok testified that if both of these plants are mandated to run at a 69% capacity factor, APCo will lose money whenever costs per MWh are higher than revenues earned in the energy market, and ratepayers will be forced to bear the unnecessary associated costs. She recommended the Commission fully consider this risk to Virginia ratepayers when evaluating whether Virginia should approve the proposed ELG costs.[209] Ms. Kwok also provided data and visualizations showing APCo's projected annual capacity factors through 2040 for Amos and Mountaineer.[210]

Ms. Kwok added that it would be very complicated for the Commission to calculate the cost of uneconomic dispatch, if the WVPSC mandates a 69% capacity factor for Amos and Mountaineer. She explained that this sort of calculation would require a counterfactual case for comparison and would involve O&M, fuel costs, and potentially capital costs.[211] Ms. Kwok recognized that operating Amos and Mountaineer at a capacity factor of at least 69% would require them to run at times when they are economic and times when they are not.[212]

Ms. Kwok also cited industry reports identifying amounts of recent and scheduled coal retirements and indicating that coal-fired generation will become less economic in the future because of both economic and regulatory forces.[213] She explained that decreasing renewable costs have contributed to coal-plant retirements and RPS policies in neighboring PJM states will continue to increase the volume of renewables. She believes this will cause the locational marginal prices for energy to decline, further lowering energy revenues earned by coal units.[214]

20230065

Based on her analysis, Ms. Kwok recommended that the Commission deny Virginia's share of the costs associated with ELG compliance at Amos and Mountaineer.[215] She is not asking the Commission to adopt a particular resource portfolio; rather, she believes her modeling suggests that there are many options for the replacement of Amos and possibly also Mountaineer.[216] While Ms. Kwok did not re-run her model to incorporate the Inflation Reduction Act, she expects that such a re-run would show that the relative benefit of the coal removal scenarios would increase because this legislation has significantly reduced the costs of wind, solar, and storage.[217] Ms. Kwok believes the extended Inflation Reduction Act tax credits will have more of an impact than the present day inflation, which she views as more of a temporary issue that she hopes will be resolved in the future.[218] She testified that the legislation extended production tax credits and/or 30% investment tax credits for wind, solar, and storage through 2032, followed by a four-year phaseout or, if certain emission reduction goals are not met by 2032, a full extension.[219]

Ms. Kwok recognized that her analysis did not incorporate the updated ELG cost estimates that APCo witness Sherrick provided during the hearing. She acknowledged that lower ELG costs would have a favorable impact on these investments.[220]

Coal Association

The Coal Association offered the testimony of **Emily S. Medine**, a Principal of Energy Venture Analysis, Inc. Ms. Medine supported APCo's position on ELG costs and provided additional reasons which she believes support ELG investment.

She discussed the generation resource portfolios developed by APCo for its RPS Plan, which was attached to APCo witness Martin's testimony. She discussed the following table in APCo's RPS Plan showing new resources APCo considered and limitations thereto.[221]

NG 1,100 MW Combined Cycle	1/1/2026	30 years	P1 unlimited P2 N/A	P3 unlimited P4 N/A	N/A	Unlimited	Unlimited

Ms. Medine indicated that APCo also recognized there are new technologies not included in its modeling, such as carbon capture and storage, hydrogen-capable combustion turbines, long-duration storage, and small modular nuclear reactors. She believes continuing to operate Amos and Mountaineer beyond 2028 will provide for greater clarity as to which technologies should be pursued.[222] She pointed out that small modular reactors are expected to be placed in service by the end of this decade and, if all goes according to plan, commercial penetration will increase in the 2030s.[223]

Ms. Medine took issue with APCo's inclusion of combined cycle gas turbines in RPS Plan Cases 1 and 3. First, she found it problematic because this resource, absent a carbon capture retrofit or conversion to green hydrogen, is inconsistent with AEP's decarbonization strategy to achieve net-zero emissions by 2050. Second, she believes a shorter analytical period is warranted to account for AEP's 2050 target date.[224]

For purposes of the instant proceeding, Ms. Medine found it best to focus on APCo's RPS Plan NPV results only through 2039.[225]

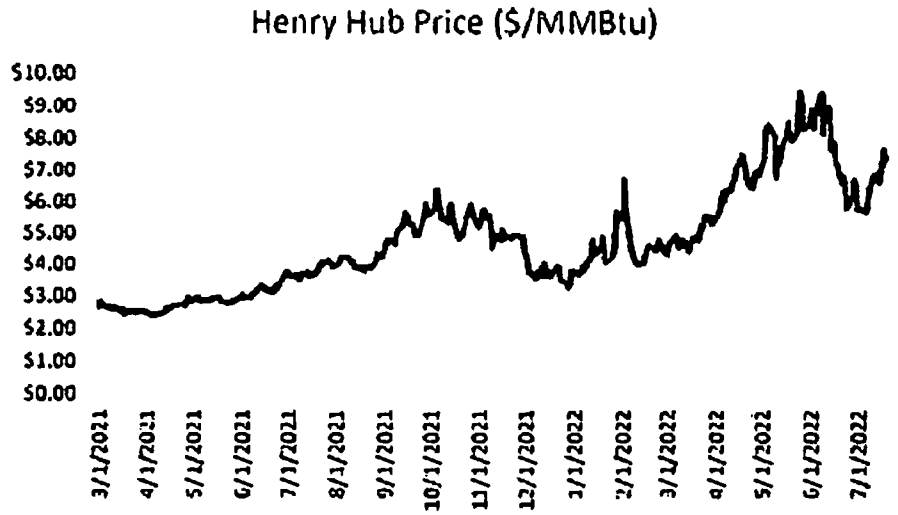
Ms. Medine discussed three WVPSC orders that culminated in the WVPSC confirming that "West Virginia would pay for the entire ELG expenses at the plants and that after 2028 the

[222] *Id.* at 6-7. She noted that Mountaineer has been deemed an attractive site for carbon capture and that an increase to the tax credit for carbon capture sequestration was included in the Inflation Reduction Act of 2022. *Id.* at 6.
[223] *Id.* at 20. She noted that small modular reactors could also be a key to producing green hydrogen through electrolysis, which will determine the viability of hydrogen conversions of gas plants. *Id.*
[224] *Id.* at 7-8. *See also* Ex. 2 (discovery responses of the Association addressing, among other things, possible zero emission strategies).
[225] Ex. 1 (Medine) at 9. She indicated that APCo did not include potential transmission costs in this analysis. *Id.*

capacity and energy produced by these plants would be for the benefit of West Virginia ratepayers only."[226] According to Ms. Medine, the WVPSC found that if the total cost of ELG compliance was added to APCo's West Virginia rate base, it would be materially less than the cost of replacement capacity for APCo's West Virginia jurisdictional customers.[227] She believes this finding is consistent with APCo's position in the instant proceeding.[228]

Ms. Medine considers it unlikely that there would be a dispute or "complications between West Virginia and Virginia related to the continued operations of Amos and Mountaineer," given APCo's acknowledgement that post-2028 Virginia jurisdictional customers have no rights to the capacity and energy (absent Virginia ELG funding) and net book value at that time remains with Virginia customers.[229]

As for the additional reasons Ms. Medine believes support ELG funding, she identified the combination of faster-than-expected demand recovery from COVID, natural gas pricing and availability, supply chain disruptions, and the war in Ukraine. She illustrated recent increases in natural gas price levels and volatility with the following chart.[230]



She cited various factors contributing to this increase, including low capital investment in 2019 and 2020 due to low prices followed by an increase in demand that has caused the natural gas industry to "play catchup." She also cited, among other things, the difficulty in finalizing greenfield pipelines needed to deliver natural gas from supply areas to demand centers.[231]

Ms. Medine indicated that coal had similar problems because the industry was slow to reactivate production levels to meet increasing demand. However, she does not have the same concerns about long-term coal pricing as she does with natural gas pricing because she believes

coal's current problems are short-term supply issues that can and will be resolved in short order. Additionally, the ability to export coal is limited due to constraints on East Coast terminals, unlike liquified natural gas ("LNG") capacity.[232] She provided a list of recent LNG projects currently under construction, approved by FERC, under review by FERC, and in a FERC pre-filing process.[233] She discussed the current economic and political incentives for exporting natural gas.[234]

Ms. Medine testified that as coal plant retirements increase, the ability of coal-fired plants to operate as a competitive cap to natural gas prices is eliminated. She indicated that natural gas prices have increased rapidly in many regions where coal supply was inadequate at coal-fired power plants and overall coal-fired capacity was reduced due to retirements. She believes that increased reliance on natural gas for generation will increase ratepayer risks by exposing utilities to price swings and decreasing the influence of other sources of generation on natural gas prices. That is, unless another type of dispatchable generation, such as small modular nuclear reactors or significant battery penetration, is used to replace significant coal plant retirements.[235]

Ms. Medine provided several recent examples of resource decisions (retirements, conversions, and new construction) being deferred due to supply chain disruptions.[236]

Ms. Medine believes the Commission should consider ELG approval as a hedge against market volatility, insurance against supply chain issues, and an opportunity to gain clarity on which resources should be pursued.[237]

Staff

Staff presented the results of its investigation through the testimonies of **Oliver C. Collier**, Assistant Utilities Analyst in the Commission's Division of Public Utility Regulation ("PUR"); **Timothy A. Morris**, Utilities Analyst in PUR; **Justin Morgan**, Manager in the Commission's Division of Utility Accounting and Finance ("UAF"); and **Cameron T. Hunt**, Utility Specialist in UAF.

Mr. Collier provided an overview of the components of the proposed E-RAC revenue requirement, cost allocation, and rate design, as discussed by APCo witness Castle.[238] Staff did not oppose the proposed cost allocation or rate design, and recommended that any Commission-approved rates be consistent with the proposed allocation and rate design methodologies.[239]

Mr. Morris explained the Company's economic analysis provided with its Petition. He described the three replacement scenarios, assumptions associated with the types and amount

---

[232] *Id.* at 14-15.
[233] *Id.* at 18.
[234] *Id.* at 17-18.
[235] *Id.* at 14-15.
[236] *Id.* at 16-17.

[239] *Id.* at 8.

(1,907 MW) of replacement capacity.[240] He noted that while APCo's RPS Portfolios present the Company's potential generation fleet for the entire system, APCo adjusted such results in this proceeding to reflect only the portion of each total RPS Portfolio needed to replace the Virginia jurisdictional share of Amos and Mountaineer's UCAP rating (1,907 MW).[241]

Mr. Morris recognized that APCo's initial analysis did not include expected energy margins of Amos and Mountaineer.[242] He testified that, all else being equal, a positive energy margin would reduce the cost of service associated with the continued operation of Amos and Mountaineer, resulting in lower costs for Virginia jurisdictional customers, while a negative energy margin would increase the cost of service.[243]

Staff witness Morris also recognized that APCo's analysis assumes the continuation of its existing depreciation rates, although APCo intends to propose changes to its Virginia jurisdictional depreciation rates for Amos and Mountaineer in a future proceeding.[244] He testified that changes in Amos and Mountaineer's depreciation rates can affect the amount or timing of cost recovery under scenarios where the ELG project costs are not approved and therefore changes in depreciation rates may affect the NPV cost of potential replacement scenarios in the instant proceeding.[245]

Mr. Morris explained that APCo's analysis assumed the full nameplate capacity of Amos and Mountaineer (2,100 MW) would need to be replaced in Case 3. However, Staff believes using Amos and Mountaineer's UCAP rating, rather than its nameplate rating, more accurately represents APCo's replacement capacity need.[246]

Mr. Morris also viewed some of the inputs in the PLEXOS modeling from the 2021 RPS Plan as stale. He explained that after such inputs were developed in July 2021, ELCC values have been updated and many variable conditions such as fuel costs and commodity and market prices have changed.[247]

As shown in Section I of this Report's Analysis, Mr. Morris presented APCo's NPV results, as filed and with two modifications.[248] The first modification incorporates an updated analysis provided by APCo in response to Staff discovery that includes its projected energy margins for Amos and Mountaineer.[249] The second modification was that for Case 3, Staff

[247] *Id.* at 11.
[248] *Id.* at 10, 12.
[249] Tr. at 215-16 (Morris); Ex. 30 (Morris) at 12-13. APCo projects that Mountaineer will operate at a profit for all years between 2028 and 2040. Amos units are projected to operate at a loss during some of these years, but is expected to produce a positive net energy margin overall. Ex. 30 (Morris) at 13.

adjusted APCo's results to reflect Amos and Mountaineer's UCAP, not nameplate, ratings.[250]

In discovery, APCo indicated that Virginia customers could avoid needing to pay for some alternative sources of capacity and may continue to benefit from the energy produced by Amos and/or Mountaineer. This could be the case under an approved potential intracompany financial arrangement by which Virginia customers compensate West Virginia customers to receive the capacity benefits of Amos and/or Mountaineer. Mr. Morris testified that such a result could lower the NPV cost of the replacement scenarios presented in APCo's analysis.[251]

According to Mr. Morris, a potential utility resource investment is typically evaluated on a total system basis – meaning the utility would attempt to determine the projected NPV change in its total system generation portfolio that results from the inclusion, or exclusion of the resource under consideration.[252] Mr. Morris testified that APCo provided such an analysis in its 2021 RPS Plan filing, the results of which Mr. Morris summarized in a the table provided below in Section I of this Report's Analysis.[253] As shown by Mr. Morris, the analysis from APCo's RPS Plan filing indicated that the continued operation of Amos and Mountaineer produced a NPV benefit of $1.242 billion and $2.535 billion, respectively, over alternative replacement scenarios.[254]

Mr. Morris also discussed the results that Sierra Club witness Kwok presented from her modeling. While Staff has not independently verified the results of her analysis or underlying assumptions, Staff believes there could be value in analysis that reflects alternative future scenarios under different assumptions as sensitivities.[255] The results of Ms. Kwok's analysis suggest to Staff that the continued operation of Amos and Mountaineer, inclusive of the ELG project costs, reflects a lower cost resource alternative compared to her "Full Coal Removal" option. Her "Partial Coal Removal" option would be the lowest-cost option among all of the scenarios she considered, regardless of whether the units operate economically or at a 69% capacity factor.[256]

Based on the economic analyses presented in this proceeding, Staff concluded that it appears the continued operation of Mountaineer, inclusive of ELG project costs, is a lower cost resource option than the range of replacement alternatives presented in this case. However, the economic viability of Amos is unclear to Staff. Mr. Morris indicated that the extent to which Amos produces a net benefit appears to be largely dependent on whether this facility will be dispatched economically, or at a designated 69% capacity factor, and on the accuracy of the assumptions and inputs contained within APCo's supporting analysis.[257] Mr. Morris also

---

[250] Ex. 30 (Morris) at 11-12. While Staff also requested that APCo update its analysis to incorporate the Company's anticipated change in Amos and Mountaineer's depreciation rates, APCo indicated it could not incorporate such changes because the Company has not yet determined the depreciation rates it will propose in a future proceeding. *Id.* at 12.
[251] *Id.* at 14.
[252] *Id.* at 14-15.
[253] *Id.* at 15.

[256] *Id.* at 17-18.
[257] *Id.* at 18.

indicated that APCo was directed to provide a comprehensive retirement analysis of Amos and Mountaineer in its 2022 IRP filing, which is currently pending before the Commission.[258] Staff believes the Commission may receive more clarity on the economic viability of Amos ELG project costs once the WVPSC has rendered its final determination in its expanded net energy cost ("ENEC") proceeding and upon the conclusion of the 2022 IRP.[259] Staff did not take a position on the reasonableness of the continued operation of Amos, inclusive of associated ELG project costs.[260]

Mr. Morgan summarized APCo's proposed Rider E-RAC revenue requirement with the following table.[261]

Summary of Company's Proposed Revenue Requirement (In Thousands)

Line No.	Description		Amount
	New Proposals		
1	ELG	$	18,444
2	DSI	$	621
3	DO	$	220
4	RGGI	$	820
5	Subtotal: Revenue Requirement for New Proposals	$	20,105
	Previously Approved		
6	CCR Related Carrying Charges, AFUDC, & Depreciation	$	4,548
7	CCR Related Compliance O&M	$	40,519
8	Total Costs	$	65,172
9	Less: Recoveries	$	(31,566)
10	**Total Revenue Requirement**	**$**	**33,606**

Staff audited support for APCo's actual construction costs and determined that such costs appear to be appropriately recoverable through Code § 56-585.1 A 5 e. Staff also reviewed APCo's projections and does not take issue with such projections at this time. Staff will continue to review actual costs of the E-RAC as they are incurred and any difference between projections and actual costs will be handled through a future E-RAC true-up.[262] Mr. Morgan

[258] *Id.* at 18-19.
[259] *Id.* at 19.
[260] *Id.*
[261] Ex. 31 (Morgan) at 3.
[262] *Id.* at 4.

also testified that Staff will conduct a more detailed review of the projected RGGI costs as part of the true-up process.[263] He testified that in his review of the RGGI revenue requirement calculation in this case, he was not aware that some of the hours of operations were the result of uneconomic dispatch because APCo had chosen must-run status.[264]

Mr. Morgan explained that to depreciate the capital investments proposed for Rider E-RAC, APCo used the estimated useful lives that formed the basis for the depreciation rates approved by the Commission in the 2020 Triennial Review, which he summarized as follows.[265]

Summary of Proposed Retirement Dates and Depreciation Rates		
	End of Useful Life	APCo VA Depreciation Rate
Amos		
CCR	2033	9.52%
ELG	2033	9.52%
DSI	2032	4.63%
Mountaineer		
CCR	2040	5.71%
ELG	2040	5.71%
Claytor Lake		
Dissolved Oxygen	2040	3.64%

Mr. Morgan did not take issue with APCo's proposed depreciation rates at this time. However, Staff recommended the Commission direct APCo to incorporate a depreciation rate analysis of its E-RAC investment in its next depreciation study, including net salvage considerations and any excess/deficient depreciation accruals on such assets through the date of the study.[266]

Mr. Morgan presented Staff's Rider E-RAC revenue requirement calculations.[267] Staff calculated the same revenue requirement amount as proposed by APCo.[268] Mr. Morgan also presented APCo and Staff's estimated $439.19 million lifetime revenue requirement of the E-RAC.[269]

Mr. Morgan provided APCo's responses to Staff interrogatories about environmental justice considerations. These responses indicate, among other things, that the projects at issue in the Petition are located in West Virginia and that they will allow the subject power plants to comply with more stringent environmental regulations.[270]

Mr. Morgan testified that retail ratepayers essentially pay for the utility costs plus whatever is left on the PJM bill. While APCo makes money on off-system sales, for APCo's

[263] Tr. at 225 (Morgan).
[264] Tr. at 226 (Morgan).
[265] Ex. 31 (Morgan) at 4-5.
[266] Mr. Morgan indicated APCo's next study should be based on depreciable plant balances as of a date no later than December 31, 2024. *Id.* at 5, n.3.

[270] *Id.* at 8.

generation that clears the PJM energy market and matches APCo's load, there is no margin because, as a vertically integrated utility, PJM bills APCo at the same price at which the generation clears.[271]

Mr. Hunt addressed APCo's proposed capital structure and cost of capital for Rider E-RAC. APCo proposes using the December 31, 2020 capital structure and a 6.817% weighted average cost of capital, both of which Staff verified.[272]

APCo - Rebuttal

APCo offered the rebuttal testimony of **Messrs. Beam, Martin, and Ross.**

Mr. Beam commented on APCo's efforts to obtain clarification of some of the WVPSC orders discussed by Sierra Club and Staff witnesses. He testified that in the Company's current ENEC proceeding before the WVPSC, APCo has asked for clarification of the 69% capacity factor identified by the WVPSC, as well as confirmation that the costs of uneconomic dispatch of Amos and Mountaineer would be borne only by West Virginia customers.[273] He attached to his testimony in the instant E-RAC case testimony filed by the Company in the pending ENEC proceeding.[274] He does not believe APCo is under a mandate[275] and testified that the Company is not currently running Amos and Mountaineer to achieve a 69% capacity factor.[276] Mr. Beam also cited provisions of Code § 56-249.6 that he understands, by advice of counsel, empower the Commission to disallow fuel costs if the Commission makes certain findings.[277] He testified further that APCo would not seek recovery in Virginia of uneconomic costs incurred as a result of any requirement by the WVPSC to run generation facilities in an uneconomic manner.[278]

Citing market volatilities and the challenges of building a reasonably priced portfolio of renewable resources by 2028, Mr. Beam described Amos and Mountaineer as "a very necessary insurance policy in these tumultuous times, a policy with a very low premium."[279] He testified that these plants allow APCo to meet the majority of its capacity obligations in PJM, and have provided reliable, low-cost energy to APCo's Virginia customers for decades.[280] According to Mr. Beam, the challenges and complications related to securing replacement capacity and energy would not be more manageable if only the ELG investment for Amos were denied by the Commission because APCo's exposure to the volatile energy market and the need to find replacement capacity would only be reduced, not eliminated.[281]

2023-00159

Based on a communication with an AEP employee involved in scheduling, it is Mr. Beam's understanding that Clinch River "uneconomically schedule[s] itself" usually to comply with air permits. He explained that there are set times when units must be tested that are tied to their air permits. Because a third party does this type of testing, it is hard to line up this testing with the market. If Clinch River doesn't do environmental testing, it loses its air permit.[282] He indicated that the only other reason Clinch River has voluntarily self-scheduled is for non-environmental testing.[283] Mr. Beam indicated that he thinks, going forward, APCo could commit to documenting and providing in its initial case-in-chief all of the hours it self-schedules and the associated reasons.[284]

Mr. Beam acknowledged that the current coal market is different from the past due to some coal production issues. However, based on his experience, he testified that usually when you go out for larger quantities of coal, a better price per unit can be obtained.[285]

In response to Sierra Club witness Kwok's testimony that renewable prices have decreased and will continue to decrease due in part to the Inflation Reduction Act, Mr. Beam testified that bid prices received by APCo in its annual RFPs for renewable prices have increased.[286]

Mr. Martin asserted that Sierra Club witness Kwok's economic analysis does not support her conclusion that ELG investments should be denied at Amos or Mountaineer.[287] He testified that:

> [Ms. Kwok's] scenario in which the Virginia jurisdictional share of both [Amos and Mountaineer] are removed and replaced in 2028 is projected to result in higher costs than a case in which they dispatch economically and serve customers through 2040. She also prepared a scenario in which only Amos is removed in 2028, and that scenario is projected to cost 0.9% less than keeping both [Amos and Mountaineer] through 2040. The fact that replacing both plants in 2028 is more expensive than replacing them in 2040, but replacing only Amos in 2028 is less expensive, shows that her analysis demonstrates that Mountaineer will be cheaper than other options, and thus that cost recovery for its ELG investment from Virginia customers should be approved.[288]

Mr. Martin also challenged several of the assumptions in Ms. Kwok's analysis. He asserted that every aspect of Ms. Kwok's analysis is undermined by the inaccurate premise that APCo, which is an FRR entity, can purchase capacity in PJM's auctions.[289] He described obtaining capacity through year-to-year bilateral contracts as an unrealistic option.[290]

[282] Tr. at 241-42, 261-63 (Beam).
[283] Tr. at 258, 261 (Beam).
[284] Tr. at 266-67 (Beam).
[285] Tr. at 243 (Beam).
[286] Tr. at 245 (Beam).
[287] Ex. 34 (Martin rebuttal) at 1.
[288] *Id.* at 2.
[289] *Id.* at 2-3; Tr. at 273, 289 (Martin).
[290] Ex. 34 (Martin rebuttal) at 3.

Mr. Martin responded to Staff witness Morris's statement that Amos's economic viability appears to be largely dependent upon whether it will be dispatched economically, or at a 69% capacity factor. Mr. Martin testified that Amos would need to lose an enormous amount of money producing energy between 2029 and 2040 to completely offset its large capacity cost advantage *and* the Commission would need to allow recovery of associated fuel costs. He described this possibility as remote.[291] He testified that even Sierra Club's high coal cost sensitivity does not produce anywhere close to enough energy losses when forced to operate at a 69% capacity factor to offset Amos's capacity cost advantage.[292]

In response to Staff witness Morris's observation that APCo's analysis includes operating losses in some individual years for Amos, Mr. Martin testified that these negative margins, which he indicated were single digit million dollar amounts in a handful of years, should not have been the modeled outcome. He emphasized that APCo's modeling projected Amos would generate positive energy margins over the entire 2028-2040 period.[293] He added that Sierra Club's analysis for Scenario (1a) projects that Amos would be profitable in total over the 2029-2040 period even if it were forced to run at a 69% capacity factor.[294]

Mr. Martin clarified that while APCo's economic analysis excluded energy margins for Amos and Mountaineer, it did include the PLEXOS-determined energy margins of every replacement resource. He described this asymmetry as handicapping Amos and Mountaineer to illustrate the point that they do not need to produce positive energy margins to be the most affordable capacity option for Virginians.[295]

Mr. Martin disagreed with the apparent suggestion that the relative differences in NPV between the cases presented in Staff witness Morris's Table 2 will change if the Commission approves a different recovery period than APCo would propose. Mr. Martin explained that none of the NPVs from any of the Company's scenarios contained any costs associated with recovery of existing plant-in-service and therefore such recovery would need to first be added to all of the scenarios and then analyzed under differing recovery periods in order to determine the impact of those periods.[296] Mr. Martin testified that the Company did not perform such an analysis because it would require speculation on multiple assumptions, which he described.[297] However, were such an analysis to be performed, he does not believe there would be much of an impact on the NPVs because the change in both timing and amount of the return on investment (return on rate base) and the change in the timing of the return of investment (depreciation expense) would come close to offsetting each other in an NPV calculation.[298]

2021-00159

Regarding the use of nameplate capacity to calculate replacement capacity in his Case 3, Mr. Martin acknowledged this as an error. However, he downplayed the significance of this error since it only amounts to a 9% reduction in the cost of Case 3, which he described as an unrealistic, hypothetical scenario (capacity-only contracts).[299] He testified that the capacity price forecast could be cut in half and the cost would still exceed the incremental cost of Amos and Mountaineer continuing to serve Virginia.[300]

Turning to Ms. Kwok's Scenario (1a), Mr. Martin testified the assumption that Amos and Mountaineer would run at a 69% capacity factor even if uneconomic is unrealistic and overstates fuel costs.[301] He does not consider this scenario worthy of much consideration given APCo witness Beam's reference to the provisions of Code § 56-249.6.[302] He added that the reduction in energy margins due to uneconomic dispatch for Amos and Mountaineer would need to be eight times larger than projected by Sierra Club before it would be large enough to offset the capacity cost savings he calculated for the Company's Cases 1 and 2.[303]

Mr. Martin indicated Ms. Kwok's Scenario (2) is her only scenario that is not unduly influenced by understated replacement resource costs or uneconomic dispatch, because Amos and Mountaineer run through 2040.[304]

Ms. Kwok's Scenarios (3) and (4) include what Mr. Martin asserts are understated replacement resource costs (3 and 4) and/or overstated fuel costs from operating Mountaineer at a loss in some hours (4). Even with these assumptions, Mr. Martin indicated that Scenario (3) shows removing both Amos and Mountaineer will be $163 million more expensive than continuing to serve Virginia with them.[305] He pointed out that because Scenario (4) (removing only Amos) is less expensive than Scenario (3), this indicates that keeping Mountaineer will save customers money. He believes Ms. Kwok's Scenario (4) shows tiny savings that are "hardly enough to justify walking away from [Amos] and putting the enormous risks associated with replacing it on the Company and its Virginia customers."[306]

Mr. Martin explained that the primary resource Ms. Kwok added to replace Amos and Mountaineer is PJM market capacity, at an assumed short-term capacity price. He reiterated that APCo cannot currently purchase capacity in PJM's auction and thus is effectively assumed to participate in "an uncertain and risky perpetual cycle of seeking year-to-year bilateral capacity contracts."[307] Section I of this Report's Analysis provides his list of reasons why it would be

[307] *Id.* at 13.

2023-00159

risky and inadvisable to replace the capacity of Amos and Mountaineer with short-term bilateral purchases of capacity.[308]

Mr. Martin testified further that "paper capacity" would necessarily be sourced from multiple existing fossil-fueled resources due to the sheer number of MW needed and the low capacity credit that the PJM ELCC methodology assigns to renewables.[309] He noted that Amos and Mountaineer will continue to operate past 2028, regardless of the Commission's decision in this case, and that the Commission denying cost recovery for ELG investments could result in APCo purchasing capacity from, and providing a financial lifeline to, other fossil-fuel plants.[310]

Mr. Martin confirmed that APCo has the right to choose FRR status or auction participation each year.[311]

Mr. Martin does not find Ms. Kwok's capacity price forecast to be credible because it was not based on any fundamental PJM regional economic modeling and was simply calculated in a spreadsheet.[312]

Mr. Martin believes APCo's customers would be exposed to far too much additional energy market exposure under Sierra Club's resource plan. He discussed a table he prepared to illustrate the reliance on bilateral capacity contracts, which is included in Section I of this Report's Analysis.[313]

Mr. Martin found Ms. Kwok's representations of load and generation to be misleading and confusing.[314] He also asserted that while modelers can produce resource plans based on the minimum level of capacity in planning exercises in the perfect world, the Company does not operate in a perfect world and has never maintained only the minimum amount of capacity to meet its PJM requirements. He believes a minimum 18-20% reserve margin, with a diverse set of fossil-fueled and renewable resources, is a more appropriate level of capacity, especially as dispatchable fossil-fueled capacity around PJM is retiring and being replaced with non-dispatchable renewables, which do not contribute as much at the critical times of peak loads.[315] He identified several reasons why APCo could fall short of meeting its capacity requirements, including, among other things, events that could cause load to be higher than forecasted, catastrophic equipment failure, or PJM rule changes.[316]

Mr. Martin pushed back on Sierra Club witness Kwok's claims that coal plants will become more uneconomic in the future. He believes that Amos and Mountaineer are uniquely situated, with rising fuel costs or lower energy prices not impacting these plants' capacity value and a competitive advantage over fossil-fuel plants that are in PJM's RGGI states. Citing the

high prices of natural gas this year, he also testified that Amos and Mountaineer can be a valuable energy hedge against natural gas plants that often set the marginal energy price in PJM.[317]

Mr. Martin testified that the third-party estimates of renewable resource costs described by Ms. Kwok grossly understate multiple components of the costs of wind and solar resources. He based this assertion on his experience during the past three years in which he has evaluated and modeled the cost of dozens of bids from resource solicitations in PJM and SPP for five AEP operating companies, including the evaluation of bids received by APCo in 2020, 2021, and 2022.[318] He testified that third-party projected costs are always much lower than real resources, as the capital cost, transmission interconnection costs, transmission network upgrades, land leases, O&M expenses, and property taxes, among other things, all tend to be understated. He stressed that developers do not price their product at what it costs to build; rather, they price their projects at what they think someone will pay for it. Given the requirements of the VCEA, he maintained that developers price their resources above the actual cost of building the resource because they know renewable resources that produce RECs would allow APCo to avoid being a price taker in the REC markets.[319] He characterized the current environment as a seller's market, and he expects high demand and higher prices to persist for some time. He also noted that Sierra Club's analysis did not account for recent inflation.[320]

He called Ms. Kwok's assertion that his analysis did not use an optimized capacity expansion and dispatch model, or that it was a simple spreadsheet model, incorrect. He explained that the analysis was based on resource selections made by the same PLEXOS model APCo has used for resource planning for 10 years, including the 2021 RPS Plan from which his inputs were taken. He elaborated that a spreadsheet was then necessary to isolate the Virginia share of the ELG investment or other ongoing costs at Amos and Mountaineer by scaling down the resources added for total company needs. He also used the PLEXOS cost inputs to convert revenue requirements from levelized lifetime values to non-levelized Virginia retail cost of service. The capacity expansion and production cost modeling were done in PLEXOS, and then spreadsheets were used to take the outputs, add what needs to be added from outside the model, and then summarize it and prepare tables and figures to illustrate the results.[321]

Mr. Martin clarified that Ms. Kwok's concern about the PJM capacity price forecast in APCo's analysis only applies to the Company's Case 3. He reiterated APCo's position that Case 3, while illustrative, is not a realistic option. He also testified that the capacity price curve could be cut in half and that option still would not be cheaper than continuing to serve Virginia customers with Amos and Mountaineer.[322]

Mr. Martin testified that Ms. Kwok's analysis overstates the impact of the REC deficiencies in APCo's modeling. He testified that APCo believes RECs will be available in

[317] *Id.* at 18-19.

2022-00165-VAR

publicly traded markets and does not anticipate being subject to the $45/MWh deficiency payment. He asserted that some of the understatements in REC requirements in the Company's 2021 VCEA modeling (which were since corrected in the 2022 Virginia IRP) occurred during 2022 through 2025, when APCo will not be able to bring any physical resources online in addition to those which are already in the forecast. He also indicated that there was no modeling error associated with the Buck and Byllesby plants.[323]

Mr. Martin identified two other statements from Ms. Kwok's testimony that he found misleading. First, he testified that the vast majority of the amounts listed on her Table 8 are fixed O&M, and not capital expense, and thus do not add to undepreciated plant balances. Second, while Ms. Kwok states that customers would also avoid paying for the variable costs of generation at Amos and Mountaineer if they no longer serve Virginia, she fails to mention that these variable costs will not be incurred unless it was economical to run Amos and Mountaineer and that if the plants do not run, APCo would have to purchase more expensive market energy.[324]

Mr. Martin reported that PJM's non-performance penalties are $3,000 per MWh for non-FRR entities compared to $1,200 per MWh for FRR entities. He added that, as an option available only to FRR entities, APCo can substitute overperformance at one unit to avoid a penalty for another unit's underperformance.[325] His understanding is that the FRR election must be on a total company basis.[326]

In Mr. Martin's view, Congress's recent passage of the Inflation Reduction Act as a way to combat climate change makes it less likely that Congress will also pass a carbon tax in the near-term. For this reason, he characterized an analysis of both the Inflation Reduction Act and a potential carbon tax as "probably double counting."[327]

Mr. Martin agreed that the new tax credits in the Inflation Reduction Act will help bring down the cost of renewables. However, APCo has "experienced massive increases in costs of renewables over the past year and a half" that are not incorporated in the economic analysis of either APCo or Sierra Club in this case. Although he acknowledged the Inflation Reduction Act would offset some of the higher resource costs, he maintained that APCo would also have to analyze the extent to which the Company has enough tax liability to use the extended tax credits on a timely basis. Additionally, the tax credits will increase the demand on the supply chain for renewable components, which Mr. Martin indicated has already made it problematic for other companies to obtain panels and turbines.[328]

He concluded that Amos and Mountaineer "are the most affordable capacity options for Virginia customers, and the next best option is not even close."[329] In response to news reports indicating that various industry participants are moving away from coal, Mr. Martin indicated that what might be good for some utilities or other coal plants is not necessarily the right thing

for APCo's customers, which his analysis indicates is making the ELG investment at Amos and Mountaineer to maintain their affordable capacity.[330]

Mr. Ross addressed depreciation issues. He has no concern with Staff witness Morgan's recommendation that the Company incorporate Amos and Mountaineer CCR/ELG salvage values into APCo's next Virginia depreciation study. He anticipates this study will be performed in conjunction with APCo's next triennial review filing due in the first quarter of 2023. He expects the study will be based on plant-in-service balances as of December 31, 2022, and identified which E-RAC assets at issue in the instant case will (and will not) be in service by December 31, 2022.[331] For this upcoming study, APCo would consider proposing changes to Virginia jurisdictional depreciation rates for Amos and/or Mountaineer if the Commission were to reject recovery of the ELG asset(s).[332]

CODE

APCo filed its Petition pursuant to Code § 56-585.1 A 5 e, which provides in part as follows:

> 5. A utility may at any time, after the expiration or termination of capped rates, but not more than once in any 12-month period, petition the Commission for approval of one or more rate adjustment clauses for the timely and current recovery from customers of the following costs:
>
> ...
>
> e. Projected and actual costs of projects that the Commission finds to be necessary ... to comply with state or federal environmental laws or regulations applicable to generation facilities used to serve the utility's native load obligations, including the costs of allowances purchased through a market-based trading program for carbon dioxide emissions. The Commission shall approve such a petition if it finds that such costs are necessary to comply with such environmental laws or regulations;

Code § 56-585.1 D further states in part as follows:

> The Commission may determine, during any proceeding authorized or required by this section, the reasonableness or prudence of any cost incurred or projected to be incurred, by a utility in connection with the subject of the proceeding. A determination of the Commission regarding the reasonableness

[330] Tr. at 293-94 (Martin).

[332] *Id.* at 4.

220165

> or prudence of any such cost shall be consistent with the Commission's authority to determine the reasonableness or prudence of costs in proceedings pursuant to the provisions of Chapter 10 (§ 56-232 et seq.).

The Commission has previously recognized that the unambiguous plain language of both of the above statutes applies to the instant proceeding, with the applicant utility bearing the burden of proof.[333]

In the instant case, APCo questioned this established Commission precedent, arguing as follows:

> Subsequent to the issuance of the 2021 E-RAC Order, the Virginia Supreme Court issued an opinion that directly addresses [Code § 56-585.1 D], holding
>
> > Where a statute includes a general provision with broad terms and a specific provision with narrow terms, the latter qualifies the former.
>
> Applying this precedent, [Code § 56-585.1 D], with its broad terms, cannot prevail over [Code § 56-585.1 A 5 e], with its narrow and specific terms. That is, [Code § 56-585.1 D] cannot be employed in order to avoid complying with the General Assembly's mandate that the Commission "shall" approve the Petition if the Company meets the two requirements in [Code § 56-585.1 A 5 e].[334]

The above argument appears to be one the Commission has already rejected,[335] repackaged with a selective quote from the recent *APCo 2022* opinion. The instant case is readily distinguishable from the case the Court addressed in *APCo 2022*. *APCo 2022* did not involve Code § 56-585.1 A 5 e, as the Court decided that certain asset impairment accounting provisions of Code § 56-585.1 A 8 applicable to triennial reviews override ratepayer protections of Code § 56-585.1 D. Additionally, in *APCo 2022*, the Court appears to have given significant interpretive weight to the fact that the relevant provisions of Code § 56-585.1 A 8 were enacted subsequent to the 2007 enactment of Code § 56-585.1 D, a sequence that indicated to the Court a substantive change in the law.[336] There is no such legislative sequence of events relevant to the

Rep. at 333-334; *Petition of Virginia Electric and Power Company, For approval of a rate adjustment clause, designated Rider E, for the recovery of costs incurred to comply with state and federal environmental regulations pursuant to § 56-585.1 A 5 e of the Code of Virginia*, Case No. PUR-2018-00195, 2019 S.C.C. Ann. Rep. 333, 336-39, Order on Reconsideration (Nov. 14, 2019).

[334] APCo's Brief at 3-4 (quoting *Appalachian Power Co.* v. *State Corp. Comm'n, et al.*, No. 210391, at 23 (Aug. 18, 2022) ("*APCo 2022*") (footnotes omitted).

[335] *2021 Rider E-RAC Order*, 2021 S.C.C. Ann. Rep. at 333-34.

[336] *See, e.g., APCo 2022* at 24 ("If the amendments to [Code § 56-585.1 A 8] did not change the law regarding the Commission's regulatory discretion for these costs, those amendments were meaningless because subsection D has been in Code § 56-585.1 since its inception.").

instant Commission proceeding. The substantive provisions of Code §§ 56-585.1 A 5 e and 56-585.1 D were enacted as part of the same 2007 re-regulation legislation.[337] In my view, *APCo 2022* does not require the Commission to: (1) stop harmonizing contemporaneously enacted statutory provisions and (2) prospectively ignore what APCo spends on environmental compliance, which is the essence of APCo's argument. For this reason, the analysis in this Report is based on a consideration of all record evidence relevant to the reasonableness and prudence of ELG investment, including quantitative evidence and also more qualitative evidence (of certain risks, for example).

However, should the Commission decide that *APCo 2022* amended the 2007 re-regulation statute to preclude any consideration of cost, as suggested by the Company, the Commission need not consider Section I below, as there is no question ELG investment is necessary for compliance. Erasing Code § 56-585.1 D would seemingly collapse this case so that it starts and ends with the application of only one criterium – whether the costs are for projects necessary to comply with an environmental law or regulation.[338] Under this new standard (which I do not recommend), the Commission should consider Sections II and III, as they involve questions about whether costs are "necessary."[339]

Because I recommend that the Commission continue to apply Code § 56-585.1 D to the environmental compliance proceedings conducted under Code § 56-585.1 A 5 e, Section I of this Report analyzes the reasonableness and prudence of APCo's ELG investment, for which the *2021 E-RAC Order* denied cost recovery without prejudice. Section II analyzes the proposed RGGI costs challenged by Appalachian Voices. Section III analyzes the proposed dry sorbent injection project costs challenged or questioned by Sierra Club and Consumer Counsel. Section IV addresses uncontested issues.

---

[337] 2007 Va. Acts chs. 888, 933. In 2014, the opening sentence of Code § 56-585.1 D was amended as follows:

> ~~Nothing in this section shall preclude the~~ *The* Commission ~~from determining~~ *may determine*, during any proceeding authorized or required by this section, the reasonableness or prudence of any cost incurred or projected to be incurred, by a utility in connection with the subject of the proceeding.

2014 Va. Acts. ch. 548.

[338] Code § 56-585.1 A 5 e. APCo's Brief indicates that the Commission must "approve the Petition if the Company meets the *two* requirements" in Code § 56-585.1 A 5 e. APCo's Brief at 4 (emphasis added). It is unclear what the second statutory requirement would be under APCo's interpretation. APCo's statement seems to refer to a prior assertion by the Company that "The evidence presented in this Petition demonstrates that the Company has met its statutory burden, set out in the plain text of [Code § 56-585.1 A 5 e], for all of the above compliance costs: they were incurred to comply with environmental laws and regulations ... and were necessary to comply with environmental laws and regulations." APCo's Brief at 2-3. As shown in the above excerpt of Code § 56-585.1 A 5 e, APCo has omitted the word "necessary" from its reference to the opening language of the statute.

[339] However, as discussed below, I view the issues raised concerning RGGI compliance costs to be relevant under Code § 56-585.1 D, which could not be considered under APCo's legal position.

I. ANALYSIS OF ELG INVESTMENT

Amos and Mountaineer

The total nameplate capacity of the coal-fired units at Amos and Mountaineer is 4,235 MW.[340] Amos has a nameplate capacity of 2,930 MW (815 MW for Unit 1, 815 MW for Unit 2, and 1,300 MW for Unit 3).[341] Mountaineer is a one-unit facility with a nameplate capacity of 1,305 MW.[342]

While jurisdictional allocation factors change over time, APCo's Petition, and the evidence of case participants, assume that Virginia's approximate share of Amos and Mountaineer is 50%,[343] which APCo assumed is approximately 2,100 MW of nameplate capacity.[344] However, the record indicates that Amos and Mountaineer's UCAP[345] value (not nameplate) is the capacity measurement used for purposes of satisfying APCo's capacity obligation in PJM.[346] The 2,100 MW "Virginia share" of Amos and Mountaineer's combined nameplate capacity equates to 1,907 MW UCAP.[347]

Annual capacity factors for Mountaineer during the last five calendar years have ranged from 46% to 71%.[348] For Virginia ratemaking purposes, Mountaineer is currently being depreciated with an assumed retirement date of 2040.[349] APCo projects that Mountaineer's net book value on December 31, 2028, excluding ELG investment, would be approximately $474 million on a total company basis.[350]

Annual capacity factors for the three units at Amos during the last five calendar years have ranged from 31% to 57%.[351] For Virginia ratemaking purposes, the Amos units are currently being depreciated with assumed retirement dates of 2032 (Units 1 and 2) and 2033 (Unit 3).[352] APCo projects that Amos's net book value on December 31, 2028, excluding ELG investment, would be approximately $582 million on a total company basis.[353]

The ELG Rule and APCo's Estimated Compliance Costs

The ELG Rule established discharge limits on FGD wastewater, transport water used for fly ash and bottom ash handling, and other wastewaters at Amos and Mountaineer. The ELG Rule, initially promulgated in 2015 and revised most recently in October 2020, eliminated the

[353] Ex. 10 (Ross direct) at 11.

discharge of most ash transport waters and requires enhanced treatment of FGD wastewaters. These requirements are implemented through modifications to the existing state wastewater discharge (NPDES) permit at each facility.[354] The ELG Rule requires that discharge limits be achieved as soon as possible before December 31, 2025, pursuant to a schedule in each facility's NPDES permit. New bioreactors would bring Amos to full ELG compliance by the end of 2023 and an upgraded bioreactor would bring Mountaineer into ELG compliance by the end of 2023.[355]

At Mountaineer, the current total estimated cost for ELG compliance is approximately $42 million on a total company basis, with Virginia's share approximately $21 million.[356] At Amos, the current total estimated cost for ELG compliance is approximately $127 million on a total company basis, with Virginia's share approximately $63.5 million.[357]

Reasonableness and Prudence Standard

In denying cost recovery of the ELG investment, the *2021 E-RAC Order* found "it is critically important to analyze the overall impact of this investment on both customer rates and reliability" but that the record of the prior case was "lacking in both regards."[358] The Commission found that APCo did not establish in the 2021 E-RAC Case "that the ELG investment is reasonable and prudent from an economic or a resource adequacy perspective."[359]

Sierra Club correctly recognized[360] that the Commission typically evaluates prudence based on the time a decision is made to incur costs.[361] While Sierra Club indicated the Commission could apply the prudence standard this way in the current case, Sierra Club indicated doing so was complicated by a WVPSC ruling that West Virginia would pay for up to 100% of the ELG investment if Virginia decides not to pay an allocated portion. Given this development, Sierra Club asserted that the Commission could consider a broader range of evidence to decide what is in the best interests of Virginia today.[362] As framed by Consumer Counsel, this case is about "with information available today, what resource option best promotes the lowest-reasonable cost for reliable electric service in a manner that complies with applicable laws, including the [VCEA]."[363]

I generally agree with Sierra Club's legal analysis concerning the prudence standard. Application of the prudence standard based on information at the time of a management decision typically involves a situation where there is the potential for a disallowance of the subject costs.

[362] Tr. at 26, 35 (Johns).
[363] Consumer Counsel's Brief at 2.

However, that is not the current situation because the WVPSC, as discussed further below, has ruled that West Virginia would pay for up to 100% of the ELG investment if Virginia decides not to pay an allocated portion. Since ELG investment and associated cost recovery are going forward one way or the other, the question in the instant case does not seem to be whether it was prudent for APCo to make this investment. Rather, in my view, the question for the Commission is whether it is reasonable and prudent for APCo to allocate a share of this cost to Virginia. I also note the *2021 E-RAC Order* stated that APCo "should be permitted to provide additional analyses and evidence to support this ELG investment."[364] Accordingly, I have considered all of the evidence in this case in my analysis of APCo's proposed allocation of ELG investment to Virginia, given the unique circumstances of this case.

WVPSC ELG Order

The WVPSC issued orders on two issues that inform case participants' positions on the economic analyses in the instant case. Consumer Counsel asserted that these orders and testimony in the instant Commission case "call into question whether Virginia customers would be treated equitably without support from this Commission."[365]

First, the WVPSC issued an order indicating that its approval of ELG investment would cover, with FERC jurisdictional customers, up to 100% of the associated post-2028 costs if the Commission were not to approve ELG investment.[366] APCo indicated that one implication of the WVPSC order approving up to 100% cost recovery, as described above, is that Amos and Mountaineer will continue to be an integral part of APCo's FRR capacity plan and these plants will continue to operate and dispatch past 2028, regardless of the Commission's decision in the instant case.[367] Counsel for APCo indicated that the question for the Commission is "not can this Commission shut down the operations of these plants. It cannot...."[368] Construction of the ELG infrastructure at Amos and Mountaineer began after the WVPSC granted its approval.[369]

Because Amos and Mountaineer will continue to operate beyond 2028 regardless of the Commission's decision, there is no need in the instant case for the Commission to assess reliability from a system impact standpoint, including the potential for any upgrades necessary to maintain reliability upon retirement(s).[370] Additionally, APCo's economic analysis offered in

[370] However, Mr. Martin's economic analysis in the instant case includes no transmission costs because Amos and Mountaineer will not retire in 2028. Ex. 13 (Martin direct) at 27.

2160305

support of its Petition does not include any such transmission costs.[371] From a resource adequacy perspective, APCo indicated that WVPSC's ratemaking support means that Amos and Mountaineer will continue to be an integral part of APCo's FRR capacity plan.[372]

The part of the order that got Consumer Counsel's attention is the WVPSC's declaration that if West Virginia were to cover all of the ELG investment and post-2028 costs, APCo's West Virginia jurisdiction would be entitled to 100% of the benefits from Amos and Mountaineer. Consumer Counsel pushed back on such a conclusion, when paired with APCo's stated expectation that Virginia would nonetheless bear some cost responsibility after 2028 for the remaining net book value of Amos and Mountaineer. Consumer Counsel stated as follows:

> First, if it is the public policy of West Virginia to continue the operation of [Amos and Mountaineer], without regard to economics, and to declare that all capacity and energy is to be assigned to West Virginia, then West Virginia will need to take ownership of that policy and all associated costs. If APCo and West Virginia were to seek to cordon off all capacity and energy associated with [Amos and Mountaineer], then the West Virginia jurisdiction will need to take cost responsibility for all O&M, capital investments, and depreciation for [Amos and Mountaineer]. Simply put, the West Virginia jurisdiction cannot fairly obtain *all* of the benefits associated with [Amos and Mountaineer] without bearing *all* of the costs.
>
> Second, the proposal to charge Virginia customers depreciation expense for a generation facility that would be used solely to serve and benefit the West Virginia jurisdiction is contrary to traditional concepts of utility ratemaking. If appealing to traditional ratemaking, then a utility may be permitted to recover from customers only costs associated with investments that are used and useful in providing them with electric service. If all capacity and energy were siphoned away from the Virginia jurisdiction post-2028, this would mean that [Amos and Mountaineer] would no longer be used and useful in providing electric service to the Virginia jurisdiction.
>
> Finally, the statement that the Virginia jurisdiction would have no "claim" to the capacity of [Amos and Mountaineer] is inconsistent with the realities of PJM's Reliability Assurance Agreement, which is a federally accepted agreement. Notwithstanding APCo's veiled threats that Virginia customers would not be entitled to capacity from [Amos and Mountaineer] if the ELG investments are denied, the Company does elsewhere seem to recognize this reality. That is, APCo admits that [Amos and Mountaineer] will

[371] *Id.*

[372] Ex. 11 (Beam direct) at 9.

> continue to be an "integral component of the Company's [Fixed Resource Capacity "("FRR")] capacity plan. Because PJM views APCo as [a] whole[,]" there is no such thing as a "West Virginia FRR plan" and a "Virginia FRR plan" - there is only one FRR plan for APCo. If the capacity associated with [Amos and Mountaineer] is included in APCo's FRR Plan, then that necessarily means that the capacity will be used to satisfy *(i.e.,* serve to benefit) the capacity obligations of both the West Virginia and Virginia jurisdictions.
>
> As discussed in more detail below, APCo can with limited notice, elect to terminate its FRR status. That is going forward, APCo could satisfy its capacity obligation using PJM's ... capacity auctions. In this event, [Amos and Mountaineer] could receive unit-specific revenues associated with their respective capacity. With unit-specific revenues, it becomes easier to imagine some intra-company arrangement between the state jurisdictions, as discussed by APCo. While it is perceivable that the WVPSC could attempt to order APCo to flow all such capacity revenue to the West Virginia jurisdiction, this would not be fair to the Virginia jurisdiction if the Virginia jurisdiction remains responsible for its share of depreciation.[373]

WVPSC 69% Capacity Factor Orders

The WVPSC issued orders that Sierra Club believes require APCo to operate Amos and Mountaineer at a 69% capacity factor.[374] Sierra Club witness Kwok described the fact that APCo's analysis did not consider the impact that uneconomic coal generation could have on energy costs or revenues "a large oversight", given the WVPSC order that she believes required APCo to run Amos and Mountaineer at a 69% capacity factor.[375] She recommended the Commission fully consider the risk of uneconomic dispatch to Virginia ratepayers when evaluating whether Virginia should approve the proposed ELG costs.[376] Based on her modeling assumptions, Ms. Kwok's modeling results show an approximately $173 million or $346 million Virginia jurisdictional NPV cost of a 69% capacity factor requirement.[377]

Mr. Beam testified that APCo has asked for more clarity regarding the 69% capacity factor, as well as confirmation that the costs of uneconomic dispatch of Amos and Mountaineer would be borne only by West Virginia customers.[378] Pending clarification,[379] APCo does not

220030059

intend to run the plants uneconomically and is not currently running these plants to try to achieve a 69% capacity factor.[380] Mr. Beam also testified in response to the questioning by Consumer Counsel as follows:

> Q ... -- if the West Virginia Commission does require APCo to run generation facilities in an uneconomic manner, would [APCo] seek cost recovery in Virginia of such uneconomic costs necessary to comply with the West Virginia directive?
>
> A No, we would not.[381]

Sierra Club asserted that while the Commission may possess the legal authority to disallow any fuel costs it deems imprudent as a result of any uneconomic dispatch (if mandated), doing so would either be practically impossible or very challenging and burdensome.[382]

Case Participants' Positions on ELG Investment

APCo framed the ELG investment as about capacity and indicated that APCo does not need Amos or Mountaineer for energy.[383] APCo argued that only its analysis is compelling and credible,[384] and that key assumptions used in Sierra Club's economic analysis are fundamentally flawed.[385] Among the key assumptions challenged by the Company, APCo argued that there is no mandate to run Amos or Mountaineer at a 69% capacity factor;[386] APCo cannot purchase capacity from the PJM auctions;[387] securing replacement capacity through short-term, bilateral capacity contracts is an imprudent utility practice;[388] and the price of renewable replacement capacity is not guaranteed to decrease.[389]

Staff found that the economic analysis in this case indicates the continued operation of Mountaineer with the necessary ELG investment is a lower cost resource option compared to alternatives. Staff was unable to reach a conclusion on the Amos ELG investment.[390]

The Coal Association argued that the relatively small cost of the ELG improvements would secure an invaluable hedge against increasingly unpredictable energy market volatility. The Coal Association further argued that the billions of dollars it would cost to replace Amos and Mountaineer "pales in comparison" to the cost of the ELG investment.[391] The Coal Association also believes that when the risk of uneconomically dispatching Amos is removed

from the economic analyses in this case, approval of the ELG improvements and cost recovery is clearly economical for Virginia ratepayers.[392]

Consumer Counsel argued that it is wrong to assume that Virginia would have "no claim" to the value of Amos and Mountaineer if the ELG investment is denied.[393] Consumer Counsel also found it unclear whether APCo satisfied its burden that incurring all costs of the ELG investment represents the best resource option for customers based on at least three issues with APCo's economic analysis. First, Virginia customers do not need to replace capacity for which they would be paying. Second, APCo's economic analysis takes an all-or-nothing approach to replacing Amos and Mountaineer. Third, APCo misstates PJM's rules, resulting in a potential missed opportunity for a lower-cost resource option.[394] Consumer Counsel believes APCo's plans to retire Amos have been inconsistent, to the detriment of customers.[395]

Sierra Club argued that APCo's economic analysis is incomplete, untimely, and fundamentally flawed.[396] Sierra Club argued further that APCo failed to address significant risks associated with the Company's preferred resource plan.[397] If the WVPSC orders mean the "ship [has] sailed" on whether Amos and Mountaineer will retire, Sierra Club believes that "[t]he real question for this Commission, then, is whether it makes sense for Virginia customers to strap themselves to that ship and become subjects to, in the Company's telling, 'the whims' of the [WVPSC]."[398]

APCo's Economic Analysis

APCo's Petition analyzed the incremental Virginia cost of service for four scenarios – one where ELG is made, with Amos and Mountaineer continuing to operate through 2040; two scenarios in which APCo replaces the capacity of Amos and Mountaineer beginning in 2029 with different generic resources identified through PLEXOS modeling conducted for the 2021 RPS Plan (Cases 1 and 2); and a scenario in which the capacity of Amos and Mountaineer is replaced with "paper capacity" (Case 3). Staff modified APCo's results to incorporate an energy margin for Amos and Mountaineer,[399] which APCo indicated it had excluded for Amos and Mountaineer (but not other resources) to illustrate that Amos and Mountaineer need not produce positive energy margins to be the most affordable capacity option for Virginians.[400] Staff also modified APCo's results to correct the amount of "paper capacity" that corresponds to Amos and Mountaineer,[401] which APCo acknowledged was an error in the Petition's analysis.[402]

[402] Ex. 34 (Martin rebuttal) at 8-9.

The Petition's NPV results, as filed and with these two Staff modifications, are shown below.[403]

Scenario	As Filed	As Modified by Staff
	NPV of 2029-2040 (in millions)	
ELG Investment – APCo's Proposal	$647	$569 (w/energy margin)
Case 1 – Renewables and Gas (RPS Port. 3)	$1,935	$1,935
Case 2 – Renewables and Storage (RPS Port. 4)	$2,290	$2,290
Case 3 – Capacity Contracts	$1,486	$1,350 (1,907 MW)

As shown above, Cases 1 and 2 reflect a significant cost of adding renewable, natural gas, and/or storage facilities to replace the capacity of both Amos and Mountaineer. As explained by APCo witness Martin, PJM assigns capacity values lower than nameplate ratings and much more nameplate capacity is required for intermittent resources to match the UCAP value of dispatchable facilities like Amos and Mountaineer.[404] Mr. Martin presented the following tables showing the resource composition and costs of Cases 1 and 2 in his analysis.[405]

Table 1 - Case 1 Replacement Resource Plan Cost

	Case 1 - Virginia Jurisdictional				
Resource Type	MW Nameplate	MW UCAP	Capital Cost ($MM)	2029 Gross Cost of Service ($MM)	2029 Net Cost of Service ($MM)
Under Development Wind/Solar	249	54	$420	$40	$18
Generic Owned Wind	200	22	$311	$25	$6
Generic PPA Wind *	150	17	$216	$20	$5
Generic Owned Solar	-	-	$0	$0	$0
Generic PPA Solar *	300	117	$355	$33	$12
Storage	300	210	$321	$61	$59
Hybrid Solar/Storage	0	0	$0	$0	$0
EE / VVO	67	67	$0	$19	$2
Gas CC	1,420	1,420	$1,546	$203	$188
Totals	2,686	1,907	$3,169	$400	$291

* PPA Capital Investment by PPA Counterparty. PPA cost is PPA price times energy

[403] Ex. 30 (Morris) at 10, 12.
[404] Ex. 13 (Martin direct) at 18.
[405] *Id.* at 13.

Table 2 - Case 2 Replacement Resource Plan Cost

	Case 2 - Virginia Jurisdictional				
Resource Type	MW Nameplate	MW UCAP	Capital Cost ($MM)	2029 Gross Cost of Service ($MM)	2029 Net Cost of Service ($MM)
Under Development Wind/Solar	249	54	$420	$40	$13
Generic Owned Wind	200	22	$309	$25	$2
Generic PPA Wind *	100	11	$142	$12	($0)
Generic Owned Solar	600	234	$843	$88	$37
Generic PPA Solar *	300	117	$388	$33	$7
Hybrid Solar/Storage	197	93	$280	$27	$14
EE / VVO	178	178	$0	$27	($10)
Storage	1,711	1,198	$1,862	$299	$284
Totals	3,535	1,907	$4,244	$551	$346

As shown, the estimated capital cost for the Case 1 resources, including 1,420 MW of combined-cycle gas, is approximately $3.2 billion. The estimated capital cost for Case 2 resources, including 1,711 MW of energy storage, is approximately $4.2 billion.[406] The $291 million and $346 million total amounts for the column on the far right are intended to show the immediate (*i.e.*, 2029) Virginia cost-of-service impact of the replacement generation, with such amounts net of fuel savings from all new resources.[407] From these amounts, Mr. Martin netted out his $73 million of avoided 2029 ongoing costs at Amos and Mountaineer to calculate 2029 cost-of-service increases of $218 million (Case 1) and $273 million (Case 2).[408] He indicated these incremental costs represent a customer rate increase between 17% and 21% in 2029 above what customers paid in 2021.[409] Shown as "[u]nder [d]evelopment" in both of these tables as an assumed (50%) Virginia share of 249 MW, Case 1 and Case 2 include the mixture of owned and PPA wind and solar projects that were selected from the 2021 RFP totaling 498 MW (nameplate) that the Commission approved in the 2021 RPS Proceeding, which will come online at various dates between 2023 and 2025.[410]

Beyond Staff's modifications, several aspects of APCo's analysis were challenged or questioned by case participants, including the assumed cost of replacement resources in Cases 1 and 2. For the "[u]nder [d]evelopment" resources, APCo used the actual resource costs. For the remaining renewable replacement resources, APCo used generic resource costs, including wind and solar costs aligned with the average of the bids received by APCo in RFPs it issued for both owned and PPA resources in 2021. As such, all new wind and solar resource costs are based on actual market information available when the analysis was performed.[411] Sierra Club used the same figures[412] but asserted that APCo's assumed cost of replacement resources based

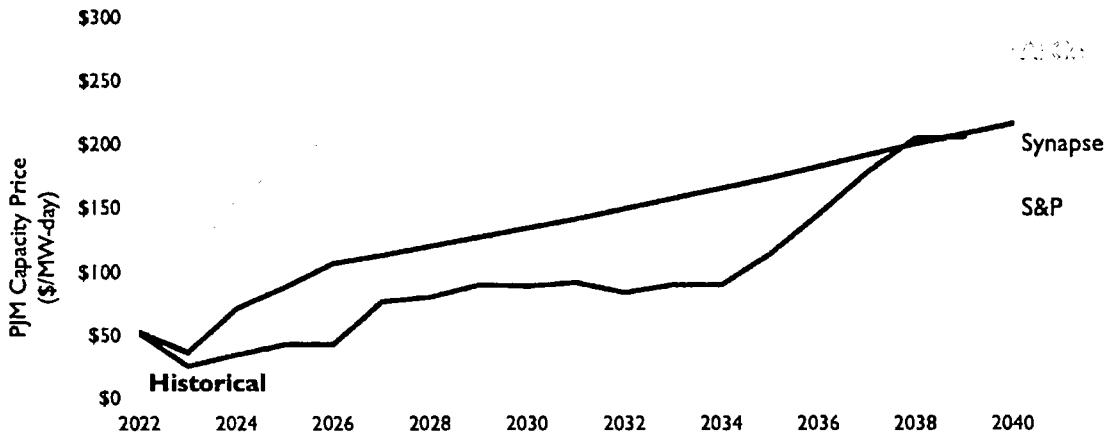
[412] Tr. at 195 (Kwok)

on 2021 data became stale with the passage of the Inflation Reduction Act of 2022, which Sierra Club indicated significantly reduced the cost of wind, solar, and storage by extending tax credits through at least 2032.[413] While APCo agreed that the tax credits in the Inflation Reduction Act will help lower the cost of renewables, the Company responded that it has "experienced massive increases in costs of renewables over the past year and a half" that are not incorporated in the economic analysis of APCo (or Sierra Club) in this case.[414] Company witness Martin reported that the Producer Price Index Final Demand-Energy that measures commodity inflation specifically for the types of materials used in the energy industry grew from 100.8% to 170.97% from January 2021 to July 2022.[415] Sierra Club witness Kwok recognized that the numbers used by APCo (and her) preceded this "price spike" identified by APCo.[416] Additionally, the Company indicated, among other things, that the tax credits will increase the demand on the supply chain for renewable components, which APCo indicated has already made it problematic for other companies to obtain panels and turbines.[417] APCo witness Martin pointed out that while reduced renewable costs might have been a trend until two or three years ago, that trend changed dramatically, coinciding with the enactment of the VCEA.[418] The record establishes that relevant industry costs have significantly increased in 2021 and 2022, but that the Inflation Reduction Act should lower such costs. I find the net effect of these opposite forces remains to be seen and is difficult to predict at this time. Accordingly, I find it was reasonable for APCo not to update its assumed replacement costs for Cases 1 and 2 in the middle of this proceeding.

Another aspect of APCo's analysis that was challenged or questioned by case participants, is the assumed price of "paper capacity" replacement resources in Case 3. Sierra Club witness Kwok illustrated APCo's assumed capacity price in Case 3 with the top line in the chart below, and with other lines illustrating an S&P forecast (bottom line) and the assumed capacity price used in her modeling analysis (middle "Synapse" line).[419]



[413] *See, e.g.*, Sierra Club's Brief at 12-13.

[417] Tr. at 280-81 (Martin).
[418] Ex. 34 (Martin rebuttal) at 19-21.
[419] Ex. 23 (Kwok) at 20.

Ms. Kwok pointed out that APCo's forecast includes prices of $100/MW-day to $151/MW-day for 2023 and 2024, which are three to four times higher than the actual auction clearing price of $34/MW-day she believes was relevant for PJM's 2023/2024 delivery year.[420] She further indicated that APCo's capacity forecast was prepared in July 2021, before significant changes to the PJM capacity market.[421] While she acknowledged there is much uncertainty around future PJM capacity prices, she believes her alternative capacity price input values are a plausible future for prices and are more up-to-date and representative of current market conditions than APCo's forecast.[422] She testified that her capacity value inputs are a blend of a May 2022 S&P forecast and APCo's July 2021 forecast.[423] According to Ms. Kwok, a recent report by PJM's market monitor indicated approximately 12,000 MW of capacity that was offered in the capacity auction for 2023/2024 did not clear. This indicates to her that surplus capacity is available to be purchased. Additionally, a $34 per MW-day clearing price suggests to her that surplus capacity could be purchased competitively.[424]

APCo downplayed its Case 3, indicating it is an unrealistic and risky option. APCo witness Martin testified that even if the Company's capacity price curve were cut in half, this option still would not be cheaper than continuing to serve Virginia customers with Amos and Mountaineer.[425] APCo added that it cannot currently purchase capacity in PJM's auction and thus is effectively assumed to participate in "an uncertain and risky perpetual cycle of seeking year-to-year bilateral capacity contracts."[426] Mr. Martin identified the following as reasons why it would be risky to replace the capacity of Amos and Mountaineer with short-term bilateral purchases of capacity:

> 1. APCo and the AEP East companies meet their PJM capacity requirements under the FRR option. The Companies self-supply capacity, and therefore cannot buy capacity in the PJM capacity market.
>
> 2. Capacity would have to be sourced from bilateral contracts signed with individual resources. The year-to-year bilateral capacity market is not a liquid or predictable market in the experience of the Company and its affiliates.
>
> 3. PJM requires that capacity used to meet an FRR utility's capacity requirement be provided from actual physical resources. That is, although it may be referred to as paper capacity because it can be obtained under a contract, there must be real resources supporting the contracts. In addition, a resource can only be used towards one entity's PJM obligation, so the universe of resources is limited to resources not already committed to other parties.

---

[420] *Id.* at 17 and attached Ex. SK-4.
[421] *Id.* at 17-18 (referencing changes to PJM's minimum offer price rule, market seller offer cap, and effective load carrying capability). While Ms. Kwok was not aware of whether aspects of PJM's minimum offer price rule are currently on appeal, she believes APCo should study ratepayer impacts of the expanded minimum offer price rule is reinstated in some form by FERC. Tr. at 183-84 (Kwok).
[422] Ex. 23 (Kwok) at 18-19.
[423] Tr. at 173 (Kwok).
[424] Tr. at 170 (Kwok).
[425] Ex. 34 (Martin rebuttal) at 22.
[426] *Id.* at 13.

4. Due to the small percentage capacity credit assigned to renewable resources by PJM, these contracts would most likely have to be with other fossil-fueled resources. If the Sierra Club's goal of opposing [Amos and Mountaineer] is to close fossil-fueled resources, this plan would not advance that goal.

5. There is competition for whatever capacity is available for bilateral contracts.

6. As short-term capacity contracts do not entitle the Company to any energy, exposure to the volatile energy market and natural gas prices would increase.

7. Each year would bring new uncertainty regarding the availability of, and price for, bilateral capacity.[427]

APCo acknowledged that PJM's rules allow the Company to decide whether or not it will continue as an FRR-entity in the future.[428]

I find that, in the context of the relevant scenarios, Sierra Club's assumed market capacity price curve for the relevant years (2029-2040) is no less plausible than the curve APCo used for its Case 3. There is no question that the auction results for PJM's 2023/2024 delivery year are far below the price levels forecasted by APCo.[429] However, this foretells little about the future price for (auction or bilateral) capacity in 2029 through 2040, which is the period relevant to the ELG investment. For 2029 through 2040, APCo's price curve is basically a straight line with a 2% upward slope.[430] As shown above, Sierra Club's lower price capacity curve over these same years also has a fairly constant slope that is comparable, but slightly steeper, than APCo's. Given the undynamic nature of APCo's and Sierra Club's data for these years, the forecasted cost in 2029 – *i.e.*, the starting point of the comparably sloped lines – appears to be a key differentiating factor between the forecasted figures for 2030 through 2040. APCo's forecasted capacity price of $222/MW-day for 2029[431] does appear high today, but as recognized by Sierra Club witness Kwok, there is much uncertainty about the future of capacity prices in PJM[432] (and perhaps what PJM's capacity market design will look like once intermittent resource have a higher penetration in PJM).

Sierra Club challenged APCo's assumption that if Virginia did not fund ELG investment the Company would need to build and/or purchase an amount of replacement capacity equal to the UCAP value of Amos and Mountaineer. Instead, Sierra Club asserted that the Company should only build or purchase the amount of firm capacity needed to meet its forecasted 14.9% reserve margin[433] (which equates to 8.6% on a UCAP basis).[434] APCo asserted that a minimum 18-20% reserve margin, with a diverse set of fossil-fueled and renewable resources, is

[427] *Id.* at 13-14; Tr. at 273 (Martin correction).

5696212

a more appropriate level of capacity.[435] APCo also indicated that one benefit of FRR status is that it has historically required a lower capacity obligation than auction participation.[436] However, if APCo's economic analysis proposes reserve margins increasing to nearly 39% by 2040 in a future where Amos and Mountaineer are not retired, Sierra Club described APCo's statements about the FRR benefit of a lower capacity obligation as "farcical."[437] Consumer Counsel believes APCo's own evidence in this regard "exposes the hypocrisy embedded in [APCo's] position."[438]

I find that the evidence introduced by APCo indicates that the analytical addition of 1,907 MW UCAP – by 2029 – as an alternative to Virginia funding ELG investment pushes the Company's expected reserve margin well above the 18-20% nameplate level[439] (or the corresponding UCAP level) that the Company itself indicates is appropriate. As an initial matter, I note that the relatively high projected reserve margins highlighted by Sierra Club and Consumer Counsel are for RPS Portfolio 1 and are on a UCAP (not nameplate) basis.[440] As shown below for the years 2022 through 2040, APCo provided the same projected UCAP reserve margin percentages for the other RPS portfolios, including RPS Portfolios 3 and 4 on which APCo based its Case 1 and Case 2 resource additions.[441]

13.7	8.6

APCo's economic analysis in the instant case takes an assumed Virginia share of the resources added in these two portfolios through the year 2028, which show 9.0% and 8.7% (UCAP) reserve margins. APCo's supporting data indicates the projected 9.0% and 8.7% levels equate to 19 MW and 5 MW above the 8.6% projected reserve margin requirement.[442] Because both of these RPS portfolios assume the retirement of Amos and Mountaineer during 2028 (illustrated by the drops from 20.7% and 47.1% in 2027), the 3,814 MW UCAP capacity of these plants would need to be added back to the resources in these portfolios to better reflect APCo's resource portfolio in Case 1 and Case 2 presented in the instant proceeding. These RPS portfolios plan for scenarios in which Amos and Mountaineer are retired by adding large new natural gas or storage resources that would be used to serve both Virginia *and* West Virginia. Since Amos and Mountaineer are not retiring, removing the West Virginia share of such new resources is appropriate to calculate the projected total company reserve margin that would be

[442] *Id.* at attached Sched. 1, Tables 26-27.

produced from APCo's Cases 1 and 2.[443] The net effect of these adjustments is that Case 1 and Case 2 would include, as of January 1, 2029, approximately 2,400 UCAP MW and 2,600 UCAP MW above APCo's projected 8.6% UCAP reserve margin, respectively. I agree with APCo that many reasons may support targeting reserve levels above a minimum 8.6% UCAP (14.9% ICAP) reserve margin.[444] But 2,400 to 2,600 UCAP MWs is a lot of surplus capacity for a utility that had peak summer and winter demands below 6,000 MW in 2021[445] and that forecasts its peak demand will decrease from 2022-2036.[446] Consequently, APCo's assumption that the Company would or should add the equivalent of a Virginia share of Amos and Mountaineer's UCAP capacity in a scenario where both resources remain operational for APCo appears to be based on matters of interjurisdictional equity, as discussed below, rather than any projected resource adequacy need. APCo's capacity obligation – currently met through the voluntary FRR option – is assessed based on the entire Company, and not by jurisdiction.[447]

APCo's RPS Plan Economic Analysis

Staff recognized that utility resource investment is typically evaluated on a total system basis that attempts to determine the projected NPV change in a utility's total system generation portfolio resulting from the inclusion, or exclusion, of a resource being considered. Staff presented the results of such an analysis presented by APCo in its 2021 RPS Plan Proceeding, as shown below.[448]

Scenario	Portfolio 3 vs. Portfolio 1	Portfolio 4 vs. Portfolio 2
	NPV in millions	
With ELG Facilities	$21,620	$24,710
Without ELG Facilities	$22,863	$27,245
Benefit of ELG Facilities	$1,242	$2,535

Sierra Club's Economic Analysis

Sierra Club witness Kwok presented the results of economic modeling she conducted using the following four scenarios and one fuel price sensitivity:

---

[443] More specifically, Case 1 adds approximately 1,400 MW (nameplate and UCAP) of natural gas as replacement resources, which corresponds to the approximately 2,800 MW of natural gas added in RPS Portfolio 3 to help replace Amos and Mountaineer. *Compare* Ex. 13 (Martin direct) at Attached Sched. 1, Table 26 with his Table 1, p. 13 of Ex. 13 (Martin direct). Case 2 adds approximately 1,711 MW of nameplate storage that corresponds to the 3,575 MW of storage added in RPS Portfolio 4 to help replace Amos and Mountaineer. *Compare* Ex. 13 (Martin direct) at Attached Sched. 1, Table 27 with his Table 2, p. 13 of Ex. 13 (Martin direct). There is no apparent reason to assume West Virginia would take on the 1,400 MW of additional natural gas or the approximately 1,200 UCAP of additional storage if Amos and Mountaineer remain operational. The net effect of adding Amos and Mountaineer but subtracting 1,400 MW of natural gas from RPS Portfolio 3 puts APCo's Case 1 approximately 2,400 UCAP above its projected 8.6% reserve margin. The net effect of adding Amos and Mountaineer but subtracting 1,200 UCAP of additional storage puts APCo's Case 2 approximately 2,600 UCAP above its projected 8.6% reserve margin.

5692717

(1a) a scenario that includes ELG investments at Amos and Mountaineer and assumes APCo operates these facilities at an annual 69% capacity factor through 2040. The model was set up to add the same new resource portfolio as APCo's RPS Portfolio 1 ("WVPSC Preferred");

(1b) a sensitivity to scenario (1a) that incorporates a coal price that is 2% to 12% higher than scenario (1a) ("WVPSC Preferred, high coal price sensitivity");

(2) a scenario that includes ELG investments at Amos and Mountaineer and is set up the same way as scenario (1a), but assumes APCo operates Amos and Mountaineer economically through 2040 ("APCo Preferred");

(3) a scenario that operates Amos and Mountaineer economically until December 31, 2028, then removes them from APCo's Virginia rate base. APCo then meets Virginia's system needs with a combination of solar PV, wind, battery storage, and market purchases based on what the model selected as optimal. After this first stage of modeling, this scenario was re-run with the full capacity of Amos and Mountaineer while locking in the same builds from the first stage to represent a future where West Virginia customers take 100% ownership of Amos and Mountaineer in 2029 and run them at a 69% capacity factor, while Virginia customers' energy and capacity needs are met with alternatives. ("Full Coal Removal"); and

(4) a scenario that uses the same two-step process as scenario (3), except that it removes only Amos from APCo's Virginia rate base on December 31, 2028. This scenario also assumes Mountaineer operates at an annual 69% capacity factor through 2040 ("Partial Coal Removal").[449]

Ms. Kwok conducted the above modeling first using APCo's capacity price forecast, then using a lower price capacity curve (shown above in the discussion of APCo's economic analysis). Finally, Ms. Kwok added to her lower capacity price results a $45/MWh penalty to scenarios that do not comply with the VCEA's mandatory RPS.

[449] *Id.* at 3-4, 12-15, 20.

The results of Ms. Kwok's analysis are summarized in the table below.[450]

Scenario	Modeling with APCo's capacity price	Modeling with lower capacity price	Modeling with lower capacity price and $45/MWh REC shortage penalty
(2) APCo Preferred (no 69% capacity factor)	$5,585	$5,743	$5,896
(3) Full Coal Removal (Amos and Mountaineer)	$6,030	$5,927	$5,927
(4) Partial Coal Removal (Amos only)	$5,720	$5,713	$5,713
(1a) WVPSC Preferred (69% capacity factor)	$5,757	$5,915	$6,068
(1b) WVPSC Preferred, high coal price	$5,931	$6,089	$6,242

Using APCo's capacity price forecast (column of figures on the left), her APCo Preferred Scenario has the lowest NPV revenue requirement, followed by her scenario in which Amos is removed in 2029. Although these results show removing both Amos and Mountaineer did not result in net savings, she stressed that this modeling assumed an unrealistically high capacity price forecast and conservative assumptions, including no future carbon pricing on coal generation during the next eighteen years.[451] She also indicated there are risks associated with higher fuel prices, some of which she quantified in her high coal price sensitivity.[452]

Using her lower price capacity curve (middle column of figures), her scenario in which Amos is removed in 2029 has the lowest NPV revenue requirement, followed closely by the APCo Preferred Scenario. Ms. Kwok believes the Commission should use the WVPSC Preferred Scenario, rather than the APCo Preferred Scenario, as the baseline for comparison to other scenarios since she views the 69% capacity factor as a mandate of the WVPSC by which APCo must abide.[453] Ms. Kwok acknowledged that these results – without consideration of other factors – indicate that leaving Mountaineer in service is $214 million more economic than removing both Amos and Mountaineer.[454] Ms. Kwok recognized the $45/MWh penalty amount (incorporated in the column of figures on the right) reflects the upper bound of the potential risk of RPS non-compliance.[455]

APCo challenged several of the assumptions in Ms. Kwok's analysis. As an overarching concern, APCo witness Martin asserted that every aspect of Ms. Kwok's analysis is undermined by an inaccurate premise that APCo, which is an FRR entity, can purchase capacity in PJM's

[450] *Id.* at 22, 23, 27.
[451] *Id.* at 24.
[452] Tr. at 159, 201-202 (Kwok).
[453] Tr. at 158-59 (Kwok).
[454] Tr. at 189 (Kwok) (discussing, in the context of another table, the difference between the $5.927 billion and $5.713 billion amounts that are also shown in the middle and right columns of the table above).
[455] Ex. 23 (Kwok) at 27.

auctions.[456] He described obtaining capacity through year-to-year bilateral contracts as an unrealistic option.[457]

Mr. Martin believes Ms. Kwok's APCo Preferred Scenario is her only scenario that is not unduly influenced by understated replacement resource costs or uneconomic dispatch, because Amos and Mountaineer will run through 2040.[458] He testified that the assumption that Amos and Mountaineer would run at a 69% capacity factor even if uneconomic is unrealistic and overstates costs.[459] He does not consider this scenario worthy of much consideration given APCo witness Beam's testimony.[460] However, Mr. Martin added that the reduction in energy margins due to uneconomic dispatch for Amos and Mountaineer would need to be eight times larger than projected by Sierra Club to offset the capacity cost savings APCo calculated for the Company's Cases 1 and 2.[461]

Mr. Martin explained that the primary resource Ms. Kwok added to replace Amos and Mountaineer is PJM market capacity, at an assumed short-term capacity price. He reiterated that APCo cannot currently purchase capacity in PJM's auction and thus is effectively assumed to participate in "an uncertain and risky perpetual cycle of seeking year-to-year bilateral capacity contracts."[462] Mr. Martin also believes APCo's customers would be exposed to far too much additional energy market exposure under Sierra Club's resource plan. He provided the data shown in the table below to illustrate the reliance on bilateral capacity contracts, which do not entitle to Company to any energy.[463]

Virginia Jurisdictional Net Market Energy Purchases/ (Sales)	2029-2040 Total Net GWh Purchases/(Sales)	2029-2040 Total ($000)	Change from 2040 Retirements ($000)
APCo Preferred – 2040 Retirements	(10,472)	($679,809)	
2028 Both Removal	83,647	$2,706,447	$3,386,256
2028 Amos Removal	36,192	$1,038,363	$1,718,172

As shown above, going from Sierra Club's APCo Preferred Scenario to the scenario removing both Amos and Mountaineer changes APCo from a net seller of energy with nearly $680 million of Virginia jurisdictional net market sales revenue to a net purchaser of $2.7 billion of energy for its Virginia customers. APCo is a net purchaser of $1.0 billion for its Virginia customers in Sierra Club's scenario where only Amos is removed in 2028. He concluded that "placing this much risk on Virginia customers by using a resource plan with capacity-only contracts (with

[456] Ex. 34 (Martin rebuttal) at 2-3; Tr. at 273, 289 (Martin).

[458] *Id.* at 12.
[459] *Id.* at 11.
[460] *Id.* at 10-11. However, he noted that Sierra Club's workpapers for Scenario 1a show Amos and Mountaineer remain profitable over the forecast period, just less profitable compared to Scenario 2. *Id.* at 11. Mr. Martin acknowledged uneconomic dispatch would also incur costs other than fuel costs. Tr. at 284-85 (Martin).
[461] Ex. 34 (Martin rebuttal) at 11.
[462] *Id.* at 13.
[463] *Id.* at 15-16.

fossil-fueled resources) is not remotely prudent, even if it were in any way possible, for the Company to do."[464]

Regarding Ms. Kwok's RPS non-compliance costs, Mr. Martin testified that her analysis overstates the impact of the REC deficiencies in APCo's modeling. He testified that, among other things, APCo believes RECs will be available in publicly traded markets and does not anticipate being subject to the $45/MWh deficiency payment.[465]

Notwithstanding the assumptions Mr. Martin challenged, he pointed out that the results of Ms. Kwok's modeling using a lower capacity price forecast show that removing both Amos and Mountaineer will be more expensive than continuing to use them to serve Virginia.[466] He pointed out that because her scenario removing only Amos is less expensive than her scenario removing both Amos and Mountaineer, this indicates that keeping Mountaineer will save customers money. He believes Ms. Kwok's scenario removing only Amos shows tiny savings that are "hardly enough to justify walking away from [Amos] and putting the enormous risks associated with replacing it on the Company and its Virginia customers."[467] APCo pointed out that the savings shown would be less if updated to reflect the Company's more recent ELG cost estimates provided during the hearing.[468]

Hearing Examiner's Conclusions

As discussed above, I agree with some of the observations of Consumer Counsel and Sierra Club about the quantity of "replacement" capacity needed if Virginia does not fund ELG investment. APCo's analysis assumes the Company would push its reserve margin in these scenarios well above what the Company testified is appropriate. Additionally, the economic divide between the scenarios in which APCo contributes to ELG investment and the alternative scenarios is only as wide as presented by APCo[469] if it is assumed that Virginia would continue paying for Amos and Mountaineer's plant-in-service, regardless of ELG investment. Were Amos and Mountaineer to be retired in 2029,[470] then I would agree with APCo that Virginia would be responsible for paying its share of any net book value remaining at retirement under traditional ratemaking.[471] But Amos and Mountaineer are not retiring in 2029, regardless of the Commission's decision in this case, and so this net book value is simply undepreciated plant that remains in service.[472] Accordingly, I cannot reconcile APCo's tandem assumptions that if Virginia does not fund ELG investment: (1) Virginia would receive 0% of the capacity or energy from Amos and Mountaineer as of 2029; but (2) Virginia would still pay an allocated

[471] Ex. 11 (Beam direct) at 8.
[472] Tr. at 58 (Castle).

share of the net book value that remains as of 2029. Should Amos and/or Mountaineer remain in service, the assumption that Virginians would continue to pay for that plant to be used exclusively for service to West Virginia[473] is a ratemaking leap in my view. As summarized by Consumer Counsel, "[a] future where Virginia customers are asked to pay up to approximately $500 million for generation facilities that will be in operation, but then are denied any capacity value is neither fair nor in line with traditional utility ratemaking practices."[474]

To be clear, my discussion of this analytical issue is in no way critical of the WVPSC. One of the WVPSC orders approving ELG investment states a clear expectation that if Virginia does not fund ELG investment then West Virginia could get 100% of the capacity or energy.[475] That finding was based in part on testimony APCo provided to the WVPSC that this would be a fair result.[476] As discussed above, my concern about APCo's assumption in the instant case of a 0% Virginia benefit (consistent with a WVPSC order) is that it is made in conjunction with APCo's assumption that Virginia would continue to pay for plant-in-service in future years (*not* in a WVPSC order). There is an analytical asymmetry. If the analysis assumes – consistent with APCo's position and the WVPSC order – that it is a fair result for West Virginia to get 100% of the capacity and energy from Amos and Mountaineer beginning in 2029, then the results of APCo's Cases 1, 2, and 3, should be reduced by an approximate Virginia share of the estimated $1.05 billion net book value as of December 31, 2028 (which Consumer Counsel reasonably ballparks as $500 million).[477] This adjustment would also address my concern about the amount of "replacement" capacity used in Cases 1, 2, and 3, because while the current FRR rules may view APCo as a whole, I have no illusion that such a rule would be sustainable if Virginia were not to fund ELG investment (the assumption in these Cases) and Virginia were to maintain no responsibility for any remaining net book value. That FERC petition might write itself. Since my view of interjurisdictional equity in these analyses is a two-way street, it is reasonable to assume that any legal or equitable claim Virginia has to the Amos and Mountaineer capacity ceases if and when – as a net book value adjustment to APCo's results necessarily assumes – Virginia stops paying for these facilities' undepreciated plant-in-service.

Turning back to the results of APCo's economic analysis, after recognizing Staff's modifications and a $500 million Virginia net book value estimate as of December 31, 2028, APCo's results, as adjusted, indicate that ELG investment in Amos and Mountaineer is more economic by $866 million (Case 1), $1.22 billion (Case 2), and $281 million (Case 3). Like APCo's economic analysis, Sierra Club's analysis reflects no net book value benefit to scenarios in which it is assumed that APCo receives zero capacity or energy benefit from Amos or Mountaineer as of January 1, 2029. Adjusting Sierra Club's modeling results to reflect a $500 million benefit where both Amos and Mountaineer are removed and a $275 million benefit

[473] In this scenario, all of the Amos and Mountaineer plant-in-service would be useful only to West Virginia.
[474] Consumer Counsel's Brief at 5.
[475] Ex. 18 at 7-10.
[476] *Id.* at 8-9. This order also indicates that the *2021 E-RAC Order* effectively ordered that APCo retire Amos and Mountaineer by 2028. *Id.* at 8. I note that Virginia law does not require APCo to get pre-approval of any environmental compliance projects or costs and that the *2021 E-RAC Order* denied APCo's proposal without prejudice.
[477] The date of the estimated net book value aligns with the use of 2029 for the NPV economic results in this case.

where only Amos is removed,[478] changes the order of Sierra Club's results. For Sierra Club witness Kwok's modeling using APCo's capacity price, her scenario in which Amos is removed and her scenario in which both Amos and Mountaineer are removed become more economic than the APCo Preferred Scenario by $140 million and $55 million, respectively.[479] For her results using a lower capacity price, her scenario removing Amos and Mountaineer and her scenario removing only Amos become more economic than the APCo Preferred Scenario by amounts ranging between $305 million and $469 million.[480]

I have given less weight to Sierra Club's scenarios that effectively penalize Virginia for an uneconomic regulatory dispatch of Amos or Mountaineer. I agree that the potential risk to Virginia associated with a mandatory regulatory dispatch of Amos and Mountaineer by the WVPSC should be among the risks considered by the Commission. While APCo asserted that there is no 69% mandate,[481] and several parts of the WVPSC's orders tend to support APCo's position that this is a ratemaking issue, other parts of the WVPSC's orders seem to suggest otherwise.[482] In my view, the sworn testimony of Mr. Beam, APCo's President, mitigates the uneconomic dispatch risk identified by Sierra Club – namely, that Virginia jurisdictional customers might bear higher costs associated with a regulatory dispatch requirement. Mr. Beam testified that APCo would not seek from Virginia the costs of any uneconomic regulatory dispatch, if mandated by WVPSC.[483] I recommend this commitment – and the Commission's ability to implement it, if necessary, through rate ring-fencing – be made a condition of any approval in this case.

I agree with Sierra Club that calculating the costs associated with the uneconomic dispatch of Amos and Mountaineer could be complicated and burdensome.[484] Such calculations may require a comparison against a hypothetical economic dispatch, and the variable costs of Amos and Mountaineer are not neatly contained in one rate mechanism. However, the Commission's decision in the instant case would not determine whether the Commission must undertake this complicated analysis unless the 69% capacity factor (1) is an operational requirement, and (2) is limited to post-2028 operations. While APCo has sought clarification on whether the 69% capacity factor is an operational requirement, I see nothing in the relevant WVPSC orders suggesting that the 69% capacity factor – whether it is an operational requirement or only a West Virginia ratemaking consideration – is relevant only after 2028. Indeed, the WVPSC incorporated an assumed 69% capacity factor in APCo's West Virginia

---

[478] $275 million is 55% of $500 million. The net book value figures provided by APCo show that Amos's projected net book value is 55% of the total net book value estimated for these plants as of December 31, 2028.

[479] In the order in which they are mentioned in this sentence, the cost of her referenced scenarios would be $5.445 billion, $5.530 billion, and $5.585 billion.

[480] In the order in which they are mentioned in this sentence, the cost of her referenced scenarios would be $5.427 billion, $5.438 billion, and $5.743 billion (without the $45/MWh penalty) or $5.896 billion (with the penalty).

[481] APCo's Brief at 10-11.

[482] *See, e.g.*, Ex. 21 at 4 ("The Commission recognized the excessive cost of relying on the PJM energy market in September 2021 *when we ordered the Companies to increase self-generation* in lieu of the PJM market and high cost purchased power contracts.") and 7 (finding APCo and Wheeling Power Company "have not achieved 69 percent capacity [sic] at their coal-fired generating plants *as ordered by the [WVPSC].*") (emphasis added).

[483] Tr. at 268 (Beam).

[484] Tr. at 154-57 (Kwok). *See also* Tr. at 255 (Beam) (testifying that APCo, while waiting on its pending request for clarification from the WVPSC, has not put forward a plan for identifying uneconomic dispatch costs).

rates approved last year.[485] How to address a WVPSC regulatory dispatch of Amos and/or Mountaineer would become a Virginia ratemaking issue if and when such dispatch occurs.

In sum, based on the scenarios I have given the most weight, APCo's and Sierra Club's economic analyses, after incorporating Staff's adjustments and a net book value adjustment, indicate a NPV benefit of Virginia investment in ELG for both Amos and Mountaineer ranging from positive $1.2 billion to negative $470 million, approximately. Sierra Club's scenario establishing the low end of this range is heavily reliant on the energy and capacity market, and with APCo assumed to secure a 14.9% reserve margin exactly. I also note that if the Commission does not agree there is an analytical asymmetry warranting a net book value adjustment, then all of Sierra Club's results indicate it would cost more to remove both Amos and Mountaineer, rather than retain them both, except in scenarios where Virginia ratepayers are penalized for an assumed 69% regulatory dispatch.[486] At the hearing, APCo provided updated ELG cost estimates of $21 million (Mountaineer) and $63.5 million (Amos), which are lower than what was incorporated in the economic analyses discussed above. These updated estimates would favorably impact the ELG investment scenarios to some extent.

APCo's and Sierra Club's results also do not capture all of the risks associated with a decision to invest, or not invest, in ELG compliance. APCo, Sierra Club, and the Coal Association identified several risks (in addition to 69% regulatory dispatch) for the Commission to consider, many of which are competing. Sierra Club highlighted, for example, additional coal price risk, the potential for additional regulation, and the risk of foregoing resources made less expensive by the Inflation Reduction Act.[487] Sierra Club witness Kwok believes such risks likely make ELG investment imprudent.[488] APCo, on the other hand, highlighted the risks associated with increased market exposure and new resource development.[489] APCo described approval of ELG investment as approval of a reasonably priced insurance policy, in essence, against such risks.[490] The Coal Association urged the Commission to consider persistent supply chain disruptions, the war in Ukraine, and concerns about the recent substantial increase in natural gas prices and volatility.[491] The Coal Association also believes ELG investment would provide time "to gain greater clarity on which new resources should be pursued."[492]

While the Commission may assign different weight to the record evidence on the various economic results and relevant risks identified in the record, based on my assessment of the record, I find that the record supports an approximately $21 million ELG investment at Mountaineer, and, to a lesser extent, an approximately $63.5 million ELG investment at Amos,

[490] Tr. at 18 (Coates).
[491] Ex. 1 (Medine) at 14-18. Similar to APCo, Ms. Medine sees ELG investment in Amos and Mountaineer "as a hedge against market volatility" and "and insurance against supply chain issues." *Id.* at 19.
[492] *Id.* at 19-20.

subject to the condition that APCo not seek from Virginia any costs of uneconomic regulatory dispatch (if required by the WVPSC) and the Commission's ability to implement this commitment through rate ring-fencing. After adjusting APCo's results as discussed above, the Company's economic analysis, showing estimated NPV benefits reaching as high as $1.2 billion, establishes a substantial likelihood that ELG investment would benefit Virginia ratepayers at a reasonable cost in my opinion. A number of conditions currently affecting the energy industry – including the recent run-up in natural gas prices,[493] supply-chain challenges, and the backlogged PJM queue[494] – seem to caution against a decision at this time to move away from significant existing sources of capacity and energy. Amos and Mountaineer provide a significant amount of capacity and, assuming uneconomic regulatory dispatch costs do not appear, provide a hedge against energy market prices and volatility. Based on my assessment discussed above, Sierra Club's modeling offers the prospect of $470 million (NPV) of savings during the next decade. This amount that would be somewhat lower assuming a reserve margin above a 14.9% minimum and/or assuming RECs can be obtained at prices lower than the statutory non-compliance penalty amount, and this amount would disappear if the Commission disagrees with my net book value adjustment. Importantly, the modeled scenario indicating the potential for such benefits carries an appetite for market risk that is much higher than scenarios in which Virginia continues to share the costs and benefits of Amos and Mountaineer beyond 2028.[495] Shifting APCo from a self-sufficient utility accessing the wholesale market when beneficial for Virginia ratepayers to one that significantly relies on the market to serve Virginia would be notable. Given PJM's relatively low penetration of renewables[496] and the effect high natural gas prices (like recent levels) can have on the energy market, Sierra Club's modeling places a bigger bet on the market than I recommend, although the Commission could assign different weight to the relative risks and the economic analyses than I have.

In addition, APCo should be able to address the risk of foregoing resources made less expensive by the Inflation Reduction Act through the Company's ongoing VCEA compliance process. If future RFPs do produce low-cost renewable and/or storage options, a more aggressive approach to compliance could be warranted. The extended tax benefits of the Inflation Reduction Act last through 2032, followed by a potential extension and/or three-year phase out.[497] In other words, even if it is not economically prudent for Virginia to pivot from one or all of the Amos units as soon as 2029, the remainder of this decade may provide greater clarity on whether and when doing so during the next decade would be prudent. Maintaining Amos's current depreciation rates (with assumed retirement dates of 2032/2033) for Virginia ratemaking purposes may provide APCo with additional flexibility to pursue, and absorb in rates, replacement resources for one or more of Amos's units in 2032, for example, should such action be in the best interests of Virginia in the future.[498]

[497] *See, e.g.,* Tr. at 200-01 (Kwok). *See also* Public Law 117-169, Sections 13701 and 13702. The potential for an extension beyond 2032 would be triggered if annual greenhouse gas emissions from domestic electricity production are not at least 75% lower than in calendar year 2022. *Id.* at Section 13701.
[498] In 2035, APCo expects that the total UCAP provided by the renewable resources APCo plans for VCEA compliance will reach the amount of capacity needed to offset one Amos unit. Ex. 11 (Beam direct) at 6.

However, I note that APCo was directed to provide a comprehensive retirement analysis of Amos and Mountaineer in its 2022 IRP filing, which the Commission will consider at a hearing next week.[499] As the records developed in the IRP and the E-RAC cases will be concurrently before the Commission, the Commission will have the benefit of a broader set of economic analysis than the record evidence on which my analysis must rely.

Should the Commission not adopt my findings and recommendations based on the record in this E-RAC case or the IRP case, much of the record evidence in this E-RAC case indicates that between Amos and Mountaineer, investment in ELG at Mountaineer is likely a more economic option than at Amos. Sierra Club's modeling results indicate that maintaining Mountaineer is lower cost than removing both Amos and Mountaineer.[500] The ELG investment in Mountaineer is lower cost (both on a dollars and dollars-per-MW basis) than ELG investment in Amos.[501] Mountaineer has also been dispatched with generally higher capacity factors than Amos in recent years. These historically higher capacity factors (including 71% in 2019, just prior to the pandemic[502]) and Mountaineer's smaller size, compared to Amos, indicate that the risk associated with quantifying any uneconomic regulatory dispatch of Mountaineer would be less than any such risk associated with Amos.[503]

If Virginia does not fund ELG, APCo characterized the remaining net book value attributable to Virginia on December 31, 2028, as a potential "stranded cost" that APCo cannot force onto West Virginia.[504] APCo is concerned that cost recovery of the Virginia share of net book value under this scenario could effectively become stuck between two jurisdictions.[505] If so, given APCo's testimony to the WVPSC, the Company should give more thought to an intracompany arrangement that is fair to all of its customers, in Virginia and West Virginia. Consumer Counsel has identified one approach – matching energy and capacity with proportional investment[506] – that may be worthy of exploration. As suggested by Consumer Counsel:

> The West Virginia jurisdiction cannot claim all of the capacity revenue for a generation facility for which Virginia customers continue to pay. A more equitable result, which would be subject to future Commission approval, would be for the West Virginia and Virginia jurisdictions to share the capacity revenues in a proportion that recognizes each jurisdiction's relative cost responsibility for all of the fixed costs of [Amos and Mountaineer]. In this manner, each jurisdiction would be allocated a fair

[499] Ex. 30 (Morris) at 18-19.
[500] Ex. 23 (Kwok) at 22, 23, 27; Tr. at 189 (Kwok).
[501] $42 million/1,305 MW = $32,183/MW; $127 million/2,930 MW = $43,345/MW.
[502] Ex. 23 (Kwok) at attached Ex. SK-11.
[503] Mountaineer's smaller size also indicates that, compared to Amos as a whole, Mountaineer is less of a hedge against some of the market risks discussed above.
[504] Tr. at 58-59 (Castle); Tr. at 98-99 (Beam).
[505] Tr. at 59 (Castle).
[506] Another potential approach, if such costs are properly classified as "stranded costs," might be for the Commission to evaluate the proposal to recover any such plant costs by assessing any ongoing stranded cost recoveries of the underlying plant costs through wholesale and/or retail revenues.

220005

> approximation of the [p]lants' capacity value, while minimizing subsidies for the public policy choices of the other.[507]

Some variation of this approach, if feasible, could seemingly be used to recognize, for example, any relatively higher investment in coal resources made by West Virginia (if Virginia denies ELG investment) and any relatively higher investment in renewables and storage made by Virginia.

II. ANALYSIS OF DRY SORBENT INJECTION RECONFIGURATION

The Amos Units 1 & 2 dry sorbent injection project would reconfigure the existing injection system to handle hydrated lime, rather than trona. According to the Company, switching to hydrated lime would reduce issues related to corrosion, improve heat rate, improve equivalent unplanned outage rate, lower minimum load, and help with the long-term protection of the SCR catalyst, air heaters, and precipitators.[508] The system is scheduled to be retrofitted during outages this fall.[509]

APCo acknowledged that this reconfiguration is not necessary for compliance with any specific environmental regulation. Rather, this project will allow for *more economic* compliance with an environmental regulation that required construction of the original dry sorbent injection system.[510]

Based on the nature of this project, Sierra Club found these costs "unfit for inclusion" under Code § 56-585.1 A 5 e.[511] Consumer Counsel questioned whether the project might be eligible for recovery through the Company's generation base rates if justified as reasonable and prudent, which Consumer Counsel did not contest.[512]

Based on the record, I find that APCo did not establish that the dry sorbent injection reconfiguration, and associated costs, are necessary to comply with state or federal environmental laws or regulations. I agree with Consumer Counsel that such a finding, if adopted by the Commission, should not preclude the Company from seeking cost recovery of this project through base rates. If, as APCo indicates, this project will lower overall costs for Virginia customers[513] the project should go forward, just with cost recovery requested through the appropriate rates. The estimated cost of this project is $9.4 million, with a proposed revenue requirement of approximately $621,000 in this case.[514]

III. ANALYSIS OF RGGI ALLOWANCE COSTS

As a result of Virginia joining RGGI in 2021, APCo must now purchase one RGGI allowance for every ton of CO_2 generated by Clinch River. These RGGI compliance costs are required because Clinch River is located in Virginia.[515]

APCo deferred approximately $341,000 of Virginia jurisdictional RGGI allowance costs through December 31, 2021.[516] APCo's proposed E-RAC includes this amount, in addition to forecasted RGGI expense of approximately $458,000 through November 2023.[517] If actual RGGI allowance costs are less than forecasted RGGI allowance costs, APCo will record the difference and include it in a future E-RAC petition.[518]

APCo witness Martin sponsored discovery responses about the self-scheduling of Clinch River that were admitted into the record. The responses indicate that APCo does not document the reason for self-scheduling Clinch River because it would be administratively burdensome to maintain records on an hourly basis given the relative infrequency of self-scheduling this plant. However, the responses also indicate that the typical reasons for self-scheduling Clinch River are related to required environmental and capacity testing.[519] The responses also identified all days and hours in 2021 when either of the units at Clinch River was self-scheduled.[520] At the hearing, Mr. Martin indicated the self-scheduled, or must-run, status was for the economic minimum of a given unit and not the entire capacity of the unit.[521] Assuming separate figures provided in discovery identify the hours in 2021 when Clinch River was economically dispatched, the document identifying all the self-scheduled hours in 2021 indicates that Clinch River Units 1 and 2 were self-scheduled (at least in part) for 32% and 24% of the respective hours they were dispatched during 2021.[522] APCo witness Martin testified that these percentages would be much smaller if they were weighted by the amount of generation that was self-scheduled.[523]

Appalachian Voices recommended that the Commission deny, without prejudice, APCo's proposed recovery of its actual and forecasted RGGI compliance costs. Appalachian Voices argued APCo has not established that its proposed RGGI compliance costs are "necessary," with Appalachian Voices asserting that APCo's conduct supports equating "necessary" to "least cost."[524] Appalachian Voices argued further that "while a RGGI cost might be 'reasonable and prudent,' it is not recoverable under an A 5 e RAC unless it is separately proven to be 'necessary.'"[525] According to Appalachian Voices, APCo failed to carry "its burden of proving that the entirety of RGGI compliance costs are necessary."[526] In support of its recommended

2021-00350

denial of RGGI costs, Appalachian Voices focused on the instances in which Clinch River self-scheduled in 2021;[527] Appalachian Voices' legal interpretation of the word "necessary";[528] and insufficient clarity on how the proposed RGGI costs were calculated.[529]

I agree that costs can be reasonable and prudent, but not necessary for environmental compliance. The costs of the dry sorbent injection project (discussed in Section II of this Report's Analysis) fit that category, for example. But I am not convinced that the word "necessary" in Code § 56-585.1 A 5 e is as expansive or complicated as Appalachian Voices suggests. For the RGGI costs at issue, environmental compliance requires APCo to purchase one RGGI allowance for every ton of carbon generated by Clinch River. Additionally, to the extent APCo incurs allowance costs associated with testing environmental equipment to maintain its air permits,[530] these costs may be necessary to comply with multiple environmental laws and regulations.

However, I find that the self-scheduling issue raised by Appalachian Voices is relevant to the Commission's consideration of whether the proposed costs are reasonable and prudently incurred. In my view, Appalachian Voices could have a colorable claim about the prudence of allowance costs incurred during self-scheduled dispatch – depending on the circumstances of such dispatch in 2021. The circumstances of self-scheduled dispatch identified by APCo, environmental testing and capacity testing, are unquestionable. Because of the potential economic and reliability consequences, testing is prudent and can be required. However, the record was not definitive on whether APCo identified the *typical* reasons or the *only* reasons for self-scheduling during 2021. In discovery, APCo indicated testing was the typical reason[531] while at the hearing APCo witness Beam indicated that he understood this to be the only reason based on a communication between him and a co-worker the day of the hearing.[532] I do not doubt the veracity of Mr. Beam's testimony, but it was based on second-hand information incapable of scrutiny at the hearing.[533] The evidentiary concern is not one of credibility, rather it is one of reliability. Accordingly, I recommend that a percentage of the actual RGGI allowance costs proposed for recovery in this case be denied without prejudice. The record does not contain precise information on the dollars at issue because the number of hours of self-scheduling, which is in the record, does not equate to the amount of energy production and associated tons of CO_2.[534] APCo suggested that the amount at issue might be approximately $7,000 to $14,000,[535] while the absolute high-end would be approximately $95,000.[536] Provided any such denial by the Commission is without prejudice, as requested by Appalachian Voices and recommended herein, any figure within this range would be reasonable for purposes of the

[532] Tr. at 242, 258-61 (Beam).
[533] *See, e.g.,* Appalachian Voices' Brief at 10-11.
[534] Tr. at 125-26, 129-30 (Martin).
[535] Tr. at 130 (Martin). $341,000 x 2% = $6,820. $341,000 x 4%= $13,640.
[536] While the 2021 self-schedule hours are for each of the two Clinch River units, the allowance price data does not distinguish between the two units. $341,000 x 28% (average of two units self-schedule hours) = $95,480.

instant case. Based on APCo's energy billing determinants,[537] I am not certain that even a $95,000 amount would affect the proposed rates.

I do not recommend denial of any of the forecasted RGGI allowance costs. No case participant questioned the quantity (tons) APCo used to calculate the projected costs, as shown in the Petition.[538] I find these projected volumes – which are noticeably lower than the actual volumes in 2021 but generally align in the same time of year as 2021 volumes – are consistent with a peak facility that runs infrequently and primarily during the summer.[539] Nor did any case participant question the forecasted prices identified in the Petition, which appear consistent with RGGI auction prices.[540] Because I find the RGGI allowance cost calculation in the Petition clear, I disagree with the assertion of Appalachian Voices that APCo offered little to no information about how the proposed RGGI costs were calculated.[541]

Where the record took a slight detour was on an issue raised at the hearing by counsel for Appalachian Voices as to whether there are some wholesale revenues that could potentially be credited in Code § 56-585.1 A 5 e against the RGGI allowance costs.[542] Ultimately, I believe the record indicated that unless there are off-system sales – the net margins of which are credited through the fuel factor, as directed by Code § 56-249.6 – the wholesale revenues APCo receives as a generator offset the wholesale costs it is charged as a load-serving entity.[543] If so, there do not appear to be any wholesale revenues that are unaccounted for at retail.[544] Where revenues can or should be credited in retail rates would appear to be a policy or a legal question for the Commission, rather than a potential shortcoming of APCo in meeting its evidentiary burden in the instant case.[545] Accordingly, I do not view this issue as grounds for denial of the proposed RGGI costs. Additionally, based on the record, I do not see any revenues that could reasonably be matched against the cost of allowances recoverable from APCo's customers under Code § 56-585.1 A 5 e, but nothing would prevent Appalachian Voices from attempting to develop a better record on this issue in a future proceeding.[546]

---

[537] Ex. 4 (Petition) at Filing Sched. 46, Section 5.

[538] *See* Ex. 4 (Petition) at Filing Sched. 46, Section 4 O&M RGGI (showing, by month, the actual and projected emissions of tons and corresponding allowance prices). These figures are on a total company basis while the amounts provided at the beginning of this section of the Report are provided on the Virginia jurisdictional basis proposed by APCo.

[539] *Id.*

[540] *Id.*

[541] Appalachian Voices' Brief at 14.

[542] *Id.* at 14-16.

[543] *See, e.g.*, Tr. at 301-302 (Morgan). *See also* APCo's Brief at 19-20. Consistent with the positive effect that the economic dispatch of Amos and Mountaineer has on the economic analyses in this case, the offsetting wholesale revenues provided by the dispatch of APCo's generation appear to benefit customers because there would otherwise be a purchase of power from the market (without the corresponding wholesale revenue).

[544] Ex. 14 (APCo's response to Appalachian Voices' discovery request no. 2-02) (identifying that both sales *and* purchased power accounts are used when Clinch River is dispatched by PJM).

[545] Appalachian Voices' Brief at 17.

[546] The record does not indicate that there are any new or increased revenues that RGGI participation created for APCo. However, the RGGI allowances paid for by ratepayers may be considered revenues for the Commonwealth and the governmental entities who receive this money, as specified by the Code. Code § 10.1-1330 C.

2760560

Appalachian Voices also recommended that the Commission:

> • Direct APCo, if it still wishes to recover RGGI costs via the E-RAC, that it must, at a minimum, provide the detailed backward-looking analysis APCo indicated it was capable of providing for its Clinch River units;
>
> o To the extent APCo is able, a backward-looking analysis should also be integrated into the going forward requirements set forth below;
>
> • Direct APCo that for future E-RAC cost recovery for RGGI compliance costs, APCo shall perform a necessary analysis that identifies least cost options and identifies with specificity how the costs it is seeking to recover from customers are necessary; and
>
> • Directs APCo, that going forward, each time it self-schedules Clinch River units, it must record (1) [MWh] and hours of the day that Clinch River units are self-scheduled to must run; (2) in the times that Clinch River units are self-scheduled to must run, record total costs to run the units at the identified level, the portion of those costs that are RGGI compliance costs, whether the RGGI costs were fully compensated for in the identified time period, and any delta that remains (i.e., the actual energy margin).[547]

I recommend that the Commission direct APCo to record the hours of each day that Clinch River self-schedules, the associated MWs, as well as the reason for each self-scheduling. The remaining recommendations appear to be too heavy-handed, in my view, for a power plant that runs as infrequently as Clinch River does. This is one peaking power plant, less than 500 MW, that basically runs a little bit of the time in the summer.[548]

IV. OTHER UNCONTESTED ISSUES

APCo asserted that the E-RAC rates should be incorporated into the balancing charge associated with the non-renewable generation rate adjustment clauses of APCo's Rider WWS. APCo believes Commission guidance confirming its opinion would benefit APCo[549] by

---

[547] Appalachian Voices' Brief at 17-18.

[548] *See* Ex. 4 (Petition) at Filing Sched. 46, Section 4 O&M RGGI.

[549] Ex. 7 (Castle direct) at 11. Mr. Castle quoted the following statement from the cited Commission order:

> [T]he Company proposes that Rider WWS participants pay for standard service plus all riders except the fuel factor rider, non-renewable generation rate adjustment clauses, and generation costs in base rates. The Company states that instead, participating customers would pay a "balancing" charge that credits the Company's base rates and these riders in amounts that keep non-participants unaffected by participation.

Application of Appalachian Power Company, For approval of a 100% renewable energy rider pursuant to § 56-577 A 5 of the Code of Virginia, Case No. PUR-2017-00179, Order Approving Tariff at 2 (Jan. 7, 2019).

providing clarity on the appropriate language in the tariff.[550] APCo witness Castle testified that Commission guidance would not affect the amounts charged to Rider WWS participants or non-participants.[551] I find this request reasonable. The costs recovered through the E-RAC are predominantly for environmental compliance at APCo's fossil-fueled generation stations.

Staff recommended the Commission direct APCo to incorporate a depreciation rate analysis of its E-RAC investment in its next depreciation study, including net salvage considerations and any excess/deficient depreciation accruals on such assets through the date of the study.[552] APCo agreed and described its plan to perform such a study in conjunction with the Company's upcoming triennial review filing.[553] I find Staff's recommendation reasonable.

Beyond the issues addressed in Sections I, II, and III, of this Report's Analysis, APCo's proposed costs, cost allocation, and rate design were not challenged. The uncontested costs include the costs of projects previously approved by the Commission under Code § 56-585.1 A 5 e, in addition to APCo's proposed dissolved oxygen project at Claytor.[554] I find these uncontested costs satisfy the applicable requirements of Code §§ 56-585.1 A 5 e and 56-585.1 D.

FINDINGS AND RECOMMENDATIONS

Based on the Code and the record developed in this proceeding, I find that:

(1) The results of APCo's ELG economic analysis should be adjusted to incorporate Staff's modifications reflecting: (i) an energy margin for Amos and Mountaineer; and (ii) unforced capacity in Case 3;

(2) The results of APCo's and Sierra Club's ELG economic analyses should be adjusted by an estimate of the Virginia share of Amos and Mountaineer's net book value as of December 31, 2028, to reflect the analytical asymmetry in assuming that, if Virginia does not make an ELG investment in Amos and Mountaineer: (i) Virginia customers would receive zero benefit from Amos and Mountaineer beyond 2028; but (ii) Virginia customers would nonetheless continue to pay for Amos and Mountaineer plant-in-service being used exclusively to serve West Virginia;

(3) Based on the scenarios I have given the most weight, APCo's and Sierra Club's economic analyses, after incorporating Staff's adjustments and a net book value adjustment, indicate a net present value benefit of Virginia investment in ELG for both Amos and Mountaineer ranging from positive $1.2 billion to negative $470 million, approximately;

---

[550] Tr. at 57 (Castle).
[551] Tr. at 56-57 (Castle).
[552] Mr. Morgan indicated APCo's next study should be based on depreciable plant balances as of a date no later than December 31, 2024. Ex. 31 (Morgan) at 5, n.3.
[553] Ex. 32 (Ross rebuttal) at 1-2.
[554] *See, e.g.*, Ex. 9 (Spitznogle direct) at 12-14; Ex. 6 (Gallimore direct) at 3-5.

(4) If the Commission does not agree that there is an analytical asymmetry warranting a net book value adjustment, then all of Sierra Club's results indicate it would cost more to remove both Amos and Mountaineer, rather than retain them both, except in scenarios where Virginia ratepayers are penalized for an assumed 69% regulatory dispatch;

(5) The record identifies, for the Commission to consider, various risks associated with either approving or denying ELG investment;

(6) The sworn testimony of Mr. Beam, APCo's President, mitigates the risk that Virginia jurisdictional customers might bear higher costs associated with a mandatory regulatory dispatch of Amos or Mountaineer (if ordered by the WVPSC). Mr. Beam testified that APCo would not seek from Virginia the costs of any uneconomic regulatory dispatch, if mandated by WVPSC;

(7) While the Commission may assign different weight to the record evidence on the various economic results and relevant risks identified in the record, I find that the record supports an approximately $21 million ELG investment in Mountaineer, and, to a lesser extent, an approximately $63.5 million ELG investment in Amos, subject to the condition that APCo not seek from Virginia any costs of uneconomic regulatory dispatch (if required by the WVPSC);

(8) APCo did not establish that its dry sorbent injection reconfiguration for Amos Units 1 and 2, or the associated costs, are necessary to comply with state or federal environmental laws or regulations. However, such costs may be recoverable through base rates;

(9) The prudence of self-scheduling, and associated RGGI costs, could depend on the circumstances. Because the record was unclear on the circumstances of Clinch River's self-scheduling in 2021 APCo did not establish whether approximately $7,000 to $95,000 of RGGI costs were prudently incurred in 2021. APCo has otherwise met its burden of proof for the proposed actual and projected RGGI costs, which would remain subject to true-up in future E-RAC proceedings;

(10) The Commission should direct APCo to record the hours of each day that Clinch River self-schedules, the self-scheduled MWs for each such hour, and the reason for each self-scheduling;

(11) The E-RAC rates, which recover generation costs that are predominantly non-renewable, can be incorporated into the balancing charge associated with the non-renewable generation rate adjustment clauses of APCo's Rider WWS; and

(12) APCo should incorporate a depreciation rate analysis of its E-RAC investment in its next depreciation study, including net salvage considerations and any excess/deficient depreciation accruals on such assets through the date of the study.

Accordingly, **I RECOMMEND** that the Commission enter an order that:

(1) ***APPROVES*** an approximately $21 million ELG investment in Mountaineer, and an approximately $63.5 million ELG investment in Amos, subject to the condition that APCo not seek from Virginia any costs of uneconomic regulatory dispatch (if required by the WVPSC) and the Commission's ability to implement this commitment through rate ring-fencing;

(2) ***DENIES***, without prejudice, the proposed recovery of Amos dry sorbent injection reconfiguration costs;

(3) ***DENIES***, without prejudice, the proposed recovery of approximately $95,000 of 2021 RGGI costs;

(4) ***APPROVES*** a $32,890,000 revenue requirement to revise the E-RAC rates for service to be rendered from December 1, 2022, to November 30, 2023;

(5) ***DIRECTS*** APCo, each time it self-schedules Clinch River, to record the hours of each day that Clinch River self-schedules, the associated megawatts that are self-scheduled, and the reason for each self-scheduling;

(6) ***CLARIFIES*** that the E-RAC rates should be incorporated into the balancing charge associated with the non-renewable generation rate adjustment clauses of APCo's Rider WWS;

(7) ***DIRECTS*** APCo to incorporate a depreciation rate analysis of its E-RAC investment in its next depreciation study, including net salvage considerations and any excess/deficient depreciation accruals on such assets through the date of the study; and

(8) ***DISMISSES*** this case.

COMMENTS

Staff and parties are advised that, pursuant to Rule 5 VAC 5-20-120 C of the Commission's Rules of Practice and Procedure and Code § 12.1-31, any comments on this Report must be filed on or before November 1, 2022. In accordance with the directives of the Commission's *COVID-19 Electronic Service Order*[555] the parties are encouraged to file electronically. If not filed electronically, an original and fifteen (15) copies must be submitted in writing to the Clerk of the Commission, c/o Document Control Center, P.O. Box 2118, Richmond, Virginia 23218. Any party filing such comments shall attach a certificate to the foot of such document certifying that copies have been sent by electronic mail to all counsel of record and any such party not represented by counsel.
