Richmond, VA 23219

Re: EO-9

Dear Secretary Wheeler:

Governor Youngkin's Executive Order (EO) 9, signed on January 15, directs the Department of Environmental Quality to coordinate with you in completing the following by February 14:

1. Provide [the Governor] a full report re-evaluating the costs and benefits of participation in the Regional Greenhouse Gas Initiative Inc. in view of all available data;

2. Develop a proposed emergency regulation for the State Air Pollution Control Board's consideration to repeal Part VII of 9VAC5-140;

3. Take all necessary steps to so that any proposed regulation to the State Air Pollution Control Board can be immediately presented for consideration for approval for public comment in accordance with the Board's authority pursuant to § 10.1-1308 of the Code of Virginia; and

4. Notify the Regional Greenhouse Gas Initiative Inc. (RGGI Inc.) of the review and the Governor's intent to withdraw from RGGI, whether by legislative or regulatory action.

Pursuant to EO-9, therefore, enclosed for your review are the following:

- A draft report re-evaluating the costs and benefits of participation in RGGI in view of all available data (Item 1);

- A draft emergency regulation (Item 2), along with a brief description of the process for promulgating an emergency regulation under Va. Code §2.2-4011, including a draft letter to the Attorney General asking for his approval as required by that statute (Item 3);

- A brief description of the process and timetable for turning an emergency regulation into a permanent regulation under the Administrative Process Act, including a draft Notice of Intended Regulatory Action (NOIRA) to commence that process (Item 3); and

- A draft letter for your signature notifying RGGI, Inc., of the Governor's intent of withdrawing the Commonwealth from the RGGI program (Item 4).

Please let me know if you have any questions. My staff and I would be glad to brief this report with you at your convenience.

Sincerely,

Michael S. Rolband

VIRGINIA CARBON TRADING RULE AND REGIONAL GREENHOUSE GAS INITIATIVE (RGGI) PARTICIPATION

COSTS AND BENEFITS

A Report to the Honorable Glenn Youngkin, Governor Commonwealth of Virginia

Department of Environmental Quality
in coordination with
The Secretary of Natural and Historic Resources

EXECUTIVE SUMMARY

On July 10, 2020, Virginia formally adopted the CO_2 Budget Trading Program (Part VII of 9VAC5-140) for the power sector to implement a carbon emissions trading and reduction program as authorized by the Clean Energy and Community Flood Preparedness Act (Article 4 of Chapter 1219 of the 2020 Acts of Assembly). The rule allowed for full participation in the Regional Greenhouse Gas Initiative (RGGI) to reduce carbon dioxide (CO_2) emissions and make emissions allowances available for sale through an auction program that power producers use for compliance purposes. Proceeds from allowance sales are returned to Virginia to fund climate mitigation and resilience programs. Adoption of the rule was the result of a 3-year process that produced a program based on a consignment auction approach, and then transitioned into a full auction program as authorized by the General Assembly in 2020. Virginia began full participation in RGGI on January 1, 2021, and participated in five quarterly auctions to date.

On January 15, 2022, Governor Youngkin issued Executive Order 9 (2022) (EO-9) to re-evaluate Virginia's participation in RGGI and immediately begin the regulatory process to end its participation. The re-evaluation is based on new information that points to higher costs for residential and industrial ratepayers due to participation in RGGI, and that the benefits of RGGI participation have not been realized. Most of this cost increase information come from the State's largest regulated utility, Dominion Energy, in rate increase filings before the State Corporation Commission to recover the costs of compliance with the carbon-trading rule that includes the cost of purchasing emissions allowances to cover their CO_2 emissions.

This report serves as the required program re-evaluation in light of all available data regarding the costs and benefits of the carbon-trading rule and participation in RGGI. However, the availability of new information is limited since Virginia has just completed its first year of participation. The focus of the evaluation will be on the program areas of ratepayer impacts, allowance prices, and emissions trends. It will also look at the various analyses performed on RGGI and related clean power programs such as the Virginia Clean Economy Act (VCEA). The report also refers to the recently submitted annual report to the Governor and General Assembly on the Virginia Clean Energy and Community Flood Preparedness Act.

Our review of the data in the report provides the following high level conclusions regarding RGGI:

- Because of the captive nature of their ratepayers, the ability for power-generators to fully pass on costs to consumers, and the fact that the Code of Virginia dedicates RGGI proceeds to grants programs, participation in RGGI is in effect a direct carbon tax on all households and businesses;
- RGGI fails to achieve its goal as a carbon "cap-and-trade" system because it lacks any incentive for power-generators to actually reduce carbon-intensive gas emissions;
- Carbon emissions rates have been reduced in Virginia by over 50% in the past 10 years, prior to the Commonwealth's participation in RGGI.

Summary of Findings

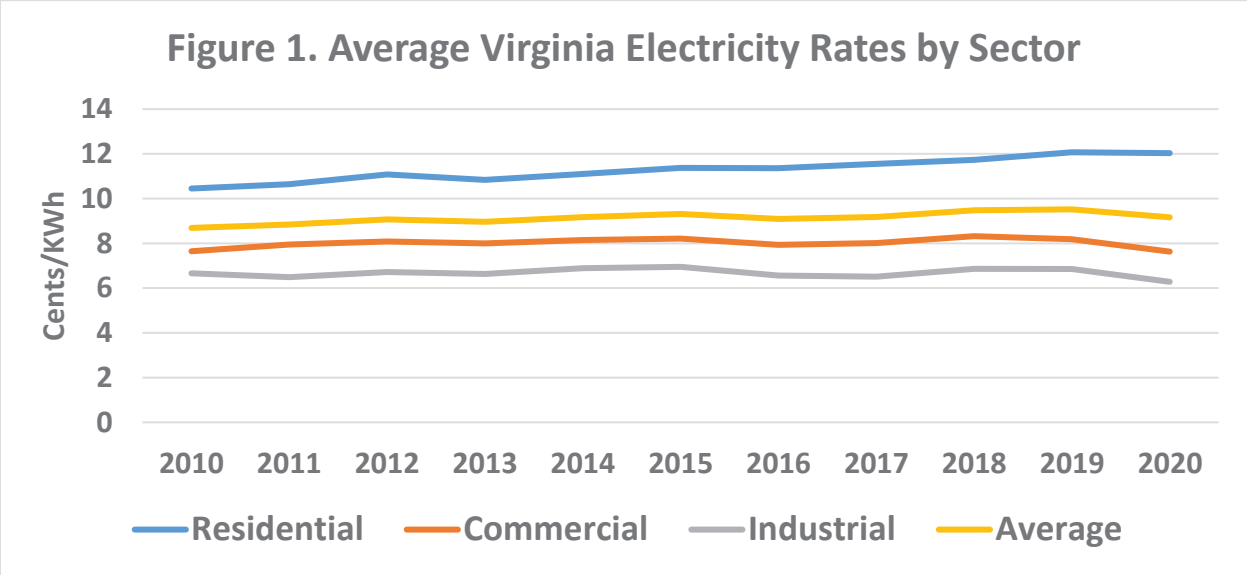
- Participation in RGGI in effect operates as a direct tax on households and businesses because all fees paid to the RGGI Board are passed through to utility-captive ratepayers.

- In addition, consumers are unable to avoid the pass through of these costs because they do not have the opportunity to switch electric providers – Dominion and other providers are monopolies in most regions of Virginia.
- The imposition of the RGGI "carbon tax" fails to offer any incentive to change behavior. Current law allows power generators, such Dominion Energy, to pass on all their costs, essentially bearing no cost for the carbon credits.
- Other states return the RGGI proceeds to consumers through rebates, while Virginia has opted to use the proceeds for separate and unrelated grant programs resulting in an effective tax increase on all ratepayers
- The original RGGI approach, prior to enactment, was designed to return the proceeds to the ratepayers in order to offset the costs of the program to the consumer, but this was not how Virginia implemented the program
- The costs of compliance with the trading rule and participation in RGGI have materialized in higher electricity rates as identified in the filings before the State Corporation Commission by Dominion Energy.
- Emission allowance prices have increased over time and substantially in the last year and are expected to continue increasing which will increase the tax on ratepayers.
- Lastly, without and prior to RGGI, electricity generation has increased while CO_2 per MWh has almost been cut in half in Virginia over the last ten years.
- RGGI is a bad construct that taxes consumers without providing incentives for change to the electricity producers.

SECTION 1 – ELECTRICITY RATE IMPACTS

One of the main concerns with participation in RGGI identified in EO-9 is the environmental compliance cost of RGGI on Virginia ratepayers. EO-9 states that the RGGI environmental compliance cost will increase "a typical" residential customer bill by $2.39 per month, and a typical industrial customer bill by $1,554 per month. EO-9 also states that Dominion Energy projects that RGGI will cost ratepayers between $1 billion and $1.2 billion over the next four years.

For background purposes, the historical trends of electricity rates from 2010 to 2020 are presented in Figure 1 below. These data show a gradual increase in all sector rates until 2020 where rates decline. Residential rates are the highest, followed by commercial with the industrial sector having the lowest average rates.



Source: Energy Information Administration

The first three-year control period for Virginia "CO_2 Budget Sources" began on January 1, 2021 and extends through December 31, 2023. Under each RGGI participating state's CO_2 Budget Trading Program, each "CO_2 budget source" is required to provide one CO_2 allowance for each ton of CO_2 emitted during the preceding three-year control period. Virginia utility law (Code of Virginia 56-585.1 A 4) allows Dominion and Appalachian Power ("CO_2 Budget Sources" under the CO_2 Budget Trading Program) to recover environmental compliance costs associated with participating in RGGI through new rate adjustment clauses.

On November 9, 2020, Dominion Energy filed a petition with the Virginia State Corporation Commission (SCC) to establish a new RGGI rate adjustment clause ("Rider RGGI") to recover $168,260,000 in "projected" RGGI compliance costs for the rate year of August 1, 2021 to July 31, 2022 (i.e., Case No. PUR-2020-00169), including:

- $129,960,000 for the purchase of 19 million allowances at $6.84 per allowance), and
- $38,330,000 of financing costs and a 9.2% rate of return associated with the purchase of 19 million allowances.

On August 4, 2021, the Commission issued an Order approving the Rider RGGI for initial year cost recovery starting on September 1, 2021 of $167.76 million (projected quantity and prices of allowances), 9.2% rate of return on projected allowance purchases, and finance costs associated with projected allowance purchases). As such, "the charge for service under Virginia Electric and Power Company's Filed Rate Schedules, as well as applicable energy charges specified in any special rates, contracts or incentives approved by the State Corporation Commission pursuant to Virginia Code § 56-235.2 shall be increased by 0.2393 cents per kilowatt-hour." The approved Rider RGGI explains the increase in a monthly residential customer electric bill and a monthly industrial customer electric bill of $2.39 and $1,554. The Order approving the Rider RGGI states, "RGGI is expected to cost Dominion's Virginia jurisdictional ratepayers approximately $3 billion [excluding finance costs] through 2045." The Order also states that any projected environmental compliance costs such as projected quantity and/or price of allowances and associated ROE and finance costs are to be trued-up in future Rider RGGI proceedings.

On August 24, 2021, a Petition for Reconsideration or Clarification ("Petition") was filed with the Commission. On November 17, 2021, the Commission issued its Order on Reconsideration, and elected not to modify the August 6, 2021 Order approving the Rider RGGI, with the exception of revised effective dates of the Rider RGGI:

- The first Rider RGGI tariff sheet is effective for usage on and after September 1, 2021 and reflects a rate of zero; and
- The next Rider RGGI tariff sheet is effective for usage on and after January 1, 2022, and reflects the 0.2393 cents per kilowatt-hour rate approved in the Rider RGGI Approval Order.

In December 2021, Dominion Energy filed a petition with the Commission for a revision of rate adjustment clause, "Rider RGGI" pursuant to § 56-585.1 A 5 e of the Code of Virginia (i.e., Case No. PUR-2021-0028). Dominion Energy withdrew the petition on January 10, 2022. The total environmental compliance cost recovery (i.e., revenue requirement) requested in the withdrawn Rider RGGI Petition for the Rate Year beginning September 1, 2022, was $323,411,000. It assumed an average price of $10.53 per allowance for the period of October 2021 through December 2023, a 9.35% ROE of allowances purchases, and finance costs associated with the allowance purchases. The withdrawn proposed petition for a revised rate adjustment clause would increase the approved Rider RGGI by 0.198 cents per kilowatt-hour, increasing the total Ride RGGI to 0.437 cents per kilowatt-hour.

Prices and quantities of allowances affect compliance costs, therefore, impact rate ratepayers. Data available on RGGI compliance costs are projected costs, because the actual quantity of allowance purchases and actual prices were not known at the time the new Rider RGGI was approved by the Commission.

Also, the second RGGI Program Review was completed in December 2017, resulting in the 2017 Model Rule, which was the foundation for the final rule subsequently adopted by Virginia as Part VII of 9VAC5-140 in accordance with the Clean Energy and Community Flood Preparedness Act. Resulting program modifications included changes to the Cost Containment Reserve (CCR) size and trigger price. The proposed CCR size from 2021 onwards will be 10% of the regional cap. The CCR trigger price will be $13.00 in 2021, and rise at 7% per year, ensuring that the CCR will only trigger if emission reduction costs are higher than projected.

In response to electricity rate concerns resulting from program compliance, four participating RGGI states, including Delaware, Maryland, Maine, and New Hampshire use a percentage of their allowance proceeds for direct bill assistance to mitigate the costs impact on ratepayers. In addition, North Carolina is seriously considering joining the RGGI program using the consignment approach modeled on the previous Virginia rule.

On February 2, 2021, the RGGI states, which include Virginia, released a statement announcing the plan for the Third Program Review to consider further updates to their programs, and in Summer 2021 the states released a preliminary timeline for conducting the Third Program Review, which will include a REMI macroeconomic analysis and bill impact analysis which may provide new information of future program costs and benefits.

The main conclusions of this section are as follows:

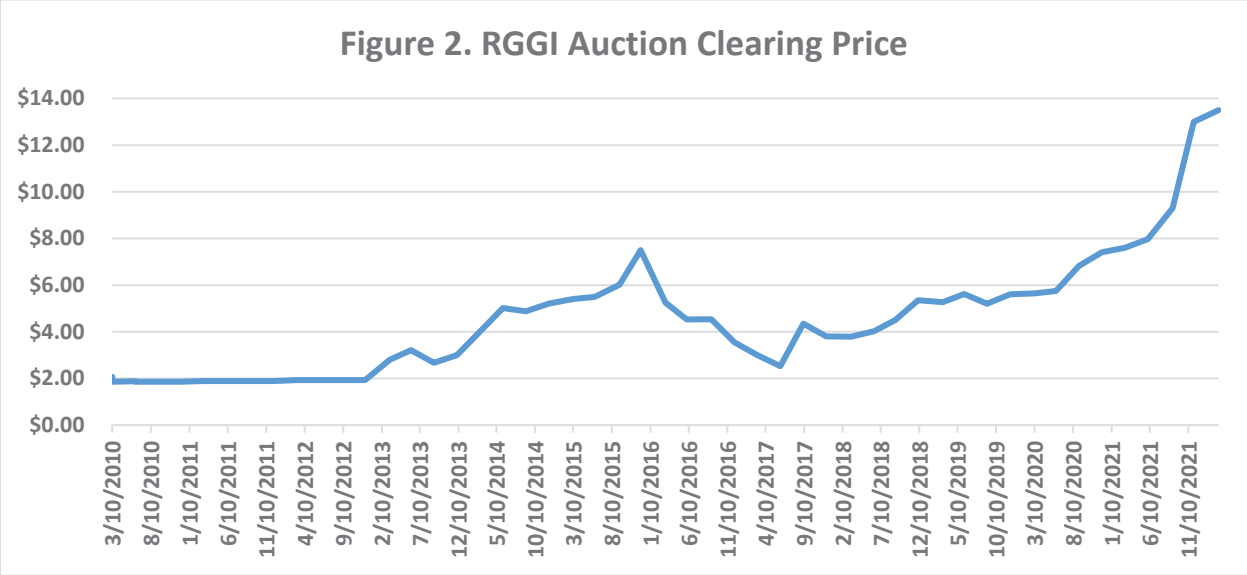
- The compliance costs of RGGI program participation have submitted by Dominion Energy and approved by the SCC, and have begun to impact electricity rates.
- These costs are and will continue to be directly related to the cost of allowances, along with other charges allowed under current law and regulations.
- Allowance prices have varied significantly in the past, and future prices will continue to vary.
- The social cost of carbon as required by VCEA has not been fully incorporated in the SCC process to date, but will be going forward, and may change future cost/benefit analyses.
- Four other RGGI participating states (and prospectively a fifth) provide bill assistance to customers using some of their auction proceeds.

SECTION 2 – ALLOWANCE PRICES AND AUCTION REVENUE

A central feature of any cap and trade program to reduce climate or criteria pollutant emissions is the concept of an emissions "allowance." An allowance usually represents the emission of one ton of pollution. These allowances are either sold or given to regulated entities for compliance or other purposes. As such, the allowance has value that is determined by the market through supply and demand. Reductions are achieved by gradually lowering the amount of allowances available in the market over time. RGGI operates under the concept where the allowances are allocated to the participating states and then sold through auctions. The proceeds are then returned to the states to support climate related programs.

Concern was raised in EO-9 about the rising cost of RGGI allowances and the resulting impact on electricity rates as described in more detail in Section 1 of this report. Therefore a review of allowance prices has been performed. Figure 2 shows the values of the RGGI auction clearing prices from 2010-2021. As shown in the figure, clearing prices have been volatile over time. Until 2014, prices remained below $4.00. From 2014 to 2017, the price rose to a high of $7.50 before falling to a low of $2.53. Since 2017, prices have risen steadily until experiencing a large jump in Auction 54, where the clearing price rose to the cost containment reserve (CCR) trigger level of $13.00. The cost containment reserve is a safeguard function of the RGGI program that sets a ceiling for allowance prices. Auction 54 is only the second time in the history of the program where the CCR has been triggered. The allowance price again increased slightly in Auction 55 to $13.50, an all-time high for the program, but did not trigger the updated CCR level

of $13.91 for 2022.



Source: Regional Greenhouse Gas Initiative Website

On the flip side of allowance prices is the proceeds generated by their sale that will go to support climate related mitigation and resilience programs. Thus far, Virginia has raised $301 million from the sale of allowances.

RGGI, Inc., administers quarterly auctions on behalf of the RGGI states where it offers allowances for sale to compliance entities and other groups. Virginia first participated in Auction 51, which was held on March 3, 2021, and the Commonwealth has participated in four additional auctions for a total of five. A summary of auction results is available in Table 1, and a distribution of funds raised from auctions is shown in Table 2.

It should be noted that RGGI, Inc., receives a small portion (0.3%) of Virginia's quarterly auction proceeds to fund its annual operating budget. Virginia's total payment to RGGI, Inc. for 2021 was $592,920.08. The payment due to RGGI Inc. for 2022 is $638,237.81.

Table 1: 2021 Auction Results Summary

	Allowances Sold	Allowance Price	Allowance Proceeds
Auction #51	5,735,509	$7.60	$43,589,868.40
Auction #52	5,698,446	$7.97	$45,416,614.62
Auction #53	5,698,445	$9.30	$52,995,538.50
Auction #54	6,587,274	$13.00	$85,634,562.00
Auction #55	5,497,712	$13.50	$74,219,112.00
Total	29,217,386		$301,855,695.52

The Clean Energy and Community Flood Preparedness Act provides that 45% and 50% of the proceeds generated from the auctions be used to fund the Virginia Community Flood

Preparedness Fund (CFPF) and the Housing Innovations in Energy Efficiency (HIEE) program, respectively. Administered by the Department of Housing and Community Development (DHCD), the CFPF helps localities across the Commonwealth reduce the impacts of flooding by implementing flood prevention and protection projects. Administered by the Department of Conservation and Recreation (DCR), the HIEE program makes energy efficiency upgrades to new and existing residential buildings to reduce energy bills for low-income Virginians. DEQ receives 3% of auction revenues to cover administrative expenses related to running the program and to carry out statewide climate change planning and mitigation activities. In partnership with the Virginia Department of Energy, DHCD receives 2% of the proceeds to administer and implement the HIEE program.

Table 2: Distribution of Funding

	RGGI	DHCD	DCR	DEQ	DHCD Admin
#51	$148,230.02	$21,720,819.19	$19,548,737.27	$1,303,249.15	$868,832.77
#52	$148,230.02	$22,634,192.30	$20,379,773.07	$1,358,051.54	$905,367.69
#53	$148,230.02	$26,423,654.24	$23,781,288.82	$1,585,419.25	$1,056,946.17
#54	$148,230.02	$42,743,165.99	$38,468,849.39	$2,564,589.96	$1,709,726.64
#55*	$159,559.45	$37,029,776.28	$33,326,798.65	$2,221,786.58	$1,481,191.05
Total	$75,2479.53	$150,551,608.00	$135,505,447.20	$9,033,096.48	$6,022,064.32

* Preliminary estimates

More information on the low-income energy efficiency and resiliency programs funded by auction proceeds can be found in the previously mentioned annual report on the Clean Energy and Community Flood Preparedness Act.

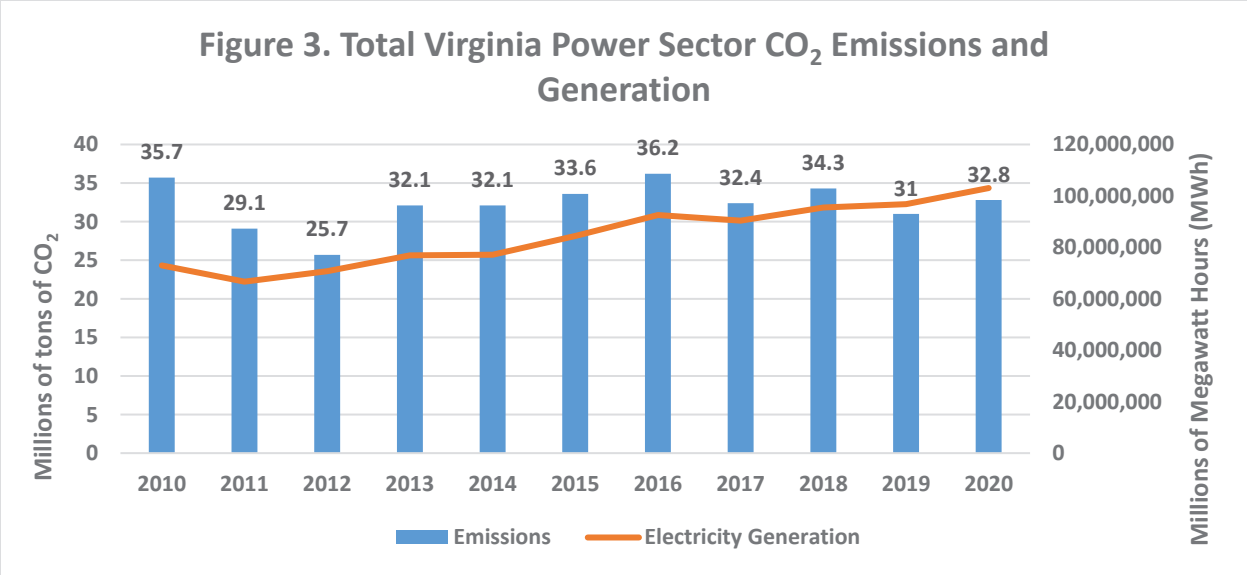
The main conclusions of this section are as follows:

- Allowance prices have varied widely over time.
- Allowance prices have increased sharply since 2020.
- Auction proceeds to Virginia for climate related programs have also increased based on these prices.
- Future allowance prices have been and will continue to be hard to predict.

SECTION 3 – POWER SECTOR GHG EMISSIONS TRENDS

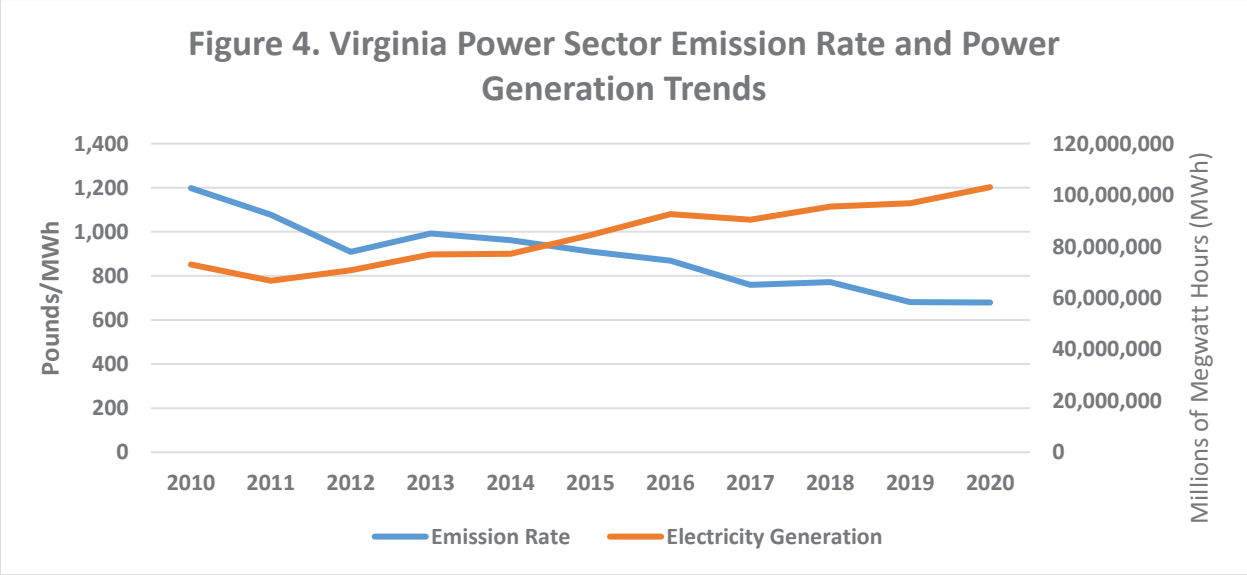
As mentioned earlier, emission reductions are the principle purpose and rationale of the carbon-trading rule and RGGI program. This is accomplished through setting emissions budgets and reducing them over time to achieve the desired reduction goal. It is too early to determine the impact of the program on emissions since 2021 is Virginia's first participation year.

However, to begin to assess this impact, the recent emission trends of the Virginia power sector must be evaluated. Emissions of CO_2 from the power sector are estimated and tracked by both the federal Environmental Protection Agency (EPA) and the DEQ. The recent trends in sector emissions are provided in Figure 3 below. It can be seen from the data that these emissions have fluctuated over the past 10 years with no discernable trend. During this period the average annual power sector emissions total in Virginia was 33.3 million tons.



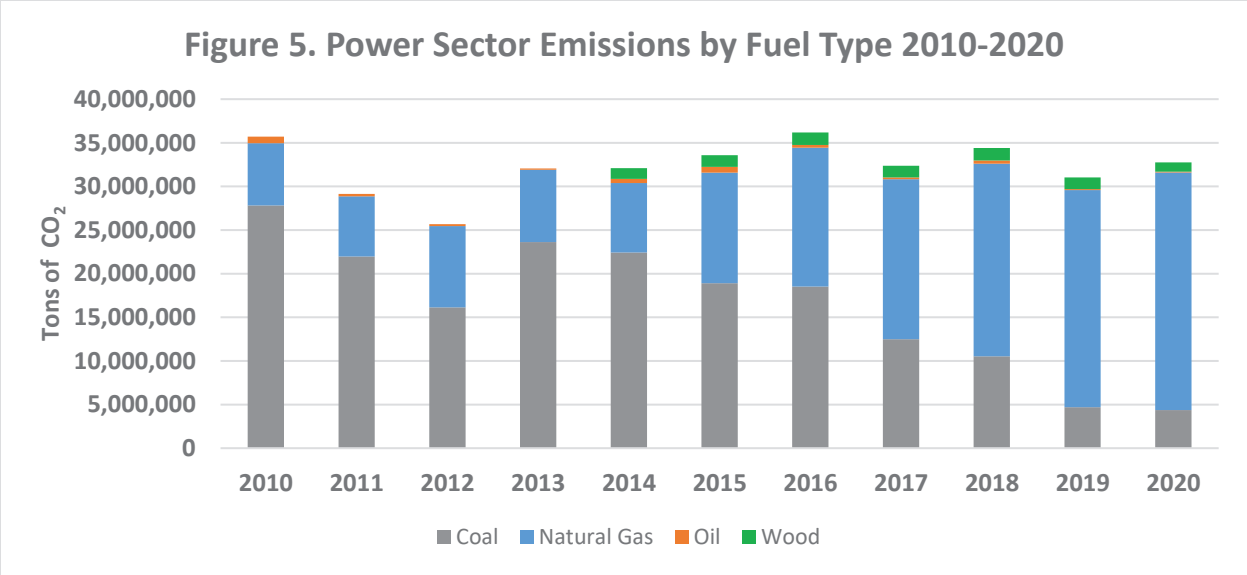
Source: EPA Air Markets Program Data and Energy Information Administration

While mass emissions have remained fairly constant, the overall state emission rate, which is the amount of CO_2 emissions produced by a set amount of electricity, has steadily and significantly been reduced. This trend is documented in Figure 4 where the statewide emission rate in 2010 was just under 1,200 lbs. per MWh that has then decreased to 679 lbs./MWh, which represents a 43% reduction in this average rate of CO_2 emissions per unit of electricity.



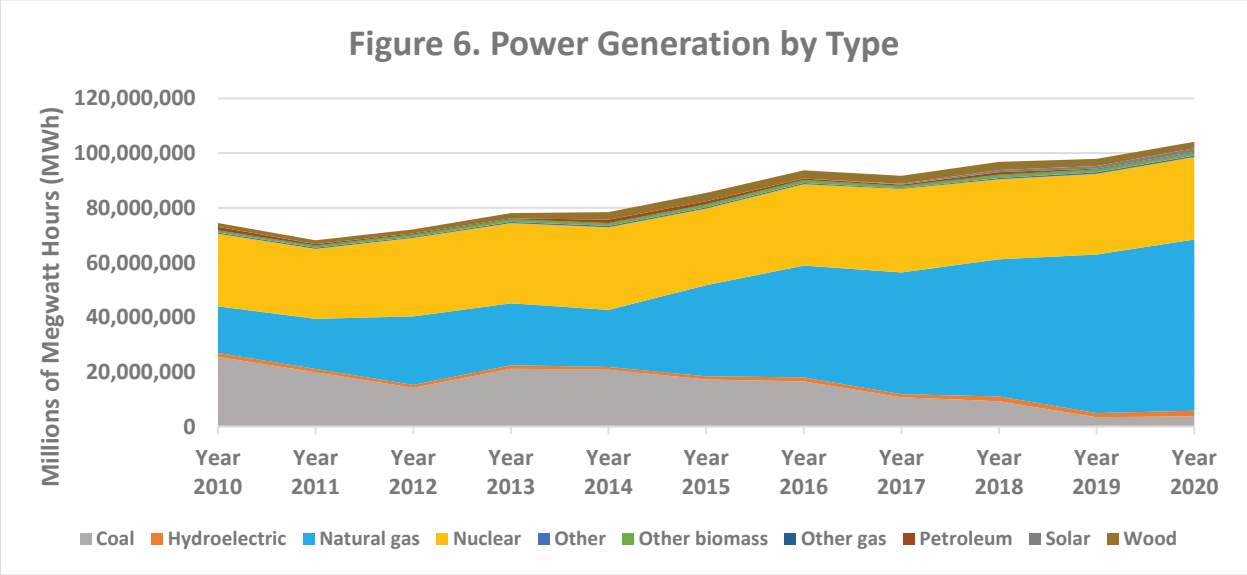
Source: Energy Information Administration

Given this mix of mass and emissions rate data and trends, a further data analysis is presented below in Figure 5 that shows that a major shift has occurred in the Virginia power sector where electricity generation from coal has been replaced by cleaner generation sources of natural gas and more recently renewable energy generation sources. Also during the same time, in-state electricity generation has increased by about 30%, which has led to the mass emissions levels remaining relatively constant.



Source: EPA Air Markets Program Data

A similar analysis of electricity generation by type is presented in Figure 6 that again shows the decrease in coal generation, increase in natural gas generation, and the introduction of renewable generation into the mix.



Source: Energy Information Administration

While these overall emissions and generation trends have occurred in the Virginia power sector, a number of source specific changes have occurred in Virginia's mix of power generation that will influence current and future emissions and generation trends. These changes, identified as new sources, closures and fuel conversions, are presented below in Table 3. From 2010 to 2020, six coal facilities closed, while five large combined cycle natural gas facilities have opened. Three coal facilities converted to biomass (wood) and one converted to gas.

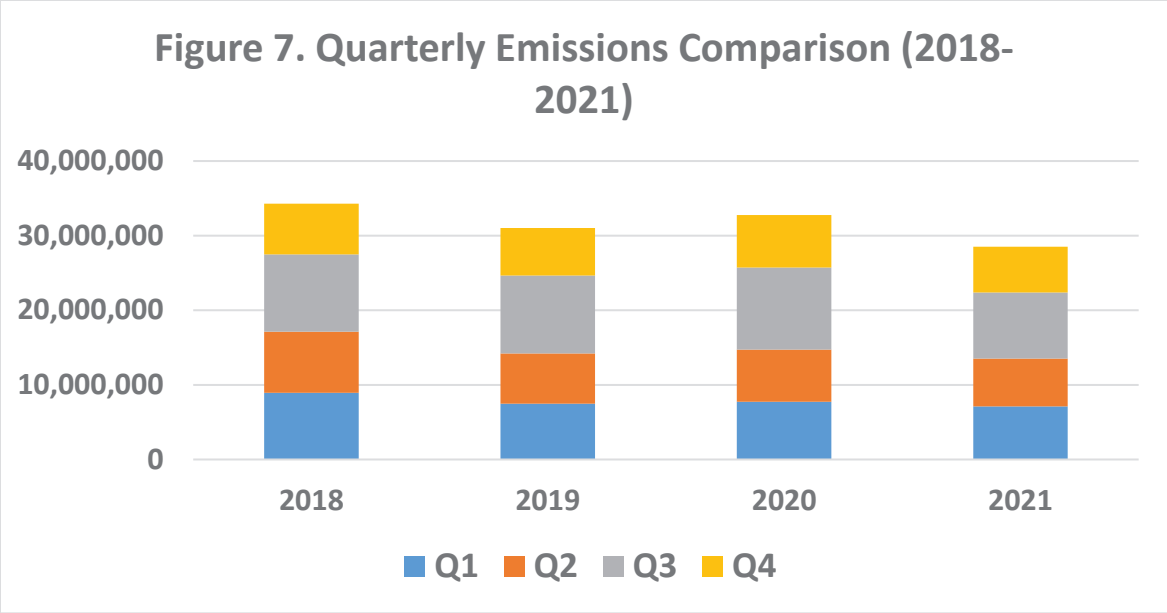
Table 3: Changes to Power Generation Sources in Virginia (2010-2020)

Plant Name	Change In Operation/Fuel	Year
Bear Garden Generating Station	Gas facility began operating	2011
Potomac River	Coal facility permanently closed	2012
Virginia City Hybrid Energy Center	Coal/biomass facility began operating	2012
Hopewell Power Station	Converted to biomass (wood) from coal	2013
NOVEC Halifax County Biomass Plant	Biomass facility began operating	2013
Southampton Power Station	Converted to biomass (wood) from coal	2013
Altavista Power Station	Converted to biomass (wood) from coal	2014
Bremo Power Station	Converted to gas from coal	2014
Chesapeake Energy Center	Coal facility permanently closed	2014
Warren County Power Station	Gas facility began operating	2014
Clinch River	Coal unit 3 retired, units 1 and 2 converted to gas	2015
Glen Lyn	Coal facility permanently closed	2015
Portsmouth Genco LLC	Coal facility permanently closed	2015
Brunswick County Power Station	Gas facility began operating	2016
Panda Stonewall Power Project	Gas facility began operating	2017
Bellemeade Power Station	Gas facility permanently closed	2018
Bremo Power Station	Gas facility permanently closed	2018
Chesterfield Power Station	Coal units 3 and 4 permanently closed	2018
Greensville County Power Station	Gas facility began operating	2018
Mecklenburg Power Station	Coal facility permanently closed	2018
Possum Point Power Station	Gas units 3 and 4 retired	2018
City Point Energy Center	Coal facility permanently closed	2019
Yorktown Power Station	Coal units 1 and 2 retired	2019
Possum Point Power Station	Oil unit 5 retired	2020

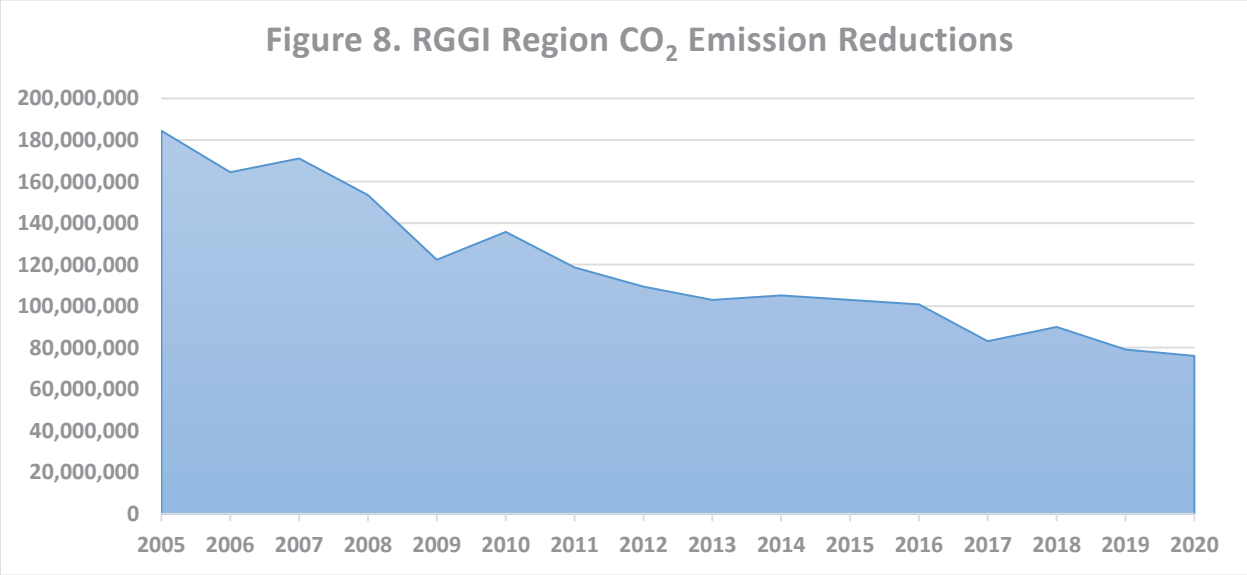
Source: PJM Generation Deactivations, EPA Air Markets Program Data tool

The carbon-trading rule and the RGGI program are designed to reduce regional CO_2 emissions over time by setting descending annual emission budgets to meet established reduction goals. The Virginia trading rule has established a starting emissions budget for 2021 of 27.6 million tons, which is then reduced annually at a consistent rate to 19.6 million tons in 2030. This is consistent with the RGGI goal of a 30% reduction between 2020 and 2030. However, since this is a regional trading program, the actual emissions reductions during this period may vary by state.

An analysis of control year 2021 emissions to date has been performed to see if any initial impact of the RGGI program can be seen in the Virginia power sector. To do so, the quarterly emissions data for 2021 have been compared the same data for past years. The results of this analysis are provided below in Figure 7. While there has been a decrease in emissions for 2021 as compared to prior years, this cannot be directly or solely attributed to RGGI participation.



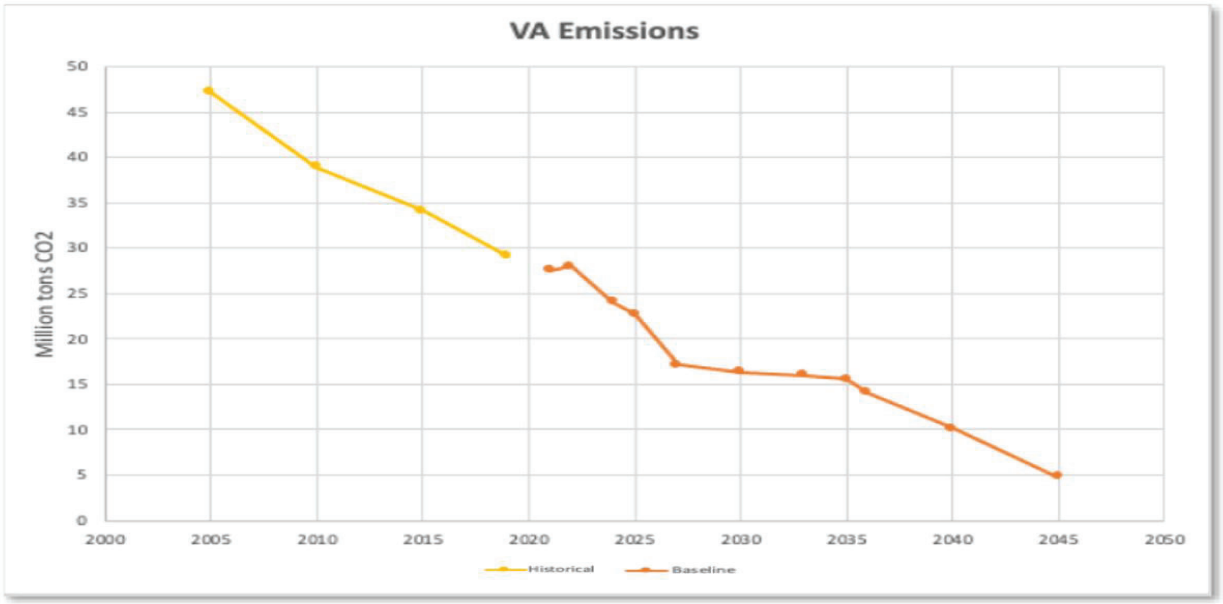
While the emissions data and impact of RGGI participation by Virginia is limited and inconclusive, the RGGI region has a long track record of emission reductions since the beginning of the program. This is shown in Figure 8 below where CO_2 emissions have decreased in the RGGI participating states by 59% from 2005 to 2020. Note that Virginia is not included in these data.



To assess the future of the power sector and predicted emissions reductions we must turn to modeling efforts that have been completed. A recently completed study and report completed by the Virginia Department of Energy, in consultation with the DEQ on the Virginia Clean Economy Act (VCEA) – Achieving Clean Electricity Generation at Least Cost to the Ratepayers by 2045. This study and report shows that the combination of participation in RGGI along with the specific mandates of the VCEA including the closure of most of the remaining coal and biomass electric generating facilities in Virginia, along with specific renewable energy

generation targets and standards, is expected to lead to a carbon free power sector in the 2045-2050 timeframe. This supports the requirements of both the VCEA and statutory goal of net-zero carbon emissions economy-wide by 2045. The CO_2 emissions reduction predictions of the study are provided in Figure 9.

Figure 9. CO_2 Emissions Reduction Predictions, VCEA Study



The main conclusions of this section are as follows:

- Mass emissions levels of CO_2 from the Virginia power sector have remained fairly constant over the last 10 years despite a 30% increase in power production.
- Average emission rates have substantially decreased during the same time and in-state electricity generation has increased.
- There is insufficient data to determine the impact of the trading rule and RGGI in reducing CO_2 emissions, since 2021 has been the first year of Virginia's participation in the program.
- The DOE study of the Virginia power sector indicates that an emission reduction program or combination of programs will be required to meet the Commonwealth's climate goals of the VCEA and the 2045 net-zero carbon emissions goal. In the absence of any such program, emissions may not reduce sufficiently to achieve these goals.

SECTION 4 – OTHER INFORMATION

Program Impact Analyses

As part of the regulatory process for the carbon-trading rule, a number of power sector and economic analyses were performed to determine the impact of the rule on generation, emissions, power prices, and allowance prices.

Prior to enactment of the Clean Energy and Community Flood Preparedness Act (CECFPA) in 2020 and subsequent carbon trading rule based on full auction participation, DEQ developed and

the SAPCB approved a trading rule that operated under a consignment auction approach. Under the consignment auction rule, Virginia's RGGI allowance budget was to be distributed directly to regulated sources on a pro rata basis according to a formula based on a source's historical CO_2 emissions. The regulated sources would then have been required to consign those allowances to the RGGI auction, with proceeds from the sale of the allowances at auction paid back to the regulated sources. The intention was that proceeds from consigned allowances would then flow to the ratepayers pursuant to a SCC process, thereby mitigating the cost of the RGGI program to ratepayers to the maximum extent. Two early analyses of the consignment auction approach indicated that electricity prices in Virginia would increase only nominally while consumer bills would actually go down. However, the CECFPA was enacted before the consignment rule could go into effect. The results of these analyses from 2017 and 2018 can be found at the following links.

November 2017

1. Policy Scenario 1
2. Policy Scenario 2
3. Reference Case 1
4. Reference Case 2
5. A bill analysis

November 2018

1. IPM reference case results
2. IPM policy case results
3. A bill analysis presentation
4. A co-benefits analysis

Also prior to Virginia becoming a full participant in RGGI, several economic impact analyses of the original CO_2 trading rule were completed by Virginia Department of Planning and Budget (DPB). This iteration of the rule implemented a consignment auction approach in lieu of a traditional auction approach in order to comply with as-then current state law. As required by § 2.2-4007.04 of the Administrative Process Act, DPB considered the economic impacts of the proposed, revised proposed, and final rule. These analyses considered a number of fiscal impact studies that were conducted as part of the regulatory development process. Note that the final regulation, which adopted the traditional auction approach, was exempt from the APA and therefore not subject to DPB review.

While these analyses informed the regulatory process at the time, they did not evaluate the rule in its current form. The IPM modeling also consistently underestimated allowance prices given the current price.

An independent comprehensive report on RGGI: Background, Impacts, and Selected Issues was published by the Congressional Research Service in 2019.

Finally, a more current study and report on the current and future power sector in Virginia has been performed to evaluate the combined impacts of the RGGI and VCEA programs as previously described in Section 3. However, this report does not assess the cost impact of the programs in detail.

Program Proceeds Investment

The RGGI program publishes annual reports on the investment of proceeds by its member states.

SECTION 5 - CONCLUSION

In conclusion, the results of this re-evaluation of the costs and benefits of the RGGI program on Virginia are as follows:

- RGGI operates as a direct tax on households and businesses because all fees paid to the RGGI Board are passed through to the ratepayers per Virginia Legislation. Since the utilities are allowed to increase their rates due to the costs associated with their required participation in the RGGI auction process, there is little correlation to emission reductions. By design the utilities are not penalized for failure to meet RGGI CO_2 emissions since they can pass on the costs to the ratepayers.
- Consumers are unable to avoid the pass through of these costs because they do not have the opportunity to switch electric providers – Dominion and other providers are monopolies in most regions of Virginia.
- Other states participating in the RGGI program designed their systems to provide rebates to their ratepayers, in Virginia the program operates as a hidden tax in which the legislature then disburses the funds through grant programs. Virginia consumers were originally told that the program would not increase their energy bills.
- The original RGGI auction approach was designed to return the proceeds to the ratepayers but this was not how Virginia implemented the program. The original analysis, conducted prior to the adoption of RGGI by the legislature, showed little impact on electricity prices to the consumer because of the anticipated return of the proceeds to the ratepayers.
- The costs of compliance with the trading rule and participation in RGGI are materializing in higher electricity rates for all ratepayers, as identified in the Dominion rate case filings. The first of these rate increase requests by Dominion Energy has been approved and went into effect on January 1. Future rate increases due to RGGI are expected and will be tied to the allowance prices which are difficult to predict.
- RGGI emissions allowance prices have increased over time and substantially in the last year. In fact, in Auction 54, the clearing price rose from $9.30 to the cost containment reserve trigger level of $13.00. The allowance price rose again slightly in Auction 55 to $13.50, an all-time high for the program. Future allowance price predictions will continue to be uncertain, but by design will continue to increase.
- In Virginia over the last 10 years energy generation has increased substantially while the CO_2 mass emissions has remained fairly constant. This is due to fuel switching and efficiencies, which is signified by the decreased emission rate. In 2010 the state produced 1,200 lbs/month of CO_2 per MWh compared to 679 lbs/CO_2 per MWh in 2020, prior to RGGI taking effect. Overall, CO_2 emissions in Virginia have fallen substantially since 2005, demonstrating that Virginia has been reducing their CO_2 emissions without regard to RGGI.
- RGGI is a bad construct that taxes consumers without providing incentives for change to the electricity producers. The program was not implemented in the way it was originally sold, and simply results in increased pricing to consumers out of the marketplace.

COMMONWEALTH OF VIRGINIA
DEPARTMENT OF ENVIRONMENTAL QUALITY

PROCESS FOR ADDRESSING EO-9 EMERGENCY REGULATION AND REPEAL CO_2 EMISSIONS TRADING PROGRAM (PART VII OF 9VAC5-140)

Executive Order 9 (2022) (EO-9) **(Attachment A)** requires that DEQ in coordination with the Secretary develop an emergency regulation to repeal the CO_2 Emissions Trading Program regulation that enables Virginia to participate in the Regional Greenhouse Gas Initiative (RGGI), and begin the process for making the emergency regulation permanent. **Attachment B** shows the general process for doing so - in sum:

- in accordance with § 2.2-4011 A of the Administrative Process Act (APA) (**Attachment C**), the department consults with the Office of Attorney General to establish the nature of the emergency and requests the approval of the Attorney General in writing (**Attachment D**) to proceed with the emergency regulation;
- the State Air Pollution Control Board adopts the emergency regulation and submits it via Town Hall for executive review; and
- the emergency regulation becomes effective on approval by the Governor and submittal to the Registrar for publication.

In accordance with § 2.2-4011 C of the APA, an emergency regulation is effective for 18 months (24 months if an extension is requested). For an emergency regulation to become permanent, it must undergo the full regulatory adoption process during those 18 months. Thus, a Notice of Intended Regulatory Action (NOIRA) is usually issued concurrently with the emergency regulation. **Attachment E** describes this process and the schedule on which it must proceed. A draft proposed emergency regulation (**Attachment F**) and NOIRA for the permanent regulation (**Attachment G**) are provided.

EO-9 also requires DEQ in coordination with the Secretary to provide the Governor, "a full report re-evaluating the costs and benefits of participation in the Regional Greenhouse Gas Initiative Inc. in view of all available data, within 30 days," a draft of which will be provided separately. Finally, EO-9 directs the Secretary or DEQ to, ". . . notify the Regional Greenhouse Gas Initiative Inc. (RGGI Inc.) of the review and the Governor's intent to withdraw from RGGI, whether by legislative or regulatory action." A draft letter providing this notification for the Secretary's signature is provided at **Attachment H**.

Commonwealth of Virginia
Office of the Governor

Executive Order

NUMBER NINE (2022)

PROTECTING RATEPAYERS FROM THE RISING COST OF LIVING DUE TO THE REGIONAL GREENHOUSE GAS INITIATIVE

By virtue of the authority vested in me as Governor, I hereby issue this Executive Order to re-evaluate Virginia's participation in the Regional Greenhouse Gas Initiative and immediately begin regulatory processes to end it.

Importance of the Initiative

Reliable and affordable access to electricity is imperative to the health and safety of all Virginians. Our hospitals, schools, businesses, and homes all rely on this essential service. And the unpredictable and rising cost of electricity poses a significant and immediate threat to our Commonwealth and its citizens. In 2019, alone, over 100,000 Virginian households required Energy Assistance with a cost of $46 million to the Commonwealth.

Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI) risks contributing to the increased cost of electricity for our citizens. Virginia's utilities have sold over $227 million in allowances in 2021 during the RGGI auctions, doubling the initial estimates. Those utilities are allowed to pass on the costs of purchasing allowances to their ratepayers. Under the initial bill "RGGI rider" created for Dominion Energy customers, typical residential customer bills were increased by $2.39 a month and the typical industrial customer bill by was raised by $1,554 per month. In a filling before the State Corporation Commission, Dominion Energy stated that RGGI will cost ratepayers between $1 billion and $1.2 billion over the next four years.

Simply stated, the benefits of RGGI have not materialized, while the costs have skyrocketed. Re-evaluation of the Initiative represents a meaningful step toward alleviating this financial burden on the Commonwealth's businesses and households. Regulations must be evaluated in view of the costs and benefits to all Virginians.

Directive

Accordingly, by virtue of the authority vested in me as the Chief Executive Officer of the Commonwealth, and pursuant to Article V of the Constitution and the laws of Virginia, I hereby direct the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural and Historic Resources, to take the following actions in accordance with the provisions and requirements of § 10.1-1300, et seq. and § 2.2-4000, et seq. of the *Code of Virginia*:

1. Provide me a full report re-evaluating the costs and benefits of participation in the Regional Greenhouse Gas Initiative Inc. in view of all available data, within 30 days.

2. During this same period, develop a proposed emergency regulation for the State Air Pollution Control Board's consideration to repeal 9VAC5-140.

3. During this same period, take all necessary steps to so that any proposed regulation to the State Air Pollution Control Board can be immediately presented for consideration for approval for public comment in accordance with the Board's authority pursuant to § 10.1-1308 of the *Code of Virginia*.

4. During this same period, notify the Regional Greenhouse Gas Initiative Inc. (RGGI Inc.) of the review and the Governor's intent to withdraw from RGGI, whether by legislative or regulatory action.

Effective Date

This Executive Order shall be effective upon its signing and shall remain in force and effect unless amended or rescinded by further executive order or directive.

Given under my hand and under the Seal of the Commonwealth of Virginia, this 15th day of January 2022.

Glenn Youngkin, Governor

Attest:

Kelly Thomasson, Secretary of the Commonwealth

Emergency regulations:

Information especially for state agencies

An emergency regulation is:

--Promulgated if (1) there is an "emergency situation" or (2) legislation requires a regulation to be promulgated within 280 days.

--Effective upon filing with the Registrar of Regulations.

--Initially effective for up to 18 months, and then may be extended for up to an additional 6 months if the Governor approves (for a total of 2 years).

--Usually replaced with a permanent regulation; therefore, a Notice of Intended Regulatory Action (NOIRA) to promulgate the permanent replacement regulation is normally filed at the same time as the emergency regulation.

Source: Section 2.2-4011 of the Code of Virginia

For more information, view the Town Hall User Manual at townhall.virginia.gov/UM/toc.cfm

Steps to promulgating:

Agency/board adopts emergency regulation and submits (Form TH-05 or TH06 and syncs RIS project) on the Town Hall for executive branch review.

↓

Executive branch review:
(In order of review)
Office of the Attorney General – no deadline;
Department of Planning & Budget – 14 day deadline;
Cabinet Secretary –14 day deadline;
Governor – no deadline.

↓

Once Governor approves, submit emergency regulation to the Virginia *Register of Regulations* via the Town Hall.
The emergency regulation is effective immediately upon filing.

↓

Ten days before publication in the *Register*, email notification is sent to registered public Town Hall users.

↓

The emergency regulation is published in the Register.
If NOIRA for permanent replacement regulation was also published, then 30-day public comment begins and Town Hall public comment forum opens.

Produced by the Virginia Department of Planning and Budget's Planning, Evaluation, and Regulation Division, 11/2018

ATTACHMENT C

Code of Virginia
Title 2.2. Administration of Government
Subtitle II. Administration of State Government
Part B. Transaction of Public Business
Chapter 40. Administrative Process Act
Article 2. Regulations

§ 2.2-4011. Emergency regulations; publication; exceptions

A. Regulations that an agency finds are necessitated by an emergency situation may be adopted by an agency upon consultation with the Attorney General, which approval shall be granted only after the agency has submitted a request stating in writing the nature of the emergency, and the necessity for such action shall be at the sole discretion of the Governor.

B. Agencies may also adopt emergency regulations in situations in which Virginia statutory law or the appropriation act or federal law or federal regulation requires that a regulation be effective in 280 days or less from its enactment and the regulation is not exempt under the provisions of subdivision A 4 of § 2.2-4006. In such cases, the agency shall state in writing the nature of the emergency and of the necessity for such action and may adopt the regulations. Pursuant to § 2.2-4012, such regulations shall become effective upon approval by the Governor and filing with the Registrar of Regulations.

C. All emergency regulations shall be limited to no more than 18 months in duration. During the 18-month period, an agency may issue additional emergency regulations as needed addressing the subject matter of the initial emergency regulation, but any such additional emergency regulations shall not be effective beyond the 18-month period from the effective date of the initial emergency regulation. If the agency wishes to continue regulating the subject matter governed by the emergency regulation beyond the 18-month limitation, a regulation to replace the emergency regulation shall be promulgated in accordance with this article. The Notice of Intended Regulatory Action to promulgate a replacement regulation shall be filed with the Registrar within 60 days of the effective date of the emergency regulation and published as soon as practicable, and the proposed replacement regulation shall be filed with the Registrar within 180 days after the effective date of the emergency regulation and published as soon as practicable.

D. In the event that an agency concludes that despite its best efforts a replacement regulation cannot be adopted before expiration of the 18-month period described in subsection C, it may seek the prior written approval of the Governor to extend the duration of the emergency regulation for a period of not more than six additional months. Any such request must be submitted to the Governor at least 30 days prior to the scheduled expiration of the emergency regulation and shall include a description of the agency's efforts to adopt a replacement regulation together with the reasons that a

replacement regulation cannot be adopted before the scheduled expiration of the emergency regulation. Upon approval of the Governor, provided such approval occurs prior to the scheduled expiration of the emergency regulation, the duration of the emergency regulation shall be extended for a period of no more than six months. Such approval shall be in the sole discretion of the Governor and shall not be subject to judicial review. Agencies shall notify the Registrar of Regulations of the new expiration date of the emergency regulation as soon as practicable.

E. Emergency regulations shall be published as soon as practicable in the Register.

F. The Regulations of the Marine Resources Commission shall be excluded from the provisions of this section.

ATTACHMENT D

January XX, 2022

The Honorable Jason S. Miyares
Attorney General of Virginia
202 North Ninth Street
Richmond, VA 23219

Dear Attorney General Miyares:

Pursuant to Va. Code §2.2-4011, the Department of Environmental Quality (DEQ) is asking your concurrence that an emergency situation exists with respect to Virginia's carbon trading program and participation in the Regional Greenhouse Gas Initiative (RGGI), and approval for DEQ to issue an emergency regulation to repeal the sections of 9VAC5-140 that establish and regulate the state's carbon trading program and participation in RGGI (VAC5-140-6010 through 6440). DEQ is making this request in accordance with Executive Order (EO) 9 issued by Governor Youngkin on January 15, 2021. (A copy of EO-9 is attached.)

Va. Code §2.2-4011 states that your approval of an emergency regulation, "shall be granted only after the agency has submitted a request stating in writing the nature of the emergency, and the necessity for such action shall be at the sole discretion of the Governor." The nature of this emergency is described by the Governor in EO-9 as follows:

> Reliable and affordable access to electricity is imperative to the health and safety of all Virginians. Our hospitals, schools, businesses, and homes all rely on this essential service. And the unpredictable and rising cost of electricity poses a significant and immediate threat to our Commonwealth and its citizens. In 2019, alone, over 100,000 Virginian households required Energy Assistance with a cost of $46 million to the Commonwealth.
>
> Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI) risks contributing to the increased cost of electricity for our citizens. Virginia's utilities have sold over $227 million in allowances in 2021 during the RGGI auctions, doubling the initial estimates. Those utilities are allowed to pass on the costs of purchasing allowances to their ratepayers. Under the initial bill "RGGI rider" created for Dominion Energy customers, typical residential customer bills were increased by $2.39 a month and the typical industrial customer bill by was raised by $1,554 per month. In a filling before the State Corporation Commission, Dominion Energy stated that RGGI will cost ratepayers between $1 billion and $1.2 billion over the next four years.

Simply stated, the benefits of RGGI have not materialized, while the costs have skyrocketed. Re-evaluation of the Initiative represents a meaningful step toward alleviating this financial burden on the Commonwealth's businesses and households. Regulations must be evaluated in view of the costs and benefits to all Virginians.

Concurrent with making this request and in conformance with Va. Code §2.2-4011 and EO-9, DEQ is preparing a Notice of Intended Regulatory Action (NOIRA) to commence the process of bringing to the State Air Pollution Control Board for its consideration a proposed rule to make the repeal of Virginia's carbon trading program permanent.

Should you find that further consultation between your office and DEQ pursuant to Va. Code §2.2-4011 would be helpful in this matter, please do not hesitate to contact me. Thank you for your prompt attention to this request.

Sincerely,

Michael S. Rolband

State Air Pollution Control Board

Repeal CO2 Budget Trading Program as required by Executive Order 9 (Revision A22)

~~Part VII~~

~~CO_2 Budget Trading Program~~

~~Article 1~~

~~CO_2 Budget Trading Program General Provisions~~

9VAC5-140-6010. ~~Purpose.~~ (Repealed.)

~~Article 1~~

~~CO_2 Budget Trading Program General Provisions~~

~~This part establishes the Virginia component of the CO_2 Budget Trading Program, which is designed to reduce anthropogenic emissions of CO_2, a greenhouse gas, from CO_2 budget sources in a manner that is protective of human health and the environment and is economically efficient.~~

9VAC5-140-6020. ~~Definitions.~~ (Repealed.)

~~A. As used in this part, all words or terms not defined here shall have the meanings given them in 9VAC5-10 (General Definitions), unless otherwise required by the context.~~

~~B. For the purpose of this part and any related use, the words or terms shall have the meanings given them in this section.~~

~~C. Terms defined.~~

~~"Account number" means the identification number given by the department or its agent to each COATS account.~~

~~"Acid Rain emission limitation" means, as defined in 40 CFR 72.2, a limitation on emissions of sulfur dioxide (SO_2) or nitrogen oxides (NO_x) under the Acid Rain Program under Title IV of the CAA.~~

~~"Acid Rain Program" means a multistate SO_2 and NO_x air pollution control and emission reduction program established by the administrator under Title IV of the CAA and 40 CFR Parts 72 through 78.~~

~~"Adjustment for banked allowances" means an adjustment applied to the Virginia CO_2 Budget Trading Program base budget for allocation years 2021 through 2025 to address allowances held in general and compliance accounts, including compliance accounts established pursuant to the CO_2 Budget Trading Program, but not including accounts opened by participating states.~~

~~"Administrator" means the administrator of the U.S. Environmental Protection Agency or the administrator's authorized representative.~~

~~"Allocate" or "allocation" means the determination by the department of the number of CO_2 allowances recorded in the CO_2 allowance account of a CO_2 budget unit.~~

~~"Allocation year" means a calendar year for which the department allocates CO_2 allowances pursuant to Article 5 (9VAC5-140-6190 et seq.) of this part. The allocation year~~

of each CO_2 allowance is reflected in the unique identification number given to the allowance pursuant to 9VAC5-140-6250 C.

"Allowance auction" or "auction" means an auction in which the department or its agent offers CO_2 allowances for sale.

"Attribute" means a characteristic associated with electricity generated using a particular renewable fuel, such as its generation date, facility geographic location, unit vintage, emissions output, fuel, state program eligibility, or other characteristic that can be identified, accounted for, and tracked.

"Attribute credit" means a credit that represents the attributes related to one megawatt-hour of electricity generation.

"Automated Data Acquisition and Handling System" or "DAHS" means that component of the Continuous Emissions Monitoring System (CEMS), or other emissions monitoring system approved for use under Article 8 (9VAC5-140-6330 et seq.) of this part, designed to interpret and convert individual output signals from pollutant concentration monitors, flow monitors, diluent gas monitors, and other component parts of the monitoring system to produce a continuous record of the measured parameters in the measurement units required by Article 8 (9VAC5-140-6330 et seq.) of this part.

"Billing meter" means a measurement device used to measure electric or thermal output for commercial billing under a contract. The facility selling the electric or thermal output shall have different owners from the owners of the party purchasing the electric or thermal output.

"Boiler" means an enclosed fossil or other fuel-fired combustion device used to produce heat and to transfer heat to recirculating water, steam, or other medium.

"CO_2 allowance" means a limited authorization by the department or participating state under the CO_2 Budget Trading Program to emit up to one ton of CO_2, subject to all applicable limitations contained in this part.

"CO_2 allowance deduction" or "deduct CO_2 allowances" means the permanent withdrawal of CO_2 allowances by the department or its agent from a COATS compliance account to account for the number of tons of CO_2 emitted from a CO_2 budget source for a control period or an interim control period determined in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part, or for the forfeit or retirement of CO_2 allowances as provided by this part.

"CO_2 Allowance Tracking System" or "COATS" means the system by which the department or its agent records allocations, deductions, and transfers of CO_2 allowances under the CO_2 Budget Trading Program. The tracking system may also be used to track CO_2 allowance prices and emissions from affected sources.

"CO_2 Allowance Tracking System account" means an account in COATS established by the department or its agent for purposes of recording the allocation, holding, transferring, or deducting of CO_2 allowances.

"CO_2 allowance transfer deadline" means midnight of March 1 occurring after the end of the relevant control period and each relevant interim control period, or if that March 1 is not a business day, midnight of the first business day thereafter and is the deadline by which CO_2 allowances shall be submitted for recordation in a CO_2 budget source's compliance account for the source to meet the CO_2 requirements of 9VAC5-140-6050 C for a control period and each interim control period immediately preceding such deadline.

"CO_2 allowances held" or "hold CO_2 allowances" means the CO_2 allowances recorded by the department or its agent, or submitted to the department or its agent for recordation, in

accordance with Article 6 (9VAC5-140-6220 et seq.) and Article 7 (9VAC5-140-6300 et seq.) of this part, in a COATS account.

"CO_2 authorized account representative" means, for a CO_2 budget source and each CO_2 budget unit at the source, the natural person who is authorized by the owners and operators of the source and all CO_2 budget units at the source, in accordance with Article 2 (9VAC5-140-6080 et seq.) of this part, to represent and legally bind each owner and operator in matters pertaining to the CO_2 Budget Trading Program or, for a general account, the natural person who is authorized, under Article 6 (9VAC5-140-6220 et seq.) of this part, to transfer or otherwise dispose of CO_2 allowances held in the general account. If the CO_2 budget source is also subject to the Acid Rain Program, CSAPR NO_x Annual Trading Program, CSAPR NO_x Ozone Season Trading Program, CSAPR SO_2 Group 1 Trading Program, or CSAPR SO_2 Group 2 Trading Program, then for a CO_2 Budget Trading Program compliance account, this natural person shall be the same person as the designated representative as defined in the respective program.

"CO_2 authorized alternate account representative" means, for a CO_2 budget source and each CO_2 budget unit at the source, the alternate natural person who is authorized by the owners and operators of the source and all CO_2 budget units at the source, in accordance with Article 2 (9VAC5-140-6080 et seq.) of this part, to represent and legally bind each owner and operator in matters pertaining to the CO_2 Budget Trading Program or, for a general account, the alternate natural person who is authorized, under Article 6 (9VAC5-140-6220 et seq.) of this part, to transfer or otherwise dispose of CO_2 allowances held in the general account. If the CO_2 budget source is also subject to the Acid Rain Program, CSAPR NO_x Annual Trading Program, CSAPR NO_x Ozone Season Trading Program, CSAPR SO_2 Group 1 Trading Program, or CSAPR SO_2 Group 2 Trading Program then, for a CO_2 Budget Trading Program compliance account, this alternate natural person shall be the same person as the alternate designated representative as defined in the respective program.

"CO_2 budget emissions limitation" means, for a CO_2 budget source, the tonnage equivalent, in CO_2 emissions in a control period or an interim control period of the CO_2 allowances available for compliance deduction for the source for a control period or an interim control period.

"CO_2 budget permit" means the portion of the legally binding permit issued by the department pursuant to 9VAC5-85 (Permits for Stationary Sources of Pollutants Subject to Regulation) to a CO_2 budget source or CO_2 budget unit that specifies the CO_2 Budget Trading Program requirements applicable to the CO_2 budget source, to each CO_2 budget unit at the CO_2 budget source, and to the owners and operators and the CO_2 authorized account representative of the CO_2 budget source and each CO_2 budget unit.

"CO_2 budget source" means a source that includes one or more CO_2 budget units.

"CO_2 Budget Trading Program" means a multistate CO_2 air pollution control and emissions reduction program established according to this part and corresponding regulations in other states as a means of reducing emissions of CO_2 from CO_2 budget sources.

"CO_2 budget unit" means a unit that is subject to the CO_2 Budget Trading Program requirements under 9VAC5-140-6040.

"CO_2 cost containment reserve allowance" or "CO_2 CCR allowance" means an allowance that has been sold at an auction for the purpose of containing the cost of CO_2 allowances. CO_2 CCR allowances offered for sale at an auction are separate from and additional to CO_2 allowances allocated from the Virginia CO_2 Budget Trading Program base and adjusted budgets. CO_2 CCR allowances are subject to all applicable limitations contained in this part.

~~"CO_2 cost containment reserve trigger price" or "CCR trigger price" means the minimum price at which CO_2 CCR allowances are offered for sale by the department or its agent at an auction. The CCR trigger price in calendar year 2021 shall be $13. The CCR trigger price in calendar year 2022 shall be $13.91. Each calendar year thereafter, the CCR trigger price shall be 1.07 multiplied by the CCR trigger price from the previous calendar year, rounded to the nearest whole cent, as shown in Table 140-1A.~~

~~Table 140-1A~~
~~CO_2 CCR Trigger Price~~

~~2021~~	~~$13.00~~
~~2022~~	~~$13.91~~
~~2023~~	~~$14.88~~
~~2024~~	~~$15.92~~
~~2025~~	~~$17.03~~
~~2026~~	~~$18.22~~
~~2027~~	~~$19.50~~
~~2028~~	~~$20.87~~
~~2029~~	~~$22.33~~
~~2030~~	~~$23.89~~

~~"CO_2 emissions containment reserve allowance" or "CO_2 ECR allowance" means a CO_2 allowance that is withheld from sale at an auction by the department for the purpose of additional emission reduction in the event of lower than anticipated emission reduction costs.~~

~~"CO_2 emissions containment reserve trigger price" or "ECR trigger price" means the price below which CO_2 allowances will be withheld from sale by the department or its agent at an auction. The ECR trigger price in calendar year 2021 shall be $6.00. Each calendar year thereafter, the ECR trigger price shall be 1.07 multiplied by the ECR trigger price from the previous calendar year, rounded to the nearest whole cent, as shown in Table 140-1B.~~

~~Table 140-1B~~
~~CO_2 ECR Trigger Price~~

~~2021~~	~~$ 6.00~~
~~2022~~	~~$ 6.42~~
~~2023~~	~~$ 6.87~~
~~2024~~	~~$ 7.35~~
~~2025~~	~~$ 7.86~~
~~2026~~	~~$8.41~~
~~2027~~	~~$ 9.00~~
~~2028~~	~~$ 9.63~~

2029	$10.30
2030	$11.02

"CO_2 offset allowance" means a CO_2 allowance that is awarded to the sponsor of a CO_2 emissions offset project by a participating state and is subject to the relevant compliance deduction limitations of the participating state's corresponding offset regulations as a means of reducing CO_2 from CO_2 budget sources.

"Combined cycle system" means a system comprised of one or more combustion turbines, heat recovery steam generators, and steam turbines configured to improve overall efficiency of electricity generation or steam production.

"Combustion turbine" means an enclosed fossil or other fuel-fired device that is comprised of a compressor (if applicable), a combustor, and a turbine, and in which the flue gas resulting from the combustion of fuel in the combustor passes through the turbine, rotating the turbine.

"Commence commercial operation" means, with regard to a unit that serves a generator, to have begun to produce steam, gas, or other heated medium used to generate electricity for sale or use, including test generation. For a unit that is a CO_2 budget unit under 9VAC5-140-6040 on the date the unit commences commercial operation, such date shall remain the unit's date of commencement of commercial operation even if the unit is subsequently modified, reconstructed, or repowered. For a unit that is not a CO_2 budget unit under 9VAC5-140-6040 on the date the unit commences commercial operation, the date the unit becomes a CO_2 budget unit under 9VAC5-140-6040 shall be the unit's date of commencement of commercial operation.

"Commence operation" means to begin any mechanical, chemical, or electronic process, including, with regard to a unit, start-up of a unit's combustion chamber. For a unit that is a CO_2 budget unit under 9VAC5-140-6040 on the date of commencement of operation, such date shall remain the unit's date of commencement of operation even if the unit is subsequently modified, reconstructed, or repowered. For a unit that is not a CO_2 budget unit under 9VAC5-140-6040 on the date of commencement of operation, the date the unit becomes a CO_2 budget unit under 9VAC5-140-6040 shall be the unit's date of commencement of operation.

"Compliance account" means a COATS account, established by the department or its agent for a CO_2 budget source under Article 6 (9VAC5-140-6220 et seq.) of this part, in which CO_2 allowances available for use by the source for a control period and each interim control period are held for the purpose of meeting the CO_2 requirements of 9VAC5-140-6050 C.

"Continuous Emissions Monitoring System" or "CEMS" means the equipment required under Article 8 (9VAC5-140-6330 et seq.) of this part to sample, analyze, measure, and provide, by means of readings recorded at least once every 15 minutes (using an automated DAHS), a permanent record of stack gas volumetric flow rate, stack gas moisture content, and oxygen or carbon dioxide concentration (as applicable), in a manner consistent with 40 CFR Part 75 and Article 8 (9VAC5-140-6330 et seq.) of this part. The following systems are types of CEMS required under Article 8 (9VAC5-140-6330 et seq.) of this part:

a. A flow monitoring system, consisting of a stack flow rate monitor and an automated DAHS and providing a permanent, continuous record of stack gas volumetric flow rate, in standard cubic feet per hour;

b. A NO_x emissions rate (or NO_x-diluent) monitoring system, consisting of a NO_x pollutant concentration monitor, a diluent gas (CO_2 or O_2) monitor, and an automated

DAHS and providing a permanent, continuous record of NO_X concentration, in parts per million (ppm), diluent gas concentration, in percent CO_2 or O_2, and NO_X emissions rate, in pounds per million British thermal units (lb/MMBtu);

c. A moisture monitoring system, as defined in 40 CFR 75.11(b)(2) and providing a permanent, continuous record of the stack gas moisture content, in percent H_2O;

d. A CO_2 monitoring system, consisting of a CO_2 pollutant concentration monitor (or an O_2 monitor plus suitable mathematical equations from which the CO_2 concentration is derived) and an automated DAHS and providing a permanent, continuous record of CO_2 emissions, in percent CO_2; and

e. An O_2 monitoring system, consisting of an O_2 concentration monitor and an automated DAHS and providing a permanent, continuous record of O_2, in percent O_2.

"Control period" means a three-calendar-year time period. The fifth control period is from January 1, 2021, to December 31, 2023, inclusive, which is the first control period of Virginia's participation in the CO_2 Budget Trading Program. The first two calendar years of each control period are each defined as an interim control period, beginning on January 1, 2021.

"Cross State Air Pollution Rule (CSAPR) NO_X Annual Trading Program" means a multistate NO_X air pollution control and emission reduction program established in accordance with Subpart AAAAA of 40 CFR Part 97 and 40 CFR 52.38(a), including such a program that is revised in a SIP revision approved by the administrator under 40 CFR 52.38(a)(3) or (4) or that is established in a SIP revision approved by the administrator under 40 CFR 52.38(a)(5), as a means of mitigating interstate transport of fine particulates and NO_X.

"Cross State Air Pollution Rule (CSAPR) NO_X Ozone Season Trading Program" means a multistate NO_X air pollution control and emission reduction program established in accordance with Subpart BBBBB of 40 CFR Part 97 and 40 CFR 52.38(b), including such a program that is revised in a SIP revision approved by the administrator under 40 CFR 52.38(b)(3) or (4) or that is established in a SIP revision approved by the administrator under 40 CFR 52.38(b)(5), as a means of mitigating interstate transport of ozone and NO_X.

"Cross State Air Pollution Rule (CSAPR) SO_2 Group 1 Trading Program" means a multistate SO_2 air pollution control and emission reduction program established in accordance with Subpart CCCCC of 40 CFR Part 97 and 40 CFR 52.39(a), (b), (d) through (f), (j), and (k), including such a program that is revised in a SIP revision approved by the administrator under 40 CFR 52.39(d) or (e) or that is established in a SIP revision approved by the administrator under 40 CFR 52.39(f), as a means of mitigating interstate transport of fine particulates and SO_2.

"Cross State Air Pollution Rule (CSAPR) SO_2 Group 2 Trading Program" means a multistate SO_2 air pollution control and emission reduction program established in accordance with Subpart DDDDD of 40 CFR Part 97 and 40 CFR 52.39(a), (c), and (g) through (k), including such a program that is revised in a SIP revision approved by the administrator under 40 CFR 52.39(g) or (h) or that is established in a SIP revision approved by the administrator under 40 CFR 52.39(i), as a means of mitigating interstate transport of fine particulates and SO_2.

"Department" means the Virginia Department of Environmental Quality.

"Excess emissions" means any tonnage of CO_2 emitted by a CO_2 budget source during an interim control period or a control period that exceeds the CO_2 budget emissions limitation for the source.

"Excess interim emissions" means any tonnage of CO_2 emitted by a CO_2 budget source during an interim control period multiplied by 0.50 that exceeds the CO_2 budget emissions limitation for the source.

"Fossil fuel" means natural gas, petroleum, coal, or any form of solid, liquid, or gaseous fuel derived from such material.

"Fossil fuel-fired" means the combustion of fossil fuel, alone or in combination with any other fuel, where the fossil fuel combusted comprises, or is projected to comprise, more than 5.0% of the annual heat input on a Btu basis during any year.

"General account" means a COATS account established under Article 6 (9VAC5-140-6220 et seq.) of this part that is not a compliance account.

"Gross generation" means the electrical output in MWe at the terminals of the generator.

"Interim control period" means a one-calendar-year time period during each of the first and second calendar years of each three-year control period. The first interim control period starts January 1, 2021, and ends December 31, 2021, inclusive. The second interim control period starts January 1, 2022, and ends December 31, 2022, inclusive. Each successive three-year control period will have two interim control periods, comprised of each of the first two calendar years of that control period.

"Life-of-the-unit contractual arrangement" means either:

a. A unit participation power sales agreement under which a customer reserves, or is entitled to receive, a specified amount or percentage of nameplate capacity or associated energy from any specified unit pursuant to a contract:

(1) For the life of the unit;

(2) For a cumulative term of no less than 30 years, including contracts that permit an election for early termination; or

(3) For a period equal to or greater than 25 years or 70% of the economic useful life of the unit determined as of the time the unit is built, with option rights to purchase or release some portion of the nameplate capacity and associated energy generated by the unit at the end of the period; or

b. Any energy conversion or energy tolling agreement that has a primary term of 20 years or more and pursuant to which the purchaser is required to deliver fuel to the CO_2 budget source or CO_2 budget unit and is entitled to receive all of the nameplate capacity and associated energy generated by such source or unit for the entire contractual period. Such agreements shall be subject to 9VAC5-140-6325. Such purchaser shall not be considered an "owner" as defined under this section.

"Maximum potential hourly heat input" means an hourly heat input used for reporting purposes when a unit lacks certified monitors to report heat input. If the unit intends to use Appendix D of 40 CFR Part 75 to report heat input, this value shall be calculated, in accordance with 40 CFR Part 75, using the maximum fuel flow rate and the maximum gross calorific value. If the unit intends to use a flow monitor and a diluent gas monitor, this value shall be reported, in accordance with 40 CFR Part 75, using the maximum potential flow rate and either the maximum CO_2 concentration in percent CO_2 or the minimum O_2 concentration in percent O_2.

"Minimum reserve price" means, in calendar year 2021, $2.38. Each calendar year thereafter, the minimum reserve price shall be 1.025 multiplied by the minimum reserve price from the previous calendar year, rounded to the nearest whole cent.

"Monitoring system" means any monitoring system that meets the requirements of Article 8 (9VAC5-140-6330 et seq.) of this part, including a CEMS, an excepted monitoring system, or an alternative monitoring system.

"Nameplate capacity" means the maximum electrical output in MWe that a generator can sustain over a specified period of time when not restricted by seasonal or other deratings as measured in accordance with the U.S. Department of Energy standards.

"Net-electric output" means the amount of gross generation in MWh the generators produce, including output from steam turbines, combustion turbines, and gas expanders, as measured at the generator terminals, less the electricity used to operate the plant (i.e., auxiliary loads); such uses include fuel handling equipment, pumps, fans, pollution control equipment, other electricity needs, and transformer losses as measured at the transmission side of the step up transformer (e.g., the point of sale).

"Non-CO_2 budget unit" means a unit that does not meet the applicability criteria of 9VAC5-140-6040.

"Operator" means any person who operates, controls, or supervises a CO_2 budget unit or a CO_2 budget source and shall include any holding company, utility system, or plant manager of such a unit or source.

"Owner" means any of the following persons:

a. Any holder of any portion of the legal or equitable title in a CO_2 budget unit;

b. Any holder of a leasehold interest in a CO_2 budget unit, other than a passive lessor, or a person who has an equitable interest through such lessor, whose rental payments are not based, either directly or indirectly, upon the revenues or income from the CO_2 budget unit;

c. Any purchaser of power from a CO_2 budget unit under a life-of-the-unit contractual arrangement in which the purchaser controls the dispatch of the unit; or

d. With respect to any general account, any person who has an ownership interest with respect to the CO_2 allowances held in the general account and who is subject to the binding agreement for the CO_2 authorized account representative to represent that person's ownership interest with respect to the CO_2 allowances.

"Participating state" means a state that has established a corresponding regulation as part of the CO_2 Budget Trading Program.

"Receive" or "receipt of" means, when referring to the department or its agent, to come into possession of a document, information, or correspondence (whether sent in writing or by authorized electronic transmission) as indicated in an official correspondence log, or by a notation made on the document, information, or correspondence by the department or its agent in the regular course of business.

"Recordation," "record," or "recorded" means, with regard to CO_2 allowances, the movement of CO_2 allowances by the department or its agent from one COATS account to another for purposes of allocation, transfer, or deduction.

"Reserve price" means the minimum acceptable price for each CO_2 allowance in a specific auction. The reserve price at an auction is either the minimum reserve price or the CCR trigger price, as specified in Article 9 (9VAC5-140-6410 et seq.) of this part.

"Serial number" means, when referring to CO_2 allowances, the unique identification number assigned to each CO_2 allowance by the department or its agent under 9VAC5-140-6250 C.

"Source" means any governmental, institutional, commercial, or industrial structure, installation, plant, building, or facility that emits or has the potential to emit any air pollutant. A source, including a source with multiple units, shall be considered a single facility.

"Submit" or "serve" means to send or transmit a document, information, or correspondence to the person specified in accordance with the applicable regulation:

a. In person;

b. By United States Postal Service; or

c. By other means of dispatch or transmission and delivery.

Compliance with any "submission," "service," or "mailing" deadline shall be determined by the date of dispatch, transmission, or mailing and not the date of receipt.

"Ton" or "tonnage" means any short ton, or 2,000 pounds. For the purpose of determining compliance with the CO_2 requirements of 9VAC5-140-6050 C, total tons for an interim control period or a control period shall be calculated as the sum of all recorded hourly emissions, or the tonnage equivalent of the recorded hourly emissions rates, in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part, with any remaining fraction of a ton equal to or greater than 0.50 ton deemed to equal one ton and any fraction of a ton less than 0.50 ton deemed to equal zero tons. A short ton is equal to 0.9072 metric tons.

"Total useful energy" means the sum of gross electrical generation and useful net thermal energy.

"Undistributed CO_2 allowances" means CO_2 allowances originally allocated to a set aside account as pursuant to 9VAC5-140-6210 that were not distributed.

"Unit" means a fossil fuel-fired stationary boiler, combustion turbine, or combined cycle system.

"Unit operating day" means a calendar day in which a unit combusts any fuel.

"Unsold CO_2 allowances" means CO_2 allowances that have been made available for sale in an auction conducted by the department or its agent, but not sold.

"Useful net thermal energy" means energy:

a. In the form of direct heat, steam, hot water, or other thermal form that is used in the production and beneficial measures for heating, cooling, humidity control, process use, or other thermal end use energy requirements, excluding thermal energy used in the power production process (e.g., house loads and parasitic loads); and

b. For which fuel or electricity would otherwise be consumed.

"Virginia CO_2 Budget Trading Program adjusted budget" means an adjusted budget determined in accordance with 9VAC5-140-6210 and is the annual amount of CO_2 tons available in Virginia for allocation in a given allocation year, in accordance with the CO_2 Budget Trading Program. CO_2 CCR allowances offered for sale at an auction are separate from and additional to CO_2 allowances allocated from the Virginia CO_2 Budget Trading Program adjusted budget.

"Virginia CO_2 Budget Trading Program base budget" means the budget specified in 9VAC5-140-6190. CO_2 CCR allowances offered for sale at an auction are separate from and additional to CO_2 allowances allocated from the Virginia CO_2 Budget Trading Program base budget.

9VAC5-140-6030. ~~Measurements, abbreviations, and acronyms.~~ (Repealed.)

Measurements, abbreviations, and acronyms used in this part are defined as follows:

Btu - British thermal unit.

~~CAA - federal Clean Air Act.~~

~~CCR - cost containment reserve.~~

~~CEMS - Continuous Emissions Monitoring System.~~

~~COATS - CO_2 Allowance Tracking System.~~

~~CO_2 - carbon dioxide.~~

~~DAHS - Data Acquisition and Handling System.~~

~~H_2O - water.~~

~~lb - pound.~~

~~LME - low mass emissions.~~

~~MMBtu - million British thermal units.~~

~~MW - megawatt.~~

~~MWe - megawatt electrical.~~

~~MWh - megawatt hour.~~

~~NO_x - nitrogen oxides.~~

~~O_2 - oxygen.~~

~~ORIS - Office of Regulatory Information Systems.~~

~~QA/QC - quality assurance/quality control.~~

~~ppm - parts per million.~~

~~SO_2 - sulfur dioxide.~~

9VAC5-140-6040. ~~Applicability.~~ (Repealed.)

~~A. Any fossil fuel-fired unit that serves an electricity generator with a nameplate capacity equal to or greater than 25 MWe shall be a CO_2 budget unit, and any source that includes one or more such units shall be a CO_2 budget source, subject to the requirements of this part.~~

~~B. Exempt from the requirements of this part is any fossil fuel CO_2 budget source located at or adjacent to and physically interconnected with a manufacturing facility that, prior to January 1, 2020, and in every subsequent calendar year, met either of the following requirements:~~

~~1. Supplies less than or equal to 10% of its annual net electrical generation to the electric grid; or~~

~~2. Supplies less than or equal to 15% of its annual total useful energy to any entity other than the manufacturing facility to which the CO_2 budget source is interconnected.~~

~~For the purpose of subdivision 1 of this subsection, annual net electrical generation shall be determined as follows:~~

~~(ES – EP) / EG x 100~~

~~Where:~~

~~ES = electricity sales to the grid from the CO_2 budget source~~

~~EP = electricity purchases from the grid by the CO_2 budget source and the manufacturing facility to which the CO_2 budget source is interconnected~~

~~EG = electricity generation~~

~~Such exempt CO_2 budget source shall have an operating permit containing the applicable restrictions under this subsection. An application for such operating permit shall be submitted to the department no later than January 1, 2022.~~

9VAC5-140-6050. ~~Standard requirements.~~ (Repealed.)

~~A. Permit requirements shall be as follows.~~

1. The CO_2 authorized account representative of each CO_2 budget source required to have an operating permit pursuant to 9VAC5-85 (Permits for Stationary Sources of Pollutants Subject to Regulation) and each CO_2 budget unit required to have an operating permit pursuant to 9VAC5-85 shall:

a. Submit to the department a complete CO_2 budget permit application under 9VAC5-140-6160 in accordance with the deadlines specified in 9VAC5-140-6150; and

b. Submit in a timely manner any supplemental information that the department determines is necessary in order to review the CO_2 budget permit application and issue or deny a CO_2 budget permit.

2. The owners and operators of each CO_2 budget source required to have an operating permit pursuant to 9VAC5-85 (Permits for Stationary Sources of Pollutants Subject to Regulation) and each CO_2 budget unit required to have an operating permit pursuant to 9VAC5-85 for the source shall have a CO_2 budget permit and operate the CO_2 budget source and the CO_2 budget unit at the source in compliance with such CO_2 budget permit.

B. Monitoring requirements shall be as follows.

1. The owners and operators and, to the extent applicable, the CO_2 authorized account representative of each CO_2 budget source and each CO_2 budget unit at the source shall comply with the monitoring requirements of Article 8 (9VAC5-140-6330 et seq.) of this part.

2. The emissions measurements recorded and reported in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part shall be used to determine compliance by the unit with the CO_2 requirements under subsection C of this section.

C. CO_2 requirements shall be as follows.

1. The owners and operators of each CO_2 budget source and each CO_2 budget unit at the source shall hold CO_2 allowances available for compliance deductions under 9VAC5-140-6260, as of the CO_2 allowance transfer deadline, in the source's compliance account in an amount not less than the total CO_2 emissions that have been generated as a result of combusting fossil fuel for an interim control period or control period from all CO_2 budget units at the source, less the CO_2 allowances deducted to meet the requirements of subdivision 2 of this subsection, with respect to the previous two interim control periods as determined in accordance with Article 6 (9VAC5-140-6220 et seq.) and Article 8 (9VAC5-140-6330 et seq.) of this part.

2. The owners and operators of each CO_2 budget source and each CO_2 budget unit at the source shall hold CO_2 allowances available for compliance deductions under 9VAC5-140-6260, as of the CO_2 allowance transfer deadline, in the source's compliance account in an amount not less than the total CO_2 emissions that have been generated as a result of combusting fossil fuel for the interim control period from all CO_2 budget units at the source multiplied by 0.50, as determined in accordance with Article 6 (9VAC5-140-6220 et seq.) and Article 8 (9VAC5-140-6330 et seq.) of this part.

3. Each ton of CO_2 emitted in excess of the CO_2 budget emissions limitation for a control period shall constitute a separate violation of this part and applicable state law.

4. Each ton of excess interim emissions shall constitute a separate violation of this part and applicable state law.

5. A CO_2 budget unit shall be subject to the requirements under subdivision 1 of this subsection starting on the later of January 1, 2021, or the date on which the unit commences operation.

6. CO_2 allowances shall be held in, deducted from, or transferred among COATS accounts in accordance with Article 5 (9VAC5-140-6190 et seq.), Article 6 (9VAC5-140-6220 et seq.), and Article 7 (9VAC5-140-6300 et seq.) of this part.

7. A CO_2 allowance shall not be deducted, to comply with the requirements under subdivision 1 or 2 of this subsection, for a control period that ends prior to the year for which the CO_2 allowance was allocated.

8. A CO_2 allowance under the CO_2 Budget Trading Program is a limited authorization by the department to emit one ton of CO_2 in accordance with the CO_2 Budget Trading Program. No provision of the CO_2 Budget Trading Program, the CO_2 budget permit application, or the CO_2 budget permit or any provision of law shall be construed to limit the authority of the department or a participating state to terminate or limit such authorization.

9. A CO_2 allowance under the CO_2 Budget Trading Program does not constitute a property right.

D. The owners and operators of a CO_2 budget source that has excess emissions in a control period shall:

1. Forfeit the CO_2 allowances required for deduction under 9VAC5-140-6260 D 1; and

2. Pay any fine, penalty, or assessment or comply with any other remedy imposed under 9VAC5-140-6260 D 2.

E. Recordkeeping and reporting requirements shall be as follows:

1. Unless otherwise provided, the owners and operators of the CO_2 budget source and each CO_2 budget unit at the source shall keep on site at the source each of the following documents for a period of 10 years from the date the document is created. This period may be extended for cause, at any time prior to the end of 10 years, in writing by the department.

a. The account certificate of representation for the CO_2 authorized account representative for the source and each CO_2 budget unit at the source and all documents that demonstrate the truth of the statements in the account certificate of representation, in accordance with 9VAC5-140-6110, provided that the certificate and documents shall be retained on site at the source beyond such 10-year period until such documents are superseded because of the submission of a new account certificate of representation changing the CO_2 authorized account representative.

b. All emissions monitoring information, in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part and 40 CFR 75.57.

c. Copies of all reports, compliance certifications, and other submissions and all records made or required under the CO_2 Budget Trading Program.

d. Copies of all documents used to complete a CO_2 budget permit application and any other submission under the CO_2 Budget Trading Program or to demonstrate compliance with the requirements of the CO_2 Budget Trading Program.

2. The CO_2 authorized account representative of a CO_2 budget source and each CO_2 budget unit at the source shall submit the reports and compliance certifications required under the CO_2 Budget Trading Program, including those under Article 4 (9VAC5-140-6170 et seq.) of this part.

F. Liability requirements shall be as follows.

1. No permit revision shall excuse any violation of the requirements of the CO_2 Budget Trading Program that occurs prior to the date that the revision takes effect.

2. Any provision of the CO_2 Budget Trading Program that applies to a CO_2 budget source, including a provision applicable to the CO_2 authorized account representative of a CO_2 budget source, shall also apply to the owners and operators of such source and of the CO_2 budget units at the source.

3. Any provision of the CO_2 Budget Trading Program that applies to a CO_2 budget unit, including a provision applicable to the CO_2 authorized account representative of a CO_2 budget unit, shall also apply to the owners and operators of such unit.

G. No provision of the CO_2 Budget Trading Program, a CO_2 budget permit application, or a CO_2 budget permit shall be construed as exempting or excluding the owners and operators and, to the extent applicable, the CO_2 authorized account representative of the CO_2 budget source or CO_2 budget unit from compliance with any other provisions of applicable state and federal law or regulations.

9VAC5-140-6060. Computation of time. (Repealed.)

A. Unless otherwise stated, any time period scheduled, under the CO_2 Budget Trading Program, to begin on the occurrence of an act or event shall begin on the day the act or event occurs.

B. Unless otherwise stated, any time period scheduled, under the CO_2 Budget Trading Program, to begin before the occurrence of an act or event shall be computed so that the period ends the day before the act or event occurs.

C. Unless otherwise stated, if the final day of any time period, under the CO_2 Budget Trading Program, falls on a weekend or a state or federal holiday, the time period shall be extended to the next business day.

9VAC5-140-6070. Severability. (Repealed.)

If any provision of this part, or its application to any particular person or circumstances, is held invalid, the remainder of this part, and the application thereof to other persons or circumstances, shall not be affected thereby.

Article 2

CO_2 Authorized Account Representative for CO_2 Budget Sources

9VAC5-140-6080. Authorization and responsibilities of the CO2 authorized account representative. (Repealed.)

Article 2

CO_2 Authorized Account Representative for CO_2 Budget Sources

A. Except as provided under 9VAC5-140-6090, each CO_2 budget source, including all CO_2 budget units at the source, shall have one and only one CO_2 authorized account representative, with regard to all matters under the CO_2 Budget Trading Program concerning the source or any CO_2 budget unit at the source.

B. The CO_2 authorized account representative of the CO_2 budget source shall be selected by an agreement binding on the owners and operators of the source and all CO_2 budget units at the source and must act in accordance with the account certificate of representation under 9VAC5-140-6110.

C. Upon receipt by the department or its agent of a complete account certificate of representation under 9VAC5-140-6110, the CO_2 authorized account representative of the source shall represent and, by his representations, actions, inactions, or submissions, legally bind each owner and operator of the CO_2 budget source represented and each CO_2 budget unit at the source in all matters pertaining to the CO_2 Budget Trading Program, notwithstanding any agreement between the CO_2 authorized account representative and such owners and operators. The owners

and operators shall be bound by any decision or order issued to the CO_2 authorized account representative by the department or a court regarding the source or unit.

D. No CO_2 budget permit shall be issued, and no COATS account shall be established for a CO_2 budget source, until the department or its agent has received a complete account certificate of representation under 9VAC5-140-6110 for a CO_2 authorized account representative of the source and the CO_2 budget units at the source.

E. Each submission under the CO_2 Budget Trading Program shall be submitted, signed, and certified by the CO_2 authorized account representative for each CO_2 budget source on behalf of which the submission is made. Each such submission shall include the following certification statement by the CO_2 authorized account representative: "I am authorized to make this submission on behalf of the owners and operators of the CO_2 budget sources or CO_2 budget units for which the submission is made. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

F. The department or its agent will accept or act on a submission made on behalf of owners or operators of a CO_2 budget source or a CO_2 budget unit only if the submission has been made, signed, and certified in accordance with subsection E of this section.

9VAC5-140-6090. ~~CO2 authorized alternate account representative.~~ (Repealed.)

A. An account certificate of representation may designate one and only one CO_2 authorized alternate account representative who may act on behalf of the CO_2 authorized account representative. The agreement by which the CO_2 authorized alternate account representative is selected shall include a procedure for authorizing the CO_2 authorized alternate account representative to act in lieu of the CO_2 authorized account representative.

B. Upon receipt by the department or its agent of a complete account certificate of representation under 9VAC5-140-6110, any representation, action, inaction, or submission by the CO_2 authorized alternate account representative shall be deemed to be a representation, action, inaction, or submission by the CO_2 authorized account representative.

C. Except in this section and 9VAC5-140-6080 A, 9VAC5-140-6100, 9VAC5-140-6110, and 9VAC5-140-6230, whenever the term "CO_2 authorized account representative" is used in this part, the term shall be construed to include the CO_2 authorized alternate account representative.

9VAC5-140-6100. ~~Changing the CO2 authorized account representatives and the CO2 authorized alternate account representative; changes in the owners and operators.~~ (Repealed.)

A. The CO_2 authorized account representative may be changed at any time upon receipt by the department or its agent of a superseding complete account certificate of representation under 9VAC5-140-6110. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CO_2 authorized account representative or CO_2 authorized alternate account representative prior to the time and date when the department or its agent receives the superseding account certificate of representation shall be binding on the new CO_2 authorized account representative and the owners and operators of the CO_2 budget source and the CO_2 budget units at the source.

B. The CO_2 authorized alternate account representative may be changed at any time upon receipt by the department or its agent of a superseding complete account certificate of representation under 9VAC5-140-6110. Notwithstanding any such change, all representations,

~~actions, inactions, and submissions by the previous CO_2 authorized alternate account representative or CO_2 authorized alternate account representative prior to the time and date when the department or its agent receives the superseding account certificate of representation shall be binding on the new CO_2 authorized alternate account representative and the owners and operators of the CO_2 budget source and the CO_2 budget units at the source.~~

~~C. Changes in the owners and operators shall be addressed as follows.~~

~~1. In the event a new owner or operator of a CO_2 budget source or a CO_2 budget unit is not included in the list of owners and operators submitted in the account certificate of representation, such new owner or operator shall be deemed to be subject to and bound by the account certificate of representation, the representations, actions, inactions, and submissions of the CO_2 authorized account representative and any CO_2 authorized alternate account representative of the source or unit, and the decisions, orders, actions, and inactions of the department, as if the new owner or operator were included in such list.~~

~~2. Within 30 days following any change in the owners and operators of a CO_2 budget source or a CO_2 budget unit, including the addition of a new owner or operator, the CO_2 authorized account representative or CO_2 authorized alternate account representative shall submit a revision to the account certificate of representation amending the list of owners and operators to include the change.~~

9VAC5-140-6110. ~~Account certificate of representation.~~ (Repealed.)

~~A. A complete account certificate of representation for a CO_2 authorized account representative or a CO_2 authorized alternate account representative shall include the following elements in a format prescribed by the department or its agent:~~

~~1. Identification of the CO_2 budget source and each CO_2 budget unit at the source for which the account certificate of representation is submitted;~~

~~2. The name, address, email address, telephone number, and facsimile transmission number of the CO_2 authorized account representative and any CO_2 authorized alternate account representative;~~

~~3. A list of the owners and operators of the CO_2 budget source and of each CO_2 budget unit at the source;~~

~~4. The following certification statement by the CO_2 authorized account representative and any CO_2 authorized alternate account representative: "I certify that I was selected as the CO_2 authorized account representative or CO_2 authorized alternate account representative, as applicable, by an agreement binding on the owners and operators of the CO_2 budget source and each CO_2 budget unit at the source. I certify that I have all the necessary authority to carry out my duties and responsibilities under the CO_2 Budget Trading Program on behalf of the owners and operators of the CO_2 budget source and of each CO_2 budget unit at the source and that each such owner and operator shall be fully bound by my representations, actions, inactions, or submissions and by any decision or order issued to me by the department or a court regarding the source or unit."; and~~

~~5. The signature of the CO_2 authorized account representative and any CO_2 authorized alternate account representative and the dates signed.~~

~~B. Unless otherwise required by the department or its agent, documents of agreement referred to in the account certificate of representation shall not be submitted to the department or its agent. Neither the department nor its agent shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.~~

9VAC5-140-6120. ~~Objections concerning the CO2 authorized account representative.~~ (Repealed.)

~~A. Once a complete account certificate of representation under 9VAC5-140-6110 has been submitted and received, the department and its agent will rely on the account certificate of representation unless and until the department or its agent receives a superseding complete account certificate of representation under 9VAC5-140-6110.~~

~~B. Except as provided in 9VAC5-140-6100 A or B, no objection or other communication submitted to the department or its agent concerning the authorization, or any representation, action, inaction, or submission of the CO_2 authorized account representative shall affect any representation, action, inaction, or submission of the CO_2 authorized account representative or the finality of any decision or order by the department or its agent under the CO_2 Budget Trading Program.~~

~~C. Neither the department nor its agent will adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of any CO_2 authorized account representative, including private legal disputes concerning the proceeds of CO_2 allowance transfers.~~

9VAC5-140-6130. ~~Delegation by CO2 authorized account representative and CO2 authorized alternate account representative.~~ (Repealed.)

~~A. A CO_2 authorized account representative may delegate, to one or more natural persons, his authority to make an electronic submission to the department or its agent under this part.~~

~~B. A CO_2 authorized alternate account representative may delegate, to one or more natural persons, his authority to make an electronic submission to the department or its agent under this part.~~

~~C. To delegate authority to make an electronic submission to the department or its agent in accordance with subsections A and B of this section, the CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, shall submit to the department or its agent a notice of delegation, in a format prescribed by the department that includes the following elements:~~

~~1. The name, address, email address, telephone number, and facsimile transmission number of such CO_2 authorized account representative or CO_2 authorized alternate account representative;~~

~~2. The name, address, email address, telephone number, and facsimile transmission number of each such natural person, referred to as the "electronic submission agent";~~

~~3. For each such natural person, a list of the type of electronic submissions under subsection A or B of this section for which authority is delegated to him; and~~

~~4. The following certification statement by such CO_2 authorized account representative or CO_2 authorized alternate account representative: "I agree that any electronic submission to the department or its agent that is by a natural person identified in this notice of delegation and of a type listed for such electronic submission agent in this notice of delegation and that is made when I am a CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, and before this notice of delegation is superseded by another notice of delegation under 9VAC5-140-6130 D shall be deemed to be an electronic submission by me. Until this notice of delegation is superseded by another notice of delegation under 9VAC5-140-6130 D, I agree to maintain an email account and to notify the department or its agent immediately of any change in my email address unless all delegation authority by me under 9VAC5-140-6130 is terminated."~~

D. A notice of delegation submitted under subsection C of this section shall be effective, with regard to the CO_2 authorized account representative or CO_2 authorized alternate account representative identified in such notice, upon receipt of such notice by the department or its agent and until receipt by the department or its agent of a superseding notice of delegation by such CO_2 authorized account representative or CO_2 authorized alternate account representative as appropriate. The superseding notice of delegation may replace any previously identified electronic submission agent, add a new electronic submission agent, or eliminate entirely any delegation of authority.

E. Any electronic submission covered by the certification in subdivision C 4 of this section and made in accordance with a notice of delegation effective under subsection D of this section shall be deemed to be an electronic submission by the CO_2 authorized account representative or CO_2 authorized alternate account representative submitting such notice of delegation.

F. A CO_2 authorized account representative may delegate, to one or more natural persons, his authority to review information in the CO_2 allowance tracking system under this part.

G. A CO_2 authorized alternate account representative may delegate, to one or more natural persons, his authority to review information in the CO_2 allowance tracking system under this part.

H. To delegate authority to review information in the CO_2 allowance tracking system in accordance with subsections F and G of this section, the CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, shall submit to the department or its agent a notice of delegation, in a format prescribed by the department that includes the following elements:

1. The name, address, email address, telephone number, and facsimile transmission number of such CO_2 authorized account representative or CO_2 authorized alternate account representative;

2. The name, address, email address, telephone number, and facsimile transmission number of each such natural person, referred to as the "reviewer";

3. For each such natural person, a list of the type of information under subsection F or G of this section for which authority is delegated to him; and

4. The following certification statement by such CO_2 authorized account representative or CO_2 authorized alternate account representative: "I agree that any information that is reviewed by a natural person identified in this notice of delegation and of a type listed for such information accessible by the reviewer in this notice of delegation and that is made when I am a CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, and before this notice of delegation is superseded by another notice of delegation under subsection I of this section shall be deemed to be a reviewer by me. Until this notice of delegation is superseded by another notice of delegation under subsection I of this section, I agree to maintain an email account and to notify the department or its agent immediately of any change in my email address unless all delegation authority by me under this section is terminated."

I. A notice of delegation submitted under subsection H of this section shall be effective, with regard to the CO_2 authorized account representative or CO_2 authorized alternate account representative identified in such notice, upon receipt of such notice by the department or its agent and until receipt by the department or its agent of a superseding notice of delegation by such CO_2 authorized account representative or CO_2 authorized alternate account representative as appropriate. The superseding notice of delegation may replace any previously identified reviewer, add a new reviewer, or eliminate entirely any delegation of authority.

~~Article 3~~

~~Permits~~

9VAC5-140-6140. ~~CO2 budget permit requirements.~~ (Repealed.)

~~Article 3~~
~~Permits~~

~~A. Each CO_2 budget source shall have a permit issued by the department pursuant to 9VAC5-85 (Permits for Stationary Sources of Pollutants Subject to Regulation).~~

~~B. Each CO_2 budget permit shall contain all applicable CO_2 Budget Trading Program requirements and shall be a complete and distinguishable portion of the permit under subsection A of this section.~~

9VAC5-140-6150. ~~Submission of CO2 budget permit applications.~~ (Repealed.)

~~For any CO_2 budget source, the CO_2 authorized account representative shall submit a complete CO_2 budget permit application under 9VAC5-140-6160 covering such CO_2 budget source to the department by the later of January 1, 2021, or 12 months before the date on which the CO_2 budget source, or a new unit at the source, commences operation.~~

9VAC5-140-6160. ~~Information requirements for CO2 budget permit applications.~~ (Repealed.)

~~A complete CO_2 budget permit application shall include the following elements concerning the CO_2 budget source for which the application is submitted, in a format prescribed by the department:~~

~~1. Identification of the CO_2 budget source, including plant name and the ORIS (Office of Regulatory Information Systems) or facility code assigned to the source by the Energy Information Administration of the U.S. Department of Energy if applicable;~~

~~2. Identification of each CO_2 budget unit at the CO_2 budget source; and~~

~~3. The standard requirements under 9VAC5-140-6050.~~

~~Article 4~~

~~Compliance Certification~~

9VAC5-140-6170. ~~Compliance certification report.~~ (Repealed.)

~~Article 4~~
~~Compliance Certification~~

~~A. For each control period in which a CO_2 budget source is subject to the CO_2 requirements of 9VAC5-140-6050 C, the CO_2 authorized account representative of the source shall submit to the department by March 1 following the relevant control period, a compliance certification report. A compliance certification report is not required as part of the compliance obligation during an interim control period.~~

~~B. The CO_2 authorized account representative shall include in the compliance certification report under subsection A of this section the following elements, in a format prescribed by the department:~~

~~1. Identification of the source and each CO_2 budget unit at the source;~~

~~2. At the CO_2 authorized account representative's option, the serial numbers of the CO_2 allowances that are to be deducted from the source's compliance account under 9VAC5-140-6260 for the control period; and~~

~~3. The compliance certification under subsection C of this section.~~

C. In the compliance certification report under subsection A of this section, the CO_2 authorized account representative shall certify, based on reasonable inquiry of those persons with primary responsibility for operating the source and the CO_2 budget units at the source in compliance with the CO_2 Budget Trading Program, whether the source and each CO_2 budget unit at the source for which the compliance certification is submitted was operated during the calendar years covered by the report in compliance with the requirements of the CO_2 Budget Trading Program, including:

1. Whether the source was operated in compliance with the CO_2 requirements of 9VAC5-140-6050 C;

2. Whether the monitoring plan applicable to each unit at the source has been maintained to reflect the actual operation and monitoring of the unit, and contains all information necessary to attribute CO_2 emissions to the unit, in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part;

3. Whether all the CO_2 emissions from the units at the source were monitored or accounted for through the missing data procedures and reported in the quarterly monitoring reports, including whether conditional data were reported in the quarterly reports in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part. If conditional data were reported, the owner or operator shall indicate whether the status of all conditional data has been resolved and all necessary quarterly report resubmissions have been made;

4. Whether the facts that form the basis for certification under Article 8 (9VAC5-140-6330 et seq.) of this part of each monitor at each unit at the source, or for using an excepted monitoring method or alternative monitoring method approved under Article 8 (9VAC5-140-6330 et seq.) of this part, if any, have changed; and

5. If a change is required to be reported under subdivision 4 of this subsection, specify the nature of the change, the reason for the change, when the change occurred, and how the unit's compliance status was determined subsequent to the change, including what method was used to determine emissions when a change mandated the need for monitor recertification.

9VAC5-140-6180. ~~Action on compliance certifications.~~ (Repealed.)

A. The department or its agent may review and conduct independent audits concerning any compliance certification or any other submission under the CO_2 Budget Trading Program and make appropriate adjustments of the information in the compliance certifications or other submissions.

B. The department or its agent may deduct CO_2 allowances from or transfer CO_2 allowances to a source's compliance account based on the information in the compliance certifications or other submissions, as adjusted under subsection A of this section.

Article 5

CO_2 Allowance Allocations

9VAC5-140-6190. ~~Base budgets.~~ (Repealed.)

Article 5

CO_2 Allowance Allocations

A. The Virginia CO_2 Budget Trading Program base budget shall be as follows:

1.

For 2021, the Virginia CO_2 Budget Trading Program base budget is 27.16 million tons.

2. For 2022, the Virginia CO_2 Budget Trading Program base budget is 26.32 million tons.

3. For 2023, the Virginia CO_2 Budget Trading Program base budget is 25.48 million tons.

4. For 2024, the Virginia CO_2 Budget Trading Program base budget is 24.64 million tons.

5. For 2025, the Virginia CO_2 Budget Trading Program base budget is 23.80 million tons.

6. For 2026, the Virginia CO_2 Budget Trading Program base budget is 22.96 million tons.

7. For 2027, the Virginia CO_2 Budget Trading Program base budget is 22.12 million tons.

8. For 2028, the Virginia CO_2 Budget Trading Program base budget is 21.28 million tons.

9. For 2029, the Virginia CO_2 Budget Trading Program base budget is 20.44 million tons.

10. For 2030, the Virginia CO_2 Budget Trading Program base budget is 19.60 million tons.

B.

For 2031 and each succeeding calendar year, the Virginia CO_2 Budget Trading Program base budget is 19.60 million tons unless modified as a result of a program review and future regulatory action.

9VAC5-140-6200. Undistributed and unsold conditional CO2 allowances. (Repealed.)

A. The department will retire undistributed CO_2 allowances at the end of each control period.

B. The department will retire unsold CO_2 allowances at the end of each control period.

9VAC5-140-6210. CO2 allowance allocations. (Repealed.)

A. The department will allocate the Virginia CO_2 Budget Trading Program base budget CO_2 allowances to the Virginia Auction Account.

B. For allocation years 2021 through 2030, the Virginia CO_2 Budget Trading Program adjusted budget shall be the maximum number of allowances available for allocation in a given allocation year, except for CO_2 CCR allowances.

C.

In the event that the CCR is triggered during an auction, the department will allocate CO_2 CCR allowances, separate from and additional to the Virginia CO_2 Budget Trading Program base budget set forth in 9VAC5-140-6190 to the Virginia Auction Account. The CCR allocation is for the purpose of containing the cost of CO_2 allowances. The department will allocate CO_2 CCR allowances as follows:

1.

On or before January 1, 2021, and each year thereafter, the department will allocate CO_2 CCR allowances equal to the quantity in Table 140-5A.

Table 140-5A
CO_2 CCR Allowances from 2021 Forward

2021	2.716 million tons
2022	2.632 million tons
2023	2.548 million tons
2024	2.464 million tons
2025	2.380 million tons
2026	2.296 million tons
2027	2.212 million tons

2028	2.128 million tons
2029	2.044 million tons
2030 and each year thereafter	1.960 million tons

2. CCR allowances allocated for a calendar year will be automatically transferred to the Virginia Auction Account to be auctioned. Following each auction, all CO_2 CCR allowances sold at auction will be transferred to winning bidders' accounts as CO_2 CCR allowances.

3. Unsold CO_2 CCR allowances will remain in the Virginia Auction Account to be re-offered for sale at auction within the same calendar year. CO_2 CCR allowances remaining unsold at the end of the calendar year in which they were originated will be made unavailable for sale at future auctions.

D. In the event that the ECR is triggered during an auction, the department will authorize its agent to withhold CO_2 allowances as needed. The department will further authorize its agent to convert and transfer any CO_2 allowances that have been withheld from any auction into the Virginia ECR account. The ECR withholding is for the purpose of additional emission reduction in the event of lower than anticipated emission reduction costs. The department's agent will withhold CO_2 ECR allowances as follows:

1. If the condition in 9VAC5-140-6420 C 1 is met at an auction, then the maximum number of CO_2 ECR allowances that will be withheld from that auction will be equal to the quantity shown in Table 140-5B minus the total quantity of CO_2 ECR allowances that have been withheld from any prior auction in that calendar year. Any CO_2 ECR allowances withheld from an auction will be transferred into the Virginia ECR account.

Table 140-5B ECR Allowances from 2021 Forward	
2021	2.716 million tons
2022	2.632 million tons
2023	2.548 million tons
2024	2.464 million tons
2025	2.380 million tons
2026	2.296 million tons
2027	2.212 million tons
2028	2.128 million tons
2029	2.044 million tons
2030 and each year thereafter	1.960 million tons

2. Allowances that have been transferred into the Virginia ECR account shall not be withdrawn.

E. The adjustment for banked allowances will be as follows. On March 15, 2021, the department may determine the adjustment for banked allowances quantity for allocation years 2021 through 2025 through the application of the following formula:

TABA = ((TA – TAE)/5) x RS%

Where:

TABA is the adjustment for banked allowances quantity in tons.

~~TA, adjustment, is the total quantity of allowances of vintage years prior to 2021 held in general and compliance accounts, including compliance accounts established pursuant to the CO_2 Budget Trading Program but not including accounts opened by participating states, as reflected in the CO_2 Allowance Tracking System on March 15, 2021.~~

~~TAE, adjustment emissions, is the total quantity of 2018, 2019, and 2020 emissions from all CO_2 budget sources in all participating states, reported pursuant to CO_2 Budget Trading Program as reflected in the CO_2 Allowance Tracking System on March 15, 2021.~~

~~RS% is Virginia budget divided by the regional budget.~~

~~F. CO_2 Budget Trading Program adjusted budgets for 2021 through 2025 shall be determined as follows: on April 15, 2021, the department will determine the Virginia CO_2 Budget Trading Program adjusted budgets for the 2021 through 2025 allocation years by the following formula:~~

~~AB = BB – TABA~~

~~Where:~~

~~AB is the Virginia CO_2 Budget Trading Program adjusted budget.~~

~~BB is the Virginia CO_2 Budget Trading Program base budget.~~

~~TABA is the adjustment for banked allowances quantity in tons.~~

~~G. The department or its agent will publish the CO_2 trading program adjusted budgets for the 2021 through 2025 allocation years.~~

~~Article 6~~

~~CO_2 Allowance Tracking System~~

9VAC5-140-6220. ~~CO2 Allowance Tracking System accounts.~~ (Repealed.)

~~Article 6~~

~~CO_2 Allowance Tracking System~~

~~A. Consistent with 9VAC5-140-6230 A, the department or its agent will establish one compliance account for each CO_2 budget source. Allocations of CO_2 allowances pursuant to Article 5 (9VAC5-140-6190 et seq.) of this part and deductions or transfers of CO_2 allowances pursuant to 9VAC5-140-6180, 9VAC5-140-6260, 9VAC5-140-6280, or Article 7 (9VAC5-140-6300 et seq.) of this part will be recorded in the compliance accounts in accordance with this section.~~

~~B. Consistent with 9VAC5-140-6230 B, the department or its agent will establish, upon request, a general account for any person. Transfers of CO_2 allowances pursuant to Article 7 (9VAC5-140-6300 et seq.) of this part will be recorded in the general account in accordance with this article.~~

9VAC5-140-6230. ~~Establishment of accounts.~~ (Repealed.)

~~A. Upon receipt of a complete account certificate of representation under 9VAC5-140-6110, the department or its agent will establish an allowance account and a compliance account for each CO_2 budget source for which an account certificate of representation was submitted.~~

~~B. General accounts shall operate as follows.~~

~~1. Any person may apply to open a general account for the purpose of holding and transferring CO_2 allowances. An application for a general account may designate one and only one CO_2 authorized account representative and one and only one CO_2 authorized alternate account representative who may act on behalf of the CO_2 authorized account representative. The agreement by which the CO_2 authorized alternate account representative is selected shall include a procedure for authorizing the CO_2 authorized alternate account representative to act in lieu of the CO_2 authorized account~~

representative. A complete application for a general account shall be submitted to the department or its agent and shall include the following elements in a format prescribed by the department or its agent:

a. Name, address, email address, telephone number, and facsimile transmission number of the CO_2 authorized account representative and any CO_2 authorized alternate account representative;

b. At the option of the CO_2 authorized account representative, organization name and type of organization;

c. A list of all persons subject to a binding agreement for the CO_2 authorized account representative or any CO_2 authorized alternate account representative to represent their ownership interest with respect to the CO_2 allowances held in the general account;

d. The following certification statement by the CO_2 authorized account representative and any CO_2 authorized alternate account representative: "I certify that I was selected as the CO_2 authorized account representative or the CO_2 authorized alternate account representative, as applicable, by an agreement that is binding on all persons who have an ownership interest with respect to CO_2 allowances held in the general account. I certify that I have all the necessary authority to carry out my duties and responsibilities under the CO_2 Budget Trading Program on behalf of such persons and that each such person shall be fully bound by my representations, actions, inactions, or submissions and by any order or decision issued to me by the department or its agent or a court regarding the general account.";

e. The signature of the CO_2 authorized account representative and any CO_2 authorized alternate account representative and the dates signed; and

f. Unless otherwise required by the department or its agent, documents of agreement referred to in the application for a general account shall not be submitted to the department or its agent. Neither the department nor its agent shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

2. Authorization of the CO_2 authorized account representative shall be as follows:

a. Upon receipt by the department or its agent of a complete application for a general account under subdivision 1 of this subsection:

(1) The department or its agent will establish a general account for the person for whom the application is submitted.

(2) The CO_2 authorized account representative and any CO_2 authorized alternate account representative for the general account shall represent and, by his representations, actions, inactions, or submissions, legally bind each person who has an ownership interest with respect to CO_2 allowances held in the general account in all matters pertaining to the CO_2 Budget Trading Program, notwithstanding any agreement between the CO_2 authorized account representative or any CO_2 authorized alternate account representative and such person. Any such person shall be bound by any order or decision issued to the CO_2 authorized account representative or any CO_2 authorized alternate account representative by the department or its agent or a court regarding the general account.

(3) Any representation, action, inaction, or submission by any CO_2 authorized alternate account representative shall be deemed to be a representation, action, inaction, or submission by the CO_2 authorized account representative.

b. Each submission concerning the general account shall be submitted, signed, and certified by the CO_2 authorized account representative or any CO_2 authorized alternate

account representative for the persons having an ownership interest with respect to CO_2 allowances held in the general account. Each such submission shall include the following certification statement by the CO_2 authorized account representative or any CO_2 authorized alternate account representative: "I am authorized to make this submission on behalf of the persons having an ownership interest with respect to the CO_2 allowances held in the general account. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

c. The department or its agent will accept or act on a submission concerning the general account only if the submission has been made, signed, and certified in accordance with subdivision 2 b of this subsection.

3. Changing CO_2 authorized account representative and CO_2 authorized alternate account representative, and changes in persons with ownership interest, shall be accomplished as follows:

a. The CO_2 authorized account representative for a general account may be changed at any time upon receipt by the department or its agent of a superseding complete application for a general account under subdivision 1 of this subsection. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CO_2 authorized account representative, or the previous CO_2 authorized alternate account representative, prior to the time and date when the department or its agent receives the superseding application for a general account shall be binding on the new CO_2 authorized account representative and the persons with an ownership interest with respect to the CO_2 allowances in the general account.

b. The CO_2 authorized alternate account representative for a general account may be changed at any time upon receipt by the department or its agent of a superseding complete application for a general account under subdivision 1 of this subsection. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CO_2 authorized account representative, or the previous CO_2 authorized alternate account representative, prior to the time and date when the department or its agent receives the superseding application for a general account shall be binding on the new alternate CO_2 authorized account representative and the persons with an ownership interest with respect to the CO_2 allowances in the general account.

c. In the event a new person having an ownership interest with respect to CO_2 allowances in the general account is not included in the list of such persons in the application for a general account, such new person shall be deemed to be subject to and bound by the application for a general account, the representations, actions, inactions, and submissions of the CO_2 authorized account representative and any CO_2 authorized alternate account representative, and the decisions, orders, actions, and inactions of the department or its agent, as if the new person were included in such list.

d. Within 30 days following any change in the persons having an ownership interest with respect to CO_2 allowances in the general account, including the addition or deletion of persons, the CO_2 authorized account representative or any CO_2 authorized

alternate account representative shall submit a revision to the application for a general account amending the list of persons having an ownership interest with respect to the CO_2 allowances in the general account to include the change.

4. Objections concerning CO_2 authorized account representative shall be governed as follows:

a. Once a complete application for a general account under subdivision 1 of this subsection has been submitted and received, the department or its agent will rely on the application unless and until a superseding complete application for a general account under subdivision 1 of this subsection is received by the department or its agent.

b. Except as provided in subdivisions 3 a and 3 b of this subsection, no objection or other communication submitted to the department or its agent concerning the authorization, or any representation, action, inaction, or submission of the CO_2 authorized account representative or any CO_2 authorized alternate account representative for a general account shall affect any representation, action, inaction, or submission of the CO_2 authorized account representative or any CO_2 authorized alternate account representative or the finality of any decision or order by the department or its agent under the CO_2 Budget Trading Program.

c. Neither the department nor its agent will adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of the CO_2 authorized account representative or any CO_2 authorized alternate account representative for a general account, including private legal disputes concerning the proceeds of CO_2 allowance transfers.

5. Delegation by CO_2 authorized account representative and CO_2 authorized alternate account representative shall be accomplished as follows:

a. A CO_2 authorized account representative may delegate, to one or more natural persons, his authority to make an electronic submission to the department or its agent provided for under this article and Article 7 (9VAC5-140-6300 et seq.) of this part.

b. A CO_2 authorized alternate account representative may delegate, to one or more natural persons, his authority to make an electronic submission to the department or its agent provided for under this article and Article 7 (9VAC5-140-6300 et seq.) of this part.

c. To delegate authority to make an electronic submission to the department or its agent in accordance with subdivisions 5 a and 5 b of this subsection, the CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, shall submit to the department or its agent a notice of delegation, in a format prescribed by the department that includes the following elements:

(1) The name, address, email address, telephone number, and facsimile transmission number of such CO_2 authorized account representative or CO_2 authorized alternate account representative;

(2) The name, address, email address, telephone number, and facsimile transmission number of each such natural person, referred to as "electronic submission agent";

(3) For each such natural person, a list of the type of electronic submissions under subdivision 5 c (1) or 5 c (2) of this subsection for which authority is delegated to him; and

(4) The following certification statement by such CO_2 authorized account representative or CO_2 authorized alternate account representative: "I agree that any electronic submission to the department or its agent that is by a natural person

identified in this notice of delegation and of a type listed for such electronic submission agent in this notice of delegation and that is made when I am a CO_2 authorized account representative or CO_2 authorized alternate account representative, as appropriate, and before this notice of delegation is superseded by another notice of delegation under 9VAC5-140-6230 B 5 d shall be deemed to be an electronic submission by me. Until this notice of delegation is superseded by another notice of delegation under 9VAC5-140-6230 B 5 d, I agree to maintain an email account and to notify the department or its agent immediately of any change in my email address unless all delegation authority by me under 9VAC5-140-6230 B 5 is terminated."

d. A notice of delegation submitted under subdivision 5 c of this subsection shall be effective, with regard to the CO_2 authorized account representative or CO_2 authorized alternate account representative identified in such notice, upon receipt of such notice by the department or its agent and until receipt by the department or its agent of a superseding notice of delegation by such CO_2 authorized account representative or CO_2 authorized alternate account representative as appropriate. The superseding notice of delegation may replace any previously identified electronic submission agent, add a new electronic submission agent, or eliminate entirely any delegation of authority.

e. Any electronic submission covered by the certification in subdivision 5 c (4) of this subsection and made in accordance with a notice of delegation effective under subdivision 5 d of this subsection shall be deemed to be an electronic submission by the CO_2 authorized account representative or CO_2 authorized alternate account representative submitting such notice of delegation.

C. The department or its agent will assign a unique identifying number to each account established under subsection A or B of this section.

9VAC5-140-6240. ~~CO2 Allowance Tracking System responsibilities of CO2 authorized account representative.~~ (Repealed.)

Following the establishment of a COATS account, all submissions to the department or its agent pertaining to the account, including submissions concerning the deduction or transfer of CO_2 allowances in the account, shall be made only by the CO_2 authorized account representative for the account.

9VAC5-140-6250. ~~Recordation of CO2 allowance allocations.~~ (Repealed.)

A. By January 1 of each calendar year, the department or its agent will record in the following accounts:

1. In each CO_2 budget source's allowance account, the CO_2 allowances allocated to those sources by the department prior to being auctioned; and

2. In each CO_2 budget source's compliance account, the allowances purchased at auction by CO_2 budget units at the source under 9VAC5-140-6210 A.

B. Each year the department or its agent will record CO_2 allowances, as allocated to the unit under Article 5 (9VAC5-140-6190 et seq.) of this part, in the compliance account for the year after the last year for which CO_2 allowances were previously allocated to the compliance account. Each year, the department or its agent will also record CO_2 allowances, as allocated under Article 5 (9VAC5-140-6190 et seq.) of this part, in an allocation set-aside for the year after the last year for which CO_2 allowances were previously allocated to an allocation set-aside.

C. Serial numbers for allocated CO_2 allowances shall be managed as follows. When allocating CO_2 allowances to and recording them in an account, the department or its agent will assign each CO_2 allowance a unique identification number that will include digits identifying the year for which the CO_2 allowance is allocated.

9VAC5-140-6260. ~~Compliance.~~ (Repealed.)

~~A. CO_2 allowances that meet the following criteria are available to be deducted for a CO_2 budget source to comply with the CO_2 requirements of 9VAC5-140-6050 C for a control period or an interim control period.~~

~~1. The CO_2 allowances are of allocation years that fall within a prior control period, the same control period, or the same interim control period for which the allowances will be deducted.~~

~~2. The CO_2 allowances are held in the CO_2 budget source's compliance account as of the CO_2 allowance transfer deadline for that control period or interim control period or are transferred into the compliance account by a CO_2 allowance transfer correctly submitted for recordation under 9VAC5-140-6300 by the CO_2 allowance transfer deadline for that control period or interim control period.~~

~~3. For CO_2 offset allowances generated by other participating states, the number of CO_2 offset allowances that are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of 9VAC5-140-6050 C for a control period or an interim control period shall not exceed 3.3% of the CO_2 budget source's CO_2 emissions for that control period, or may not exceed 3.3% of 0.50 times the CO_2 budget source's CO_2 emissions for an interim control period, as determined in accordance with this article and Article 8 (9VAC5-140-6330 et seq.) of this part.~~

~~4. The CO_2 allowances are not necessary for deductions for excess emissions for a prior control period under subsection D of this section.~~

~~B. Following the recordation, in accordance with 9VAC5-140-6310, of CO_2 allowance transfers submitted for recordation in the CO_2 budget source's compliance account by the CO_2 allowance transfer deadline for a control period or an interim control period, the department or its agent will deduct CO_2 allowances available under subsection A of this section to cover the source's CO_2 emissions, as determined in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part, for the control period or interim control period, as follows:~~

~~1. Until the amount of CO_2 allowances deducted equals the number of tons of total CO_2 emissions, or 0.50 times the number of tons of total CO_2 emissions for an interim control period, determined in accordance with Article 8 (9VAC5-140-6330 et seq.) of this part, from all CO_2 budget units at the CO_2 budget source for the control period or interim control period; or~~

~~2. If there are insufficient CO_2 allowances to complete the deductions in subdivision 1 of this subsection, until no more CO_2 allowances available under subsection A of this section remain in the compliance account.~~

~~C. Identification of available CO_2 allowances by serial number and default compliance deductions shall be managed as follows:~~

~~1. The CO_2 authorized account representative for a source's compliance account may request that specific CO_2 allowances, identified by serial number, in the compliance account be deducted for emissions or excess emissions for a control period or interim control period in accordance with subsection B or D of this section. Such identification shall be made in the compliance certification report submitted in accordance with 9VAC5-140-6170.~~

~~2. The department or its agent will deduct CO_2 allowances for an interim control period or a control period from the CO_2 budget source's compliance account, in the absence of an identification or in the case of a partial identification of available CO_2 allowances by serial number under subdivision 1 of this subsection, as follows: Any CO_2 allowances that are available for deduction under subdivision 1 of this subsection. CO_2 allowances shall be~~

deducted in chronological order (i.e., CO_2 allowances from earlier allocation years shall be deducted before CO_2 allowances from later allocation years). In the event that some, but not all, CO_2 allowances from a particular allocation year are to be deducted, CO_2 allowances shall be deducted by serial number, with lower serial number allowances deducted before higher serial number allowances.

D. Deductions for excess emissions shall be managed as follows.

1. After making the deductions for compliance under subsection B of this section, the department or its agent will deduct from the CO_2 budget source's compliance account a number of CO_2 allowances equal to three times the number of the source's excess emissions. In the event that a source has insufficient CO_2 allowances to cover three times the number of the source's excess emissions, the source shall be required to immediately transfer sufficient allowances into its compliance account.

2. Any CO_2 allowance deduction required under subdivision 1 of this subsection shall not affect the liability of the owners and operators of the CO_2 budget source or the CO_2 budget units at the source for any fine, penalty, or assessment, or their obligation to comply with any other remedy, for the same violation, as ordered under applicable state law. The following guidelines will be followed in assessing fines, penalties, or other obligations:

a. For purposes of determining the number of days of violation, if a CO_2 budget source has excess emissions for a control period, each day in the control period constitutes a day in violation unless the owners and operators of the unit demonstrate that a lesser number of days should be considered.

b. Each ton of excess emissions is a separate violation.

c. For purposes of determining the number of days of violation, if a CO_2 budget source has excess interim emissions for an interim control period, each day in the interim control period constitutes a day in violation unless the owners and operators of the unit demonstrate that a lesser number of days should be considered.

d. Each ton of excess interim emissions is a separate violation.

3. The propriety of the department's determination that a CO_2 budget source had excess emissions and the concomitant deduction of CO_2 allowances from that CO_2 budget source's account may be later challenged in the context of the initial administrative enforcement, or any civil or criminal judicial action arising from or encompassing that excess emissions violation. The commencement or pendency of any administrative enforcement, or civil or criminal judicial action arising from or encompassing that excess emissions violation will not act to prevent the department or its agent from initially deducting the CO_2 allowances resulting from the department's original determination that the relevant CO_2 budget source has had excess emissions. Should the department's determination of the existence or extent of the CO_2 budget source's excess emissions be revised either by a settlement or final conclusion of any administrative or judicial action, the department will act as follows:

a. In any instance where the department's determination of the extent of excess emissions was too low, the department will take further action under subdivisions 1 and 2 of this subsection to address the expanded violation.

b. In any instance where the department's determination of the extent of excess emissions was too high, the department will distribute to the relevant CO_2 budget source a number of CO_2 allowances equaling the number of CO_2 allowances deducted which are attributable to the difference between the original and final quantity of excess emissions. Should such CO_2 budget source's compliance account no longer exist, the

~~CO_2 allowances will be provided to a general account selected by the owner or operator of the CO_2 budget source from which they were originally deducted.~~

~~E. The department or its agent will record in the appropriate compliance account all deductions from such an account pursuant to subsections B and D of this section.~~

~~F. Action by the department on submissions shall be as follows:~~

~~1. The department may review and conduct independent audits concerning any submission under the CO_2 Budget Trading Program and make appropriate adjustments of the information in the submissions.~~

~~2. The department may deduct CO_2 allowances from or transfer CO_2 allowances to a source's compliance account based on information in the submissions, as adjusted under subdivision 1 of this subsection.~~

9VAC5-140-6270. ~~Banking.~~ (Repealed.)

~~Each CO_2 allowance that is held in a compliance account or a general account will remain in such account unless and until the CO_2 allowance is deducted or transferred under 9VAC5-140-6180, 9VAC5-140-6260, 9VAC5-140-6280, or Article 7 (9VAC5-140-6300 et seq.) of this part.~~

9VAC5-140-6280. ~~Account error.~~ (Repealed.)

~~The department or its agent may, at its sole discretion and on its own motion, correct any error in any COATS account. Within 10 business days of making such correction, the department or its agent will notify the CO_2 authorized account representative for the account.~~

9VAC5-140-6290. ~~Closing of general accounts.~~ (Repealed.)

~~A. A CO_2 authorized account representative of a general account may instruct the department or its agent to close the account by submitting a statement requesting deletion of the account from the COATS and by correctly submitting for recordation under 9VAC5-140-6300 a CO_2 allowance transfer of all CO_2 allowances in the account to one or more other COATS accounts.~~

~~B. If a general account shows no activity for a period of one year or more and does not contain any CO_2 allowances, the department or its agent may notify the CO_2 authorized account representative for the account that the account will be closed in the COATS 30 business days after the notice is sent. The account will be closed after the 30-day period unless before the end of the 30-day period the department or its agent receives a correctly submitted transfer of CO_2 allowances into the account under 9VAC5-140-6300 or a statement submitted by the CO_2 authorized account representative demonstrating to the satisfaction of the department or its agent good cause as to why the account should not be closed. The department or its agent will have sole discretion to determine if the owner or operator of the unit demonstrated that the account should not be closed.~~

~~Article 7~~

~~CO_2 Allowance Transfers~~

9VAC5-140-6300. ~~Submission of CO2 allowance transfers.~~ (Repealed.)

~~Article 7~~

~~CO_2 Allowance Transfers~~

~~The CO_2 authorized account representatives seeking recordation of a CO_2 allowance transfer shall submit the transfer to the department or its agent. To be considered correctly submitted, the CO_2 allowance transfer shall include the following elements in a format specified by the department or its agent:~~

~~1. The numbers identifying both the transferor and transferee accounts;~~

~~2. A specification by serial number of each CO_2 allowance to be transferred;~~

3. The printed name and signature of the CO_2 authorized account representative of the transferor account and the date signed;

4. The date of the completion of the last sale or purchase transaction for the allowance, if any; and

5. The purchase or sale price of the allowance that is the subject of a sale or purchase transaction under subdivision 4 of this section.

9VAC5-140-6310. ~~Recordation.~~ (Repealed.)

A. Within five business days of receiving a CO_2 allowance transfer, except as provided in subsection B of this section, the department or its agent will record a CO_2 allowance transfer by moving each CO_2 allowance from the transferor account to the transferee account as specified by the request, provided that:

1. The transfer is correctly submitted under 9VAC5-140-6300; and

2. The transferor account includes each CO_2 allowance identified by serial number in the transfer.

B. A CO_2 allowance transfer into or out of a compliance account that is submitted for recordation following the CO_2 allowance transfer deadline and that includes any CO_2 allowances that are of allocation years that fall within a control period prior to or the same as the control period to which the CO_2 allowance transfer deadline applies will not be recorded until after completion of the process pursuant to 9VAC5-140-6260 B.

C. Where a CO_2 allowance transfer submitted for recordation fails to meet the requirements of subsection A of this section, the department or its agent will not record such transfer.

9VAC5-140-6320. ~~Notification.~~ (Repealed.)

A. Within five business days of recordation of a CO_2 allowance transfer under 9VAC5-140-6310, the department or its agent will notify each party to the transfer. Notice will be given to the CO_2 authorized account representatives of both the transferor and transferee accounts.

B. Within 10 business days of receipt of a CO_2 allowance transfer that fails to meet the requirements of 9VAC5-140-6310 A, the department or its agent will notify the CO_2 authorized account representatives of both accounts subject to the transfer of (i) a decision not to record the transfer and (ii) the reasons for such nonrecordation.

C. Nothing in this section shall preclude the submission of a CO_2 allowance transfer for recordation following notification of nonrecordation.

9VAC5-140-6325. ~~Life-of-the-unit contractual arrangements.~~ (Repealed.)

A. A power purchaser entered into a life-of-the-unit contractual arrangement as described in subdivision b of the definition of "life-of-the-unit contractual arrangement" with a CO_2 budget source or unit shall be responsible for acquiring and transferring all allowances to the CO_2 budget source or unit that are necessary for demonstrating compliance with the CO_2 budget trading program.

B. The CO_2 budget source or unit shall provide a copy of the energy conversion or energy tolling agreement to the department within six months of July 10, 2020. If such agreement is subject to third-party disclosure restrictions, the CO_2 budget source or unit shall provide purchaser within 10 days prior written notice of its intention to disclose the agreement to the department and request confidential treatment from the public disclosure of such agreement. The department will grant a request for confidential treatment pursuant to applicable statutory and regulatory requirements addressing confidential information.

C. The CO_2 budget source or unit shall be responsible for compliance with and otherwise be subject to all other requirements of this part and the CO_2 budget trading program.

~~Article 8~~

~~Monitoring, Reporting, and Recordkeeping~~

9VAC5-140-6330. ~~General requirements.~~ (Repealed.)

~~Article 8~~

~~Monitoring, Reporting, and Recordkeeping~~

~~A. The owners and operators, and to the extent applicable, the CO_2 authorized account representative of a CO_2 budget unit shall comply with the monitoring, recordkeeping, and reporting requirements as provided in this section and all applicable sections of 40 CFR Part 75. Where referenced in this article, the monitoring requirements of 40 CFR Part 75 shall be adhered to in a manner consistent with the purpose of monitoring and reporting CO_2 mass emissions pursuant to this part. For purposes of complying with such requirements, the definitions in 9VAC5-140-6020 and in 40 CFR 72.2 shall apply, and the terms "affected unit," "designated representative," and "CEMS" in 40 CFR Part 75 shall be replaced by the terms "CO_2 budget unit," "CO_2 authorized account representative," and "CEMS," respectively, as defined in 9VAC5-140-6020. For units not subject to an Acid Rain emissions limitation, the term "administrator" in 40 CFR Part 75 shall be replaced with "the department or its agent." Owners or operators of a CO_2 budget unit who monitor a non-CO_2 budget unit pursuant to the common, multiple, or bypass stack procedures in 40 CFR 75.72(b)(2)(ii), or 40 CFR 75.16 (b)(2)(ii)(B) pursuant to 40 CFR 75.13, for purposes of complying with this part, shall monitor and report CO_2 mass emissions from such non-CO_2 budget units according to the procedures for CO_2 budget units established in this article.~~

~~B. The owner or operator of each CO_2 budget unit shall meet the following general requirements for installation, certification, and data accounting.~~

~~1. Install all monitoring systems necessary to monitor CO_2 mass emissions in accordance with 40 CFR Part 75, except for equation G-1. Equation G-1 in Appendix G shall not be used to determine CO_2 emissions under this part. This may require systems to monitor CO_2 concentration, stack gas flow rate, O_2 concentration, heat input, and fuel flow rate.~~

~~2. Successfully complete all certification tests required under 9VAC5-140-6340 and meet all other requirements of this section and 40 CFR Part 75 applicable to the monitoring systems under subdivision 1 of this subsection.~~

~~3. Record, report, and quality-assure the data from the monitoring systems under subdivision 1 of this subsection.~~

~~C. The owner or operator shall meet the monitoring system certification and other requirements of subsection B of this section on or before the following dates. The owner or operator shall record, report, and quality-assure the data from the monitoring systems under subdivision B 1 of this section on and after the following dates:~~

~~1. The owner or operator of a CO_2 budget unit, except for a CO_2 budget unit under subdivision 2 of this subsection, shall comply with the requirements of this section by January 1, 2021.~~

~~2. The owner or operator of a CO_2 budget unit that commences commercial operation July 1, 2021, shall comply with the requirements of this section by (i) January 1, 2022, or (ii) the earlier of 90 unit operating days after the date on which the unit commences commercial operation or 180 calendar days after the date on which the unit commences commercial operation.~~

~~3. For the owner or operator of a CO_2 budget unit for which construction of a new stack or flue installation is completed after the applicable deadline under subdivision 1 or 2 of this subsection by the earlier of (i) 90 unit operating days after the date on which emissions~~

first exit to the atmosphere through the new stack or flue or (ii) 180 calendar days after the date on which emissions first exit to the atmosphere through the new stack or flue.

D. Data shall be reported as follows:

1. Except as provided in subdivision 2 of this subsection, the owner or operator of a CO_2 budget unit that does not meet the applicable compliance date set forth in subsection C of this section for any monitoring system under subdivision B 1 of this section shall, for each such monitoring system, determine, record, and report maximum potential, or as appropriate minimum potential, values for CO_2 concentration, CO_2 emissions rate, stack gas moisture content, fuel flow rate, heat input, and any other parameter required to determine CO_2 mass emissions in accordance with 40 CFR 75.31(b)(2) or (c)(3) or Section 2.4 of Appendix D of 40 CFR Part 75 as applicable.

2. The owner or operator of a CO_2 budget unit that does not meet the applicable compliance date set forth in subdivision C 3 of this section for any monitoring system under subdivision B 1 of this section shall, for each such monitoring system, determine, record, and report substitute data using the applicable missing data procedures in Subpart D, or Appendix D of 40 CFR Part 75, in lieu of the maximum potential, or as appropriate minimum potential, values for a parameter if the owner or operator demonstrates that there is continuity between the data streams for that parameter before and after the construction or installation under subdivision C 3 of this section.

a. CO_2 budget units subject to an Acid Rain emissions limitation or CSAPR NO_X Ozone Season Trading Program that qualify for the optional SO_2, NO_x, and CO_2 (for Acid Rain) or NO_X (for CSAPR NO_X Ozone Season Trading Program) emissions calculations for low mass emissions (LME) units under 40 CFR 75.19 and report emissions for such programs using the calculations under 40 CFR 75.19, shall also use the CO_2 emissions calculations for LME units under 40 CFR 75.19 for purposes of compliance with these regulations.

b. CO_2 budget units subject to an Acid Rain emissions limitation that do not qualify for the optional SO_2, NO_x, and CO_2 (for Acid Rain) or NO_X (for CSAPR NO_X Ozone Season Trading Program) emissions calculations for LME units under 40 CFR 75.19 shall not use the CO_2 emissions calculations for LME units under 40 CFR 75.19 for purposes of compliance with these regulations.

c. CO_2 budget units not subject to an Acid Rain emissions limitation shall qualify for the optional CO_2 emissions calculation for LME units under 40 CFR 75.19, provided that they emit less than 100 tons of NO_X annually and no more than 25 tons of SO_2 annually.

3. The owner or operator of a CO_2 budget unit shall report net-electric output data to the department as required by Article 5 (9VAC5-140-6190 et seq.) of this part.

E. Prohibitions shall be as follows.

1. No owner or operator of a CO_2 budget unit shall use any alternative monitoring system, alternative reference method, or any other alternative for the required CEMS without having obtained prior written approval in accordance with 9VAC5-140-6380.

2. No owner or operator of a CO_2 budget unit shall operate the unit so as to discharge, or allow to be discharged, CO_2 emissions to the atmosphere without accounting for all such emissions in accordance with the applicable provisions of this article and 40 CFR Part 75.

3. No owner or operator of a CO_2 budget unit shall disrupt the CEMS, any portion thereof, or any other approved emissions monitoring method, and thereby avoid monitoring and recording CO_2 mass emissions discharged into the atmosphere, except for periods of

~~recertification or periods when calibration, quality assurance testing, or maintenance is performed in accordance with the applicable provisions of this article and 40 CFR Part 75.~~

~~4. No owner or operator of a CO_2 budget unit shall retire or permanently discontinue use of the CEMS, any component thereof, or any other approved emissions monitoring system under this article, except under any one of the following circumstances:~~

~~a. The owner or operator is monitoring emissions from the unit with another certified monitoring system approved, in accordance with the applicable provisions of this article and 40 CFR Part 75, by the department for use at that unit that provides emissions data for the same pollutant or parameter as the retired or discontinued monitoring system; or~~

~~b. The CO_2 authorized account representative submits notification of the date of certification testing of a replacement monitoring system in accordance with 9VAC5-140-6340 D 3 a.~~

9VAC5-140-6340. ~~Initial certification and recertification procedures.~~ (Repealed.)

~~A. The owner or operator of a CO_2 budget unit shall be exempt from the initial certification requirements of this section for a monitoring system under 9VAC5-140-6330 B 1 if the following conditions are met:~~

~~1. The monitoring system has been previously certified in accordance with 40 CFR Part 75; and~~

~~2. The applicable quality-assurance and quality-control requirements of 40 CFR 75.21 and Appendix B and Appendix D of 40 CFR Part 75 are fully met for the certified monitoring system described in subdivision 1 of this subsection.~~

~~B. The recertification provisions of this section shall apply to a monitoring system under 9VAC5-140-6330 B 1 exempt from initial certification requirements under subsection A of this section.~~

~~C. Notwithstanding subsection A of this section, if the administrator has previously approved a petition under 40 CFR 75.72(b)(2)(ii), or 40 CFR 75.16(b)(2)(ii)(B) as pursuant to 40 CFR 75.13 for apportioning the CO_2 emissions rate measured in a common stack or a petition under 40 CFR 75.66 for an alternative requirement in 40 CFR Part 75, the CO_2 authorized account representative shall submit the petition to the department under 9VAC5-140-6380 A to determine whether the approval applies under this program.~~

~~D. Except as provided in subsection A of this section, the owner or operator of a CO_2 budget unit shall comply with the following initial certification and recertification procedures for a CEMS and an excepted monitoring system under Appendix D of 40 CFR Part 75 and under 9VAC5-140-6330 B 1. The owner or operator of a unit that qualifies to use the low mass emissions excepted monitoring methodology in 40 CFR 75.19 or that qualifies to use an alternative monitoring system under Subpart E of 40 CFR Part 75 shall comply with the procedures in subsection E or F of this section, respectively.~~

~~1. For initial certification, the owner or operator shall ensure that each CEMS required under 9VAC5-140-6330 B 1, which includes the automated DAHS, successfully completes all of the initial certification testing required under 40 CFR 75.20 by the applicable deadlines specified in 9VAC5-140-6330 C. In addition, whenever the owner or operator installs a monitoring system to meet the requirements of this article in a location where no such monitoring system was previously installed, initial certification in accordance with 40 CFR 75.20 is required.~~

~~2. For recertification, the following requirements shall apply.~~

~~a. Whenever the owner or operator makes a replacement, modification, or change in a certified CEMS under 9VAC5-140-6330 B 1 that the administrator or the department~~

~~determines significantly affects the ability of the system to accurately measure or record CO_2 mass emissions or to meet the quality-assurance and quality-control requirements of 40 CFR 75.21 or Appendix B to 40 CFR Part 75, the owner or operator shall recertify the monitoring system according to 40 CFR 75.20(b).~~

~~b. For systems using stack measurements such as stack flow, stack moisture content, CO_2 or O_2 monitors, whenever the owner or operator makes a replacement, modification, or change to the flue gas handling system or the unit's operation that the administrator or the department determines to significantly change the flow or concentration profile, the owner or operator shall recertify the CEMS according to 40 CFR 75.20(b). Examples of changes that require recertification include replacement of the analyzer, change in location or orientation of the sampling probe or site, or change of flow rate monitor polynomial coefficients.~~

~~3. The approval process for initial certifications and recertification shall be as follows: subdivisions 3 a through 3 d of this subsection apply to both initial certification and recertification of a monitoring system under 9VAC5-140-6330 B 1. For recertifications, replace the words "certification" and "initial certification" with the word "recertification," replace the word "certified" with "recertified," and proceed in the manner prescribed in 40 CFR 75.20(b)(5) and (g)(7) in lieu of subdivision 3 e of this subsection.~~

~~a. The CO_2 authorized account representative shall submit to the department or its agent, the appropriate EPA Regional Office and the administrator a written notice of the dates of certification in accordance with 9VAC5-140-6360.~~

~~b. The CO_2 authorized account representative shall submit to the department or its agent a certification application for each monitoring system. A complete certification application shall include the information specified in 40 CFR 75.63.~~

~~c. The provisional certification date for a monitor shall be determined in accordance with 40 CFR 75.20(a)(3). A provisionally certified monitor may be used under the CO_2 Budget Trading Program for a period not to exceed 120 days after receipt by the department of the complete certification application for the monitoring system or component thereof under subdivision 3 b of this subsection. Data measured and recorded by the provisionally certified monitoring system or component thereof, in accordance with the requirements of 40 CFR Part 75, will be considered valid quality-assured data, retroactive to the date and time of provisional certification, provided that the department does not invalidate the provisional certification by issuing a notice of disapproval within 120 days of receipt of the complete certification application by the department.~~

~~d. The department will issue a written notice of approval or disapproval of the certification application to the owner or operator within 120 days of receipt of the complete certification application under subdivision 3 b of this subsection. In the event the department does not issue such a notice within such 120-day period, each monitoring system that meets the applicable performance requirements of 40 CFR Part 75 and is included in the certification application will be deemed certified for use under the CO_2 Budget Trading Program.~~

~~(1) If the certification application is complete and shows that each monitoring system meets the applicable performance requirements of 40 CFR Part 75, then the department will issue a written notice of approval of the certification application within 120 days of receipt.~~

~~(2) If the certification application is incomplete, then the department will issue a written notice of incompleteness that sets a reasonable date by which the CO_2 authorized account representative shall submit the additional information required to complete the~~

certification application. If the CO_2 authorized account representative does not comply with the notice of incompleteness by the specified date, then the department may issue a notice of disapproval under subdivision 3 d (3) of this subsection. The 120-day review period shall not begin before receipt of a complete certification application.

(3) If the certification application shows that any monitoring system or component thereof does not meet the performance requirements of 40 CFR Part 75, or if the certification application is incomplete and the requirement for disapproval under subdivision 3 d (2) of this subsection is met, then the department will issue a written notice of disapproval of the certification application. Upon issuance of such notice of disapproval, the provisional certification is invalidated by the department and the data measured and recorded by each uncertified monitoring system or component thereof shall not be considered valid quality assured data beginning with the date and hour of provisional certification. The owner or operator shall follow the procedures for loss of certification in subdivision 3 e of this subsection for each monitoring system or component thereof, which is disapproved for initial certification.

(4) The department may issue a notice of disapproval of the certification status of a monitor in accordance with 9VAC5-140-6350 B.

e. If the department issues a notice of disapproval of a certification application under subdivision 3 d (3) of this subsection or a notice of disapproval of certification status under subdivision 3 d (3) of this subsection, then:

(1) The owner or operator shall substitute the following values for each disapproved monitoring system, for each hour of unit operation during the period of invalid data beginning with the date and hour of provisional certification and continuing until the time, date, and hour specified under 40 CFR 75.20(a)(5)(i) or 40 CFR 75.20(g)(7): (i) for units using or intending to monitor for CO_2 mass emissions using heat input or for units using the low mass emissions excepted methodology under 40 CFR 75.19, the maximum potential hourly heat input of the unit; or (ii) for units intending to monitor for CO_2 mass emissions using a CO_2 pollutant concentration monitor and a flow monitor, the maximum potential concentration of CO_2 and the maximum potential flow rate of the unit under Section 2.1 of Appendix A of 40 CFR Part 75;

(2) The CO_2 authorized account representative shall submit a notification of certification retest dates and a new certification application in accordance with subdivisions 3 a and 3 b of this subsection; and

(3) The owner or operator shall repeat all certification tests or other requirements that were failed by the monitoring system, as indicated in the department's notice of disapproval, no later than 30 unit operating days after the date of issuance of the notice of disapproval.

E. The owner or operator of a unit qualified to use the low mass emissions excepted methodology under 9VAC5-140-6330 D 3 shall meet the applicable certification and recertification requirements of 40 CFR 75.19(a)(2), 40 CFR 75.20(h), and this section. If the owner or operator of such a unit elects to certify a fuel flow meter system for heat input determinations, the owner or operator shall also meet the certification and recertification requirements in 40 CFR 75.20(g).

F. The CO_2 authorized account of each unit for which the owner or operator intends to use an alternative monitoring system approved by the administrator and, if applicable, the department under Subpart E of 40 CFR Part 75 shall comply with the applicable notification and application procedures of 40 CFR 75.20(f).

9VAC5-140-6350. ~~Out-of-control periods.~~ (Repealed.)

~~A. Whenever any monitoring system fails to meet the quality assurance/quality control (QA/QC) requirements or data validation requirements of 40 CFR Part 75, data shall be substituted using the applicable procedures in Subpart D or Appendix D of 40 CFR Part 75.~~

~~B. Whenever both an audit of a monitoring system and a review of the initial certification or recertification application reveal that any monitoring system should not have been certified or recertified because it did not meet a particular performance specification or other requirement under 9VAC5-140-6340 or the applicable provisions of 40 CFR Part 75, both at the time of the initial certification or recertification application submission and at the time of the audit, the department or administrator will issue a notice of disapproval of the certification status of such monitoring system. For the purposes of this subsection, an audit shall be either a field audit or an audit of any information submitted to the department or the administrator. By issuing the notice of disapproval, the department or administrator revokes prospectively the certification status of the monitoring system. The data measured and recorded by the monitoring system shall not be considered valid quality-assured data from the date of issuance of the notification of the revoked certification status until the date and time that the owner or operator completes subsequently approved initial certification or recertification tests for the monitoring system. The owner or operator shall follow the initial certification or recertification procedures in 9VAC5-140-6340 for each disapproved monitoring system.~~

9VAC5-140-6360. ~~Notifications.~~ (Repealed.)

~~The CO_2 authorized account representative for a CO_2 budget unit shall submit written notice to the department and the administrator in accordance with 40 CFR 75.61.~~

9VAC5-140-6370. ~~Recordkeeping and reporting.~~ (Repealed.)

~~A. The CO_2 authorized account representative shall comply with all recordkeeping and reporting requirements in this section, the applicable recordkeeping and reporting requirements under 40 CFR 75.73, and the requirements of 9VAC5-140-6080 E.~~

~~B. The owner or operator of a CO_2 budget unit shall submit a monitoring plan in the manner prescribed in 40 CFR 75.62.~~

~~C. The CO_2 authorized account representative shall submit an application to the department within 45 days after completing all CO_2 monitoring system initial certification or recertification tests required under 9VAC5-140-6340, including the information required under 40 CFR 75.63 and 40 CFR 75.53(e) and (f).~~

~~D. The CO_2 authorized account representative shall submit quarterly reports, as follows:~~

~~1. The CO_2 authorized account representative shall report the CO_2 mass emissions data for the CO_2 budget unit, in an electronic format prescribed by the department unless otherwise prescribed by the department for each calendar quarter.~~

~~2. The CO_2 authorized account representative shall submit each quarterly report to the department or its agent within 30 days following the end of the calendar quarter covered by the report. Quarterly reports shall be submitted in the manner specified in Subpart H of 40 CFR Part 75 and 40 CFR 75.64. Quarterly reports shall be submitted for each CO_2 budget unit, or group of units using a common stack, and shall include all of the data and information required in Subpart G of 40 CFR Part 75, except for opacity, heat input, NO_x, and SO_2 provisions.~~

~~3. The CO_2 authorized account representative shall submit to the department or its agent a compliance certification in support of each quarterly report based on reasonable inquiry of those persons with primary responsibility for ensuring that all of the unit's emissions are correctly and fully monitored. The certification shall state that:~~

a. The monitoring data submitted were recorded in accordance with the applicable requirements of this article and 40 CFR Part 75, including the quality assurance procedures and specifications;

b. For a unit with add-on CO_2 emissions controls and for all hours where data are substituted in accordance with 40 CFR 75.34(a)(1), the add-on emissions controls were operating within the range of parameters listed in the QA/QC program under Appendix B of 40 CFR Part 75 and the substitute values do not systematically underestimate CO_2 emissions; and

c. The CO_2 concentration values substituted for missing data under Subpart D of 40 CFR Part 75 do not systematically underestimate CO_2 emissions.

9VAC5-140-6380. ~~Petitions.~~ (Repealed.)

A. Except as provided in subsection C of this section, the CO_2 authorized account representative of a CO_2 budget unit that is subject to an Acid Rain emissions limitation may submit a petition to the administrator under 40 CFR 75.66 and to the department requesting approval to apply an alternative to any requirement of 40 CFR Part 75. Application of an alternative to any requirement of 40 CFR Part 75 is in accordance with this article only to the extent that the petition is approved in writing by the administrator, and subsequently approved in writing by the department.

B. Petitions for a CO_2 budget unit that is not subject to an Acid Rain emissions limitation shall meet the following requirements.

1. The CO_2 authorized account representative of a CO_2 budget unit that is not subject to an Acid Rain emissions limitation may submit a petition to the administrator under 40 CFR 75.66 and to the department requesting approval to apply an alternative to any requirement of 40 CFR Part 75. Application of an alternative to any requirement of 40 CFR Part 75 is in accordance with this article only to the extent that the petition is approved in writing by the administrator and subsequently approved in writing by the department.

2. In the event that the administrator declines to review a petition under subdivision 1 of this subsection, the CO_2 authorized account representative of a CO_2 budget unit that is not subject to an Acid Rain emissions limitation may submit a petition to the department requesting approval to apply an alternative to any requirement of this article. That petition shall contain all of the relevant information specified in 40 CFR 75.66. Application of an alternative to any requirement of this article is in accordance with this article only to the extent that the petition is approved in writing by the department.

C. The CO_2 authorized account representative of a CO_2 budget unit that is subject to an Acid Rain emissions limitation may submit a petition to the administrator under 40 CFR 75.66 and to the department requesting approval to apply an alternative to a requirement concerning any additional CEMS required under the common stack provisions of 40 CFR 75.72 or a CO_2 concentration CEMS used under 40 CFR 75.71(a)(2). Application of an alternative to any such requirement is in accordance with this article only to the extent the petition is approved in writing by the administrator and subsequently approved in writing by the department.

9VAC5-140-6390. ~~[Reserved].~~ (Repealed.)

9VAC5-140-6400. ~~[Reserved].~~ (Repealed.)

~~Article 9~~

~~Auction of CO_2 CCR and ECR Allowances~~

9VAC5-140-6410. ~~Purpose.~~ (Repealed.)

~~Article 9~~

~~Auction of CO_2 CCR and ECR Allowances~~

~~The following requirements shall apply to each allowance auction. The department or its agent may specify additional information in the auction notice for each auction. Such additional information may include the time and location of the auction, auction rules, registration deadlines, and any additional information deemed necessary or useful.~~

9VAC5-140-6420. ~~General requirements.~~ (Repealed.)

~~A. The department's agent will include the following information in the auction notice for each auction:~~

~~1. The number of CO_2 allowances offered for sale at the auction, not including any CO_2 CCR allowances;~~

~~2. The number of CO_2 CCR allowances that will be offered for sale at the auction if the condition of subdivision B 1 of this section is met;~~

~~3. The minimum reserve price for the auction;~~

~~4. The CCR trigger price for the auction;~~

~~5. The maximum number of CO_2 allowances that may be withheld from sale at the auction if the condition of subdivision D 1 of this section is met; and~~

~~6. The ECR trigger price for the auction.~~

~~B. The department's agent will follow these rules for the sale of CO_2 CCR allowances.~~

~~1. CO_2 CCR allowances shall only be sold at an auction in which total demand for allowances, above the CCR trigger price, exceeds the number of CO_2 allowances available for purchase at the auction, not including any CO_2 CCR allowances.~~

~~2. If the condition of subdivision 1 of this subsection is met at an auction, then the number of CO_2 CCR allowances offered for sale by the department or its agent at the auction shall be equal to the number of CO_2 CCR allowances in the Virginia Auction Account at the time of the auction.~~

~~3. After all of the CO_2 CCR allowances in the Virginia Auction Account have been sold in a given calendar year, no additional CO_2 CCR allowances will be sold at any auction for the remainder of that calendar year, even if the condition of subdivision 1 of this subsection is met at an auction.~~

~~4. At an auction in which CO_2 CCR allowances are sold, the reserve price for the auction shall be the CCR trigger price.~~

~~5. If the condition of subdivision 1 of this subsection is not satisfied, no CO_2 CCR allowances shall be offered for sale at the auction, and the reserve price for the auction shall be equal to the minimum reserve price.~~

~~C. The department's agent shall implement the reserve price as follows: (i) no allowances shall be sold at any auction for a price below the reserve price for that auction and (ii) if the total demand for allowances at an auction is less than or equal to the total number of allowances made available for sale in that auction, then the auction clearing price for the auction shall be the reserve price.~~

~~D. The department's agent will meet the following rules for the withholding of CO_2 ECR allowances from an auction.~~

~~1. CO_2 ECR allowances shall only be withheld from an auction if the demand for allowances would result in an auction clearing price that is less than the ECR trigger price prior to the withholding from the auction of any ECR allowances.~~

~~2. If the condition in subdivision 1 of this subsection is met at an auction, then the maximum number of CO_2 ECR allowances that may be withheld from that auction will be equal to the quantity shown in Table 140-5B of 9VAC5-140-6210 E minus the total quantity of CO_2 ECR allowances that have been withheld from any prior auction in that calendar year. Any CO_2 ECR allowances withheld from an auction will be transferred into the Virginia ECR Account.~~

9VAC5-140-6440. ~~Program monitoring and review.~~ (Repealed.)

~~Article 10~~

~~Program Monitoring and Review~~

~~In conjunction with the CO_2 Budget Trading Program program monitoring and review process, the department will evaluate impacts of the program specific to Virginia, including economic, energy, and environmental impacts and impacts on vulnerable and environmental justice and underserved communities. The department will, in evaluating the impacts on environmental justice communities, including low income, minority, and tribal communities, develop and implement a plan to ensure increased participation of environmental justice communities in the review.~~

Emergency Regulation and Notice of Intended Regulatory Action (NOIRA) Agency Background Document

Agency name	State Air Pollution Control Board
Virginia Administrative Code (VAC) Chapter citation(s)	Part VII of 9VAC5-140
VAC Chapter title(s)	Regulation for Emissions Trading
Action title	Repeal CO_2 Budget Trading Program as required by Executive Order 9 (Revision A22-E)
Date this document prepared	

This information is required for executive branch review and the Virginia Registrar of Regulations, pursuant to the Virginia Administrative Process Act (APA), Executive Order 14 (as amended, July 16, 2018), the Regulations for Filing and Publishing Agency Regulations (1VAC7-10), and the *Form and Style Requirements for the Virginia Register of Regulations and Virginia Administrative Code*.

Brief Summary

Provide a brief summary (preferably no more than 2 or 3 paragraphs) of the subject matter, intent, and goals of this this regulatory change (i.e., new regulation, amendments to an existing regulation, or repeal of an existing regulation). Alert the reader to all substantive matters or changes. If applicable, generally describe the existing regulation.

Executive Order 9 (2022), "Protecting Ratepayers from the Rising Cost of Living Due to the Regional Greenhouse Gas Initiative," requires that the department re-evaluate Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI) and immediately begin regulatory processes to end it. Specifically, the order requires that the department develop a proposed emergency regulation for the State Air Pollution Control Board's consideration to repeal the implementing regulation implementing participation in RGGI (Part VII of 9VAC5-140), and take all necessary steps to so that any proposed regulation to the State Air Pollution Control Board can be immediately presented for consideration for approval for public comment in accordance with the board's authority pursuant to § 10.1-1308 of the Code of Virginia.

Acronyms and Definitions

Define all acronyms used in this form, and any technical terms that are not also defined in the "Definitions" section of the regulation.

EO-9 - Executive Order 9 (2022)
RGGI - Regional Greenhouse Gas Initiative

Mandate and Impetus (Necessity for Emergency)

Explain why this rulemaking is an emergency situation in accordance with § 2.2-4011 A and B of the Code of Virginia. In doing so, either:

a) Indicate whether the Governor's Office has already approved the use of emergency regulatory authority for this regulatory change.
b) Provide specific citations to Virginia statutory law, the appropriation act, federal law, or federal regulation that require that a regulation be effective in 280 days or less from its enactment.

As required by § 2.2-4011, also describe the nature of the emergency and of the necessity for this regulatory change. In addition, delineate any potential issues that may need to be addressed as part of this regulatory change

The Governor's Office has already approved the use of emergency regulatory authority for this regulatory change via EO-9. The nature of the emergency and the necessity for this regulatory change are described in EO-9 as follows:

> Reliable and affordable access to electricity is imperative to the health and safety of all Virginians. Our hospitals, schools, businesses, and homes all rely on this essential service. And the unpredictable and rising cost of electricity poses a significant and immediate threat to our Commonwealth and its citizens. In 2019, alone, over 100,000 Virginian households required Energy Assistance with a cost of $46 million to the Commonwealth.
>
> Virginia's participation in the Regional Greenhouse Gas Initiative (RGGI) risks contributing to the increased cost of electricity for our citizens. Virginia's utilities have sold over $227 million in allowances in 2021 during the RGGI auctions, doubling the initial estimates. Those utilities are allowed to pass on the costs of purchasing allowances to their ratepayers. Under the initial bill "RGGI rider" created for Dominion Energy customers, typical residential customer bills were increased by $2.39 a month and the typical industrial customer bill by was raised by $1,554 per month. In a filling before the State Corporation Commission, Dominion Energy stated that RGGI will cost ratepayers between $1 billion and $1.2 billion over the next four years.
>
> Simply stated, the benefits of RGGI have not materialized, while the costs have skyrocketed. Re-evaluation of the Initiative represents a meaningful step toward alleviating this financial burden on the Commonwealth's businesses and households. Regulations must be evaluated in view of the costs and benefits to all Virginians.

Legal Basis

Identify (1) the promulgating agency, and (2) the state and/or federal legal authority for the regulatory change, including the most relevant citations to the Code of Virginia or Acts and Assembly chapter number(s), if applicable. Your citation must include a specific provision, if any, authorizing the

promulgating agency to regulate this specific subject or program, as well as a reference to the agency's overall regulatory authority.

Statutory Authority

Section 10.1-1308 of the Virginia Air Pollution Control Law (Title 10.1, Chapter 13 of the Code of Virginia) authorizes the State Air Pollution Control Board to promulgate regulations abating, controlling and prohibiting air pollution in order to protect public health and welfare.

Promulgating Entity

The promulgating entity for this regulation is the State Air Pollution Control Board.

State Requirements

The specific directive of EO-9 states:

> . . . I hereby direct the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural and Historic Resources, to take the following actions in accordance with the provisions and requirements of § 10.1-1300, et seq. and § 2.2-4000, et seq. of the Code of Virginia:
>
> > 1. Provide me a full report re-evaluating the costs and benefits of participation in the Regional Greenhouse Gas Initiative Inc. in view of all available data, within 30 days.
> >
> > 2. During this same period, develop a proposed emergency regulation for the State Air Pollution Control Board's consideration to repeal 9VAC5-140.
> >
> > 3. During this same period, take all necessary steps to so that any proposed regulation to the State Air Pollution Control Board can be immediately presented for consideration for approval for public comment in accordance with the Board's authority pursuant to § 10.1-1308 of the Code of Virginia.
> >
> > 4. During this same period, notify the Regional Greenhouse Gas Initiative Inc. (RGGI Inc.) of the review and the Governor's intent to withdraw from RGGI, whether by legislative or regulatory action.

This NOIRA is intended to implement items 2 and 3 of the directive.

Purpose

Describe the specific reasons why the agency has determined that this regulation is essential to protect the health, safety, or welfare of citizens. In addition, explain any potential issues that may need to be addressed as the regulation is developed.

As described in the Mandate and Impetus section of this document, EO-9 describes nature of the emergency and the necessity for this regulatory change in order to protect public health, safety and welfare.

Substance

Briefly identify and explain the new substantive provisions, the substantive changes to existing sections, or both. A more detailed discussion is provided in the "Detail of Changes" section below.

The purpose of this regulatory action is to repeal Part VII of 9VAC5-140 in its entirety.

Issues

Identify the issues associated with the regulatory change, including: 1) the primary advantages and disadvantages to the public, such as individual private citizens or businesses, of implementing the new or amended provisions; 2) the primary advantages and disadvantages to the agency or the Commonwealth; and 3) other pertinent matters of interest to the regulated community, government officials, and the public. If there are no disadvantages to the public or the Commonwealth, include a specific statement to that effect.

The primary advantage associated with the regulatory change is to protect the health, safety and welfare of the public through the reduced cost of electricity for citizens and businesses. Any potential adverse impacts are speculative as of this writing; however, should adverse impacts become apparent, they can be addressed at the appropriate time and by the appropriate regulatory means.

Alternatives to Regulation

Describe any viable alternatives to the regulatory change that were considered, and the rationale used by the agency to select the least burdensome or intrusive alternative that meets the essential purpose of the regulatory change. Also, include discussion of less intrusive or less costly alternatives for small businesses, as defined in § 2.2-4007.1 of the Code of Virginia, of achieving the purpose of the regulatory change.

Alternatives to the proposal will be considered by the board. It has been tentatively determined that the first alternative is appropriate, as it is the least burdensome and least intrusive alternative that fully meets the purpose of the regulatory action. The alternatives being considered, along with the reasoning by which any of the alternatives have been rejected, are discussed below.

1. Repeal the regulation to satisfy the provisions of EO-9. This option is being selected because it meets the stated purpose of the regulatory action.

2. Make alternative regulatory changes to those required by EO-9. This option is not being selected because it would not meet the stated purpose of the regulatory action.

3. Take no action. This option is not being selected because it would not satisfy the provisions of EO-9.

Periodic Review and Small Business Impact Review Announcement

If you wish to use this regulatory action to conduct, and this Emergency/NOIRA to announce, a periodic review (pursuant to § 2.2-4017 of the Code of Virginia and Executive Order 14 (as amended, July 16, 2018)), and a small business impact review (§ 2.2-4007.1 of the Code of Virginia) of this regulation, keep the following text. Modify as necessary for your agency. Otherwise, delete the paragraph below and insert "This NOIRA is not being used to announce a periodic review or a small business impact review."

This NOIRA is not being used to announce a periodic review or a small business impact review.

Public Participation

Indicate how the public should contact the agency to submit comments on this regulation, and whether a public hearing will be held, by completing the text below. In addition, as required by § 2.2-4007.02 of the Code of Virginia describe any other means that will be used to identify and notify interested parties and seek their input, such as regulatory advisory panels or general notices.

The the board is seeking comments on this regulation, including but not limited to: ideas to be considered in the development of this regulation, the costs and benefits of the alternatives stated in this background document or other alternatives, and the potential impacts of the regulation. The the board is also seeking information on impacts on small businesses as defined in § 2.2-4007.1 of the Code of Virginia. Information may include: 1) projected reporting, recordkeeping, and other administrative costs; 2) the probable effect of the regulation on affected small businesses; and 3) the description of less intrusive or costly alternatives for achieving the purpose of the regulation.

Anyone wishing to submit written comments may do so by mail, email or fax to Karen G. Sabasteanski, Department of Environmental Quality, P.O. Box 1105, Richmond VA 23218, phone 804-659-1973, fax 804-698-4178, email karen.sabasteanski@deq.virginia.gov. Comments may also be submitted through the Public Forum feature of the Virginia Regulatory Town Hall (http://www.townhall.virginia.gov). Written comments must include the name and address of the commenter. In order to be considered, comments must be received before midnight on the last day of the public comment period.

Public Hearing at Proposed Stage

[If holding a public hearing after the proposed stage, insert:]
A public hearing will be held following the publication of the proposed stage of this regulatory action and notice of the hearing will be posted on the Virginia Regulatory Town Hall (http://www.townhall.virginia.gov) and on the Commonwealth Calendar (https://www.virginia.gov/connect/commonwealth-calendar).

[If not holding a public hearing during the proposed stage, insert:]
A public hearing will not be held following the publication of the proposed stage of this regulatory action unless requests for a public hearing are received during the NOIRA public comment period from at least 25 persons.

Regulatory Advisory Panel

Please indicate, to the extent known, if advisers (e.g., regulatory advisory panel or negotiated rulemaking panel) will be involved in the development of the proposed regulation. Indicate that 1) the agency is not using a panel in the development of the proposal; 2) the agency is using a panel in the development of the proposal; or 3) the agency is inviting comment on whether to use a panel to assist the agency in the development of a proposal.

The board does not intend to establish a panel to assist in the development of the proposal. However, in response to requests received during the NOIRA public comment period the board will consider establishing a panel. Persons requesting the agency use a panel and interested in assisting in the development of a proposal should notify the Department's contact person by the end of the comment period and provide their name, address, phone number, email address and their organization (if any). If a panel is used, notification of the composition of the panel will be sent to all applicants.

Detail of Changes

List all regulatory changes and the consequences of the changes. Explain the new requirements and what they mean rather than merely quoting the text of the regulation. For example, describe the intent of the language and the expected impact. Describe the difference between existing requirement(s) and/or agency practice(s) and what is being proposed in this regulatory change. Use all tables that apply, but delete inapplicable tables.

Current chapter-section number	New chapter-section number, if applicable	Current requirements in VAC	Change, intent, rationale, and likely impact of new requirements
9VAC5-140-6010		Purpose of the regulation is described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6020		Terms defined.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6030		Measurements, abbreviations, and acronyms used in the regulation are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6040		Entities to which the regulation applies are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6050		Standard requirements for permitting, monitoring, recordkeeping, liability, etc., are explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6060		Computation of time is described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6070		Severability is established.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6080		Authorization and responsibilities of the CO_2 authorized account representative are explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6090		The role of the CO_2 authorized alternate account representative is described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6100		Changing the CO_2 authorized account representatives and the CO_2 authorized alternate account representative; changes in the owners and operators are delineated.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6110		The elements of an account certificate of representation are provided.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6120		Objections concerning the CO_2 authorized account representative are addressed.	Repealed in accordance with the directives of EO-9.

9VAC5-140-6130		Delegation by CO_2 authorized account representatives and CO_2 authorized alternate account representatives is explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6140		CO_2 budget permit requirements are provided.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6150		Submission of CO_2 budget permit applications.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6160		Information requirements for CO_2 budget permit applications are established.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6170		Compliance certification reports are explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6180		Actions on compliance certifications are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6190		The Virginia CO_2 Budget Trading Program base budgets are listed.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6200		How to handle undistributed and unsold CO_2 allowances is found in this section.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6210		Allowance allocations are provided.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6220		CO_2 allowance tracking system accounts are established.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6230		Establishment of accounts is described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6240		The CO_2 allowance tracking system responsibilities of CO_2 authorized account representatives are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6250		How the recordation of allowance allocations is to be accomplished.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6260		Compliance requirements are established.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6270		Banking requirements are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6280		Management of account errors is explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6290		How to close general accounts.	Repealed in accordance with the directives of EO-9.

9VAC5-140-6300		How to submit CO_2 allowance transfers.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6310		The recordation of allowance transfers is explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6320		Notification of allowance transfers is explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6325		Life-of-the-unit contractual arrangements are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6330		General requirements for monitoring, reporting, and recordkeeping.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6340		The initial certification and recertification procedures for a monitoring system are delineated.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6350		Out-of-control periods are addressed.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6360		Notifications are described.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6370		Recordkeeping and reporting requirements are explained.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6380		Petitions for approval to apply an alternative to any acid rain requirement are provided.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6390		Reserved.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6400		Reserved.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6410		The purpose of the requirements for allowance auctions is provided.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6420		General requirements for the auction notice.	Repealed in accordance with the directives of EO-9.
9VAC5-140-6430		[repealed section]	[already repealed]
9VAC5-140-6440		Program monitoring and review requirements.	Repealed in accordance with the directives of EO-9.

Family Impact

In accordance with § 2.2-606 of the Code of Virginia, assess the potential impact of the proposed regulatory action on the institution of the family and family stability including to what extent the regulatory action will: 1) strengthen or erode the authority and rights of parents in the education, nurturing, and supervision of their children; 2) encourage or discourage economic self-sufficiency, self-pride, and the assumption of responsibility for oneself, one's spouse, and one's children and/or elderly parents; 3) strengthen or erode the marital commitment; and 4) increase or decrease disposable family income.

A positive impact to the institution of the family may be anticipated as a result of improved health, safety and welfare of the public through the reduced cost of electricity for citizens.

Executive Director
The Regional Greenhouse Gas Initiative, Inc.
90 Church Street, 4th Floor
New York, NY 10007

Re: Notice of Intent to Withdraw the Commonwealth of Virginia from RGGI

Dear Mr. McKeon:

In accordance with Governor Youngkin's Executive Order 9 (2022), this letter is to notify the Regional Greenhouse Gas Initiative, Inc. (RGGI, Inc.) of the following actions to be undertaken by the Virginia Department of Environmental Quality:

1. Provide the Governor with a full report re-evaluating the costs and benefits of participation in RGGI in view of all available data, within 30 days.

2. During this same period, develop a proposed emergency regulation for the State Air Pollution Control Board's consideration to repeal the CO_2 Budget Trading Program (Part VII of 9VAC5-140).

3. During this same period, take all necessary steps so that any proposed regulation to the State Air Pollution Control Board can be immediately presented for consideration for approval for public comment in accordance with the Board's authority pursuant to § 10.1-1308 of the Code of Virginia.

4. During this same period, notify RGGI, Inc., of the review and the Governor's intent to withdraw from RGGI, whether by legislative or regulatory action.

Accordingly, this letter notifies RGGI, Inc., of the Governor's intent to withdraw the Commonwealth of Virginia from RGGI upon the conclusion of an appropriate legislative or regulatory process. I will keep you informed as this process progresses. Please contact either me or my staff if you have any questions.

Sincerely,

MSR/MGD/kgs

Attachment 2

VIRGINIA:

IN THE CIRCUIT COURT FOR THE CITY OF RICHMOND
JOHN MARSHALL COURTS BUILDING

RECEIVED AND FILED
CIRCUIT COURT
MAY 07 2021
EDWARD F. JEWETT, CLERK
BY_____D.C.

VIRGINIA MANUFACTURERS ASSOCIATION,	:	
Petitioner,	:	
v.	:	Case No.: CL20-4918
VIRGINIA DEPARTMENT OF ENVIRONMENTAL QUALITY, ET AL.,	:	Hon. Judge Beverly W. Snukals
Respondents.	:	

Respondents' Brief in Opposition

Respondents, the Virginia Department of Environmental Quality ("DEQ"), the State Air Pollution Control Board, and Director David Paylor, the Director of DEQ, by counsel, respectfully submit this brief in Opposition to the Petitioner's appeal.

This case is important, but not complex. The General Assembly passed legislation mandating that DEQ amend regulations for the CO_2 Budget Trading Program. The legislation expressly exempted the amended regulations from the Virginia Administrative Process Act ("APA"). DEQ followed the General Assembly's mandate and promulgated amended regulations.

Petitioner, Virginia Manufacturers Association ("VMA") has appealed the amended regulations but not challenged the legislation that required them. As discussed below, VMA's arguments are incorrect: the amended regulations follow the General Assembly's mandate, indeed at times, incorporating *verbatim* the language from the legislation; the amended regulations are exempt from the APA; they are not vague; and there is no illegal tax on electricity ratepayers. VMA is asking this Court to set aside a program that controls CO_2 pollution and provides millions of dollars to help low-income households and vulnerable shoreline communities. This Court should not be persuaded to undermine these efforts in contravention of the law.

Table of Contents

Relevant Factual History....1

I. The Act mandated that DEQ establish a CO2 auction trading program and then sell 100% of Virginia's CO2 allowances through that program. 1

A. Before the Act, Virginia could only participate in CO_2 auctions on a limited, "consignment" basis....1

B. The General Assembly mandated that DEQ establish a CO_2 direct auction and "sell 100 percent" of all annual CO_2 allowances in the auction. 2

C. The Act explicitly exempted the Amended Regulations from the APA.....3

II. DEQ followed the Act's mandate by revising its CO2 Trading Regulations so that Virginia could directly participate in CO2 auctions. 4

III. Virginia received $43 million in net revenue from its first auction.....5

Standard of Review and Burden of Proof....6

I. Standard of review when comparing regulations to enabling legislation....6

II. Burden of Proof....6

Argument 7

I. The Amended Regulations satisfy the Act's mandate of implementing a "market-based trading program consistent with the RGGI program" and of selling "100 percent of all allowances each year through the allowance auction."....7

A. DEQ's Amended Regulations follow the General Assembly's Mandate.....7

B. VMA's argument that DEQ "failed to incorporate" certain provisions of the Act fails because those provisions are either unrelated to DEQ's mandate or explicitly incorporated in the Amended Regulations. 8

1. VMA's allegation that DEQ failed to incorporate the definitions section of the Act is both illogical, because that section did not require DEQ to do anything, and undermined by the 13 pages of definitions in the Amended Regulations.....8

2. VMA's allegation that DEQ failed to incorporate Section 1331 is incorrect: The Amended Regulations contain a nearly *verbatim* inclusion of that section. 10

3. VMA's allegation that the Amended Regulations "fail to incorporate" Section 10.1-1330(C) is a red herring: that provision addresses how the *proceeds* from direct auctions will be spent, there is nothing in that provision for DEQ to include in its regulations implementing and managing a direct auction program.....12

II. VMA's APA-based assignments of error fail because: (A) the Act exempted the Amended Regulations from the APA; and (B) the Act authorized each of the changes VMA identifies in its brief.....14

A. The Act expressly exempts the Amended Regulations from the APA.....14

B. The Act authorized each of the changes VMA identifies in its brief.....15

III. Contrary to VMA's assertion, the Amended Regulations are not vague.....18

A. The Amended Regulations are not void under Virginia law. 18

B. Each of VMA's voidness arguments is flawed.....20

1. VMA's argument that the Amended Regulations "do not even mention" RGGI ignores the Act's mandate and how the Amended Regulations work.....21

2. VMA's argument that RGGI requirements are de facto rules is internally inconsistent, misapplies caselaw, and is a challenge to the Original Regulations, not the Amended Regulations. ..22

3. VMA offers no evidence to support its claim that a "person of ordinary intelligence" could not comply with the Amended Regulations and the results of Virginia's first CO_2 auction demonstrate that VMA's claim is false.....23

IV. VMA's tax claims fail because: (A) they are challenges to the Act, not the Amended Regulations; and (B) the revenue collected is not an illegal tax. 24

A. VMA's tax arguments are challenges to the Act, not the Amended Regulations; yet, VMA did not challenge the Act in this case. 24

B. Even if the Act was before this Court, the General Assembly's authorization for utilities to include the costs of allowances in their rates is not an illegal tax...25

V. VMA is not entitled to attorney's fees under the APA or otherwise. 27

Conclusion 28

Relevant Factual History

The relevant facts in this case are not in dispute.[1] As discussed below, before 2020, DEQ had a CO_2 budget trading program that was limited to utilizing a conditional allowance / consignment model. In 2020, the General Assembly passed legislation that mandated DEQ to implement a CO_2 direct auction program and then to sell all CO_2 allowances through such auctions. The General Assembly further required that DEQ implement these changes by amending its existing regulations and then expressly exempted those amendments from the APA. It is those Amended Regulations that VMA challenges in this case.

I. The Act mandated that DEQ establish a CO_2 auction trading program and then sell 100% of Virginia's CO_2 allowances through that program.

A. Before the Act, Virginia could only participate in CO_2 auctions on a limited, "consignment" basis.

The State Air Pollution Control Board, with the support of DEQ, adopted regulations establishing a CO_2 Budget Trading Program on April 19, 2019 and published those regulations on May 27, 2019 (hereafter referred to as the "Original Regulations"). VMA Pet. at ¶ 35.[2]

[1] VMA filed over 450 pages of attachments to its Brief in Support; most of these documents were not included in the Certified Agency Record. VMA never objected to the Certified Agency Record nor moved to supplement the record. Thus, this Court need not consider any of these documents as they are not part of the record in this case. *See* Va. Sup. Ct. R. 2A:3(c) (2020). Moreover, most of these documents are irrelevant to the issue in this case, which is whether DEQ's Amended Regulations are *lawful.* VMA's attachments address whether it is a good *policy* to establish a CO_2 trading program. *See, e.g.*, VMA Attachment E (2017 article on RGGI); Attachment J (cost study of Virginia's CO_2 trading program). The General Assembly answered that policy question in 2020. Thus, these attachments are largely irrelevant to this case.

[2] The dates of adoption and publication for the Original Regulations are significant because, as discussed below, it is by those dates that the General Assembly refers to the Original Regulations in the Clean Energy and Community Flood Preparedness Act.

Prior to adoption, the Original Regulations went through a full notice and comment process pursuant to the APA. *Id.* at ¶ 33. VMA participated in that process and submitted "extensive written comments." *Id.*

The Original Regulations were limited because DEQ lacked legislative authority to either directly sell CO_2 allowances in an auction or spend or receive proceeds from an auction. *Id.* at ¶ 31. The Original Regulations worked around these limitations by utilizing a consignment model. Under the Original Regulations, DEQ granted "conditional allowances" to power plants and other CO_2 sources, those sources then "consigned" those allowances over to the CO_2 auction program where they were sold at a consignment auction. *Id.* At the same time, CO_2 sources were required to obtain CO_2 allowances that equaled their CO_2 emissions. *Id.* In this way, DEQ neither participated directly in the auctions nor spent or received revenue from the auction. *Id.*

B. The General Assembly mandated that DEQ establish a CO_2 direct auction and "sell 100 percent" of all annual CO_2 allowances in the auction.

In the 2020 legislative session, the General Assembly passed two historic pieces of environmental legislation. The first was the Virginia Clean Economy Act, which is not subject to this lawsuit. The second was the Virginia Clean Energy and Community Flood Preparedness Act (hereafter referred to as the "Act.").[3]

[3] Both the media and trade publications immediately recognized the significance of both pieces of legislation. As one commenter described the importance of the Act:

> The Act directs DEQ to revise the Rule without notice and comment through the Virginia Administrative Process Act by incorporating the statute into the existing Rule. Now, Virginia will be sprinting toward RGGI membership by the end of this year. Direct RGGI membership is a significant shift from the prior consignment membership….

Liz Williamson, *Virginia Regional Carbon Trading: Ready, Set, Join RGGI!*, JD Supra, July 15, 2020) (available at https://www.jdsupra.com/legalnews/virginia-regional-carbon-trading-ready-77904/ (last visited Apr. 14, 2021). *See also Virginia Enacts Aggressive Clean Energy Laws*, The National Law Review (Apr. 17, 2020) (available at

The Act created a new Virginia Code provision: Section 10.1-1330, which requires DEQ to take two actions. First, Section 1330.B. authorizes the Director of DEQ to "establish, implement, and manage an auction program to sell allowances into a market-based trading program consistent with the RGGI program and this article." Va. Code § 10.1-1330.B (2020). Second, the section mandates that the "Director shall seek to sell 100 percent of all allowances issued each year through the allowance auction." *Id.*[4]

C. The Act explicitly exempted the Amended Regulations from the APA.

Subsection A of Section 1330 of the Act requires DEQ to incorporate the provisions of the Act "into the final regulation adopted by the Board on April 19, 2019, and published in the Virginia Register on May 27, 2019." Va. Code § 10.1-1330.A. The dates referenced in this provision refer to the dates of adoption and publication of the Original Regulations; *i.e.*, the regulations that developed the conditional allowance / consignment model described above.

Section 1330.A. then states: "Such incorporation by the Department shall be exempt from the provisions of the Virginia Administrative Process Act (§ 2.2-4000 *et seq.*)." *Id.*

Thus, Section 1330 is clear. Whereas before, DEQ was not allowed to directly participate in a CO_2 auction and could not directly receive proceeds from auction sales, now:

---

https://www.natlawreview.com/article/virginia-enacts-aggressive-clean-energy-laws (last visited Apr. 14, 2021); *Virginia Gov. Ralph Northam signs clean energy legislation*, WJHL News (Apr. 12, 2020) (available at https://www.wjhl.com/news/regional/virginia/virginia-gov-ralph-northam-signs-clean-energy-legislation/ (last visited Apr. 14, 2021).

[4] The legislation also contains several provisions that are not directly relevant to this case, but which demonstrate the General Assembly's purpose and intent. For example, the General Assembly revised Virginia Code 10.1-603.25 by converting the Virginia Shoreline Resiliency Fund into the Virginia Community Flood Preparedness Fund. Pursuant to the revisions, the fund "shall be used solely for the purpose of enhancing flood prevention or protection and coastal resilience as required by this article." Va. Code § 10.1-603.25.B. The General Assembly also required that "[n]o less than 25 percent of the moneys disbursed from the Fund each year shall be used for projects in low-income geographic areas." Va. Code § 10.1-603.25.E.

- DEQ must implement and manage a CO_2 auction program;
- DEQ must sell 100% of all CO_2 allowances through an allowance auction; and
- DEQ must do these tasks by amending the Original Regulations; however, those amendments are exempt from the APA.

II. DEQ followed the Act's mandate by revising its CO_2 Trading Regulations so that Virginia could directly participate in CO_2 auctions.

Consistent with the Act, on July 10, 2020, DEQ issued amendments to the Original Regulations (hereafter referred to as the "Amended Regulations"). VMA Pet. at ¶ 43. These Amended Regulations comprise the majority of the Certified Agency Record that DEQ filed in this case. Specifically, the Amended Regulations begin on the third page of the Certified Agency Record and consist of 57 pages of regulations that are now codified as 9 VAC5-140-6010 through 9 VAC5-140-6440. The Amended Regulations, as filed as part of the Certified Agency Record in this case, are paginated 1 through 57, with the page number appearing on the top right corner of each page. For ease of reference, this Opposition Brief will refer to this pagination system when citing to the Amended Regulations.

The Amended Regulations, as filed in this case, show both the Original Regulations and the amendments. The Original Regulations appear as regular typeface. Where DEQ deleted words, those words appear with a line through them. Where DEQ added words, those words are underlined. *See, e.g.*, Amended Regulations at 2 ("Allocate" or "allocation" means the determination by the department of the number of ~~conditional~~ $\underline{CO_2}$ allowances recorded in the ~~conditional~~ allowance account of a CO_2 budget unit…"). In other words, the Amended Regulations DEQ has filed with this Court are a blackline, edited version of the Original Regulations that show both the Original Regulations and the Amended Regulations.

As the Amended Regulations demonstrate, most of the Original Regulations remain unchanged. For example, two of the regulations that VMA challenge as impermissibly vague, 9 VAC5-140-6050.C and 9 VAC5-140-6260 (*see* VMA Brief at 22), are unchanged and only contain minor edits that update dates and remove obsolete terminology. *See* Amended Regulations at 16 (showing the only amendments to 9 VAC5-140-6050.C are to remove the phrase "initial control period" and to update dates); at 39 – 43 (showing minimal changes to 9 VAC5-140-6260).

Most of the changes in the Amended Regulations, as required by the Act, change the CO_2 trading program from a conditional allowance / consignment model to a direct auction model. For example, the Amended Regulations add language stating that CO_2 allowances would now be sold "by the Department or its agent" through an auction. *Id.* at 5. The Amended Regulation also delete references to conditional allowances and consignment auctions. *Id.* at 6-7; 28; 32-33; 56-57.[5]

III. Virginia received $43 million in net revenue from its first auction.

On March 5, 2021, Virginia participated in its first quarterly auction of CO_2 allowances. As reported, Virginia earned more than $43 million in net proceeds from the auction.[6] Pursuant to the Act, 45% of this revenue will assist localities affected by flooding and sea level rise. Va. Code § 10.1-1330.C. 50% of this revenue will be spent on low-income energy efficiency programs. *Id.* The next RGGI auction is scheduled for June 2, 2021.[7]

---

[5] The Amended Regulations also add to the definition of the term "life-of-the-unit contractual arrangement" and then have a new regulation specifying the parties' obligations for CO_2 allowances under such an arrangement. *Id.* at 9-10; 45. These new regulations were explicitly required by Section 1331 of the Act. *See* Va. Code § 10.1-1331.

[6] *See* Sarah Vogelsong, *Virginia Nets More than $43 Million in First Carbon Allowance Auction*, The Virginia Mercury (Mar. 9, 2021) (available at https://www.virginiamercury.com/blog-va/virginia-nets-more-than-43-million-in-first-carbon-allowance-auction/) (last visited Apr. 13, 2021).

[7] https://www.rggi.org/auctions/upcoming-auctions.

Standard of Review and Burden of Proof

I. Standard of review when comparing regulations to enabling legislation.

At its core, VMA's Brief argues that the Amended Regulations are inconsistent with the Act. As the Virginia Court of Appeals has explained: "[w]hen [a] [c]ourt reviews whether a regulation is inconsistent with its enabling legislation, it must take into account the text as well as the context in the underlying statute, viewing it as a symmetrical and coherent regulatory scheme." *Karr v. Dep't of Envtl. Quality*, 66 Va. App. 507, 526 (2016) (internal citations and quotation marks omitted). Further, a court "is duty bound to interpret the several parts of a statute as a consistent and harmonious whole so as to effectuate the legislative goal." *Id.* at 527 (citing *Virginia Elec. & Power Co. v. Citizens for Safe Power*, 222 Va. 866, 869 (1981)).

Finally, although "pure questions of statutory interpretation" are subject to *de novo* review, if the statute in question "falls within the agency's specialized competence, the agency decision is entitled to special weight and will be overturned only if it constitutes a clear abuse of the delegated discretion." *Dorman v. Commonwealth*, 2019 Va. App. LEXIS 209, *6 (2019) (unpublished) (internal citations omitted); *see also Thormac, LLC v. Dep't of Alcoholic Bev. Control*, 68 Va. App. 216, 223 (Va. Ct. App. 2017) ("where the question involves an interpretation which is within the specialized competence of the agency and the agency has been entrusted with wide discretion by the General Assembly, the agency's decision is entitled to special weight in the court.").

II. Burden of proof

The APA places the burden upon VMA to demonstrate an error of law. Va. Code § 2.2-4027. "[T]he agency action is presumed valid on review and the burden rests upon the party complaining to overcome this presumption." *Strawbridge v. Cnty. of Chesterfield*, 23 Va. App. 493, 503 (1996).

Argument

VMA's Brief asserts four arguments for why the Amended Regulations should be declared void. These four arguments relate to VMA's six assignments of error that it has listed in its Petition for Appeal. For ease of reference, this Opposition Brief will address each of VMA's arguments in the order they were presented.

I. The Amended Regulations satisfy the Act's mandate of implementing a "market-based trading program consistent with the RGGI program" and of selling "100 percent of all allowances each year through the allowance auction."

VMA's first argument is that DEQ violated the Act when it issued the Amended Regulations. VMA Brief at 17. As discussed below, this argument fails because DEQ satisfied the Act's mandate that it establish a CO_2 auction program and then sell all CO_2 allowances through those auctions. Furthermore, VMA's assertion that DEQ "failed to incorporate" certain portions of the Act fails because those portions of the Act either had no relevance to the CO_2 auction program or were implemented in the Amended Regulations *verbatim*.

A. DEQ's Amended Regulations follow the General Assembly's Mandate.

Section 1330.B of the Act (codified at Virginia Code Section 10.1-1330.B) contains two sentences, each of which directs DEQ to take certain action. First, the Act authorizes DEQ to "establish, implement, and manage an auction program to sell allowances into a market-based trading program consistent with the RGGI program and this article." Va. Code § 10.1330.B. Second, the Director of DEQ "shall seek to sell 100 percent of all allowances issued each year through the allowance auction." *Id.*

DEQ did exactly as the General Assembly instructed. Through the Amended Regulations, DEQ struck all language referencing the former consignment model and replaced it with the direct auction model the Act requires. For example, the Amended Regulations:

- Added language stating that CO_2 allowances would now be sold "by the Department or its agent" through a direct auction (Amended Regulations at 5);
- Deleted reference to conditional allowances and consignment auctions (*id.* at 6 – 7);
- Deleted "conditional allowances" and replaced them with "CO_2 allowances" (*id.* at 28);
- Repealed the methodology for conditional allocations (*id.* at 32 – 33); and
- Repealed the consignment auctions (*id.* at 56 – 57).

VMA does not, and cannot, dispute that the Amended Regulations repealed consignment auctions, removed references to conditional allowances, and removed other transitional provisions that are not compatible with a direct auction program. *See* VMA Brief at 17 (alleging that the Amended Regulations "*implement*" the Act but still violate it) (emphasis in original). Simply put, the Act mandated that DEQ take two significant steps: implement and manage a direct auction CO_2 program, and sell 100% of Virginia's CO_2 allowances in that program. Through the Amended Regulations, DEQ has done exactly what the General Assembly mandated. DEQ did not violate the Act, it followed it.

B. VMA's argument that DEQ "failed to incorporate" certain provisions of the Act fails because those provisions are either unrelated to DEQ's mandate or explicitly incorporated in the Amended Regulations.

Rather than argue that the Amended Regulations fail to satisfy the Act's mandate, VMA argues that DEQ did not go far enough and that, allegedly, DEQ "failed to incorporate" certain provisions of the Act. VMA Brief at 17. As discussed below, VMA is incorrect.

1. VMA's allegation that DEQ failed to incorporate the definitions section of the Act is both illogical, because that section did not require DEQ to do anything, and undermined by the 13 pages of definitions in the Amended Regulations.

First, VMA alleges that DEQ "failed to incorporate" Section 10.1-1329 of the Act. VMA Brief at 17. Section 1329 is titled "Definitions" and is a list of nine defined terms that are used in

the Act, including "DMME," "Energy efficiency program, and "Fund." Va. Code § 10.1-1329. ("As used in this article, unless the context requires a different meaning: [followed by nine defined terms]").

VMA's argument seems to be that DEQ was required to define terms such as "DMME" or "Fund" in the Amended Regulations. There are two problems with this argument. First, definitions prescribed by the General Assembly are already incorporated into the Board's regulations. The very first section in the Board's Regulations, 9 VAC5-10-10, provides that "[u]nless specifically defined in the Virginia Air Pollution Control Law . . . terms used [in the Air Board's regulations] shall have the meanings given them by 9VAC5-170-20, or commonly ascribed to them by recognized authorities." 9 VAC5-10-10(B). Thus, the regulations, by operation of 9 VAC5-10-10(B), defer to and adopt definitions provided by the General Assembly. *Id.* DEQ has already incorporated the definitions contained in the Act by virtue of existing regulations. Repeating this incorporation in the Amended Regulations would be redundant.

Second, the fact that the General Assembly included a list of defined terms in the Act does not require DEQ to do anything in its Amended Regulations. Indeed, those Amended Regulations contain 13 pages of definitions, many of which were unchanged by the amendments. *See* Amended Regulations at 1-13. DEQ did not "fail to incorporate" Section 10.1-1329 because there was nothing in that section for DEQ to incorporate. And, VMA has not shown a single instance where the definitions in the Amended Regulations contradict or undermine the Act's defined terms. Thus, VMA is incorrect: DEQ did not violate the Act by "failing to incorporate" the definitions listed in the Act. The Board's existing regulations already incorporate by reference definitions passed by the General Assembly, the Original Regulations already had a lengthy definitions section, and DEQ amended those definitions where necessary to comply with the Act. *Id.*

2. VMA's allegation that DEQ failed to incorporate Section 1331 is incorrect: The Amended Regulations contain a nearly *verbatim* inclusion of that section.

Second, VMA alleges that DEQ "failed to incorporate" Section 10.1-1331. *See* VMA Brief at 17 (listing Section 10.1-1331 as one of the provisions DEQ "failed to incorporate") and at 18 (alleging that the Amended Regulations "also has not incorporated . . . Section 1331.").

This argument is demonstrably false: not only do the Amended Regulations incorporate this section, they do so nearly *verbatim*. Section 1331 of the Act (codified at Virginia Code Section 10.1-1331) is titled "Energy conversion or energy tolling agreements." The section states that if Virginia becomes a "full participant in RGGI," then two items must be included in DEQ's Amended Regulations. Va. Code § 10.1-1331. First, the Amended Regulations must include within its definition of the phrase "life-of-the-unit contractual arrangement" the following phrase: "any energy conversion or energy tolling agreement that has a primary term of 20 years or more and pursuant to which the purchaser is required to deliver fuel to the CO2 budget source or CO2 budget unit and is entitled to receive all of the nameplate capacity" from that source. *Id.* Second, the Act requires the Amended Regulations include a provision stating that under such an agreement, the purchaser is responsible for acquiring the associated CO_2 allowances. *Id.*[8]

The Amended Regulations include both requirements. The Original Regulations already contained a definition of "life-of-the-unit contractual arrangement." *See* Amended Regulations at 9-10 (showing the original definition in subsection "a"). Thus, the Amended Regulations added

[8] A "life-of-the-unit contractual arrangement" in the electricity utility industry is essentially a dedicated power plant: a situation where a power plant commits, by long-term contract, to provide all or most of its produced electricity to a single purchaser. *See, e.g.* 42 U.S.C. § 7651a(27) (2020) (defining the term under federal law). Section 1331 of the Act clarifies that under such a contractual arrangement, it is the power purchaser who must obtain the CO_2 allowances. *See* Va. Code § 10.1-1331 ("any purchaser under an energy conversion or energy tolling agreement shall be responsible for acquiring any CO2 allowances"); Amended Regulations at 45 (adding a new section, 9 VAC5-140-6325, that includes this same clarification).

the word "either" to the definition, made the original definition subsection "a." and then added a new "b." *Id.* Subsection b of that definition is, *verbatim*, the definition from Section 1331. *Id.*

Then, the Amended Regulations added a new provision, 9 VAC 5-140-6325, that clarifies that the purchaser under such an arrangement is responsible for obtaining the necessary CO_2 allowances. *Id.* at 45.

So that there is no doubt as to whether the Amended Regulations incorporate Section 1331, here is the exact language from both the Act and the Amended Regulations:

Section 1331 of the Act	**Relevant Amended Regulations**
If the Governor seeks to include the Commonwealth as a full participant in RGGI or another carbon trading program… then	
(i) the definition of the term "life-of-the-unit contractual arrangement" under the Final Regulation shall include any energy conversion or energy tolling agreement that has a primary term of 20 years or more and pursuant to which the purchaser is required to deliver fuel to the CO2 budget source or CO2 budget unit and is entitled to receive all of the nameplate capacity and associated energy generated by such source or unit for the entire contractual period and	"Life-of-the-unit contractual arrangement" means either… (b) For any energy conversion or energy tolling agreement that has a primary term of 20 years or more and pursuant to which the purchaser is required to deliver fuel to the CO_2 budget source or CO_2 budget unit and is entitled to receive all of the nameplate capacity and associated energy generated by such source or unit for the entire contractual period. (Amended Regulations at pp. 9-10.)
(ii) any purchaser under an energy conversion or energy tolling agreement shall be responsible for acquiring any CO2 allowances required under the Final Regulation in relation to a CO2 budget source or CO2 budget agreement that is subject to such agreement.	A power purchaser entered into a life-of-the-unit contractual arrangement… shall be responsible for acquiring and transferring all allowances to the CO_2 budget source or unit that are necessary for demonstrating compliance with the CO_2 budget trading program. (Amended Regulations at p. 45.)

VMA never mentions the Amended Regulations' new definition of "life-of-the-unit contractual arrangement." VMA Brief at 17-18. Nor does VMA ever mention the new

requirement, codified in 9 VAC5-140-6325, that the purchaser under such an arrangement acquire the requisite CO_2 allowances. *Id.* Instead, VMA ignores these provisions and claims that the Amended Regulations "fail to incorporate" Section 1331. *Id.* This is simply false: the Amended Regulations incorporate, on a nearly *verbatim* basis, Section 1331.[9]

3. VMA's allegation that the Amended Regulations "fail to incorporate" Section 10.1-1330(C) is a red herring: that provision addresses how the *proceeds* from direct auctions will be spent; there is nothing in that provision for DEQ to include in its regulations implementing and managing a direct auction program.

Third, VMA alleges in its Petition for Appeal that DEQ failed to incorporate Section 10.1-1330.C, which VMA describes as "the most substantive and impactful part" of the Act. VMA Pet. at ¶ 51. Curiously, VMA never makes this argument in its Brief in Support. *See* VMA Brief at 17-18 (listing the three provisions of the Act it alleges that DEQ "failed to incorporate" but not including Section 10.1-1330.C). Nonetheless, because VMA made this assertion in its Petition for Appeal, the Respondents will address it here.

Section 1330.C of the Act (codified at Virginia Code Section 10.1-1330.C) specifically provides for how the proceeds from the CO_2 direct auctions shall be allocated:

1. 45% of the revenue shall go to the Virginia Community Flood Preparedness Fund;

[9] In support of its argument that DEQ failed to incorporate Section 1331, VMA cites *Jackson v. Marshall*, 454 S.E.2d 23 (Va. Ct. App. 1995). VMA Brief at 18. VMA cites *Jackson* for the proposition that "no deference can be given to an agency when compliance with a statute is at issue." *Id.* The word "deference" is only used once in in the *Jackson* opinion: "On review, the interpretation which an administrative agency gives its law must be accorded great deference." *Jackson*, 454 S.E.2d at 26. Not only is VMA's characterization of *Jackson* incorrect, it is also irrelevant. *Jackson* involved a Department of Social Services administrative hearing over allegations of sexual abuse where the hearing officer issued a ruling finding "Reason to Suspect Sexual Abuse," yet the statute at issue only allowed for findings of either "Founded" or "Unfounded." *Id.* at 24-25. The *Jackson* court then reasoned that, even though agency interpretation of its law "must be accorded great deference," where a statute "is clear and unambiguous, a court will give the statute its plain meaning." *Id.* at 26. Here, Section 1331 is clear and DEQ inserted its provisions directly into the Amended Regulations. Thus, *Jackson* is inapplicable.

2. 50% of the revenue shall go to the Department of Housing and Community Development to support low-income energy efficiency programs;
3. 3% of the revenue shall go to DEQ to cover administrative expenses of managing the auction and related activities; and
4. 2% of the revenue shall go to the Department of Housing and Community Development, in partnership with the Department of Mines, Minerals, and Energy, to administer and implement the low-income efficiency programs funded above.

Va. Code § 10.1-1330.C.

There is nothing in this provision related to how DEQ shall "establish, implement, and manage" the CO_2 direct auction program. Va. Code § 10.1-1330.B. Nor is there anything in this provision related to how the Director of DEQ shall "seek to sell 100 percent of all allowances issued each year." *Id.* Thus, there was nothing for DEQ to incorporate from Section 1330.C into the Amended Regulations. Indeed, it would be nonsensical for DEQ, through regulations that implement the auction program, to prescribe rules for how other state agencies, such as the Department of Housing and Community Development, are to administer separate programs. DEQ did not "fail to incorporate" Section 1330.C as VMA alleges; rather, there is nothing in that provision for DEQ to incorporate in the Amended Regulations.[10]

[10] VMA included a fourth "failure to incorporate" allegation in its brief. In two separate places, VMA alleges that DEQ failed to incorporate "Section 10.1-1300." *See* VMA Brief at 17 (listing among the sections DEQ allegedly "failed to incorporate" "Section 10.1-1300"); at 18 ("Revision A20 also has not incorporated Section 10.1-1300 . . . ."). This could be a typographical error as Virginia Code Section 10.1-1300 is not part of the Act, is unrelated to the CO_2 trading program, and is not mentioned in VMA's Petition for Appeal.

Since VMA makes this assertion twice in its brief; however, the Respondents will briefly address it here. This allegation should be rejected for three reasons. First, VMA did not identify this provision as an assignment of error in its Petition for Appeal; and therefore, has waived its right to raise this new issue now. *See* Va. Sup. Ct. R. 2A:4(a) (requiring a petition for appeal to "specify the errors assigned") (2020). Second, this code provision was not changed by the Act.

II. VMA's APA-based assignments of error fail because: (A) the Act exempted the Amended Regulations from the APA; and (B) the Act authorized each of the changes VMA identifies in its brief.

VMA's first three assignments of error (Claims I, II, and III) in its Petition for Appeal allege that DEQ violated the APA by issuing the Amended Regulations without going through APA's notice-and-comment process. VMA Pet. at ¶¶ 58-78. VMA supports these claims through the second argument in its brief. *See* VMA Brief at 18-21. As discussed below, VMA's argument is incorrect because the Act expressly exempts the Amended Regulations from the APA and because the Act authorizes each of the changes VMA complains of.

A. The Act expressly exempts the Amended Regulations from the APA.

Section 1330.A of the Act (codified at Virginia Code Section 10.1-1330.A) states:

> The provisions of this article shall be incorporated by the Department, without further action by the Board, into the final regulation adopted by the Board on April 19, 2019, and published in the Virginia Register on May 27, 2019. Such incorporation by the Department *shall be exempt from the provisions of the Virginia Administrative Process Act (§ 2.2-4000 et. seq.*).

Va. Code § 10.1-1330.A (emphasis added). Thus, the Act expressly exempts DEQ's Amended Regulations from the requirements of the APA. This Court's analysis need go no further.

VMA incorrectly alleges that DEQ claims that the Amended Regulations qualify for one of the exemptions listed in the APA. VMA Brief at 19 (asserting that DEQ was invoking Virginia Code 2.2-4006(A)(4)(a) to justify avoiding the APA). In support of this assertion, VMA cites "Attachment A (Agency Record) at 3." *Id.* But nowhere on that page, nor anywhere else in the

---

Virginia Code Section 10.1-1300 is the definitions section for the chapter of the Virginia Code that establishes the State Air Pollution Control Board. It was last amended in 2015, well before the Original Regulations or the Act. *See* Va. Code § 10.1-1300 (legislative history section showing the last amendment in 2015). Thus, VMA's argument that DEQ somehow violated "the Act" by failing to incorporate this section is internally inconsistent: this section is not part of the Act so failing to incorporate it cannot be a violation of the Act. Finally, VMA has not identified any definition or provision in the Amended Regulations that is inconsistent with Section 10.1-1300. Thus, VMA's contention that DEQ "failed to incorporate" this code provision is without merit.

record, does DEQ ever claim this APA exemption. There is no reason to claim such an exemption: the Act exempts the Amended Regulations from the APA. [11]

VMA relies upon a strawman fallacy: after misrepresenting DEQ's justification for not going through the APA process, VMA spends the remainder of its second argument refuting DEQ's supposed position. *See* VMA Brief at 19-22. There was no reason for DEQ to resort to one of the APA's exemptions when the Act exempted the Amended Regulations from the APA.[12]

B. The Act authorized each of the changes VMA identifies in its brief.

VMA concedes that the Act exempts the Amended Regulations from the APA. VMA Brief at 19. But according to VMA, DEQ went "far beyond the scope of the exemption" and included

[11] Recently, VMA made the same APA argument in a case before the Honorable Judge W. Reilly Marchant. In *VMA v. Northam*, Case No. CL20-4521, VMA asserted that emergency temporary standards for workplace safety, passed in response to the COVID-19 pandemic, were illegal because they did not go through the APA process. VMA also asserted that Governor Northam's emergency executive orders, also passed in response to the COVID-19 pandemic, had to go through the APA process. This Court dismissed VMA's APA claim reasoning:

> Count I is an allegation that there are violations to the Administrative Process Act. The Court finds that the VAPA doesn't apply to executive orders. In regard to the Emergency Temporary Standards, the Court also agrees with the Defense that 40.1 exempts the ETS, the Emergency Temporary Standards, from the VAPA. They exempt it. So the Court grants the Defense motion to dismiss Count I for those reasons.

VMA v. Northam, Case No. CL20-4521, Hearing Transcript at 60:6-15 (Feb. 16, 2021). *See also* Order Granting Motion to Dismiss at ¶ 1 ("Count I… is **HEREBY DISMISSED** for the reasons stated on the record at the February 16, 2021 hearing and because the VAPA does not apply to Emergency Executive Orders and because Virginia Code Section 40.1-22(6a) expressly exempts the Emergency Temporary Standard from the VAPA."). VMA has now filed a notice of appeal. *See* Notice of Appeal (Mar. 31, 2021).

While VMA may prefer to have the Amended Regulations go through the APA, just like they wanted the Emergency Temporary Standards at issue before the Honorable Judge Marchant to go through the APA, in both instances the General Assembly expressly exempted the regulations from the APA. In both instances, VMA's reliance on the APA is mistaken.

[12] VMA also asserts, without explanation, that the Act's APA exemption "is very narrow." VMA Brief at 20. Yet VMA does not point to any limiting language in the exemption.

"abundant substantive changes" in the Amended Regulations. *Id.* VMA then lists, in bullet-point format, six such changes.

Yet each of these changes are amendments that move Virginia from the previous consignment model (where DEQ granted "conditional allowances" to the regulated community who then consigned them over to the RGGI market) to the current direct auction model that the Act requires. Specifically, the first and third of VMA's examples are provisions where DEQ removed the concept of conditional allowances. *Compare* VMA Brief at 20 *with* Amended Regulations at 2 (replacing "conditional allowances" with "CO_2 allowances"). Similarly, the fourth, fifth, and sixth examples are provisions where DEQ removed the concept of a consignment auction and replaced it with a direct auction. *Compare* VMA Brief at 20 *with* Amended Regulations at 32-33 (repealing conditional allocation methodology regulations and removing reference to consignment auctions); at 56-57 (repealing consignment auction regulations).

These changes are expressly required by Section 1330.B of the Act, which requires DEQ to "establish, implement, and manage an auction program to sell allowances into a market-based trading program consistent with the RGGI program," and which requires the Director to "sell 100 percent of all allowances issued each year." Va. Code § 10.1-1330.B. Put differently, because the General Assembly mandated that DEQ move from the consignment/conditional allowance model to a direct auction model, DEQ amended its regulations to remove all references to consignment auctions and conditional allowances.

VMA characterizes its second example as an amendment that "strikes language in the definition for 'adjustment for banked allowances.'" VMA Brief at 20. This change, found on page 1 of the Amended Regulations, simply deletes the last phrase from the definition of the term "Adjustment for banked allowances." Specifically:

> "Adjustment for banked allowances" means an adjustment applied to the Virginia CO_2 Budget Trading Program base budget for allocation years 2021 through 2025 to address allowances held in general and compliance accounts, including compliance accounts established pursuant to the CO_2 Budget Trading Program, but not including accounts opened by participating states~~, that are in addition to the aggregate quantity of emissions from all CO_2 budget sources in all of the participating states at the end of the initial control period in 2020 and as reflected in the CO_2 Allowance Tracking System on March 15, 2021~~.

Amended Regulations at 1. DEQ made this change because, by moving from the consignment model to being a "full participant in RGGI" (Act at Section 1331), DEQ was now in sync with RGGI's time schedule—not its own—and it no longer needed an "initial control period in 2020." *See* Amended Regulations at 9 (deleting the term "Initial Control Period.") In other words, the Original Regulations included both an "Initial Control Period" and an "Interim Control Period." *Id.* (including both terms in the Original Regulations). After the Act, DEQ no longer needed both concepts so it deleted the term "Initial Control Period" from the Amended Regulations. *Id.* For consistency, it then deleted the last phrase in the definition of "adjustment for banked allowances" that referenced this now obsolete term. *Id.* at 1. VMA incorrectly characterizes this change as more than it is by describing it as changing "how the adjustment shall be aggregated with other participating states." VMA Brief at 20. This is incorrect. The only revision, as shown on the record, is removing reference to an obsolete term, *i.e.*, allowances from the "Initial Control Period."[13]

[13] After listing six examples of "abundant substantive changes" that VMA contends are illegal, VMA includes another example. VMA claims that "DEQ opted to further exceed its authority" by imposing a new provision requiring manufacturing facilities that generate some of their own electricity to apply for a permit exemption. VMA Brief at 20. According to VMA, this requirement is not in the Act; and is therefore, not exempt from the APA. *Id.* This is another red herring. The manufacturing facility exemption already existed in the Original Regulations; thus, it already went through the APA process. *See* Amended Regulations at 14 (showing the Original Regulations and showing that the exemption found in 9 VAC5-140-6040 is not one of the new amendments). Thus, this exemption already went through the APA process and VMA's opportunity to appeal these regulations has passed.

III. Contrary to VMA's assertion, the Amended Regulations are not vague.

The third argument in VMA's Brief (and its sixth assignment of error in its Petition for Appeal) is that the Amended Regulations are "void as a vague regulation." VMA Brief at 21. As discussed below, VMA's argument is incorrect. First, to establish that a regulation is unlawfully void, VMA faces an incredibly high burden, yet VMA points to no language in the Amended Regulations that comes anywhere close to meeting that burden Second, each of the specific arguments VMA advances in support of its vagueness theory is flawed.

A. The Amended Regulations are not void under Virginia law.

VMA cites two Virginia Supreme Court cases in support of its unlawfully void argument: *Tanner v. City of Va. Beach*, 277 Va. 432 (2009), and *Volkswagon of Am., Inc. v. Smit*, 279 Va. 327 (2010). *See* VMA Brief at 22. In each opinion, the court begins its analysis by stating that setting aside a statute or regulation on voidness grounds, which is rooted in due process concerns, is an extreme remedy that should be avoided if possible. In *Tanner*, the court stated:

> We are required to resolve any reasonable doubt concerning the constitutionality of a law in favor of its validity. Thus, if a statute or ordinance can be construed reasonably in a manner that will render its terms definite and sufficient, *such an interpretation is required*.

Moreover, these facilities were already required to apply for a permit. *See generally* 9 VAC5 Chapter 85 (permits for stationary sources of pollutants subject to regulation). Thus, the permit requirement is not new either. The only new revision DEQ made to this exemption is to provide a new application deadline of January 1, 2022. *See* Amended Regulations at 14. There are other updated deadlines throughout the Amended Regulations. *See, e.g. id.* at 5 (updating calendar year trigger price definitions); at 10 (similar update for the definition of "minimum reserve price"); at 25 (new deadline for submission of CO_2 budget permit applications); at 27 (revising Virginia's base budget to begin in 2021 rather than 2020); at 46 (replacing certain 2020 deadlines with new 2021 deadlines). According to VMA's argument, anytime the General Assembly mandates that a state agency make changes to an existing regulatory regime, the General Assembly must also explicitly empower the agency to make necessary deadline changes that go with those revisions.

Tanner, 277 Va. at 438-39 (emphasis added) (citations omitted). In *Volkswagon*, the court began its analysis by citing *Tanner*, and adding, "a court should not declare a statute to be wholly unconstitutional unless such a determination *is absolutely necessary* to decide the merits of the case. *Volkswagon*, 279 Va. at 337 (emphasis added) (citations and internal quotations omitted).

Thus, VMA as the moving party, has the burden to demonstrate that there is no "reasonable doubt" that the Amended Regulations are so vague that they are incapable of being "construed reasonably in a manner that will render [them] definite and sufficient." *Tanner*, 277 Va. at 439.

VMA cannot meet this burden. The key obligation that the Amended Regulations place on owners and operators of fossil-fuel burning power plants is to acquire CO_2 allowances that are equal or greater than the amount of the plant's CO_2 emissions. This obligation is codified in 9 VAC5-140-6050.C. *See* Amended Regulations at 16. That provision states:

> 1. The owners and operators of each CO_2 budget source and each CO_2 budget unit at the source *shall hold CO_2 allowances* available for compliance deductions under 9 VAC5-140-6260, as of the CO_2 allowance transfer deadline, in the source's compliance account *in an amount not less than the total CO_2 emissions* that have been generated as a result of combusting fossil fuel for an interim control period or control period from all CO_2 budget units at the source….

Id. There is nothing vague about this obligation. Indeed, each of the key terms in this regulation is specifically defined in the Amended Regulations. *See, e.g.*, Amended Regulations at 4 (defining "CO_2 budget source" and "CO_2 budget unit"); at 6 (defining "compliance account"); at 12 (defining "source" and "unit"). VMA fails to explain how any of this is vague; much less, incapable of being "construed reasonably in a manner that will render its terms definite and sufficient," which is the legal standard articulated in *Tanner*. 277 Va. at 438-39.

The Amended Regulations stand in stark contrast to the ordinance at issue in *Tanner*. There, Virginia Beach imposed a city ordinance that made it unlawful "for any person to create, or allow to be created any unreasonably loud, disturbing and unnecessary noise in the city." *Id.* at

435. The ordinance failed to define "unreasonably loud" and the trial court heard testimony from police officers that they interpreted the ordinance using a "reasonable person standard" that "depends on an individual officer's assessment." *Id.* at 437. The Virginia Supreme Court ruled that the ordinance was unlawfully vague because persons subject to the ordinance could not determine in advance whether activity was unlawful. *Id.* at 439-40.

Here, there is no reasonable person test. Indeed, the phrase "reasonable person" does not appear anywhere in the Amended Regulations. VMA fails to demonstrate how any CO_2 unit or budget source, subject to these Amended Regulations, is unable to determine whether activity is unlawful. The Amended Regulations are clear: such a regulated entity must acquire CO_2 allowances that are "not less than" its CO_2 emissions.[14]

There is one final point worth noting about VMA's vagueness claim. Challenges to statutes or regulations on vagueness grounds are due process claims. *See Volkswagon*, 279 Va. at 337. Yet most of the obligations the Amended Regulations place on power plants, such as the obligation to acquire CO_2 allowances, are not new: they are obligations that existed in the Original Regulations. *See, e.g.*, Amended Regulations at 16 (showing only one minor change to 9VAC-140-6050.C). The Original Regulations went through a full APA notice and comment process that VMA participated in. VMA elected not to appeal the Original Regulations. Thus, even if the obligations were somehow vague, VMA has had due process and waived its right to now challenge the specificity of these obligations.

B. Each of VMA's voidness arguments is flawed.

In support of its "unlawfully void" argument, VMA makes three arguments; each is flawed.

[14] Also, *Tanner* involved a city ordinance that applied to the general population. The Amended Regulations, by contrast, apply to fossil-fuel burning electric utilities and other large, sophisticated entities who already comply with a myriad of federal, state, and local regulations.

1. VMA's argument that the Amended Regulations "do not even mention" RGGI ignores the Act's mandate and how the Amended Regulations work.

First, VMA argues that "[w]ithout RGGI, the [Amended Regulations] cannot operate; however, the RGGI program is not even mentioned." VMA Brief at 22. There are two flaws in this argument. First, the Act does not require DEQ to join RGGI or mention RGGI in its amendments; rather, it very specifically mandates that DEQ "establish, implement, and manage an auction program to sell allowances into a market-based trading program consistent with the RGGI program." Va. Code § 10.1-1330.B. In other words, the General Assembly gave DEQ flexibility: it could join RGGI, create its own auction "consistent with the RGGI program," or should a new auction be created in the future, join it. *See also* Va. Code § 10.1-1331 ("If the Governor seeks to include the Commonwealth as a full participant in RGGI…."). DEQ followed the Act's mandate by fashioning Amended Regulations that are "consistent with RGGI" but would also be consistent with one of these other options. Thus, rather than being an unlawful ambiguity, the lack of the word "RGGI" in the Amended Regulations is intentional and consistent with the Act.

The second flaw with this argument is that other states' regulations do not mention RGGI either; yet there is no evidence that their auctions, which have been occurring for years, impose vague or uncertain obligations on participants.[15] If VMA's argument that regulations that fail to mention RGGI are so vague that they cannot be complied with, then one would not expect over a

[15] For example, Massachusetts' CO2 Budget Trading Program regulations are nearly identical to Virginia's Amended Regulations, yet Massachusetts has been successfully participating in RGGI auctions for years. *See* 310 Code of Mass. Regulations 7.70 (creating the "Massachusetts CO2 Budget Trading Program," requiring utilities to purchase allowances through that trading program, and only using the word "RGGI" when discussing the "RGGI CO_2 Allowance Tracking System"). *See also* 26 Code of Maryland Regulations Subtitle 9 (establishing the "Maryland CO2 Budget Trading Program" without using the word "RGGI"); 6 New York Code of Rules and Regulations Subpart 242-1 (establishing the New York CO2 Budget Trading Program but not using the word "RGGI"); Code of Vermont Regulations 12-031-002 (establishing the Vermont CO 2 Budget Trading Program but not using the word "RGGI").

decade of successful auctions by other states that have regulations that do not mention RGGI. *See, e.g.,* RGGI Auction Results (showing cumulative auction proceeds since RGGI's inception of $3,953,834,280.29) (available at https://www.rggi.org/auctions/auction-results) (last visited Apr. 14, 2021); RGGI Fourth Compliance Report (Apr. 2, 2021) (finding that "99.1% of covered power section emissions were in compliance" with auction requirements) (available at https://www.rggi.org/sites/default/files/Uploads/PressReleases/2021_04_02_FoCP_Compliance.pdf) (last visited Apr. 14, 2021).

2. VMA's argument that RGGI requirements are de facto rules is internally inconsistent, misapplies caselaw, and is a challenge to the Original Regulations, not the Amended Regulations.

VMA's second argument is that "RGGI requirements are de facto rules neatly eluding public notice or engagement in Virginia." VMA Brief at 24. There are three flaws with this argument. First, it is inconsistent with VMA's prior argument that the regulations are vague for failing to mention RGGI. Both statements cannot be true: regulations cannot be simultaneously vague for not using the word "RGGI" and vague for imposing RGGI.

The second flaw is that it misconstrues the concept of "de facto rules." VMA cites a single case regarding "de facto rules" — *Virginia Bd. Of Med. v. Virginia Physical Therapy Ass'n.*, 413 S.E.2d 59 (Va. Ct. App. 1991). *Id.* That case involved a determination of whether an informal "rule" adopted by the Board of Medicine constituted a "rule or regulation" under the APA. *Virginia Bd. of Medicine*, 413 S.E.2d at 64-65. In that context, the Court of Appeals discussed the concept of a "de facto rule," meaning, an agency action that the agency characterizes as something short of a final rule or regulation, but nonetheless, may constitute a rule or regulation under the APA. *Id.* That concept has no application here. The Amended Regulations are regulations. There

is no dispute. The Amended Regulations did not go through the APA process because the General Assembly expressly exempted them. Va. Code § 10.1-1330.A.

The third flaw in this argument, mentioned in Section A above, is that the *Original Regulations* imposed the requirements VMA now complains of. For example, VMA complains that the Amended Regulations require participants to comply with the requirements for RGGI COATS accounts. VMA Brief at 22. Yet the regulation VMA cites to make this argument, 9VAC5-140-6260, is substantially unchanged by the Amended Regulations. *See* Amended Regulations at 39-41 (showing the only change the Amended Regulations made to this provision is to remove reference to an "initial control period"). In other words, the Original Regulations imposed the same requirements VMA now claims to be unlawfully vague. Yet, the Original Regulations went through a full notice and comment process that VMA participated in and VMA chose not to pursue an APA appeal. Thus, VMA cannot now claim some sort of due process violation for a requirement that is not new. Moreover, the Original Regulations are not before the Court; thus, any alleged ambiguity is not at issue here.

3. VMA offers no evidence to support its claim that a "person of ordinary intelligence" could not comply with the Amended Regulations and the results of Virginia's first CO_2 auction demonstrate that VMA's claim is false.

VMA's third argument is that a "person of ordinary intelligence, in the Revision A20 program could not decipher the program requirements in general." VMA Brief at 23-24. This argument is flawed for two reasons. First, VMA has the burden of proof and, as discussed above, it is a very high burden for a vagueness claim. VMA points to no evidence in the record to substantiate this claim.

Second, this Court can take judicial notice[16] of media accounts of Virginia's first CO_2 auction which occurred earlier this year. As reported, Virginia generated over $43 million in revenue from the first auction and there were no reports of widespread confusion by participants.[17]

IV. VMA's tax claims fail because: (A) they are challenges to the Act, not the Amended Regulations; and (B) the revenue collected is not an illegal tax.

The fourth argument in VMA's Brief (and its fourth and fifth assignments of error in its Petition for Appeal) is that "requiring utilities to buy CO2 allowances to offset 100% of their annual tons of CO2 emissions" is an "illegal carbon tax on Virginia electricity ratepayers." VMA Brief at 25. There are two flaws with this argument. First, it is a challenge to the Act (and other statutes), not a challenge to the Amended Regulations. Second, utilities charging their customers for CO_2 allowances is not an illegal tax under Virginia law.

A. VMA's tax arguments are challenges to the Act, not the Amended Regulations; yet, VMA did not challenge the Act in this case.

According to VMA, "[t]he trading market, as structured under Revision A20, creates a carbon tax outside of the required taxation process." *Id.* Yet, "the trading market," that VMA describes was explicitly mandated by the General Assembly through the Act:

> The Director is hereby authorized to establish, implement, and manage an auction program to sell allowances into a market-based trading program consistent with the RGGI program and this article. The Director shall seek to sell 100 percent of all allowances issued each year through the allowance auction. . . .

---

[16] Pursuant to Virginia Supreme Court Rule 2:201, this Court may take judicial notice of "a factual matter not subject to reasonable dispute in that it is either (1) common knowledge or (2) capable of accurate and ready determination by resort to sources whose accuracy cannot reasonably be questioned." Va. Sup. R. 2:201(a) (2020).

[17] *See* Sarah Vogelsong, *Virginia Nets More than $43 Million in First Carbon Allowance Auction*, The Virginia Mercury (Mar. 9, 2021) (available at https://www.virginiamercury.com/blog-va/virginia-nets-more-than-43-million-in-first-carbon-allowance-auction/) (last visited Apr. 13, 2021). VMA has provided no evidence of widespread confusion in any of the other RGGI states since their adoption of similar regulations.

Va. Code § 10.1-1330.B. Thus, the General Assembly — not DEQ — created "the trading program" that VMA asserts is an illegal tax and the General Assembly mandated that the DEQ Director sell "100 percent" of all allowances through that program. Yet VMA did not challenge the Act.

VMA similarly argues that "the CECFPA directs the state treasury to hold the proceeds recovered from the allowance auction in an interest-bearing account," and by doing so, "the CECFPA specifically evades the general treasury." VMA Brief at 26. According to VMA, this evasion of the general treasury is unconstitutional. *Id.* But as VMA's own brief demonstrates, this is an argument against the Act, not the Amended Regulations. *Id.* ("the CECFPA specifically evades the general treasury…").

VMA did not challenge the constitutionality of the Act. Instead, VMA is asking this Court to set aside the Amended Regulations. But even if this Court did so, the Act would remain in place; thus, the "illegal tax" VMA claims exists would remain.

B. Even if the Act was before this Court, the General Assembly's authorization for utilities to include the costs of allowances in their rates is not an illegal tax.

VMA argues that "Revision A20 effectively *imposes a tax on electricity ratepayers* because the CECFPA provides for recovery of these costs through rates as environmental compliance project costs." VMA Brief at 25 (emphasis added). Not only is this argument, as discussed above, a challenge to the Act rather than to the Amended Regulations, this argument suffers from two additional defects: this provision is neither a tax nor illegal.

First, the Act mandates the creation of a CO_2 direct auction program. Va. Code § 10.1-1330.B. The potential added costs of electricity that ratepayers may pay utilities to comply with that program is not a tax under Virginia law. As the United States Court of Appeals for the Fourth Circuit reasoned in *Corr v. Metro. Wash. Airports Auth.*, 740 F.3d 295, 300 (4th Cir. 2013), in

assessing an illegal tax claim, "Virginia courts ask whether a given exaction is a bona fide fee-for-service or an invalid revenue-generating device." For example, tolls "are user fees and not taxes when they are nothing more than an authorized charge for the use of a special facility." *Id.* (quoting *Elizabeth River Crossings OpCo., LLC v. Meeks*, 749 S.E.2d 176, 183 (Va. 2013) (internal quotation marks omitted)). The rate that electricity customers pay an electricity utility is the "authorized charge" the customer pays in exchange for receiving the electricity. *Id.* The fact that the General Assembly, through the Act, has allowed utilities to include within that fee the costs of purchasing CO_2 allowances necessary to produce that electricity does not transform a customer's electricity bill into a tax.[18]

The second defect with VMA's argument is that even if passing on the costs of purchasing CO_2 allowances to ratepayers did constitute a tax, the General Assembly has the legal authority to levy taxes. *See* Va. Cont. Art. VII, § 7. *See also Wise Cty Bd. of Supervisors v. Wilson*, 250 Va. 482, 484 (1995) ("no entity other than an elected governing body may levy taxes"). The constitutional limitation on the General Assembly's taxing power is found in Article X, Section 7 of the Virginia Constitution, which states that "[n]o money shall be paid out of the State treasury except in pursuance of appropriations made by law." Va. Const. Art X, § 7. The Virginia Supreme Court has interpreted the term "appropriation" to mean "payment out of the state treasury." *Button v. Day*, 203 Va. 687, 695 (1962). Thus, taxes collected in Virginia can only be paid out of the state

[18] If VMA's argument were correct, every "environmental compliance project cost" that a utility includes in its costs of service would constitute an illegal tax on rate payers. For example, the General Assembly allows a utility to charge all its customers for the costs of projects that replace existing overhead powerlines with underground power lines. *See* Va. Code § 56-585.1.A.6. According to VMA, this cost sharing would be an illegal tax because it is a project cost that is paid for by all customers for a public need. Similarly, the General Assembly allows utilities to include the "cost of compliance" with renewable energy portfolio standards as part of its cost of service. Va. Code § 56-585.1.A.5.d. These costs, according to VMA's logic, would also constitute illegal taxes on electricity customers.

treasury if authorized by the General Assembly through the passage of a law. Here, the General Assembly did just that: it passed the Act. Specifically, Section 10.1-1330.C of the Act, begins with, "[t]o the extent permitted by Article X, Section 7 of the Constitution of Virginia," and then articulates exactly how proceeds from direct auctions are to be distributed. Thus, even if the Act were challenged in this case (which it is not), and even if requiring electricity customers to pay through electricity rates for the purchase of CO_2 allowances necessary to produce their electricity constituted a tax (which it does not), it is not an unconstitutional or illegal tax because the General Assembly explicitly directed how the proceeds should be distributed through a law.

V. VMA is not entitled to attorneys' fees under the APA or otherwise.

In its petition, VMA requests that this Court award it attorneys' fees that VMA incurred in bringing this action. VMA Pet. at 26. Pursuant to Virginia Code Section 2.2-4030, a party is only entitled to attorneys' fees in an APA appeal if "(i) the agency's position is not substantially justified, (ii) the agency action was in violation of law, or (iii) the agency action was for an improper purpose." Va. Code § 2.2-4030.A.

Here, none of these elements have been satisfied. As discussed above, DEQ's issuance of the Amended Regulations was mandated by the General Assembly through the Act and the Act expressly exempted the Amended Regulations from the APA. Thus, DEQ neither violated the law nor acted "for an improper purpose." *Id.* For all the reasons stated above, DEQ respectfully requests that this Court deny VMA's request for attorneys' fees.

Conclusion

This case is important. In 2020, the Virginia General Assembly passed historic environmental legislation that addresses both the causes of climate change and its impact on vulnerable communities in Virginia. Part of that legislation required that DEQ amend the existing CO_2 budget trading program by moving to a direct auction model and then selling 100% of Virginia's CO_2 allowances in those auctions. The General Assembly expressly exempted these amendments from the APA. DEQ followed the General Assembly's mandate: it issued the Amended Regulations that made all necessary changes to the existing CO_2 Budget Trading Program. Now, DEQ is directly auctioning CO_2 allowances and the proceeds, which were over $43 million in the first auction, are going to support programs for low-income communities and vulnerable shorelines. This is exactly what the General Assembly legislated.

Yet this case is not complicated. VMA has challenged the Amended Regulations, but not the Act. Contrary to VMA's assertions, the Amended Regulations expressly follow the Act, they do not violate it. There can be no APA violation because the Act exempts the Amended Regulations from the APA. The Amended Regulations are not unlawfully vague. Finally, allowing utilities to charge their customers for the costs of CO_2 allowances is not an issue before this Court (because it is an issue that goes to the Act, not the Amended Regulations), and even if it was, doing so is not an illegal tax.

The Virginia General Assembly acted to address climate change and vulnerable communities in Virginia are receiving the benefit of these actions. This Court should not be persuaded to undermine this progress.

ENERGY + ENVIRONMENT
GENERAL ASSEMBLY 2020
GOVERNMENT + POLITICS

Virginia lawmakers agreed to join a regional carbon market. Here's what happens next.

By: Sarah Vogelsong - April 14, 2020 12:01 am

Coal fired units at Dominion Energy's Chesterfield Power Station would close by 2024 under the Clean Economy Act that passed the General Assembly in 2020. (Ryan M. Kelly/ For the Virginia Mercury)

A year after Republican resistance stalled Virginia's effort to cap carbon emissions from large producers of the greenhouse gas at the forefront of climate change, the wheels are again in motion: Virginia is joining the Regional Greenhouse Gas Initiative.

Joining the cap-and-invest program was one of Democrats' top legislative priorities for the 2020 General Assembly session. Thanks to their majorities in both the House of Delegates and the Senate, they achieved their goal on mostly, but not quite, party-line votes. Gov. Ralph Northam has also supported the state's participation, although several technical amendments he's proposed related to fund administration still have to be approved by the reconvened General Assembly next week.

"By joining RGGI, Virginia will take part in a proven, market-based program for reducing carbon pollution in a manner that protects consumers," Northam said in a statement Sunday. "I am proposing important refinements and I look forward to signing it into law soon."

Clearing these political hurdles, though, is only the beginning of the administration's work. Virginia will become a full participant in RGGI starting Jan. 1. Here's what will happen between now and then.

The caboose budget will be finalized, allowing the state to devote resources to joining RGGI

In 2019, Republicans blocked Virginia from joining RGGI by adding language to the budget that forbid the Department of Environmental Quality from spending any money "to support membership or participation in the Regional Greenhouse Gas Initiative until such time as the General Assembly has approved such membership."

The General Assembly has now approved such participation — but that approval doesn't go into effect until July 1, while the budget passed in 2019, with its prohibition on RGGI spending, remains in force.

That doesn't mean the state's hands are tied until July, however. The solution lies in the "caboose" budget, a bill that amends the last biennial budget and applies to spending through June 30, the last day of the fiscal year. The 2020 caboose budget, as might be expected, strips out the RGGI spending provision.

Last weekend, Northam returned the caboose bill to the General Assembly with 37 proposed amendments designed to help Virginia respond to the COVID-19 pandemic. None of the amendments are related to RGGI, but legislators will have to agree on a final version of the caboose budget when they reconvene April 22 before the administration can take any further action to join the initiative.

"We are anxiously awaiting the date and time where that becomes effective, because that will be sort of the starting gun for us," said DEQ Deputy Director Chris Bast.

The state's existing carbon regulation will be rewritten

Virginia already has a regulation on its books to govern how the state could operate in a carbon market. But because the General Assembly has to approve all state expenditures and

revenues, and the "carbon rule" was written before any such approval had been given, regulators had to devise a way for the state to participate in the RGGI market without spending or making any money.

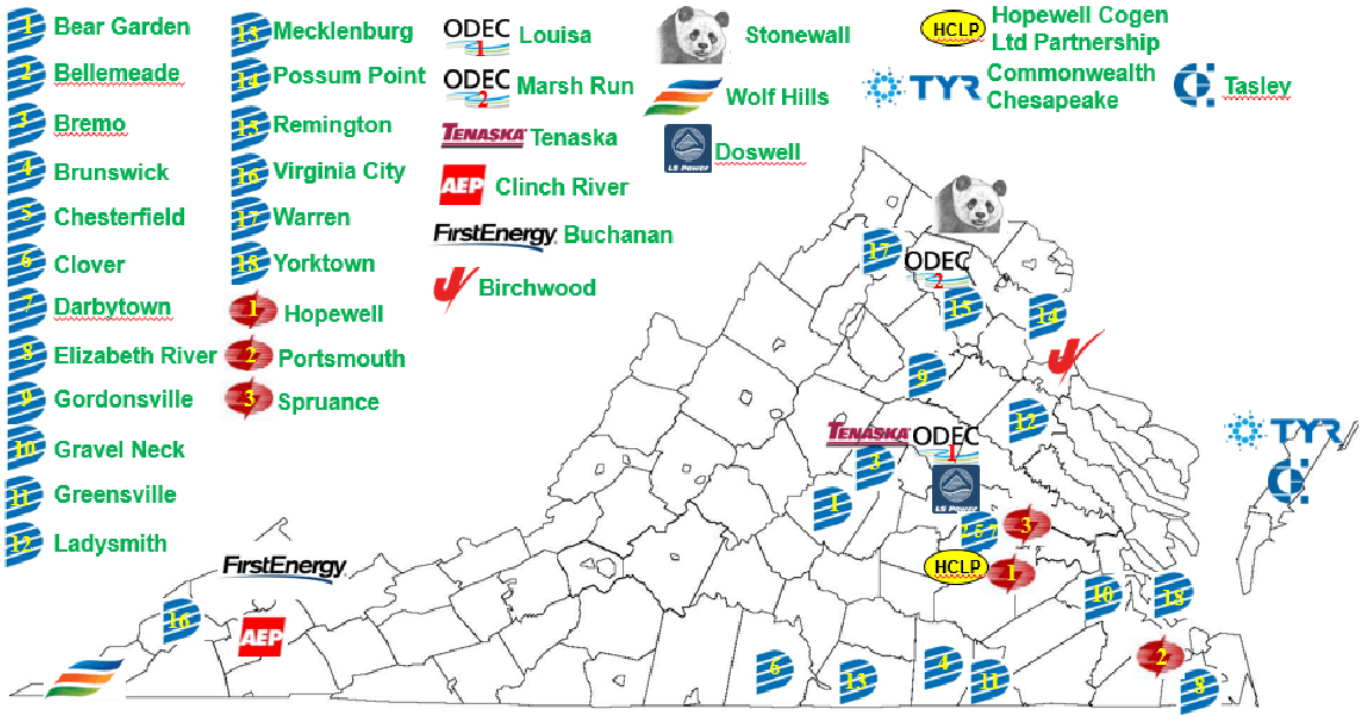
What they came up with was an elaborate workaround called a consignment auction. Under this plan the state would have distributed carbon allowances to emitters based on their historical emissions, and the emitters would then have been required to sell those allowances into the market while buying back what they needed.

It was "a very complicated regime that we had concocted. But it worked, or it would have worked," said Virginia Department of Environmental Quality Air Director Mike Dowd.

Now there's no need for that system. The legislation that cleared the General Assembly this session authorizes the state to take a simpler approach of directly auctioning off carbon allowances to emitters and then depositing the revenues of that auction in specific funds for energy efficiency, flood preparedness and other measures.

"We'll be doing what every other state in RGGI does," said Dowd.

With the existing carbon rule now out of date, DEQ will be charged with revising it to match the new law. To ease and speed up that process, the General Assembly has also allowed the agency to bypass the typical procedural requirements for changing regulations outlined in the Administrative Process Act.



Power plants covered under Virginia's carbon regulation. The unbuilt Chickahominy Power Station and C4GT facilities are not included. (Virginia Department of Environmental Quality presentation, October 2018)

Virginia will sign a contract with RGGI, Inc. and appoint two members to its Board of Directors

Once the budget restrictions are lifted, Virginia will be free to enter into talks with RGGI, Inc., the nonprofit organization that coordinates the states' participation in the program. Although RGGI, Inc. has no regulatory authority of its own — its role is administrative and technical — it is the hub through which Virginia will finalize the details of how it will participate in the regional carbon market.

Some of the outstanding issues to be resolved, said Dowd, include Virginia's contribution to the overall program's annual administrative costs, the process of transferring allowances and confirmation that the state's system will work smoothly with the regional one.

Why RGGI states are called "participants," not "members"

Although this reporter and others have frequently referred to the 10 New England and Mid-Atlantic states that are part of RGGI as "members" of the program, the states staunchly insist they are "participants," a distinction intended to keep them from running afoul of the Compact Clause of the U.S. Constitution.

This Article I clause declares that "No State shall, without the Consent of Congress, … enter into any Agreement or Compact with another State."

That might seem to be an insurmountable barrier to the kind of agreement RGGI is built on. But, as the *Harvard Law Review* observed, "no court has ever invalidated an interstate agreement for lack of [congressional] consent," and "the Supreme Court has long maintained that not every arrangement that might be considered an 'agreement or compact' in the modern meaning of the terms requires congressional consent."

Despite legal challenges to RGGI from the electric industry and other parties, no ruling to date has struck down the effort. Many scholars and policymakers have accepted that the initiative does not violate the Compact Clause based on three key points. First, RGGI, Inc. has no regulatory or enforcement authority. Second, every state that participates in RGGI does so by adopting its own independent legislation, albeit legislation based on a consistent Model Rule. And third, any state is free to exit or enter RGGI as it sees fit, as the case of New Jersey — which voted to withdraw from RGGI in 2011 and then, in 2019, to rejoin it — illustrates.

As DEQ Air Director Mike Dowd put it, RGGI "is in large measure a gentleman's agreement among the participating states."

"These are the details that we haven't been able to talk about with RGGI for the last year," he said.

Northam will also appoint two people to the RGGI, Inc. Board of Directors, which usually includes each state's environmental agency head and the leader of its energy regulatory body.

"RGGI's a consensus organization. It's not the type of organization that operates by a majority-rule vote," said Bast. Joining the board, he said, will ensure Virginia has a seat at the table in future decisions, including those related to Pennsylvania's pending linkage with the market.

Carbon emitters will prepare for auctions and compliance obligations

All fossil fuel plants with a capacity of 25 or more megawatts will be required to buy carbon allowances to cover their emissions once Virginia begins fully participating in the market Jan. 1 — a cost the legislature will allow utilities to pass directly onto their customers, with no extra returns for investors.

In February, Dominion estimated RGGI compliance would raise the average customer's monthly bill by $1.22 over the next five years, while the State Corporation Commission estimated monthly bills will increase between $2 and $2.50.

These facilities will also need to ready themselves for regular compliance reporting to ensure they are purchasing enough allowances and monitoring their emissions appropriately.

Because RGGI auctions are held quarterly and the first won't occur until March 2021, there might appear to be a lag between the program's requirements and the first chance emitters have to meet them. Compliance with RGGI limits, however, is assessed on a three-year basis (although emitters do have to meet certain targets during that time).

This design gives facilities some flexibility: as long as they can prove they hit their targets and held the necessary number of allowances over that period, they will be in the clear.

Between the quarterly auctions, businesses can also buy and sell allowances on RGGI's secondary market. Some Virginia emitters, officials believe, may already be storing them up for Jan. 1.

State modeling will be updated

State models developed during the crafting of the original carbon regulation will be updated to match what Bast called the "new reality" in Virginia, one shaped by Northam's goal of weaning the state's electric grid off fossil fuels by midcentury, the shift from a compliance auction system to a direct one, and passage of the Virginia Clean Economy Act, which sets hard targets for utilities to develop renewable resources and encourage energy efficiency.

All of those factors will change estimates of what RGGI compliance will cost Virginians, as well as what revenues it will produce.

"The emissions cap and the clean energy standard in the Clean Economy Act really do work hand in hand," said Bast. "The sum is greater than its parts."

Other modeling will likely occur on the regional level, as the RGGI states assess how the participation of a large emitter like Virginia will affect the broader market.

RGGI Director of Program Administration Anna Ngai said in an email this March that the other states "recognize the benefits of a broader market with more participants, as larger markets increase economic efficiency and cost-effectiveness."

While the list of hoops for the state to jump through before Jan. 1 may be long, Dowd said he had few doubts the process would be completed in time.

"There are no problems that we see on the horizon that would in any way hinder our full participation starting next year," he said.

VIRGINIA CLEAN ENERGY AND COMMUNITY FLOOD PREPAREDNESS ACT

A Joint Report to Governor Ralph S. Northam
and the General Assembly of Virginia

Department of Environmental Quality
Department of Housing and Community Development
Department of Conservation and Recreation
Department of Energy

DECEMBER 2021

EXECUTIVE SUMMARY

This report was prepared pursuant to § 10.1-1330 of the Code of Virginia which directs the Department of Environmental Quality (DEQ), the Department of Conservation and Recreation (DCR), the Department of Housing and Community Development (DHCD), and the Department of Energy (DOE) to, beginning January 1, 2022, annually prepare a joint annual written report describing the Commonwealth's participation in the Regional Greenhouse Gas Initiative, the annual reduction in greenhouse gas emissions, the revenues collected and deposited in the interest-bearing account maintained by the Department of Environmental Quality pursuant to the Clean Energy and Community Flood Preparedness Act, and a description of each way in which money was expended during the fiscal year.

SECTION 1 – DEPARTMENT OF ENVIRONMENTAL QUALITY

1.1 Introduction

Signed in April 2020 by Governor Northam, the Clean Energy and Community Flood Preparedness Act (CECFPA) directed DEQ to establish through regulation a carbon dioxide (CO_2) cap and trade program to reduce emissions released by electric generation facilities. The Act also authorizes Virginia to link its cap and trade program to the larger Regional Greenhouse Gas Initiative (RGGI).

Several executive actions concerning the development of a market-based mechanism to reduce carbon pollution preceded the signing of the Clean Energy and Community Flood Preparedness Act. Executive Order 57, signed by Governor McAuliffe in 2016, directed the Secretary of Natural Resources to convene a work group to study and recommend methods to reduce CO_2 from electric power facilities and grow the clean energy economy within existing state authority. This group facilitated extensive stakeholder engagement before submitting a final report with recommendations to the Governor.

Subsequently, in 2017, Governor McAuliffe signed Executive Directive 11, titled, “Reducing Carbon Dioxide Emissions from the Electric Power Sector and Growing Virginia’s Clean Energy Economy.” This order directed DEQ to develop a regulation to control CO_2 from electric power facilities that allows for the use of market-based mechanisms and the trading of CO_2 allowances through a multi-state trading program.

Although the regulation was officially adopted in 2019, language in the 2019 budget effectively suspended its implementation. Then, as noted above, during the 2020 Session, the General Assembly passed the Clean Energy and Community Flood Preparedness Act. Pursuant to the Act, DEQ adopted a revised regulation in June 2020 that converted the Carbon Trading Program from the prior consignment-based model to a direct auction trading system. The regulation was subject to a legal challenge in the Circuit Court for the City of Richmond. The Circuit Court upheld the regulation in July 2021.

1.2 Overview of the Carbon Trading Program

Virginia has chosen to implement its carbon trading rule pursuant to Clean Energy and

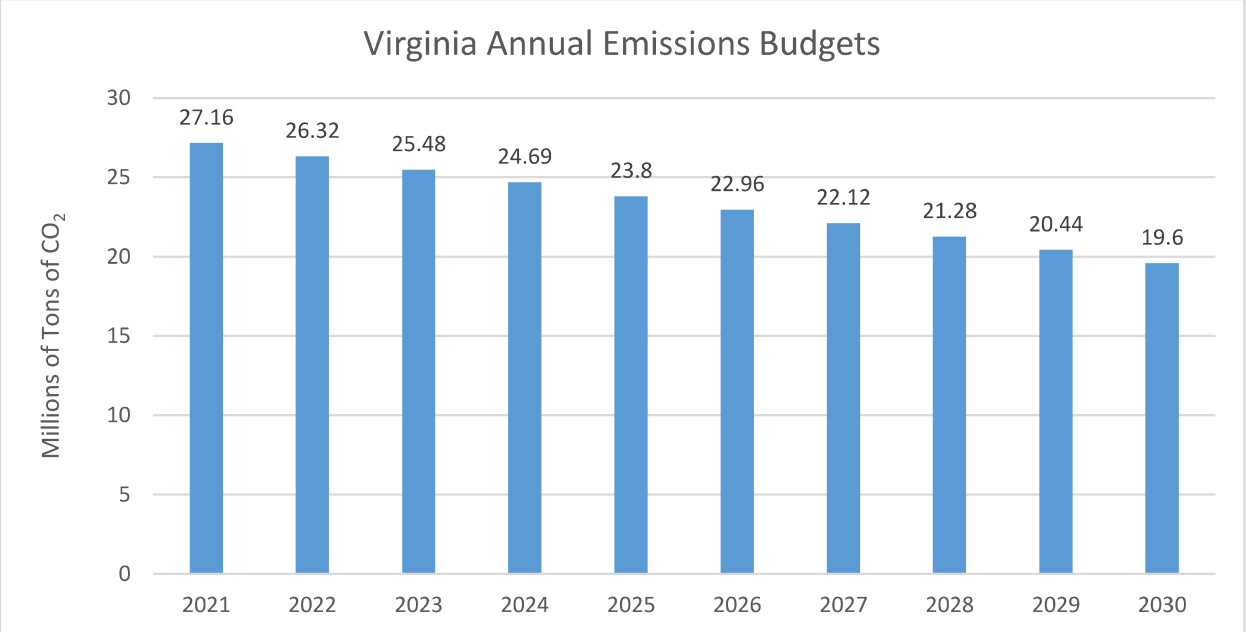
Community Flood Preparedness Act by participating in the Regional Greenhouse Gas Initiative, which currently has 11 participating states in the mid-Atlantic, and New England.

The RGGI program serves a dual purpose in that it is a cap and trade program for regulated sources where allowances can be purchased for each ton of CO_2 emissions. These allowances can then be used for compliance purposes, banked for future use, or traded to other sources. These allowances are fully fungible and can be used throughout the RGGI program area. At the end of each three-year compliance period, regulated sources must surrender the number of allowances equal to their CO_2 emissions during the compliance period.

For participating states, the RGGI program serves as a cap and invest program where each state offers their allowances based on established emissions budgets for sale during quarterly auctions. As these emission budgets decrease over time, so do the regional CO_2 emissions. The proceeds from the auctions are returned to the states to fund climate related programs.

The Virginia Carbon Trading Program regulation establishes a declining annual budget on carbon dioxide emissions from power plants consistent with the RGGI reduction goals. To comply with the regulation, power generators must reduce emissions and purchase allowances through quarterly auctions administered by RGGI, Inc., the curating non-profit organization for the RGGI program, on behalf of DEQ. Emissions reductions are secured as the budget is lowered over time. From 2020 to 2030, the power sector emissions budgets among Virginia and the RGGI states will decrease by 30%. Virginia's annual emissions budgets are shown in Table 1.

Figure 1: Virginia Carbon Trading Rule Annual Budgets



Source: Virginia Carbon Trading Program Regulation

The Clean Energy and Community Flood Preparedness Act provides that 45% and 50% of the proceeds generated from the auctions are used to fund the Virginia Community Flood Preparedness Fund (CFPF) and the Housing Innovations in Energy Efficiency (HIEE) program,

respectively. The CFPF helps localities across the Commonwealth reduce the impacts of flooding by implementing flood prevention and protection projects. The HIEE program makes energy efficiency upgrades to new and existing residential buildings to reduce energy bills for low-income Virginians. DEQ receives 3% of auction revenues to cover administrative expenses related to running the Program and to carry out statewide climate change planning and mitigation activities. The Department of Housing and Community Development, in partnership with the Virginia Department of Energy, receives 2% of the proceeds to administer and implement the low-income energy efficiency programs.

Virginia's participation in RGGI is expected to facilitate Virginia's energy transition and the goal of achieving 100% carbon-free electricity generation by 2045 set forth in the Virginia Clean Economy Act.

1.3 Sources Affected in Virginia

A total of 27 electric generating facilities in Virginia are currently subject to the carbon trading rule. The combined capacity of these facilities is 19,922 megawatts (MWs) and their combined emissions in 2020 were 31.4 million tons of CO_2. In terms of fuel specific generation, 2,827 MWs of coal-fired generation emitted 4.4 million tons of CO_2, 14,765 MWs of natural gas-fired combine cycle generation emitted 26.9 million tons of CO_2, and 2,330 MWs of oil-fired generation emitted 0.1 million tons of CO_2. A list and map of the affected sources in Virginia are presented in Table 1 and Figure 2. Some sources are not visible on the map due to their proximity to each other.

Table 1: RGGI Sources in Virginia

	County	Plant Name	Capacity (MW)	2020 CO_2 Emissions (Tons)
1	Buckingham	Bear Garden Generating Station	559	1,805,606
2	King George	Birchwood Power Facility	258	108,616
3	Brunswick	Brunswick County Power Station	1,472	4,135,381
4	Buchanan	Buchanan Units 1 & 2	88	258,931
5	Chesterfield	Chesterfield Power Station	1,500	2,020,768
6	Russell	Clinch River	475	184,040
7	Halifax	Clover Power Station	848	1,432,252
8	Accomack	Commonwealth Chesapeake	403	20,758
9	Henrico	Darbytown Combustion Turbine	368	80,893
10	Hanover	Doswell Limited Partnership	1,313	3,097,621
11	Chesapeake City	Elizabeth River Combustion Turbine	389	63,055
12	Louisa	Gordonsville Power Station	300	594,369
13	Surry	Gravel Neck Combustion Turbine	408	113,015
14	Greensville	Greensville County Power Station	1,773	4,189,822
15	Hopewell	Hopewell Cogeneration Facility	399	1,025,984
16	Caroline	Ladysmith Combustion Turbine Station	893	682,849
17	Louisa	Louisa Generation Facility	509	238,055
18	Fauquier	Marsh Run Generation Facility	513	355,517
19	Loudoun	Panda Stonewall Power Project	812	2,012,751
20	Prince William	Possum Point Power Station	1,591	1,604,137

Figure 2: RGGI Regulated Sources

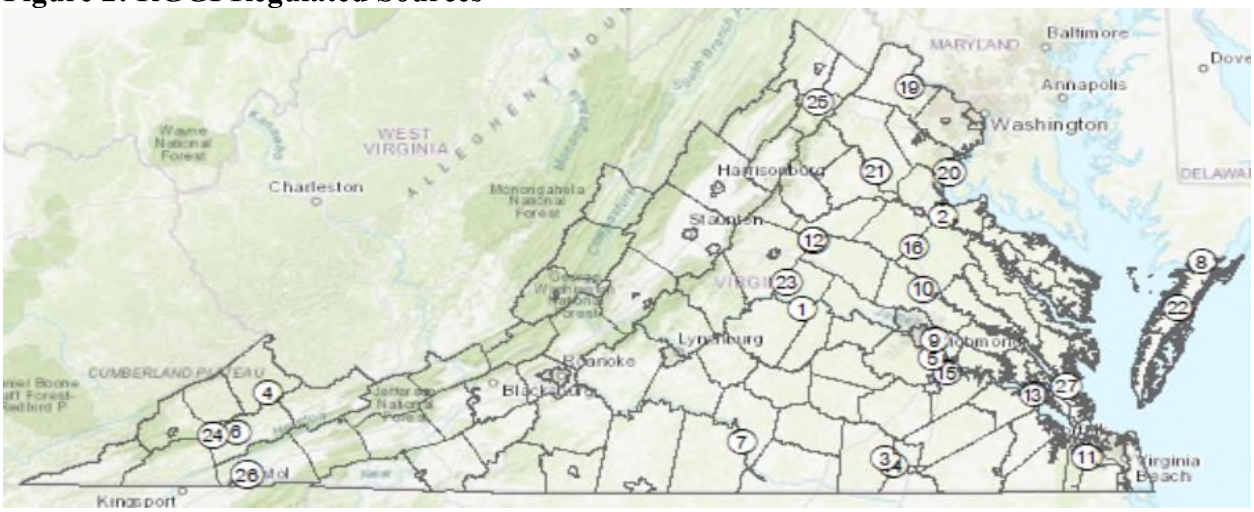

Figure 3 shows the 2020 emissions from each of the sources regulated under the carbon-trading rule. The largest CO_2 emitting sources in Virginia in 2020 were newly constructed and highly efficient combined cycle natural gas-fired facilities. Further discussion of the transition of the Virginia power sector to more efficient and less-polluting generation is available in Section 1.4.

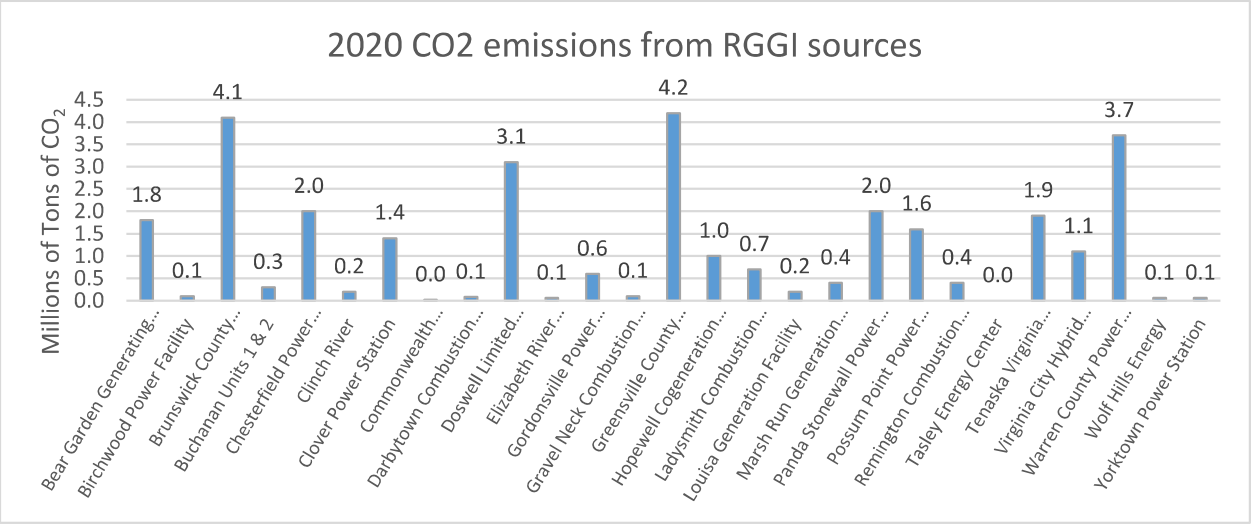
Figure 3: 2020 CO_2 Emissions from RGGI Sources



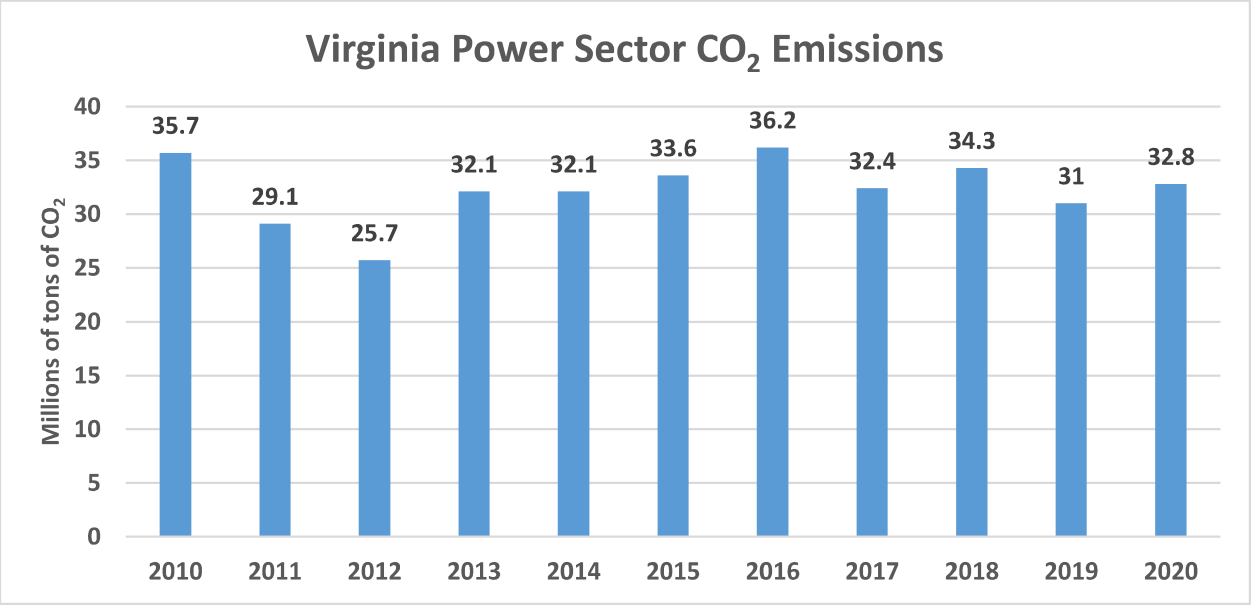
Source: EPA Air Markets Program Data

1.4 Virginia Power Sector Trends

The Virginia power sector historically produced the majority of electricity generation and carbon emissions from the combustion of coal. In 2005, half of the total electricity generation and 80% of CO_2 emissions came from coal-fired units and facilities. Since then, a transition in the Virginia power sector has occurred with coal being replaced with cleaner burning natural gas, and the introduction of renewables. Natural gas overtook coal as the largest fossil fuel generation source in 2012. The other major in-state electricity source is zero-carbon emitting nuclear generation from two nuclear plants in Virginia. The level of nuclear generation has remained mostly constant over the years. To further document this transition a series of figures are presented below.

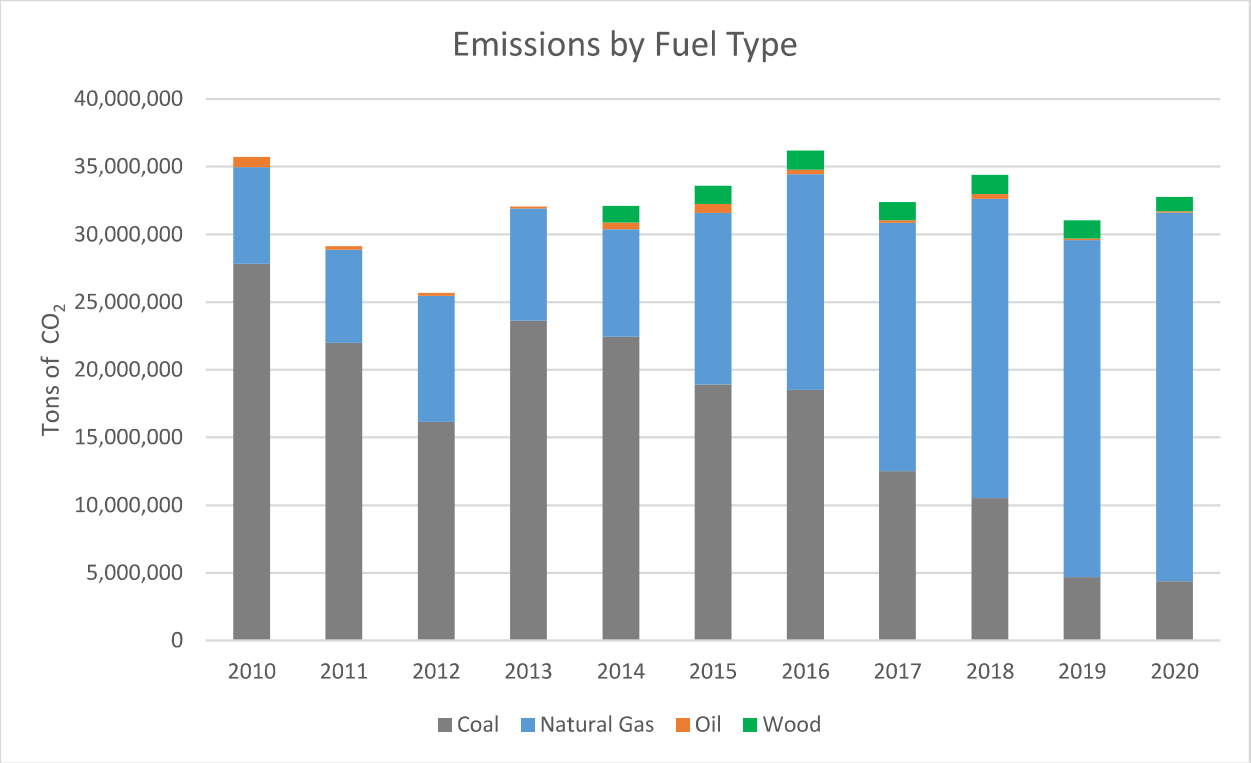
- Figure 4 shows the CO_2 emissions from the Virginia power sector from 2010 to 2020. Sector emissions have varied from year to year due to normal factors such as seasonal weather conditions and changes in electricity demand with no obvious trend either up or down. At first this would seem to contradict the transition from coal to cleaner natural gas generation. Much of the continuing levels of power sector CO_2 emissions is due to the addition of a substantial amount of natural gas generation capacity during this ten-year period with a corresponding increase of in-state electricity generation which has also reduced the amount of power imported into Virginia as shown in the next two figures.
- Figure 5 shows the same total emissions by year and broken down by fuel use. This shows the decrease in CO_2 emissions from coal generation and increase in emissions from increased natural gas generation.
- Figure 6 most noticeably shows the power sector transition with the large decrease in coal generation, and even larger increase in natural gas generation and overall in-state generation.

Figure 4: Total Virginia Power Sector CO_2 Emissions 2010-2020



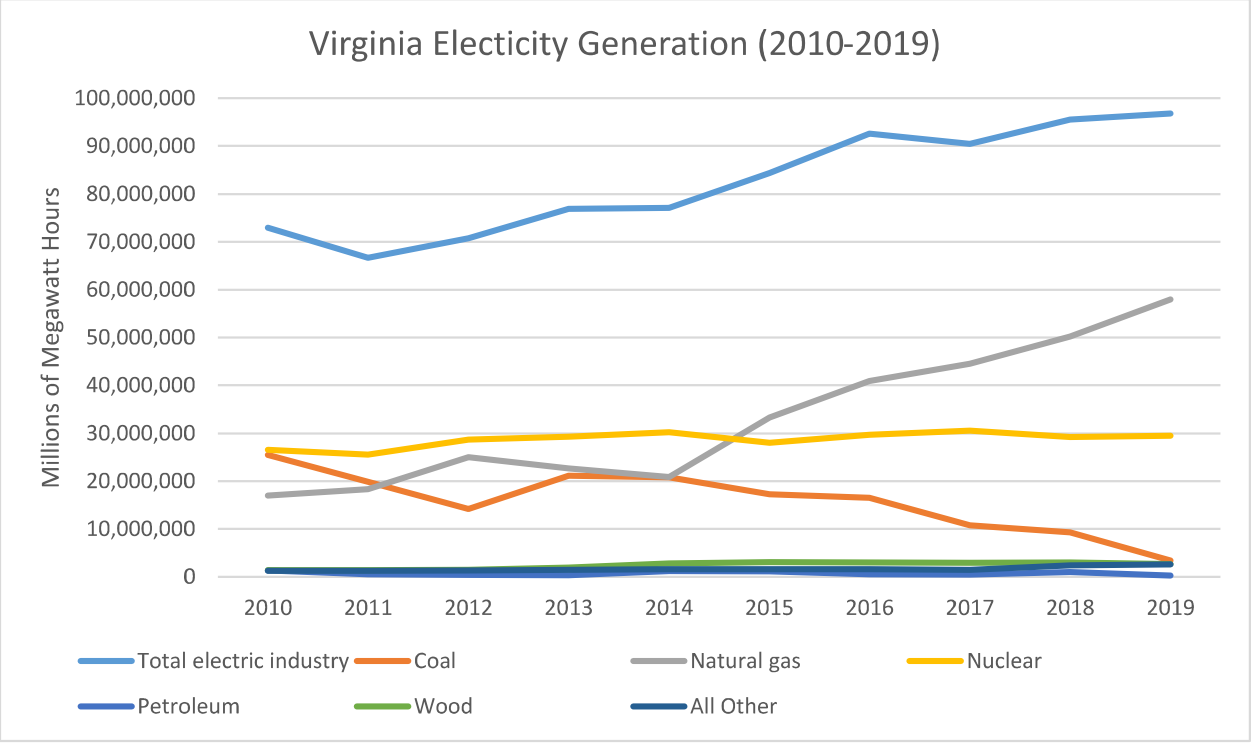
Source: EPA Air Markets Program Data

Figure 5: Power Sector Emissions by Fuel Type 2010-2020



Source: EPA Air Markets Program Data

Figure 6: Electricity Generation in Virginia by Fuel Type 2010-2019



Source: EIA State Energy Profile

Looking towards the future, it is expected that Virginia's power sector CO_2 emissions will steadily decrease due to the combination of the decreasing annual emissions caps of the RGGI program and the long term clean energy requirements and goals of the Virginia Clean Economy Act.

The RGGI program is currently under review, which could yield changes in program reduction targets going forward, and in other notable program components such as environmental justice considerations. This program review is expected to be completed in 2023.

The Virginia Clean Economy Act (VCEA) sets forth specific mandates for the power sector including the shutter of most of the remaining coal and biomass electric generating facilities in Virginia, along with specific renewable energy generation targets and standards. Implementation of the Virginia Clean Economy Act is expected to lead to a carbon free power sector in the 2045-2050 timeframe. The Virginia Department of Energy (previously the Department of Mines, Minerals, and Energy) is currently conducting a study of the Virginia power sector going forward under the requirements of the VCEA that supports this conclusion. More information on that study can be found at https://www.energy.virginia.gov/environmental/decarbonization.shtml.

1.5 Source Specific Power Sector Changes

A number of source specific changes have occurred in Virginia's mix of power generation that will impact current and future emissions and generation trends. These changes, identified as closures and fuel conversions, are presented below in Table 2. From 2010 to 2020, six coal facilities closed, while five large combined cycle natural gas facilities have opened. Three coal facilities converted to biomass (wood) and one converted to gas.

The impact of these changes is shown in Figure 7. During the 2010 to 2020 period, operating coal generation capacity has decreased but there has been a corresponding increase in natural gas capacity of over 5,000 megawatts.

Table 2: Changes to Power Generation Sources in Virginia (2010-2020)

Plant Name	Change In Operation/Fuel	Year
Bear Garden Generating Station	Gas facility began operating	2011
Potomac River	Coal facility permanently closed	2012
Virginia City Hybrid Energy Center	Coal/biomass facility began operating	2012
Hopewell Power Station	Converted to biomass (wood) from coal	2013
NOVEC Halifax County Biomass Plant	Biomass facility began operating	2013
Southampton Power Station	Converted to biomass (wood) from coal	2013
Altavista Power Station	Converted to biomass (wood) from coal	2014
Bremo Power Station	Converted to gas from coal	2014
Chesapeake Energy Center	Coal facility permanently closed	2014
Warren County Power Station	Gas facility began operating	2014
Clinch River	Coal unit 3 retired, units 1 and 2 converted to gas	2015
Glen Lyn	Coal facility permanently closed	2015

Portsmouth Genco LLC	Coal facility permanently closed	2015
Brunswick County Power Station	Gas facility began operating	2016
Panda Stonewall Power Project	Gas facility began operating	2017
Bellemeade Power Station	Gas facility permanently closed	2018
Bremo Power Station	Gas facility permanently closed	2018
Chesterfield Power Station	Coal units 3 and 4 permanently closed	2018
Greensville County Power Station	Gas facility began operating	2018
Mecklenburg Power Station	Coal facility permanently closed	2018
Possum Point Power Station	Gas units 3 and 4 retired	2018
City Point Energy Center	Coal facility permanently closed	2019
Yorktown Power Station	Coal units 1 and 2 retired	2019
Possum Point Power Station	Oil unit 5 retired	2020

1.6 Regional Greenhouse Gas Initiative Auctions

RGGI, Inc. administers quarterly auctions on behalf of the RGGI states where it offers allowances for sale to compliance entities and other groups. Virginia first participated in Auction 51, which was held on March 3, 2021, and the Commonwealth has participated in three additional auctions for a total of four. A summary of auction results for 2021 is available in Table 3, and a distribution of funds raised from auctions is shown in Table 4.

It should be noted that RGGI, Inc. receives a small portion of Virginia's quarterly auction

proceeds to fund its annual operating budget. Virginia's total payment to RGGI, Inc. for 2021 is $592,920.08.

Table 3: 2021 Auction Results Summary

	Allowances Sold	Allowance Price	Allowance Proceeds
Auction #51	5,735,509	$7.60	$43,589,868.40
Auction #52	5,698,446	$7.97	$45,416,614.62
Auction #53	5,698,445	$9.30	$52,995,538.50
Auction #54	6,587,274	$13.00	$85,634,562.00
Total	23,719,674		$227,636,583.52

Table 4: Distribution of Funding

	RGGI	DHCD	DCR	DEQ	DHCD Admin
#51	$148,230.02	$21,720,819.19	$19,548,737.27	$1,303,249.15	$868,832.77
#52	$148,230.02	$22,634,192.30	$20,379,773.07	$1,358,051.54	$905,367.69
#53	$148,230.02	$26,423,654.24	$23,781,288.82	$1,585,419.25	$1,056,946.17
#54	$148,230.02	$42,743,165.99	$38,468,849.39	$2,564,589.96	$1,709,726.64
Total	$592,920.08	$113,521,831.72	$102,178,648.55	$6,811,309.90	$4,540,873.27

SECTION 2 – DEPARTMENT OF HOUSING AND COMMUNITY DEVELOPMENT

2.1 Stakeholder Advisory Group and Housing Innovations in Energy Efficiency (HIEE) Program Development Framework

The Department of Housing and Community Development (DHCD) prepared for investments of Regional Greenhouse Gas Initiative (RGGI) funds by choosing to brand the RGGI funds the agency would manage as Housing Innovations in Energy Efficiency (or HIEE) funding. The HIEE label would also allow for differentiation between RGGI funds managed by the Department of Conservation and Recreation (DCR).

To facilitate a transparent program development process for the public and stakeholder groups, DHCD convened a broad-based, 15-member HIEE Stakeholder Advisory Group (SAG), with representatives from affordable housing developers, consumer and environmental advocacy groups, weatherization providers, academia, and subject matter experts on energy efficient buildings. SAG members were selected from a list of over 100 parties that expressed interest in participating via DHCD's website. The SAG met monthly starting in December, 2020, to provide input and guidance to DHCD on the HIEE program development process and RGGI funding allocations. All SAG meetings were open to the public and recorded, and public comments were taken both verbally during the meetings and in writing. Meeting recordings and presentation materials are available on the HIEE webpage.

DHCD and the Stakeholder Advisory Group reached general agreement during the first two meetings on the principle that channeling HIEE funds through existing affordable housing programs would be the most efficient and effective means to quickly deploy resources to serve Virginians. The process of developing and standing up a new and separate program (or programs) could cause delay, and be a source of potential market confusion. The HIEE funds offer additional resources for project developers to achieve higher energy efficiency performance, or "additionality," a concept that expresses the improved outcomes that would not have occurred absent an incentive.

HIEE Stakeholder Advisory Group Members:

- Liz Beardsley, US Green Building Council
- Nate Benforado, Southern Environmental Law Center
- Carmen Bingham, Virginia Poverty Law Center
- KC Bleile, Viridiant
- Janaka Casper, Community Housing Partners
- Eric Claville, Norfolk State University
- Michelle Foster, Home Innovation Research Lab
- Chelsea Harnish, Virginia Energy Efficiency Council

- Dawone Robinson, Natural Resources Defense Council
- Sunshine Mathon, Piedmont Housing Alliance
- Brian Staub, Marlyn Development Corporation
- Adam Stockmaster, TM Development Corporation
- Narissa Turner, Virginia Conservation Network
- Karen Wilds, Newport News Redevelopment and Housing Authority

The final SAG meeting will occur in December 2021, and starting in 2022, the SAG will no longer meet as currently configured. Instead, DHCD will transition to twice-yearly (spring and summer) HIEE public input sessions open to all interested stakeholders. The two annual input sessions are consistent with practices in other established DHCD programs and will allow for comments on upcoming fiscal year allocations of HIEE funds and any proposed program adjustments.

2.2 HIEE Program Investments and Funding Allocation Percentages

As this report is prepared, four RGGI auctions have taken place in 2021: March 3, June 2, September 8, and December 1. Net RGGI proceeds (50 percent to programs) to DHCD are $113,521,832. RGGI auction clearing prices for these auctions have been significantly higher than initially predicted in late 2020, so net proceeds have been greater than expected.

DHCD has used the RGGI administrative funds (2 percent of net proceeds or $2,833,694) to begin staffing the Energy Efficiency Office, a new team in the Community Development and Housing Division, which is tasked with overseeing implementation of the HIEE funding across multiple programs and creating new programs. Three staff positions are filled at the time of this report (Associate Director, Program Administrator, and Technical Monitor-Inspector) with additional in process.

Because actual RGGI revenues received depend on each quarterly auction's clearing price and the number of allowances offered, DHCD proposed three funding components for the HIEE funding and allocation percentages that would guide the overall level of investment per fiscal year. This approach was supported by consensus of the SAG. Table 1 provides percentage allocations and actual obligations for Fiscal Year 2021 HIEE funds. More detail on these HIEE program funding investments is provided below the table.

Table 2.1 – Fiscal Year 2021 HIEE investments

HIEE Component	**Fiscal Year '21 - % HIEE allocation**	**Net to DHCD** *($21.7m from March, 2021 auction)*	**Actual Allocation** *(total $21.1m)*

Weatherization Deferral Repair (WDR) Program	60%	$13.0m	$15.2m
Affordable and Special Needs Housing (ASNH) Program	40%	$8.7m	$5.9m
Housing Energy Efficiency Partnerships Grants	0%	$0 m	$0

1. Weatherization Deferral Repair (WDR) program

WDR utilizes HIEE funds for incidental repairs to reduce deferrals and increase access to services through DHCD's Weatherization Assistance Program (WAP). The purpose of the WDR program is to make repairs that have caused homes (or units in multifamily buildings) to be deferred from the WAP because of restrictions on use of federal funds. Once needed repairs are made and the weatherization grantee deems the home or building "weatherization-ready," the energy efficiency and health and safety measures available through WAP (such as insulation, air sealing, energy efficient light bulbs, and carbon monoxide detectors) may be installed. Clients must sign an agreement with the weatherization agency, agreeing to both the WDR repairs and the weatherization services.

The WDR program is delivered by the network of 17 local weatherization agency grantees, and clients must work with the local weatherization agency serving their area through the WAP. DHCD has grant agreements in place with all of the weatherization agencies for use of the HIEE funds to provide WDR services statewide. Because WAP is a federally funded and regulated program, separate agreements were established with the weatherization agencies for WDR.

Based on information provided to DHCD by the weatherization agencies, approximately 350 single-family homes and 700 dwelling units in multi-family buildings have deferral repairs needed and may be served through the WDR program. In order to qualify for WDR, clients must meet WAP income eligibility requirements (household income must be at or below 60 percent of state median income) and have an energy audit done.

The Weatherization Deferral Repair Program Guidelines are available, here.

2. Affordable and Special Needs Housing Program (ASNH)

HIEE funds are available through DHCD's Affordable and Special Needs Housing (ASNH) program to support development of new affordable housing units and renovation of existing buildings providing affordable housing. HIEE funds are offered as forgivable, no-interest loans to developers to significantly increase energy efficiency in the housing units built or preserved. In order to receive HIEE funds, developers must provide a fundable ASNH application, which qualifies for at least one of the four traditional funding sources available under ASNH (National Housing Trust, HOME, Virginia Housing Trust Fund, or State Permanent Supportive Housing) and must demonstrate the building is designed to meet the additional HIEE performance criteria. Developers may receive HIEE funds up to 10 percent of total construction costs, with a cap of $2 million per qualifying project. The HIEE performance criteria (shown in Table 2 below) were developed ahead of the spring, 2021 ASNH application round in consultation with the SAG, and build upon the existing energy efficiency performance requirements of Virginia Housing's Low-Income Housing Tax Credit (LIHTC) program.

Low- to moderate-income Virginians benefit from the HIEE funds available through ASNH by having access to affordable rental housing units that are more energy efficient and offer improved indoor air quality. For example, $5.9 million in HIEE funds obligated through the spring 2021 ASNH application round provided additional funding to 11 projects, comprising over 700 dwelling units of either new or substantially renovated affordable housing. Energy modeling conducted on behalf of DHCD by Virginia Tech's Center for Housing Research predicts that occupants of typical newly constructed apartments in an affordable housing project will save about $200 annually in energy costs by virtue of the HIEE requirement for Zero Energy Ready Homes level of performance.

Guidelines for the 2021-2022 Affordable and Special Needs Housing Program including the HIEE requirements are available, here.

Table 2.2 – HIEE Additional Energy Efficiency Requirements for ASNH projects

Project Type	VA Housing Low-income Housing Tax Credit (LIHTC) Program Requirements	HIEE Requirements
New Construction	ENERGY STAR v3.0	Zero Energy Ready Homes (ZERH)

Substantial Rehab	30% improvement in HERS* index or HERS index 80 (or below)	40% improvement in HERS index or average of HERS 70 (or below) across all units
Adaptive Reuse	HERS index 95 (or below)	Average of HERS 80 (or below) across all units

**HERS refers to the Home Energy Rating System, a national standard used to evaluate and compare energy efficiency performance across housing sizes and types. Similar to an MPG rating on a vehicle, the HERS index predicts energy use under typical building operating conditions.*

3. Housing Energy Efficiency Partnerships Grants

The purpose of the Housing Energy Efficiency Partnerships grant program is to utilize a portion of the HIEE funding to find new pathways, methods, and work processes for preserving, upgrading and maintaining existing affordable housing stock to significantly reduce energy burdens on low-income households, for both rental and owner-occupied housing units. This grant program will provide resources and facilitate new partnership opportunities to demonstrate innovative and scalable approaches to reducing energy use, carbon emissions and occupant energy burdens through deep energy efficiency retrofits of existing residential buildings designated as affordable housing and physically located in Virginia. Local governments, tribal governments, non-profits, community-based organizations, academic institutions, and other affordable housing industry partners will be eligible to apply and/or partner on applications.

The program draft proposal was reviewed and commented on by the SAG in May, 2021. The program proposal was revised and reformatted as a grant application process with application instructions and review criteria. The grant application process will go through a 30-day public comment period starting on October 11. If there are no significant comments or changes, the grant application will be opened up in DHCD's Centralized Application Management System (CAMS) shortly thereafter.

The goal of the initial round of grants will be to demonstrate a deep energy retrofit approach that results in 50 percent reduction in occupant energy costs over a one-year period. Eligible building configurations include:

- Multi-family buildings of any size (renter tenants)
- Groups of detached single-family or attached townhomes (owner-occupied, or rentals with landlord's permission)
- Groups of manufactured or mobile homes (owner-occupied, or rentals with landlord's permission)
- Group homes or facilities providing housing and services for special needs or vulnerable populations, such as treatment and recovery

For the three primary investments of HIEE funds, DHCD has proposed and SAG supported a Fiscal Year 2022 allocation as shown in Table 3 below. DHCD will create programs with the projected $55 million revenue and use any additional revenue above these amounts to allocate to programs with the most demand.

Table 2.3 – Fiscal Year 2022 HIEE Investments

HIEE Component	**Fiscal Year '22 - % HIEE allocation**	**Projected revenue** *($55 m from Q2-Q4 2021 & Q1 2022 auctions)*
Weatherization Deferral Repair Program	30%	$16.5 m
Affordable and Special Needs Housing Program	60%	$33 m
Housing Energy Efficiency Partnerships Grants	10%	$5.5 m

2.3 HIEE Funding Contribution in Virginia's Affordable Housing Development Market

The HIEE funds represent a significant new dedicated revenue stream for improving affordable housing in Virginia. The Affordable and Special Needs Housing (ASNH) program and Weatherization Assistance Program (WAP) have combined annual budgets of over $50 million from federal and state sources. Virginia Housing's Low Income Housing Tax Credit (LIHTC) program currently generates $20-$25 million annually for affordable housing projects in Virginia. These programs also encourage significant additional leveraged funding.
In summary, HIEE funds are an important additional funding source for existing affordable housing programs that will provide flexibility to DHCD in helping thousands of low-income Virginians access more energy efficient and healthier homes.

SECTION 3 – DEPARTMENT OF CONSERVATION AND RECREATION

3.1 State Fiscal Year 2021– July 1, 2020 through June 30, 2021

During March and April of 2021, a project manager and administrative coordinator were hired to assist the Special Assistant to the Governor for Coastal Adaptation and Protection with the development of the Virginia Coastal Resilience Master Plan. The Master Plan details the Commonwealth's equity driven approach to coastal protection and adaptation and enhances coastal resilience, better protects key assets, and provides cost-effective strategies to conserve and enhance natural flood controls. Also in March, negotiations were finalized with Dewberry Engineers, Inc. for the development of the final Master Plan. The Plan includes a coastal flood hazard assessment, a risk and impact assessment of community resources, critical sector infrastructure and natural infrastructure, including identification of "hotspots" those areas most vulnerable to coastal flooding in the near term, development of a project database and project prioritization process, development of a funding source database – searchable and aligned to identify specific funding sources by project, development of a publicly accessible web application and viewer to host all of the above deliverables, and a final document. The project database will provide a list of locality-approved projects throughout the coastal region that will be shovel ready when funding is available.

The contract, valued at $2.8 million, is to be completed in two phases: Basic Services, described below, valued at $1.4 million, completed November 30, 2021, and Additional Services, valued at $1.2 million. Additional services anticipated include future condition modeling of fluvial and pluvial impacts, as well as other services as determined by the Commonwealth. In addition , the Commonwealth has added approximately $200,000 of additional work, including five additional four hour working meetings with PDC/RC's and Federal Installation partners (completed), and one working session with Virginia Tribes (pending), project ID and Capacity Building data collection, web application support and data hosting through November, 2022, and coastal flood hazard impact assessment through the year 2100. The contract Basic Services also include tracking and documentation tools as well as the following deliverables:

Task 1:

- Project coordination meeting with CRO/SACAP (24 meetings)
- Technical Advisory Committee Meetings Support and Minutes (7 meetings)
- Technical Advisory Subcommittee Meetings, Support and Minutes (49 meetings across 7 Subcommittees)

Task 2: Study Conceptual Model,

Task 3: Coastal Flood Hazard Framework, including Dynamic Future Condition Modeling Approach (Additional Services)

Task 4: Built and natural Infrastructure Risk Assessment
Including Data Gathering, Impact Assessment and Risk Summarization

Task 5: Adaptation Strategies and Prioritization
Including Prioritization Framework, Project inventory, Identification, Suitability Assessment, Impact Assessment Working Meetings with PDC/RC's

Task 6: Funding Analysis
Including Funding databases and Analysis and Funding Stream Alignments by Project

Task 7: Master Plan Document

Task 8: Project Database and GIS Web Service
Including Wireframe, Web Application, and Data Migration

Task 9: External Outreach and Public Engagement (60 total meetings):

- Coastal Planning District Commissions (8 meetings),
- Local Governments (8 meetings),
- Local Communities with emphasis on Underserved and Rural Communities (32 meetings),
- Local Businesses/Industries (2 meetings),
- Universities/Military (2 meetings),
- Key Stakeholder Interviews (8 meetings),
- Social Media, Outreach Media, Press/event tracking and content (25 content items)
- Build, Conduct, Analyze surveys of (A) General Public and (B) Local Practitioners (2 Surveys)

Throughout this process the Special Assistant to the Governor for Coastal Adaptation and Protection, the Virginia Coastal Resilience Master Plan Project Manager and the Virginia Coastal Resilience Master Plan Project Coordinator conducted, and continue to conduct multiple outreach, engagement, coordination and presentation sessions and working meetings explaining and seeking input on the Master Plan and process with a wide range of stakeholders, including State Agencies, PDC/RC Staff, Locality Staff, Non-Governmental organizations, Business and Community organizations, Community members, Civic Organizations, Federal Partners, Academia, and many others.

The Virginia Coastal Resilience Master Plan and Web Application may be viewed here: https://www.dcr.virginia.gov/crmp/

On June 4, 2021, DCR opened the first grant round of the Community Flood Preparedness Fund (CFPF) with a total of $18M in funding available under three categories; Capacity Building and Planning, Studies, and Projects. The CFPF requires that at least 25 percent of funds disbursed from the fund is provided to low-income geographic areas. Local governments and tribal organizations were able to submit applications through September 3, 2021. Applications under the "Projects" category required a DCR approved resilience plan prior to the acceptance of applications. The resilience plan is the locally developed roadmap to address recurrent and

repetitive flooding as localities seek funding through the CFPF.

On June 15, 2021, DCR conducted a technical assistance workshop to assist potential applicants to better understand the requirements of the CFPF grant program. The workshop and associated recording and Q&A is linked below.

- **June 15, 1-3 p.m.**

  View the recording.

- Read the **transcript of the recording** (PDF).
- Read the **chat log** (PDF).

3.2 State Fiscal Year 2022 through November 2021

Grant application reviews were conducted by DCR in consultation with the Secretary of Natural and Historic Resources and the Special Assistant to the Governor for Coastal Adaptation and Protection on September 21, 2021. First round awards were announced through the Governor's office in October 2021.

Using the same grant guidance and requirements, on August 5, 2021, DCR opened a second grant round of the CFPF with a total of $17M in funding available. This grant round closed for applications on November 5, 2021 and are now under review.

DCR conducted two additional technical assistance workshops in July and August 2021 to assist potential applicants to better understand the requirements of the CFPF grant program. The workshops and associated recordings and Q&As are linked below.

- **Aug. 13, 1-3 p.m.**

  View the recording.

  - Read the **transcript of the recording** (PDF).
  - Read the **chat log** (PDF).

- **July 15, 1-3 p.m.**

  View the recording.

  - Read the **transcript of the recording** (PDF).
  - Read the **chat log** (PDF).

The first grant round of the CFPF closed September 3, 2021. DCR received 32 applications with total project costs of more than $23 million. This total includes $16 million in requested CFPF funds.

Community Flood Preparedness Fund 2021 Grant Awards for the first round:

Eastern Branch of Elizabeth River Wetland and Floodplain Restoration | $3,000,000
City of Virginia Beach

McGuire and Chapel Drive Drainage Improvements Project | $1,100,000
City of Richmond

Norfolk Coastal Storm Risk Management Analysis | $900,000
City of Norfolk

Portsmouth's Data-Driven and Equity-Driven Resilience Strategy | $527,949
City of Portsmouth

Lake Whitehurst Watershed Study | $500,000
City of Norfolk

Plans and Capacity Building with Consultant Services | $387,500
Buchanan County

Oyster Plan - Capacity Building and Resilience Planning | $202,232
Northampton County

Resilient Hampton: Downton Hampton, Phoebus and Buckroe Beach | $158,681
City of Hampton

Moores Creek Watershed | $153,500
City of Charlottesville

Honor Park Resilience Park | $147,994
City of Hampton

Mill Point Living Shoreline | $126,498
City of Hampton

Resilient Stormwater Capacity and Green Streets Project | $115,200
City of Alexandria

Richmond Manchester and Shockoe Bottom Neighborhoods | $103,500
City of Richmond

Southern Chesapeake - Watershed 5 | $91,404
City of Chesapeake

Resilience Plan | $74,997
City of Chesapeake

Capacity Building and Planning | $68,024
City of Suffolk

Resilience Plan | $65,040
City of Winchester

The Impacts of Climate Change on Crop Planning and Production: An Agricultural Study of the Eastern Shore | $47,121
Accomack-Northampton Planning District Commission

Carlton Road Boat Ramp, Wake, Virginia - Design and Permitting | $26,400
Middle Peninsula Planning District Commission (Middlesex County)

A third RGGI auction occurred during September 2021 and provided an additional $23,781,288.82 in funding to the CFPF. A third grant round is currently under development. That application period will open in January 2022 and run for 90 days.

The fourth RGGI auction in December 2021 will provide sufficient funding to initiate loans by mid-2022. DCR and the Virginia Resource Authority (VRA) will soon begin meeting to develop loan guidelines, such as any requirements for collateral.

The Virginia Coastal Resilience Master Plan Phase One was completed on November 30th, on schedule, and released by Governor Ralph Northam on December 7th, 2021. The Public Announcement event was held in Hampton, Virginia. The Department of Conservation and Recreation also opened its Virginia Coastal Resilience Master Plan website and Web Application on December 7th, making the full impact assessment and project database available to the public. Coastal Flood Hazard layers are downloadable for use by localities and the public, and additional data layers are being made available for download in the future. The Project Database will be accessible to localities and identified users to continue to add projects and capacity building needs for further evaluation and funding consideration as additional risks are evaluated and analyzed in future iterations of the Master Plan.

The Special Assistant to the Governor, along with the VCRMP Project Manager and Project Coordinator are now coordinating with Stakeholders to determine and refine the Additional Services, with a focus on the Dynamic Future Condition Modeling, and fluvial and pluvial modeling. In addition, they are developing and Outreach and Engagement plan to continue through the Additional Services portion of the contract to facilitate a sustained public planning and input process.

The Virginia Coastal Resilience Master Plan and Web Application may be viewed here: https://www.dcr.virginia.gov/crmp/

SECTION 4 – DEPARTMENT OF ENERGY

4.1 Overview of Participation

Throughout 2021, Virginia Department of Energy ("Virginia Energy") staff participated in advisory discussions with DHCD relating to low-income energy efficiency programs, including programs for eligible housing developments. This included participation as an "Agency Partner" in meetings with the Housing Innovations in Energy Efficiency ("HIEE") Stakeholder Advisory Group, as well as direct discussions with DHCD staff on matters relating to program development, funding opportunities, and data analysis. Virginia Energy staff provided recommendations pertaining to how historically economically disadvantaged communities ("HEDCs") could be a component of the program and data analysis to ensure the program funds are benefitting disadvantaged communities. Virginia Energy staff will continue to serve as advisors to the program and are available for additional technical assistance upon request.

Attachment 5

Commonwealth of Virginia
Office of the Governor

Executive Order

NUMBER FIFTY SEVEN (2016)

DEVELOPMENT OF CARBON REDUCTION STRATEGIES FOR ELECTRIC POWER GENERATION FACILITIES

Part I – Importance of the Initiative

Though our coastal communities may be the first to witness the effects of climate change, the risks presented by increasingly fierce storms, severe flooding, and other extreme weather events are not confined to a single geographic area. Neither are their causes. The economic implications are significant, and we must do all we can to protect our critical military infrastructure, our ports, our homes, and our businesses. It is only by acting together with common purpose that the Commonwealth can effectively adapt and stave off the most severe consequences of climate change.

One key step forward is to continue with a strategic goal of reducing carbon emissions. Virginia has already made meaningful strides – between 2005 and 2014, Virginia reduced its carbon emissions from power plants by 21 percent. However, the electric sector is still responsible for approximately 30 percent of the carbon dioxide pollution in the Commonwealth. Moreover, electric companies are including carbon regulation projections in their long-term plans. The electric sector is changing rapidly through increasing reliance on low and zero carbon resources. As such, it is vital that the Commonwealth continue to facilitate and engage in a dialogue on carbon reduction methods while simultaneously creating a pathway for clean energy initiatives that will grow jobs and help diversify Virginia's economy.

Accordingly, by virtue of the authority vested in the Governor under Article V of the Constitution of Virginia and under the laws of the Commonwealth, I hereby direct the Secretary of Natural Resources to convene a Work Group, chaired by the Secretary, to study and recommend methods to reduce carbon emissions from electric power generation facilities. The Secretary shall receive input from interested stakeholders.

Such methods shall align with the Virginia Air Pollution Control Board's power to promulgate regulations abating, controlling and prohibiting air pollution throughout or in any part of the Commonwealth.

Part II – Scope and Guidance

In preparing their recommendations, the Secretary and the Work Group shall consider the following:

(1) the establishment of regulations for the reduction of carbon pollution from existing electric power generation facilities pursuant to existing authority under Virginia Code § 10.1-1300 *et seq.*;

(2) the carbon reduction requirements for existing electric power generation facilities established under § 111(d) of the federal Clean Air Act, which are currently stayed pending final disposition;

(3) the interaction between electric utilities and regional markets, including PJM Interconnection;

(4) the impact any reduction requirements place on the reliability of the electric system;

(5) the impact any reduction of carbon pollution may have on electric rates and electric bills;

(6) the impact of reducing carbon pollution on low income and vulnerable communities;

(7) the cost effectiveness of pollution reduction technologies that may be deployed;

(8) the economic development opportunities associated with deployment of new carbon reduction technologies;

(9) the implementation and administration of carbon reduction regulations; and

(10) flexibility in achieving the goals of any carbon reduction regulation.

The Secretary of Natural Resources shall complete her work, including the development of recommendations as to viable carbon reduction methods for the electric power generation facilities by April 30, 2017. The Secretary of Natural Resources shall provide a report on the recommendations to the Governor by May 31, 2017.

Effective Date of the Executive Order

This Executive Order shall be effective upon its signing and shall remain in full force and effect for one year after its signing unless amended or rescinded by further executive order.

Given under my hand and under the Seal of the Commonwealth of Virginia this 28th Day of June, 2016.

Terence R. McAuliffe, Governor

Attest:

Kelly Thomasson, Secretary of the Commonwealth

3. Improve state and corporate access to clean energy resources 7

4. Develop an energy efficiency accounting and registry tool 8

5. Establish a statewide Environmental Justice Advisory Council 9

IV. Conclusion 10

APPENDIX A: Text of Executive Order 57

APPENDIX B: Executive Order 57 Work Group Agendas

I. Introduction

Climate change along with associated sea-level rise and increasingly volatile weather patterns pose potentially devastating risk to Virginia. According to data compiled by the Georgetown Climate Center and Old Dominion University's Mitigation and Adaptation Research Institute, the Commonwealth has already seen a 33 percent increase in heavy rainstorms and snowstorms in the last sixty years, as well as an 11 percent increase in precipitation from the largest storms.[1] The same report found that as many as 400,000 Virginia homes are at risk of damage from increased storm surges. The researchers projected that rebuilding Virginia's at-risk residential property could cost $92 billion. Home loss disproportionately affects low-income homeowners who often lack the insurance or capital to relocate or rebuild without jeopardizing their overall financial security.

Climate change also has the potential to endanger the Commonwealth's agricultural sector, particularly small, family-owned farms without the resources to implement expensive site-specific adaptation strategies. Half of Virginia's counties face increased risk of water shortages by 2050 as the result of climate-related shifts in precipitation and weather.[2] Currently, agriculture is Virginia's largest industry, supporting almost 311,000 jobs with an annual economic impact of $52 billion.[3] Other business sectors are similarly feeling the impacts of climate change as warmer temperatures affect worker productivity and the health of the workforce.[4]

In addition to the environmental and economic consequences of climate change, carbon emissions also pose a significant risk to human health. According to data from the United States Centers for Disease Control and Prevention, the burning of fossil fuels has resulted in negative impacts to air and water quality and been linked to increased incidence of asthma and cardiovascular disease.[5] Across the United States, warmer temperatures have been linked to increased ground-level ozone[6] and more frequent and sustained wildfires,[7] a major contributor to

particulate matter pollution harmful to public health. Evidence from the Virginia Department of Health shows increased incidences of West Nile virus and Lyme disease,[8] an indication that recent environmental shifts may have improved survival rates for disease vectors like ticks and mosquitos.

The impacts of climate change are also causing ocean warming and ice-sheet loss, resulting in potential sea level rise of more than five feet in Virginia by the turn of the century.[9] Because of its low-lying elevation, natural geography, and high rate of land subsidence, Hampton Roads is consistently ranked as the second most vulnerable region in the country at risk from rising seas, a clear and accelerating result of climate change.[10] According to analysis by Risk Management Solutions, the Virginia Beach-Norfolk Metropolitan Statistical Area ranks 10th in the world for assets at risk of flooding as the result of relative sea level rise.[11] The Hampton Roads Planning District Commission estimates that a conservative three foot rise in sea level would cover nearly 900 miles of roads in the region, costing as much as $87 billion.[12] Naval Station Norfolk, the world's largest naval base, has replaced four World War II-era piers to compensate for higher seas and plans to build eight more, at a cost of more than $100 million per pier.[13]

Given the challenges associated with climate change and the need for solutions, Virginia is uniquely positioned to become a leader in the international efforts to reduce carbon dioxide emissions and stave off the most dramatic consequences of climate change. While carbon dioxide emissions from Virginia's electric generating units have fallen by 21 percent between 2005 and 2014, they still account for approximately 30 percent of the state's overall carbon dioxide emissions. Investments have accelerated since 2014, but the Commonwealth has tremendous potential to build on this growth and achieve even greater carbon emission reductions through additional investments in clean energy technologies.

Today, Virginia has more than 1,800 megawatts (MW) of solar currently in service or under development.[14] In the last year alone, the number of solar jobs in Virginia has increased by 65 percent, from 1,963 to 3,236.[15] Virginia's solar job market is the 9th-fastest-growing solar jobs market in the nation.[16] The Commonwealth is already home to over 75,000 energy efficiency workers.[17] Energy efficiency business revenue in Virginia has increased from $300 million in 2013 to $1.5 billion in 2016, a five-fold increase.[18] The continued growth of clean energy investment in the Commonwealth has the potential to bring about long-term sustainable economic development while also mitigating the impacts of climate change through reduced carbon dioxide emissions.

With these two principals in mind – the enormity of climate change impacts and the potential for clean energy industry growth – Governor McAuliffe signed Executive Order 57 ("EO 57") on June 28, 2016. When the Governor issued EO 57, he recognized that the Commonwealth must continue to facilitate and engage in a dialogue on carbon reduction methods while simultaneously creating a pathway for clean energy initiatives that will grow jobs and help diversify Virginia's economy. Through the Executive Order, Governor McAuliffe directed the Virginia Secretary of Natural Resources, Molly Ward, to convene an EO 57 Work Group ("Work Group") to study these issues and recommend methods to reduce carbon emissions from the electric sector in Virginia. The focus of the Work Group was to evaluate options under the Governor's existing authority while simultaneously creating more clean energy jobs.

In addition to Secretary Ward, the Work Group was comprised of Secretary of Commerce and Trade Todd Haymore, Virginia Department of Environmental Quality Director David Paylor, Virginia Department of Mines, Minerals and Energy Director John Warren, and Deputy Attorney General for Commerce, Environment, and Technology John Daniel. Through a robust stakeholder engagement process, the Work Group received presentations and feedback from a variety of perspectives including electric utilities, clean energy businesses, industrial manufacturing, academic institutions, environmental organizations, and other interested stakeholders. This report is the result of the efforts of the Work Group.

The full text of Executive Order 57 is provided in Appendix A and the complete agendas for all of the Work Group meetings are provided in Appendix B of this report.

II. Process

EO 57 outlined a process for the Governor, through the Secretary of Natural Resources, to receive recommendations from the public to further reduce the Commonwealth's carbon emissions and grow the clean energy economy under existing state authority. This process ensured that the Work Group would have the necessary public input to develop recommendations and submit a report to the Governor by the May 31, 2017 deadline stipulated in the Executive Order.

The process consisted of six monthly meetings that began on August 31, 2016 and ended on February 28, 2017. Each public meeting lasted between two and three hours, and the meetings consisted of presentations from members of the public. The presentations were voluntary, and all members of the public were invited to send suggested topics and presenter information to the Secretary of Natural Resources' office. In total, the Work Group received more than forty presentations. Each presentation was made publicly available on the Secretary of Natural Resources' website.[19]

In addition to the public meetings, the Work Group also facilitated a three month written public comment period that opened on February 1, 2017 and closed on April 30, 2017. Members of the public were invited to submit comments either electronically or in hard copy to the Office of the Secretary of Natural Resources. In total, the Work Group received over 8,000 written comments.

III. Recommendations

The recommendations set forth in this report are drawn from the information developed and understanding gained through the public meetings and the public comment process. The Work Group synthesized the many presentations and comment topics down to the five recommendations set forth below. This list does not attempt to include every recommendation that was provided to the Work Group, but it covers the broad categories of recommendations for the Governor's consideration.

1.) Promulgate regulations to limit carbon dioxide emissions

The Work Group received a number of presentations and written comments from stakeholders advocating for a regulation to limit carbon dioxide emissions from power plants. These comments included recommendations that the Commonwealth join or participate in the Regional Greenhouse Gas Initiative ("RGGI") or another regional trading program, that a price be put on carbon, and that Virginia strive to reduce its greenhouse gas emissions by 30 to 40 percent by the year 2030.

[19] *See* Office of the Secretary of Natural Resources Website*, available at* http://naturalresources.virginia.gov/initiatives/eo-57/.

The Work Group received information on both ratepayer impacts and potential job creation opportunities associated with a regulation to limit carbon emissions. Advanced Energy Economy modeled carbon reduction targets similar to those in the federal Clean Power Plan that would be achieved through implementation of power generation fleet changes already planned by utilities along with the addition of renewable energy and energy efficiency measures. They found that these actions would result in 54,231 cumulative additional job years by 2030 and, if Virginia reduced its imports while applying the same carbon reduction actions, we could see the number of cumulative additional job-years double to more than 120,000. The Natural Resources Defense Council, which advocated for a 30 percent reduction target by the year 2030 (i.e., 30x30), also performed utility-sector modeling. They found that if the target included 20 percent in-state renewable generation and 1.5 percent annual energy efficiency savings, Virginia customer electric bills would decrease by almost $100 per year.

The business community also weighed in on the establishment of carbon dioxide regulations. Mars, Nestle, and Unilever filed joint comments noting that "an annual emissions reduction cap or clean energy standard are models that have been effective in other states' efforts to foster clean energy development." These companies stated that while they do not support one particular policy over another, they "believe that such policies will create market certainty and drive private-sector investments."

The Business Council for Sustainable Energy stated that "[s]uccessful reduction of Virginia's carbon emissions will require embracing the full portfolio of clean energy and energy efficiency technologies, products, and services." Dominion Resources filed comments stating that they "have confidence the Commonwealth can devise a forward-looking plan ensuring the continued decline in carbon emissions that is compatible with promoting a growing economy and keeping Virginia the most attractive state for new businesses." In addition, Dominion stated, "a rate-based approach or a mass-based limit on existing sources is the most accurate way to stimulate economic growth and job creation while achieving measurable carbon emission reductions."

The University of Virginia's Environmental and Regulatory Law Clinic and the Southern Environmental Law Center provided information on the legal justification for regulatory action. Both presentations focused on the current authority of the State Air Pollution Control Board ("Board") and the Department of Environmental Quality under Virginia Code § 10.1-1300 *et seq*. Each concluded that the Board has authority to regulate carbon dioxide from electric power generation facilities. This has since been confirmed by Attorney General Mark Herring in an official opinion dated May 12, 2017.

In short, there was tremendous public interest in this particular recommendation. Although many stakeholders provided feedback focused on specific in-state targets (such as 30x30), the Work Group believes that it is important and necessary that Virginia work through a

regional model, like the established and successful RGGI, in order to both achieve lower compliance costs and address the interstate nature of the electric grid.

The Work Group recommends that the Governor consider taking action via a regulatory process to establish a "trading-ready" carbon emissions reduction program for fossil fuel fired electric generating facilities that will enable participation in a broader, established multi-state carbon market.

2.) Update state building codes to reflect current technology and standards

Buildings account for approximately 70 percent of America's electricity consumption and more than 40 percent of total national energy usage annually, producing 39 percent of the United States' overall carbon emissions.[20] Inefficiency in building design was a major source of stakeholder concern, and a number of presenters and written comments focused on the need to strengthen Virginia's building codes. Some commenters recommended that Virginia adopt the 2015 International Energy Conservation Code (IECC) with no alterations while others recommended updating to the 2012 IECC without amendments.

Currently, Virginia's building code embraces the standards from the 2012 IECC for commercial properties and the 2009 equivalent for residential structures. Arlington County recommended adoption of the 2015 IECC with no alterations, and noted that "Virginia homeowners would save $2.5 billion between 2010-2040 and avoid nearly 16 million metric tons of carbon emissions." The Southeast Energy Efficiency Alliance also recommended that Virginia update its building codes to the 2015 IECC, and noted that "Virginia could achieve annual carbon savings of 1.21 million metric tons CO2 by 2030, and cumulative savings of 15.66 million metric tons CO2 from 2010 to 2030." The Virginia Energy Efficiency Council and Local Energy Alliance Program similarly recommended updating the building codes to the 2015 IECC. The Virginia Poverty Law Center recommended that Virginia update the building codes to the 2012 IECC, but that Virginia develop a plan to adopt the 2018 updates when they are released.

The Work Group also received information evaluating compliance with Virginia's current building codes. Recent testing in both Charlottesville and McLean, presented by the Virginia Energy Efficiency Council and the Local Energy Alliance Program, shows that a significant portion of the Commonwealth's homes do not meet established standards for air-tightness or ductwork. The U.S. Department of Energy (DOE) is conducting a statewide research field study investigating energy code implementation in residential buildings in Virginia. This study will provide valuable Virginia-specific data on energy code compliance as well as insight into market-driven efficiency decisions of homebuilders.

[20]Presentation by Virginia Energy Efficiency Council and Local Energy Alliance Program, *The Role of Building Energy Codes in a Carbon Reduction Strategy for Virginia*, *available at* http://naturalresources.virginia.gov/media/8635/4-vaeec.pdf.

The Virginia Board of Housing and Community Development (BHCD) is currently in the process of updating the Commonwealth's Uniform State building codes (USBC). This spring, BHCD began accepting amendments to the draft code and stakeholder workgroups began meeting. By November of 2017, BHCD will vote on the final State Building Codes.

The Work Group recommends that BHCD update the commercial building codes to reflect the 2015 IECC and that the residential building codes be consistent with current technology and be more reflective of the 2015 IECC. In addition, the Department of Mines, Minerals and Energy should participate in data collection efforts, including the previously-mentioned DOE energy code field study, to better inform the building code process and to provide data and best practices for implementation.

3.) Improve access to clean energy resources like solar, wind, and energy efficiency

Stakeholders from a variety of constituencies across the Commonwealth presented or filed comments on the need to further increase deployment of clean energy resources. However, the policy recommendations that would achieve such a result varied. Some presenters recommended adoption of a mandatory Renewable Portfolio Standard (RPS) while others focused on market opportunities and customer choice.

A number of presenters focused on recommendations regarding the adoption of a mandatory RPS. Virginia's Renewable Energy Portfolio goal was created via legislation in 2007 as part of the re-regulation of the Commonwealth's electrical industry. The goal was set to incrementally increase until 2025, at which point it would level off to 15 percent of electricity sold by a utility. Two years after adoption of this preliminary goal, legislation was passed allowing research and development expenses to be counted towards up to 20 percent of the goal. Further legislative modifications were made in 2013 to remove the incentive structure supporting utility compliance. While there are merits to the RPS, a mandatory RPS would require legislation, and the Work Group has aimed its focus on recommendations that could be implemented through the Governor's executive authority.

The Governor has used his executive authority to show state leadership in powering state operations with renewable energy. In 2014, the Governor announced a goal of getting 8 percent of state government's electricity from renewable sources within three years. The Commonwealth is moving toward achieving this goal through partnerships with the U.S. Navy and the University of Virginia. However, some presenters noted that Virginia should expand on this lead-by-example model by meeting stated energy reduction targets and expanding the state renewable procurement target.

Another set of recommendations addressed the need to grow market opportunities and increase customer choice, both at the business and residential levels. Mars, Nestle, and Unilever recommended that the Governor develop an "explicit legal framework to allow companies to enter into contracts with non-utility energy providers through third-party financing or offering

utility-administered, cost-of-service-based renewable energy tariffs for large buyers." E2 recommended that the Governor convene a task force including DMME, the State Corporation Commission, the Department of Environmental Quality, the Virginia Economic Development Partnership, Dominion, and Appalachian Power to discuss corporate renewable procurement needs and how to meet them. Ceres noted that corporate procurement targets increasingly focus on achieving 100 percent renewable energy and companies will factor this into site selection when considering investments in new facilities or expansion of existing operations.

A number of activities have occurred in the General Assembly to drive increased solar development. Solar industry and utility representatives met over fifty times in 2016 to break the legislative impasse over needed changes to the existing legislative framework governing solar generation in Virginia. This group (the "Solar Group"), facilitated by the Virginia Center for Consensus Building at VCU, crafted three pieces of legislation that passed the General Assembly unanimously in 2017 and were signed into law by the Governor. Senate Bill 1393 created a pilot program for community solar projects administered by utilities. Senate Bill 1394 and House Bill 2303 enacted an additional option for agricultural customers with solar installations. Senate Bill 1395 opened the streamlined Permit by Rule process for regulatory approval to certain projects not previously eligible. The EO 57 Work Group received recommendations to tackle additional solar deployment access issues. Building on the trust and respect that was established in 2016, the Solar Group could tackle even more complex issues in 2017 with more outreach to additional stakeholders.

The Work Group recommends that the Governor update Virginia's current renewable energy procurement target and work with the Solar Group to develop a comprehensive plan to increase corporate access to renewable energy as an economic development tool.

4.) Develop an energy efficiency accounting and registry tool

The Work Group received many presentations focused on the fact that Virginia faces challenges in the effort to improve and increase energy efficiency. Many other states are already in the process of implementing energy efficiency programs that are much more expansive than those in Virginia. In addition to recommendations on specific energy efficiency deployment mechanisms, the Work Group also received a presentation from E4TheFuture on the National Energy Efficiency Registry ("NEER").

This presentation noted that many regulatory systems and their supporting computer infrastructure have been developed independently at the state level, making it difficult to accurately track and compare results across state lines. To remedy this problem, the Tennessee Department of Environment & Conservation has partnered with the U.S. Department of Energy, the National Association of State Energy Officials, the Climate Registry, and agencies from Michigan, Minnesota, Oregon, and Pennsylvania to create the NEER. The registry, currently

under development, is intended to serve as a software platform for credibly evaluating the benefits of energy efficiency projects.

By providing a consistent framework for measuring and assessing energy efficiency initiatives, the registry could help states apply efficiency savings to their self-selected energy goals as well as existing or future federal or state regulation. In addition, NEER will use best practices in data management, reporting, and registry design, to improve data collection and management efficiency and, where possible, automate processes. Increased transparency could allow both private and public sector entities to see validated cost savings that can be achieved through improved efficiency, thus encouraging increased investments in conservation.

The Work Group recommends that the Department of Mines, Minerals and Energy investigate the NEER model and evaluate whether the registry could be a starting point for an energy efficiency accounting and trading mechanism conceptually similar to the currently used Renewable Energy Certificate.

5.) Establish a statewide Environmental Justice Advisory Council

An important element of the Executive Order 57 process, which was spelled out in the text of the order itself, is to make a particular effort to ensure that all people and perspectives have a voice in environmental discussions. This concept, known as environmental justice, is defined as "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income, with respect to the development, implementation, and enforcement of environmental law, regulations, and policies."[21]

Some environmental issues can be compounded or concentrated as the result of sociological factors. Low-income communities at risk from sea level rise often lack the resources to adequately improve resiliency and can suffer more sustained consequences as the result of personal property loss and damage. Virginia's power plants are disproportionately located in areas with high concentrations of poverty and people of color. Many of the most severe health consequences arising from coal-fired electrical generation are localized in nature, so this distribution unfairly burdens already disadvantaged communities with increased health problems and accompanying costs.

The Virginia Environmental Justice Collaborative proposed the creation of a statewide Environmental Justice Advisory Council ("EJAC"). Pursuant to this recommendation, the EJAC would serve as a sustained conduit for conversations about environmental justice and underserved communities.

The Work Group recommends that the Governor convene an EJAC consisting of appointed representatives to communicate directly with the Secretary of Natural Resources, the

[21]U.S. Environmental Protection Agency, *Learn About Environmental Justice*, *available at* https://www.epa.gov/environmentaljustice/learn-about-environmental-justice.

Secretary of Commerce and Trade, the Secretary of Health and Human Resources, the Secretary of Public Safety and Homeland Security, and the Commission on Local Government. The EJAC should provide a forum for sharing information and making recommendations to policy makers to help ensure fair treatment and meaningful involvement by all people with respect to policy decisions that impact the environment and health of local communities.

IV. Conclusion

Climate change is among the most pressing issues facing humanity, but it is not insurmountable. While no single solution exists, the recommendations in this report offer attainable strategies that could be performed under the Governor's existing executive authority. These recommendations are aimed at both reducing carbon dioxide emissions from the electrical generation sector and driving economic growth from the clean energy sector. While Virginia cannot solve the problem of climate change alone, we can take important and necessary steps at the state level to protect our citizens from the most extreme impacts and create meaningful opportunities to grow the clean energy sector.

Appendix A:

Text of Executive Order 57

Commonwealth of Virginia
Office of the Governor

Executive Order

NUMBER FIFTY SEVEN (2016)

DEVELOPMENT OF CARBON REDUCTION STRATEGIES FOR ELECTRIC POWER GENERATION FACILITIES

Part I – Importance of the Initiative

Though our coastal communities may be the first to witness the effects of climate change, the risks presented by increasingly fierce storms, severe flooding, and other extreme weather events are not confined to a single geographic area. Neither are their causes. The economic implications are significant, and we must do all we can to protect our critical military infrastructure, our ports, our homes, and our businesses. It is only by acting together with common purpose that the Commonwealth can effectively adapt and stave off the most severe consequences of climate change.

One key step forward is to continue with a strategic goal of reducing carbon emissions. Virginia has already made meaningful strides – between 2005 and 2014, Virginia reduced its carbon emissions from power plants by 21 percent. However, the electric sector is still responsible for approximately 30 percent of the carbon dioxide pollution in the Commonwealth. Moreover, electric companies are including carbon regulation projections in their long-term plans. The electric sector is changing rapidly through increasing reliance on low and zero carbon resources. As such, it is vital that the Commonwealth continue to facilitate and engage in a dialogue on carbon reduction methods while simultaneously creating a pathway for clean energy initiatives that will grow jobs and help diversify Virginia's economy.

Accordingly, by virtue of the authority vested in the Governor under Article V of the Constitution of Virginia and under the laws of the Commonwealth, I hereby direct the Secretary of Natural Resources to convene a Work Group, chaired by the Secretary, to study and recommend methods to reduce carbon emissions from electric power generation facilities. The Secretary shall receive input from interested stakeholders.

Such methods shall align with the Virginia Air Pollution Control Board's power to promulgate regulations abating, controlling and prohibiting air pollution throughout or in any part of the Commonwealth.

Part II – Scope and Guidance

In preparing their recommendations, the Secretary and the Work Group shall consider the following:

(1) the establishment of regulations for the reduction of carbon pollution from existing electric power generation facilities pursuant to existing authority under Virginia Code § 10.1-1300 *et seq.;*

(2) the carbon reduction requirements for existing electric power generation facilities established under § 11l(d) of the federal Clean Air Act, which are currently stayed pending final disposition;

(3) the interaction between electric utilities and regional markets, including PJM Interconnection;

(4) the impact any reduction requirements place on the reliability of the electric system;

(5) the impact any reduction of carbon pollution may have on electric rates and electric bills;

(6) the impact of reducing carbon pollution on low income and vulnerable communities;

(7) the cost effectiveness of pollution reduction technologies that may be deployed;

(8) the economic development opportunities associated with deployment of new carbon reduction technologies;

(9) the implementation and administration of carbon reduction regulations; and

(10) flexibility in achieving the goals of any carbon reduction regulation.

The Secretary of Natural Resources shall complete her work, including the development of recommendations as to viable carbon reduction methods for the electric power generation facilities by April 30, 2017. The Secretary of Natural Resources shall provide a report on the recommendations to the Governor by May 31, 2017.

Effective Date of the Executive Order

This Executive Order shall be effective upon its signing and shall remain in full force and effect for one year after its signing unless amended or rescinded by further executive order.

Given under my hand and under the Seal of the Commonwealth of Virginia this 28th Day of June, 2016.

_____

Terence R. McAuliffe, Governor

Attest:

Executive Order 57
Work Group Agendas

Executive Order 57 Work Group Meeting

August 31, 2016
1:00pm – 4:00pm
Patrick Henry Building, West Reading Room
1111 E. Broad St., Richmond, VA 23219

Agenda

I. Welcome and Overview of Work Group Structure – Molly Ward, Secretary of Natural Resources

II. Presentation on Virginia's Carbon Reduction Efforts – Mike Dowd, Virginia Department of Environmental Quality

III. Presentation on the Legal Status of Carbon Reduction Rules – Matt Gooch, Virginia Office of the Attorney General

IV. Presentation on Supportive Research Regarding Climate Impacts – Emily Steinhilber and Molly Mitchell, Center for Recurrent Flooding Resiliency

V. Next Steps and Adjournment – Molly Ward, Secretary of Natural Resources

Work Group Members

1. Molly Ward, Secretary of Natural Resources
2. Maurice Jones, Secretary of Commerce and Trade
3. David Paylor, Director of the Virginia Department of Environmental Quality
4. John Warren, Director of the Virginia Department of Mines, Minerals, and Energy
5. John Daniel, Deputy Attorney General for Commerce, Environment and Technology

Executive Order 57 Work Group Meeting

October 6, 2016
1:00pm – 4:00pm
Patrick Henry Building, East Reading Room
1111 E. Broad St., Richmond, VA 23219

Agenda

I. Welcome – Molly Ward, Secretary of Natural Resources

II. Presentations:

a. PJM Interconnection, LLC

b. Tenaska

c. Advanced Energy Economy

d. Business Council for Sustainable Energy

e. Virginia League of Conservation Voters

f. Faith Alliance for Climate Solutions

g. Warrenton Climate Change Group

III. Next Steps and Adjournment – Molly Ward, Secretary of Natural Resources

Work Group Members

1. Molly Ward, Secretary of Natural Resources
2. Todd Haymore, Secretary of Commerce and Trade
3. David Paylor, Director of the Virginia Department of Environmental Quality
4. John Warren, Director of the Virginia Department of Mines, Minerals, and Energy
5. John Daniel, Deputy Attorney General for Commerce, Environment and Technology

Executive Order 57 Work Group Meeting

October 31, 2016
1:00pm – 4:00pm
Patrick Henry Building, East Reading Room
1111 E. Broad St., Richmond, VA 23219

Agenda

I. Welcome – Molly Ward, Secretary of Natural Resources

II. Presentations:

a. American Council for an Energy Efficient Economy

b. Oil Change International

c. Alliance for Industrial Efficiency

d. Sierra Club

e. Virginia Housing Alliance

f. National Green Fuels

III. Next Steps and Adjournment – Molly Ward, Secretary of Natural Resources

For those unable to attend in person, we have arranged a webcast using the following link: https://attendee.gotowebinar.com/register/6736447537171170050

Work Group Members

1. Molly Ward, Secretary of Natural Resources
2. Todd Haymore, Secretary of Commerce and Trade
3. David Paylor, Director of the Virginia Department of Environmental Quality

Attachment 7

COMMONWEALTH of VIRGINIA

Executive Department

Executive Directive 11 (2017)

REDUCING CARBON DIOXIDE EMISSIONS FROM ELECTRIC POWER FACILITIES AND GROWING VIRGINIA'S CLEAN ENERGY ECONOMY

There is no denying the science and the real-world evidence that climate change threatens the Commonwealth of Virginia, from our homes and businesses to our critical military installations and ports. Rising storm surges and flooding could impact as many as 420,000 properties along Virginia's coast that would require $92 billion of reconstruction costs.

The challenges and costs of bolstering resilience and minimizing risk are too great for any locality to bear alone. While the impacts are significant, there are technologies in the clean energy sector that could help mitigate these impacts while simultaneously creating jobs in twenty-first century industries. The number of solar jobs in Virginia has grown by 65 percent in the last year alone, and Virginia is now the ninth fastest growing solar jobs market in the country. Revenue for energy efficiency businesses in Virginia has increased from $300 million in 2014 to $1.5 billion in 2016. Through state leadership, Virginia can face the threats of climate change head on and do so in a way that makes clean energy a pillar of our future economic growth and a meaningful part of our energy portfolio.

With these considerations in mind, I issued Executive Order 57 (EO 57) on June 28, 2016. Under EO 57, I directed the Secretary of Natural Resources to convene a work group to study and recommend methods to reduce carbon dioxide emissions from electric power facilities and grow the clean energy economy within existing state authority. The group consisted of the Secretary of Natural Resources, the Secretary of Commerce and Trade, the Director of the Virginia Department of Environmental Quality, the Director of the Virginia Department of

Mines, Minerals and Energy, and the Deputy Attorney General for Commerce, Environment, and Technology. This group facilitated extensive stakeholder engagement over the last year, including six in-person meetings and a three month public comment period, before compiling the recommendations and submitting a final report to me on May 12, 2017.

Among the most significant recommendations from the group is the need to develop regulations limiting the total amount of carbon dioxide emitted from electric power facilities. Given the nature of the climate change threat and the promise of clean energy solutions, I agree with this recommendation.

Accordingly, pursuant to the authority vested in me as the Chief Executive Officer of the Commonwealth, and pursuant to Article V of the Constitution and the laws of Virginia, I hereby direct the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural Resources, to take the following actions in accordance with the provisions and requirements of Virginia Code § 10.1-1300, *et seq.* and Virginia Code § 2.2-4000, *et seq.*:

1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit carbon dioxide emissions from electric power facilities that:

    a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of carbon dioxide allowances through a multi-state trading program; and

    b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on carbon dioxide emissions imposed in other states with such limits.

2. By no later than December 31, 2017, present the proposed regulation to the State Air Pollution Control Board for consideration for approval for public comment in accordance with the Board's authority pursuant to Virginia Code § 10.1-1308.

Effective Date

This Executive Directive shall be effective upon its signing and shall remain in force and effect unless amended or rescinded by further executive order or directive.

Given under my hand and under the Seal of the Commonwealth of Virginia, this 16th day of May, 2017.

Terence R. McAuliffe, Governor

Attest:

Kelly Thomasson, Secretary of the Commonwealth

Notice of Intended Regulatory Action (NOIRA)
Agency Background Document

Agency name	State Air Pollution Control Board
Virginia Administrative Code (VAC) citation(s)	Part VII, 9VAC5-140
Regulation title(s)	Regulation for Emissions Trading
Action title	Establish a new regulation to reduce and cap carbon dioxide (CO_2) from fossil fuel fired electric power generating facilities by means of an interstate trading program (Revision C17)
Date this document prepared	May 22, 2017

This information is required for executive branch review and the Virginia Registrar of Regulations, pursuant to the Virginia Administrative Process Act (APA), Executive Orders 17 (2014) and 58 (1999), and the *Virginia Register Form, Style, and Procedure Manual.*

Subject matter and intent

Please describe briefly the subject matter, intent, and goals of the planned regulatory action. Also include a brief explanation of the need for and the goals of the new or amended regulation.

The purpose of the proposed action is to develop a regulation, in accordance with Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from Electric Power Facilities and Growing Virginia's Clean Energy Economy," that (i) ensures that Virginia is trading-ready to allow for the use of market-based mechanisms and the trading of carbon dioxide (CO_2) allowances through a multi-state trading program, and (ii) establishes abatement mechanisms that provide for a corresponding level of stringency to CO_2 limits imposed in other states with such limits.

Acronyms and Definitions

Please define all acronyms used in the Agency Background Document. Also, please define any technical terms that are used in the document that are not also defined in the "Definition" section of the regulations.

CO_2 - carbon dioxide

RGGI - Regional Greenhouse Gas Initiative

Legal basis

Please identify (1) the agency (includes any type of promulgating entity) and (2) the state and/or federal legal authority for the proposed regulatory action, including the most relevant citations to the Code of Virginia or General Assembly chapter number(s), if applicable. Your citation should include a specific provision, if any, authorizing the promulgating entity to regulate this specific subject or program, as well as a reference to the agency's overall regulatory authority.

Statutory Authority

Section 10.1-1308 of the Virginia Air Pollution Control Law (Title 10.1, Chapter 13 of the Code of Virginia) authorizes the State Air Pollution Control Board to promulgate regulations abating, controlling and prohibiting air pollution in order to protect public health and welfare.

Promulgating Entity

The promulgating entity for this regulation is the State Air Pollution Control Board.

State Requirements

Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from the Electric Power Sector and Growing Virginia's Clean Energy Economy," directs the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural Resources, to take the following actions in accordance with the provisions and requirements of Virginia Code § 10.1-1300 et seq., and Virginia Code § 2.2-4000, et seq.:

1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit CO_2 from electric power facilities that:

a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of CO_2 allowances through a multi-state trading program; and

b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on CO_2 emissions imposed in other states with such limits.

2. By no later than December 31, 2017, present the proposed regulation to the State Air Pollution Control Board for consideration for approval for public comment in accordance with the Board's authority pursuant to Virginia Code § 10.1-1308.

Purpose

Please describe the specific reasons why the agency has determined that the proposed regulatory action is essential to protect the health, safety, or welfare of citizens. In addition, please explain any potential issues that may need to be addressed as the regulation is developed.

Governor McAuliffe's Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from the Electric Power Sector and Growing Virginia's Clean Energy Economy" states:

There is no denying the science and the real-world evidence that climate change threatens the Commonwealth of Virginia, from our homes and businesses to our critical military installations and ports. Rising storm surges and flooding could impact as many as 420,000 properties along Virginia's coast that would require $92 billion of reconstruction costs.

The challenges and costs of bolstering resilience and minimizing risk are too great for any locality to bear alone. While the impacts are significant, there are technologies in the clean energy sector that could help mitigate these impacts while simultaneously creating jobs in twenty-first century industries. The number of solar jobs in Virginia has grown by 65 percent in the last year alone, and Virginia is now the ninth fastest growing solar jobs market in the country. Revenue for clean energy businesses in Virginia has increased from $300 million in 2014 to $1.5 billion in 2016. Through state leadership, Virginia can face the threats of climate change head on and do so in a way that makes clean energy a pillar of our future economic growth and a meaningful part of our energy portfolio.

With these considerations in mind, I issued Executive Order 57 (EO 57) on June 28, 2016. Under EO 57, I directed the Secretary of Natural Resources to convene a work group to study and recommend methods to reduce carbon dioxide emissions from electric power facilities and grow the clean energy economy within existing state authority. The group consisted of the Secretary of Natural Resources, the Secretary of Commerce and Trade, the Director of the Virginia Department of Environmental Quality, the Director of the Virginia Department of Mines, Minerals and Energy, and the Deputy Attorney General for Commerce, Environment, and Technology. This group facilitated extensive stakeholder engagement over the last year, including six in-person meetings and a ninety-day public comment period, before compiling its recommendations and submitting a final report to me on May 12, 2017.

Among the most significant recommendations from the group is the need to develop regulations limiting the total amount of carbon dioxide emitted from electric power facilities. Given the nature of the climate change threat and the promise of clean energy solutions, I agree with this recommendation.

Accordingly, pursuant to the authority vested in me as the Chief Executive Officer of the Commonwealth, and pursuant to Article V of the Constitution and the laws of Virginia, I hereby direct the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural Resources, to take the following actions in accordance with the provisions and requirements of Virginia Code § 10. 1-1300, et seq. and Virginia Code § 2.2-4000, et seq.:

1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit carbon dioxide emissions from electric power facilities that:

a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of carbon dioxide allowances through a multi-state trading program; and

b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on carbon dioxide emissions imposed in other states with such limits.

2. By no later than December 31, 2017, present the proposed regulation to the State Air Pollution Control Board for consideration for approval for public comment in accordance with the Board's authority pursuant to Virginia Code § 10. 1-1308.

Additionally, Executive Order 57 Work Group's "Report and Final Recommendations to the Governor" states that:

The Work Group received a number of presentations and written comments from stakeholders advocating for a regulation to limit carbon dioxide from power plants. These comments included recommendations that the Commonwealth join or participate in the Regional Greenhouse Gas Initiative (RGGI) or another regional trading program, that a price be put on carbon, and that Virginia strive to reduce its greenhouse gases by 30 to 40 percent by the year 2030. Although many stakeholders provided feedback focused on specific in-state targets (such as 30x30), the Work Group believes that it is important and necessary that Virginia work through a regional model, like the established and successful RGGI, in order to achieve lower compliance costs and address the interstate nature of the electric grid.

The Work Group recommends that the Governor consider taking action via a regulatory process to establish a 'trading-ready' carbon emissions reduction program for fossil fuel fired electric generating facilities that will enable participation in a broader, multi-state carbon market.

Substance

Please briefly identify and explain the new substantive provisions that are being considered, the substantive changes to existing sections that are being considered, or both.

The following is a general outline of the likely main elements of the new regulation directed by the Governor.

- CO_2 Budget Trading Program General Provisions (Purpose; Definitions; Measurements, abbreviations and acronyms; Applicability; Standard Requirements; Computation of time; Severability)
- Authorized Account Representative for CO_2 Budget Sources (Authorization and responsibilities of the CO_2 authorized account representative; Alternate CO_2 authorized account representative; Changing the CO_2 authorized account representatives and the alternate CO_2 authorized account representative; changes in the owner as and operators; Account certificate of representation; Objections concerning the CO_2 authorized account representative; Delegation by CO_2 authorized account representative and alternate CO_2 authorized account representative)
- Permits (General CO_2 budget permit requirements; Submission of CO_2 budget permit applications; Information requirements for CO_2 budget permit applications)
- Compliance Certification (Compliance certification report; Agency's action on compliance certifications)
- CO_2 Allowance Allocations (Virginia CO_2 trading program base budget; Timing requirements for CO_2 allowance allocations; CO_2 allowance allocations)
- CO_2 Allowance Tracking System (CO_2 Allowance Tracking System accounts; Establishment of accounts; CO_2 Allowance Tracking System responsibilities of CO_2 authorized account representative; Recordation of CO_2 allowance allocations; Compliance; Banking; Account error; Closing of general accounts)
- CO_2 Allowance Transfers (Submission of CO_2 allowance transfers; Recordation; Notification)
- Monitoring and Reporting (General requirements; Initial certification and recertification procedures; Out-of-control periods; Notifications; Recordkeeping and reporting; Petitions; CO_2 budget units that co-fire eligible biomass; Additional requirements to provide output data)

- CO_2 Emissions Offset Projects (Purpose, Definitions, General requirements, Application process, CO_2 emissions offset project standards, Accreditation of independent verifiers, Award and Recordation of CO_2 offset allowances)

Alternatives

Please describe any viable alternatives to the proposal considered and the rationale used by the agency to select the least burdensome or intrusive alternative that meets the essential purpose of the action. Also, include discussion of less intrusive or less costly alternatives for small businesses, as defined in § 2.2-4007.1 of the Code of Virginia, of achieving the purpose of the regulation.

Alternatives to the proposal will be considered by the board. It has been tentatively determined that the first alternative is appropriate, as it is the least burdensome and least intrusive alternative that fully meets the purpose of the regulatory action. The alternatives being considered, along with the reasoning by which any of the alternatives have been rejected, are discussed below.

1. Adopt the regulations to satisfy the provisions of Executive Directive 11 (2017). This option is being selected because it meets the stated purpose of the regulatory action: to develop a regulation that (i) ensures that Virginia is trading-ready to allow for the use of market-based mechanisms and the trading of carbon dioxide (CO_2) allowances through a multi-state trading program, and (ii) establishes abatement mechanisms that provide for a corresponding level of stringency to CO_2 limits imposed in other states with such limits.

2. Make alternative regulatory changes to those required by Executive Directive 11 (2017). This option is not being selected because it would not meet the stated purpose of the regulatory action.

3. Take no action to adopt the regulation. This option is not being selected because it would not satisfy the provisions of Executive Directive 11 (2017).

Public participation

Please indicate whether the agency is seeking comments on the intended regulatory action, including ideas to assist the agency in the development of the proposal and the costs and benefits of the alternatives stated in this notice or other alternatives. Also, indicate whether a public hearing is to be held to receive comments. Please include one of the following choices: (1) a panel will be appointed and the agency's contact if you're interested in serving on the panel is _____; (2) a panel will not be used; or (3) public comment is invited as to whether to use a panel to assist in the development of this regulatory proposal.

The agency is seeking comments on this regulatory action, including but not limited to: (1) ideas to be considered in the development of this proposal; (2) the costs and benefits of the alternatives stated in this background document or other alternatives; (3) potential impacts of the regulation; and, (4) impacts of the regulation on farm and forest land preservation. The agency is also seeking information on impacts on small businesses as defined in § 2.2-4007.1 of the Code of Virginia. Information may include: projected reporting, recordkeeping and other administrative costs; the probable effect of the regulation on affected small businesses; and the description of less intrusive or costly alternatives for achieving the purpose of the regulation.

The agency is seeking specific comment on how credits under a trading program should be allocated.

Anyone wishing to submit written comments may do so by mail, email or fax to Karen G. Sabasteanski, Department of Environmental Quality, P.O. Box 1105, Richmond VA 23218, phone 804-698-4426, fax 804-698-4510, email karen.sabasteanski@deq.virginia.gov. Comments may also be submitted through the Public Forum feature of the Virginia Regulatory Town Hall web site (http://www.townhall.virginia.gov**).** Written comments must include the name and address of the commenter. In order to be considered, comments must be received before midnight on the last day of the public comment period.

Public hearing at proposed stage

A public hearing will be held following the publication of the proposed stage of this regulatory action and notice of the hearing will be posted on the Virginia Regulatory Town Hall website (http://www.townhall.virginia.gov) and on the Commonwealth Calendar website (https://www.virginia.gov/connect/commonwealth-calendar).

Regulatory panel

Please indicate, to the extent known, if advisers (e.g., regulatory advisory panel or negotiated rulemaking panel) will be involved in the development of the proposed regulation. Indicate that 1) the agency is not using a panel in the development of the proposal; 2) the agency is using a panel in the development of the proposal; or 3) the agency is inviting comment on whether to use a panel to assist the agency in the development of a proposal.

The Board is using a panel to develop a proposal. The primary function of the panel is to develop a recommended regulation for Department consideration through the collaborative approach of regulatory negotiation and consensus. Notification of the composition of the panel will be sent to all panel members. Panel meetings are open to the public and will be announced via the Department website (http://deq.virginia.gov/Programs/Air/PublicNotices/AirRegulations.aspx) and on the Virginia Regulatory Town Hall website (http://www.townhall.virginia.gov).

Family Impact

Assess the potential impact of the proposed regulatory action on the institution of the family and family stability including to what extent the regulatory action will: 1) strengthen or erode the authority and rights of parents in the education, nurturing, and supervision of their children; 2) encourage or discourage economic self-sufficiency, self-pride, and the assumption of responsibility for oneself, one's spouse, and one's children and/or elderly parents; 3) strengthen or erode the marital commitment; and 4) increase or decrease disposable family income.

It is not anticipated that the proposal will have a direct impact on families.

REG\DEV\C17-01PD

Proposed Regulation
Agency Background Document

Agency name	State Air Pollution Control Board
Virginia Administrative Code (VAC) citation(s)	Part VII, 9VAC5-140
Regulation title(s)	Regulation for Emissions Trading
Action title	Establish a new regulation to reduce and cap carbon dioxide (CO_2) from fossil fuel fired electric power generating facilities by means of an interstate trading program (Revision C17)

This information is required for executive branch review and the Virginia Registrar of Regulations, pursuant to the Virginia Administrative Process Act (APA), Executive Orders 17 (2014) and 58 (1999), and the *Virginia Register Form, Style, and Procedure Manual.*

Brief summary

Please provide a brief summary (preferably no more than 2 or 3 paragraphs) of the proposed new regulation, proposed amendments to the existing regulation, or the regulation proposed to be repealed. Alert the reader to all substantive matters or changes. If applicable, generally describe the existing regulation.

The purpose of the proposed new regulation is, in accordance with Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from Electric Power Facilities and Growing Virginia's Clean Energy Economy," (i) ensure that Virginia is trading-ready to allow for the use of market-based mechanisms and the trading of carbon dioxide (CO_2) allowances through a multi-state trading program, and (ii) establish abatement mechanisms that provide for a corresponding level of stringency to CO_2 limits imposed in other states with such limits. The proposal includes two options on the base budgets, 33 million tons and 34 million tons, which will determine, based on a 3% annual reduction, the annual budgets and allocations for future years.

Acronyms and Definitions

Please define all acronyms used in the Agency Background Document. Also, please define any technical terms that are used in the document that are not also defined in the "Definition" section of the regulations.

CO_2 - carbon dioxide
CHP - combined heat and power
CPP - Clean Power Plan

CSAPR - Cross-State Air Pollution Rule
CT - combustion turbine
DMME - Department of Mines, Minerals and Energy
EGU - electric generating unit
ED 11 - Executive Directive 11
EPA - U.S. Environmental Protection Agency
ETS - Emissions Trading System
GHG - greenhouse gas
IRP - Integrated Resource Plan
MATS - Mercury and Air Toxics Standards
MW - megawatt
NGCC - natural gas-fired combined cycle
NRC - U.S. Nuclear Regulatory Commission
PEV - plug-in electric vehicle
PJM - PJM Interconnection
PSD - Prevention of Significant Deterioration
RGGI - Regional Greenhouse Gas Initiative
SCC - State Corporation Commission

Legal basis

Please identify the state and/or federal legal authority to promulgate this proposed regulation, including: 1) the most relevant citations to the Code of Virginia or General Assembly chapter number(s), if applicable; and 2) promulgating entity, i.e., agency, board, or person. Your citation should include a specific provision authorizing the promulgating entity to regulate this specific subject or program, as well as a reference to the agency/board/person's overall regulatory authority.

Section 10.1-1308 of the Virginia Air Pollution Control Law (Title 10.1, Chapter 13 of the Code of Virginia) authorizes the State Air Pollution Control Board to promulgate regulations abating, controlling and prohibiting air pollution in order to protect public health and welfare. Written assurance from the Office of the Attorney General that the State Air Pollution Control Board possesses the statutory authority to promulgate the proposed regulation amendments is available upon request.

Promulgating Entity

The promulgating entity for this regulation is the State Air Pollution Control Board.

State Requirements

Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from the Electric Power Sector and Growing Virginia's Clean Energy Economy," directs the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural Resources, to take the following actions in accordance with the provisions and requirements of Virginia Code § 10.1-1300 et seq., and Virginia Code § 2.2-4000, et seq.:

1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit CO_2 from electric power facilities that:

a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of CO_2 allowances through a multi-state trading program; and

b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on CO_2 emissions imposed in other states with such limits.

2. By no later than December 31, 2017, present the proposed regulation to the State Air Pollution Control Board for consideration for approval for public comment in accordance with the Board's authority pursuant to Virginia Code § 10.1-1308.

Purpose

Please explain the need for the new or amended regulation. Describe the rationale or justification of the proposed regulatory action. Describe the specific reasons the regulation is essential to protect the health, safety or welfare of citizens. Discuss the goals of the proposal and the problems the proposal is intended to solve.

The regulation is needed to control CO_2 emissions in order to protect the public's health and welfare. The proposed regulation is being developed in order to meet the direction of Governor McAuliffe's Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from the Electric Power Sector and Growing Virginia's Clean Energy Economy," which states:

> There is no denying the science and the real-world evidence that climate change threatens the Commonwealth of Virginia, from our homes and businesses to our critical military installations and ports. Rising storm surges and flooding could impact as many as 420,000 properties along Virginia's coast that would require $92 billion of reconstruction costs.
>
> The challenges and costs of bolstering resilience and minimizing risk are too great for any locality to bear alone. While the impacts are significant, there are technologies in the clean energy sector that could help mitigate these impacts while simultaneously creating jobs in twenty-first century industries. The number of solar jobs in Virginia has grown by 65 percent in the last year alone, and Virginia is now the ninth fastest growing solar jobs market in the country. Revenue for clean energy businesses in Virginia has increased from $300 million in 2014 to $1.5 billion in 2016. Through state leadership, Virginia can face the threats of climate change head on and do so in a way that makes clean energy a pillar of our future economic growth and a meaningful part of our energy portfolio.
>
> With these considerations in mind, I issued Executive Order 57 (EO 57) on June 28, 2016. Under EO 57, I directed the Secretary of Natural Resources to convene a work group to study and recommend methods to reduce carbon dioxide emissions from electric power facilities and grow the clean energy economy within existing state authority. The group consisted of the Secretary of Natural Resources, the Secretary of Commerce and Trade, the Director of the Virginia Department of Environmental Quality, the Director of the Virginia Department of Mines, Minerals and Energy, and the Deputy Attorney General for Commerce, Environment, and Technology. This group facilitated extensive stakeholder engagement over the last year, including six in-person meetings and a ninety-day public comment period, before compiling its recommendations and submitting a final report to me on May 12, 2017.
>
> Among the most significant recommendations from the group is the need to develop regulations limiting the total amount of carbon dioxide emitted from electric power facilities. Given the nature of the climate change threat and the promise of clean energy solutions, I agree with this recommendation.
>
> Accordingly, pursuant to the authority vested in me as the Chief Executive Officer of the Commonwealth, and pursuant to Article V of the Constitution and the laws of Virginia, I hereby direct the Director of the Department of Environmental Quality, in coordination with the Secretary

of Natural Resources, to take the following actions in accordance with the provisions and requirements of Virginia Code § 10. 1-1300, et seq. and Virginia Code § 2.2-4000, et seq.:

1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit carbon dioxide emissions from electric power facilities that:

a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of carbon dioxide allowances through a multi-state trading program; and

b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on carbon dioxide emissions imposed in other states with such limits.

2. By no later than December 31, 2017, present the proposed regulation to the State Air Pollution Control Board for consideration for approval for public comment in accordance with the Board's authority pursuant to Virginia Code § 10. 1-1308.

Additionally, Executive Order 57 Work Group's "Report and Final Recommendations to the Governor" states that:

> The Work Group received a number of presentations and written comments from stakeholders advocating for a regulation to limit carbon dioxide from power plants. These comments included recommendations that the Commonwealth join or participate in the Regional Greenhouse Gas Initiative (RGGI) or another regional trading program, that a price be put on carbon, and that Virginia strive to reduce its greenhouse gases by 30 to 40 percent by the year 2030. . . . Although many stakeholders provided feedback focused on specific in-state targets (such as 30x30), the Work Group believes that it is important and necessary that Virginia work through a regional model, like the established and successful RGGI, in order to achieve lower compliance costs and address the interstate nature of the electric grid.

The Work Group recommends that the Governor consider taking action via a regulatory process to establish a "trading-ready" carbon emissions reduction program for fossil fuel fired electric generating facilities that will enable participation in a broader, multi-state carbon market.

Substance

Please briefly identify and explain the new substantive provisions, the substantive changes to existing sections, or both. A more detailed discussion is provided in the "Detail of changes" section below.

1. The primary purpose of the regulation is to implement a declining cap on carbon emissions. The administrative means of accomplishing this will be effected by linking Virginia to RGGI, which is an established emissions trading program. An allowance will be issued for each ton of carbon emitted by an electricity generating facility. The company must then decide if it will reduce carbon emissions and sell the resulting additional allowances, or if it will not reduce carbon emissions and make up the difference with purchased allowances. The proposal includes two options on the base budgets, 33 million tons and 34 million tons, which will determine, based on a 3% annual reduction, the annual budgets and allocations for future years.

2. The mechanism for determining the cost of allowances will be a consignment auction.

3. A cost containment reserve allowance will be offered for sale at an auction for the purpose of containing the cost of CO_2 allowances in the event of higher than anticipated emission reduction costs. An emission containment reserve allowance will be withheld from sale at an auction for the purpose of additional emission reduction in the event of lower than anticipated emission reduction costs.

4. Monitoring, recording, and recordkeeping requirements will be implemented to track compliance.

5. Conditional allowances will be allocated to the Department of Mines, Minerals and Energy (DMME) in order to assist the department for the abatement and control of air pollution, specifically, CO_2.

Issues

Please identify the issues associated with the proposed regulatory action, including: 1) the primary advantages and disadvantages to the public, such as individual private citizens or businesses, of implementing the new or amended provisions; 2) the primary advantages and disadvantages to the agency or the Commonwealth; and 3) other pertinent matters of interest to the regulated community, government officials, and the public. If there are no disadvantages to the public or the Commonwealth, please indicate.

1. Public: The primary advantage to the public would be health and welfare benefits associated with controlling carbon pollution. The program is designed to avoid any significant economic impacts.

2. Department: No significant advantages or disadvantages to the department can be identified. There may be a minor impact in terms of administering a new program.

Requirements more restrictive than federal

Please identify and describe any requirement of the proposal which is more restrictive than applicable federal requirements. Include a rationale for the need for the more restrictive requirements. If there are no applicable federal requirements or no requirements that exceed applicable federal requirements, include a statement to that effect.

There are no applicable federal requirements.

Localities particularly affected

Please identify any locality particularly affected by the proposed regulation. Locality particularly affected means any locality which bears any identified disproportionate material impact which would not be experienced by other localities.

There is no locality that will bear any identified disproportionate material air quality impact due to the proposed regulation which would not be experienced by other localities. None of the affected sources is owned or operated by a locality, and it is the generation of electricity that is directly subject to the regulation, not its end users.

Public participation

Please include a statement that in addition to any other comments on the proposal, the agency is seeking comments on the costs and benefits of the proposal, the impacts of the regulated community and the impacts of the regulation on farm or forest land preservation.

In addition to any other comments, the board is seeking comment on whether the initial Virginia CO_2 Budget Trading Program base budget for 2020 should be 33 million tons or 34 million tons, and declining accordingly by 3% per year as shown in Article 5. After considering public comment, the board will make a final selection of either 33 million tons or 34 million tons.

Additionally, the board is seeking comment on whether any fossil fuel power generating unit owned by an individual facility and located at that individual facility that generates electricity and heat from fossil fuel for the primary use of operation of the facility should be exempt from the requirements of this regulation.

The board is also seeking comment on the costs and benefits of the proposal, the potential impacts of this regulatory proposal and any impacts of the regulation on farm and forest land preservation. Also, the board is seeking information on impacts on small businesses as defined in § 2.2-4007.1 of the Code of Virginia. Information may include 1) projected reporting, recordkeeping and other administrative costs, 2) probable effect of the regulation on affected small businesses, and 3) description of less intrusive or costly alternative methods of achieving the purpose of the regulation.

Anyone wishing to submit written comments for the public comment file may do so by mail, email or fax to the agency contact: Karen G. Sabasteanski, Policy Analyst, Office of Regulatory Affairs, Department of Environmental Quality, P.O. Box 1105, Richmond, Virginia, 23218 (email karen.sabasteanski@deq.virginia.gov, fax 804-698-4510). Comments may also be submitted through the Public Forum feature of the Virginia Regulatory Town Hall web site at: http://www.townhall.virginia.gov. Written comments must include the name and address of the commenter. In order to be considered, comments must be received by 11:59 pm on the last day of the public comment period.

A public hearing will be held following the publication of this stage and notice of the hearing will be posted on the Virginia Regulatory Town Hall website (http://www.townhall.virginia.gov) and on the Commonwealth Calendar website (https://www.virginia.gov/connect/commonwealth-calendar). Both oral and written comments may be submitted at that time.

Economic impact

Please identify the anticipated economic impact of the proposed new regulations or amendments to the existing regulation. When describing a particular economic impact, please specify which new requirement or change in requirement creates the anticipated economic impact.

Projected cost to the state to implement and enforce the proposed regulation, including: **a) fund source / fund detail; and** **b) a delineation of one-time versus on-going expenditures**	It is not expected that the regulation will result in any cost to the department beyond that currently in the budget. The sources of department funds to carry out this regulation are the general fund and the federal trust (grant money provided by EPA under § 105 of the federal Clean Air Act or permit fees charged to affected entities under the permit program). The activities are budgeted under the following programs (codes)/subprograms (codes): Air Protection Permitting (513025); Air Protection Compliance and Enforcement (513026); Air Protection Planning and Policy (513028); and Air Protection Monitoring and Assessment (513029). The costs are expected to be ongoing.
Projected cost of the new regulations or changes to existing regulations on localities.	The projected cost of the regulation on localities is not expected to be beyond that of other affected entities. Essentially, every individual and every organized entity--whether government or private--

	uses electricity, and it is the generation of that electricity that is directly subject to the regulation, not its end users. Furthermore, none of the affected sources is owned or operated by any locality.
Description of the individuals, businesses, or other entities likely to be affected by the new regulations or changes to existing regulations.	Electric power facilities with a capacity of >25 MW that operate on some form of fossil fuel (coal, natural gas) will be directly affected by the regulation.
Agency's best estimate of the number of such entities that will be affected. Please include an estimate of the number of small businesses affected. Small business means a business entity, including its affiliates, that: a) is independently owned and operated and; b) employs fewer than 500 full-time employees or has gross annual sales of less than $6 million.	There are 32 electric power facilities with a capacity of >25 MW operated by 12 companies located throughout the state that will likely be directly affected by the regulation. None of these entities is a small business. There may be limited indirect impacts on small businesses in general as discussed in greater detail below.
All projected costs of the new regulations or changes to existing regulations for affected individuals, businesses, or other entities. Please be specific and include all costs including: **a) the projected reporting, recordkeeping, and other administrative costs required for compliance by small businesses; and** **b) specify any costs related to the development of real estate for commercial or residential purposes that are a consequence of the proposed regulatory changes or new regulations.**	The primary purpose of the regulation is to implement a declining cap on carbon emissions. The administrative means of accomplishing this will be effected by linking Virginia to RGGI, which is an established emissions trading program. An allowance will be issued for each ton of carbon emitted by an electricity generating unit. It will then be up to the company to decide if it wants to reduce carbon emissions and sell its additional allowances, or or if it will not reduce carbon emissions and make up the difference with purchased allowances. Because there will not be a significant change to the allowance values RGGI already has in place, adding Virginia to the equation will not change compliance costs. The cost of allowances will be administratively managed by means of a consignment auction. In general, auctions have been known to decrease costs because the process is transparent (costs and prices are known), and the secondary market is not involved. Consignment auctions are revenue neutral, so the only actual cost to a facility would be the administrative cost of managing its consignment auction activities. Based on department experience with emissions trading programs and traditional auctions in the past (for example, under 9VAC5-140 for the NO_X Trading Rule, and CAIR), it is expected that these costs will be minor, unless a facility generates enough allowances to sell and realizes a profit from that sale. Generally speaking, wholesale electricity costs may go up or down depending on the price of allowances. Any impacts to residential consumers will be very small because wholesale costs are only a very small portion of a residential consumer's bill. Rates for commercial users may

	fluctuate more because wholesale costs are somewhat higher for commercial users, and industrial users, which pay rates close to wholesale, will experience the greatest of any potential impact. It is important to note that Virginia's energy market is regulated. This means that the Virginia SCC is responsible for monitoring electric rates such that Virginia's consumers (whether businesses, institutions or individuals) are protected from any dramatic changes to the electricity market. Regardless of what business decisions the affected utilities make in the future to comply with the carbon cap, Virginia's utility structure is designed to accommodate this type of pollution control program. The RGGI program is designed to avoid dramatic fluctuations in consumer costs. Thus far, electricity rates for RGGI customers have been stable over the life of the program, and this stability is expected to continue.
Beneficial impact the regulation is designed to produce.	To quote ED 11, "The challenges and costs of bolstering resilience and minimizing risk are too great for any locality to bear alone. While the impacts are significant, there are technologies in the clean energy sector that could help mitigate these impacts while simultaneously creating jobs in twenty-first century industries. The number of solar jobs in Virginia has grown by 65 percent in the last year alone, and Virginia is now the ninth fastest growing solar jobs market in the country. Revenue for clean energy businesses in Virginia has increased from $300 million in 2014 to $1.5 billion in 2016. Through state leadership, Virginia can face the threats of climate change head on and do so in a way that makes clean energy a pillar of our future economic growth and a meaningful part of our energy portfolio." It is expected that the regulation will address the health and welfare impacts of climate change in an efficient, cost-effective manner. RGGI has successfully reduced carbon emissions with no negative economic impacts; see https://www.rggi.org/rggi_benefits. Emissions trading programs have proven to be very effective--with both traditional pollutants such as NO_X, and with more recently regulated pollutants such as CO_2--and an affiliation with RGGI will enable Virginia to quickly take advantage of a proven trading program.

Alternatives

Please describe any viable alternatives to the proposal considered and the rationale used by the agency to select the least burdensome or intrusive alternative that meets the essential purpose of the action. Also, include discussion of less intrusive or less costly alternatives for small businesses, as defined in § 2.2-4007.1 of the Code of Virginia, of achieving the purpose of the regulation.

Alternatives to the proposal are being considered by the board. The board has tentatively determined that the first alternative is appropriate, as it is the least burdensome and least intrusive alternative that fully meets the purpose of the regulatory action. The alternatives being considered by the board, along with the reasoning by which the board has rejected any of the alternatives being considered, are discussed below.

1. Amend the regulations to satisfy the provisions of the law and associated regulations and policies. This option is being selected because it meets the stated purpose of the regulatory action: to develop a carbon trading regulation in accordance with ED 11 (2017).

2. Make alternative regulatory changes to those required by the provisions of the law and associated regulations and policies. This option is not being selected because it would not meet the specific requirements of ED 11.

3. Take no action to amend the regulations and continue to not control carbon emissions via a trading program. This option is not being selected because it it would not meet the specific requirements of ED 11.

Regulatory flexibility analysis

Pursuant to § 2.2-4007.1B of the Code of Virginia, please describe the agency's analysis of alternative regulatory methods, consistent with health, safety, environmental, and economic welfare, that will accomplish the objectives of applicable law while minimizing the adverse impact on small business. Alternative regulatory methods include, at a minimum: 1) the establishment of less stringent compliance or reporting requirements; 2) the establishment of less stringent schedules or deadlines for compliance or reporting requirements; 3) the consolidation or simplification of compliance or reporting requirements; 4) the establishment of performance standards for small businesses to replace design or operational standards required in the proposed regulation; and 5) the exemption of small businesses from all or any part of the requirements contained in the proposed regulation.

This regulation meets the requirements of Executive Directive 11. Any less stringent compliance requirements, any delays in adopting the standards, any different compliance or reporting requirements, any substitution of performance standards, and any exemption of small businesses from these requirements will not meet the minimum requirements of ED11. Any such changes would compromise the effectiveness of the regulation in protecting the health and welfare of the public.

Public comment

Please summarize all comments received during the public comment period following the publication of the NOIRA, and provide the agency response.

Commenter	Comment	Agency response
1. General support (92 commenters)	General support for the regulatory action was expressed.	Support for the regulatory action is appreciated.

2. Advanced Energy Economy Institute (AEE Institute)	By implementing a carbon reduction policy with a flexible design that allows for a variety of technologies and services for that best suit the state, Virginia has the opportunity to modernize its electric grid for the benefit of consumers and the economy to accelerate a transition to a higher performing grid that is reliable, resilient, and affordable. To achieve those improvements, Virginia must continue to invest in 21st century electricity generation and grid technologies. Luckily, these same technologies will also lower carbon emissions. Forty such technologies are detailed in *Advanced Energy Technologies for Greenhouse Gas Reduction*. Renewable energy and energy efficiency are cost-effective mechanisms for carbon reduction but also expected to grow strictly on the basis of cost. The levelized cost of electricity for utility-scale wind and solar has declined such that these technologies are increasingly competitive. Renewable energy purchases that were once driven by state policies are increasingly made based on economics. Generation from zero- and low-carbon-emitting technologies can be used to meet baseload generation. These resources can integrate with variable renewable energy and also complement each other both technologically and economically, allowing the electricity system to provide reliable, low-carbon energy. High voltage direct current transmission can facilitate the integration of renewable energy technologies and reduce transmission line losses 30-50% compared to traditional alternating current systems. Demand response also provides grid benefits, including firm capacity reserves, system-wide peak shaving when demand is high, and ancillary services to facilitate the integration	DEQ agrees that renewable energy and energy efficiency are important elements in the reduction of carbon emissions. Although advanced energy programs as discussed by the commenter are recognized as important tools in the control of carbon emissions, they must be addressed in other, more appropriate venues. Electricity and energy policy in Virginia is primarily regulated and overseen by the Department of Mines, Minerals and Energy (DMME) and the State Corporation Commission (SCC).

	of renewable resources in a low-carbon manner. Demand response can directly reduce CO_2 emissions by more than 1% through peak load reductions and provision of ancillary services, and that it can indirectly reduce CO_2 emissions by more than 1% through accelerating changes in the fuel mix and increasing renewable penetration. Demand response can strengthen reliability. It also provides cost-effective alternatives to meeting peak demand, both locally and at the wholesale level, and can improve reliability while reducing peak power costs. Neighboring states are reducing energy costs for their customers through the deployment of utility peak-shaving demand response programs. These programs boost the local economy, as the majority of program payments are given to participating local businesses and organizations (e.g. school districts). Distributed resources can also provide grid benefits such as reduced congestion and increased reliability. These resources include distributed generation such as residential/commercial solar and wind, CHP, waste energy recovery, and fuel cells. Similarly, energy efficiency reduces congestion and peak demand, and reduces the impacts of changes in the capacity associated with retiring EGUs. Advanced grid technologies can help integrate and manage the growing diversity of renewable, low-emitting and traditional fossil generation. Energy storage also helps integrate renewables and reduces the need for peaking power plants–leading to fewer emissions–and thermal units to provide ancillary services such as frequency regulation and spinning reserves, allowing these traditional units to operate at more efficient heat rate blocks leading to fewer emissions.	

	Plug-in electric vehicles (PEVs) can be an important component to aid in GHG reduction and grid support as market penetration continues. PEVs both reduce emissions and provide grid energy storage. These advanced energy technologies can ensure that deployment of these technologies will have no significant adverse impacts on grid reliability and cost. In a recent report, AEE Institute described the grid benefits of the transforming energy sector. As the energy revolution sweeps the United States, greater fuel diversity has provided us with more options to meet our energy needs while maintaining, if not improving, reliability. *Changing the Power Grid for the Better* argues that incorporating more renewable energy, fast-ramping natural gas generation, a range of demand management techniques, and new resources like energy storage--rather than a return to a singular reliance on baseload resources--is the foundation of electric power system reliability. Advanced energy technologies and services will help Virginia balance cost, energy system performance, environmental, and public health considerations. These technologies are also well established in the U.S. and global marketplaces.	
3. AEE Institute	DEQ has discretion to distribute allowances in its state plan, either a) to Emitting Generating Units (EGUs); b) eligible resources; or c) both. Consider allocating allowances to all emission reduction measures, not just EGUs. This will ensure that the allowance allocation remains technology neutral and encourages competition among emission reduction measures, allowing for both existing future technologies to serve as compliance mechanisms. Although an auction method for	A consignment auction with updating output-based allocation has been selected as the mechanism for distributing and utilizing allowances. Consignment auctions are revenue neutral, and will enable Virginia to link to RGGI while recognizing its own energy distribution requirements.

	distributing allowances as currently employed by other carbon allowance systems including RGGI is not permissible under state law, a variation of allowance allocation that distributes to the load-serving entity or an updating output-based allocation could serve as a good alternative.	
4. American Council for an Energy-Efficient Economy (ACEEE)	Energy efficiency is an important strategy to reduce emissions. As it lowers electricity use, energy efficiency avoids emissions of CO_2 and other harmful pollutants, often at lowest cost. ACEEE estimates that if Virginia placed a cap on CO_2 emissions to reduce pollution 30% by 2030, Virginia could realize 100% of pollution reductions through energy efficiency policies and programs. As DEQ considers approaches to distributing allowances under a trading program, keep in mind that the selected approach will affect both CO_2 emissions and compliance costs during and after the compliance period. It is therefore essential for the success and long-term viability of the trading program that the method of allowance distribution drive lasting and cost-effective emission reductions. Energy efficiency is often the lowest-cost option to meet CO_2 reduction goals, and deployment should be encouraged under a CO_2 trading program. In an allowance trading program, CO_2 reductions from energy efficiency will help electric generating units (EGUs) meet the state's CO_2 emissions limit by reducing electricity production. However, this does not mean that energy efficiency deployment will increase - even when it is more cost-effective than other CO_2 reduction options. Current market and regulatory barriers to investment in energy efficiency can hinder its use as a compliance strategy in a trading program. DEQ should consider using methods for allowance distribution to help address these barriers to energy	DEQ agrees that energy efficiency is an important factor in the reduction of carbon emissions; energy efficiency efforts in the state are managed by the Department of Mines, Minerals and Energy (DMME). The RGGI states have proposed, as of this writing, a regional cap trajectory that will provide an additional 30% cap reduction by the year 2030, relative to 2020 levels. The proposed regional program changes include the addition of an Emissions Containment Reserve (ECR) wherein states can withhold allowances from auction if emission reduction costs are lower than projected. The proposed ECR is an innovative way to adaptively respond to supply and demand in the market. When this program is finalized, Virginia will align the regulation to meet any new requirements of RGGI states.

	efficiency deployment. We do not recommend a historical approach to allowance distribution, where allowances are given away to covered EGUs, as this is the least effective option. A historical approach does not promote the most cost-effective emission reduction measures in the state, such as energy efficiency.	
5. ACEEE	Auctions held by the state or another entity allow EGUs to purchase the allowances needed for compliance. The revenues from the sale of allowances can then be reinvested in activities that further reduce emissions, such as energy efficiency. RGGI has successfully distributed almost all allowances through regional auctions, with the largest portion of revenues reinvested in energy efficiency programs. According to RGGI, these investments are projected to save participants $3.62 billion on energy bills and avoid 12.9 million short tons of CO_2 pollution. As DEQ develops provisions to trade allowances through a multi-state trading program, joining RGGI and adopting the approach of auctioning allowances and reinvesting proceeds into energy efficiency programs and other purposes should be strongly considered. While a revenue-raising auction provides many benefits, there are other approaches for allowance distribution that would incentivize lasting CO_2 reductions and engage the private sector to invest in energy efficiency. A consignment auction will influence market responses in a similar way as a revenue-raising auction. Allowances are allocated for free, and recipients are then required to sell those allowances and use the revenue to repurchase the amount needed for compliance. This approach could avoid the need for legislative approval, and provide a transparent price signal and promotes long-term, cost-effective	DEQ agrees that a revenue-neutral consignment auction is the best means of achieving compliance, and the regulation has been developed with this approach.

	strategies to reduce CO_2 emissions.	
6. ACEEE	An updating output-based allocation rewards measures that deliver lasting CO_2 reductions. Allowances are distributed on the basis of electricity generated or demand avoided, relative to the amount of pollution emitted or fuel consumed. The allocation formula should be updated regularly to track generation and savings from efficiency, and reward future progress toward CO_2 reductions. This approach fosters technology-neutral competition, allowing energy efficiency project developers or investors to earn allowances alongside covered EGUs. It provides a transparent and predictable price signal, and ensures the activities that reduce the most CO, will receive the greatest number of allowances.	DEQ agrees that an updating output-based allocation approach will be the most effective means of reducing CO_2 and have designed the new program accordingly.
7. ACEEE	Set-asides allow for a portion of allowances to be budgeted for certain programs, such as energy efficiency. The amount of available allowances is capped at a certain percentage of the total allowance pool, therefore if the cap is exceeded certain projects will not be fully compensated for their contributions. While set-asides provide an incentive for qualified energy efficiency projects, the total allowances available are likely too small to allow for significant investment.	DEQ agrees that energy efficiency is an important factor in the reduction of carbon emissions; energy efficiency efforts in the state are managed by the Department of Mines, Minerals and Energy (DMME).
8. Appalachian Power Company (APCo)	APCo has demonstrated leadership in making carbon reductions over the past decade and will continue to deploy clean energy sources over the coming decades. As such, we feel that it is not in the best interest of Virginia to develop incremental carbon policies to intervene in an already ongoing transformation of the electric sector. On May 1, APCo filed its annual IRP with the Virginia SCC. In addition to projected load changes, IRPs are updated at regular intervals for changing market conditions as well as other external factors, including achieving	APCo's carbon reduction efforts are recognized and appreciated. DEQ does not agree that linking Virginia's CO_2 action to a broader CO_2 trading program could result in less control over Virginia's emissions trajectory and economic well-being. Joining RGGI is administratively practical and transparent, while meeting the important goal of reducing carbon emissions that are already having a detrimental economic impact to the state. Acting in concert with a program proven to reduce carbon emissions cost effectively will enable Virginia to reduce emissions while protecting the state's economic interests. The commenter's concerns are well-taken, however, we believe that this is the best approach in moving forward with the most

	potential environmental requirements. Such long-term plans--beyond any near-term 'actionable period'--can and do shift as such conditions warrant. APCo is required to provide an IRP that encompasses a 15-year forecast period (in this filing, 2017-2031). This IRP has been developed using the Company's current long-term assumptions for: customer load requirements; commodity prices; supply-side alternative costs; and demand-side program costs and impacts. In addition, APCo considered the effect of environmental rules and guidelines, such as the CPP, which could add significant costs and challenges to operations. State plans to implement this uncertain rule may not be finalized, let alone approved, for years. In preparing the IRP, APCo analyzed multiple scenarios, with differing commodity pricing conditions, as well as multiple internal load conditions. APCo has also conducted analyses that address certain aspects of compliance with the CPP. The 2017 APCo IRP suggests that APCo will not be integrating any new fossil resources into its system over the next 15 years. All incremental load increases are assumed to be met through installation of cost-effective wind and large-scale solar, both of which would provide customers with emissions-free energy, as well as the prospect of additional demand side management measures. The IRP also suggests that APCo may retire its remaining fossil units within Virginia by 2026. At such point that these units would be retired APCo would be left with a Virginia-domiciled generating fleet that is 100% carbon emissions free. In light of the transition that APCo has made and will continue to make in its generating fleet with respect to	certainty and least risk.

	emission reductions and generation diversification, APCo encourages DEQ and the board to recognize that planning practices already in place, such as the IRP process, can be appropriate means to establish a carbon reduction pathway. Given that the current Virginia regulatory process is robust and that CO_2 emissions have trended significantly downward, it not is in the state's best interest to take action on a small subset of emissions sources to address a concern that is global in nature. Linking Virginia's CO_2 action to a broader CO_2 trading program such as RGGI could ultimately result in Virginia having less control over its emissions trajectory and economic well-being. APCo is committed to working to ensure any regulatory action will be workable and equitable for APCo customers.	
9. Audubon Society of Northern Virginia	Climate change poses serious public health risks. In Northern Virginia, hotter summers make it more difficult to meet air quality standards. Our area is also vulnerable to vector-borne diseases, particularly Lyme Disease. We also face increased risks of flooding along the tidal Potomac and an increase in the number and intensity of extreme weather events. Extreme weather events also threaten our water and wastewater infrastructure, adding to the cost of public service. As shown by the shifting peak bloom date of the cherry trees in Washington, D.C., climate change is also disrupting ecosystems in Northern Virginia, putting pressure on migratory birds, whose reproduction is closely linked to the timing of spring. Climate change can cause a mismatch in the timing of food supplies and the birds and other wildlife that depend on them. The National Audubon Society's 2014 report concluded that global warming is the greatest threat to	The commenter's concerns are well taken. The purpose of this regulatory action is to meet the ED 11 requirement to control carbon emissions, and we believe that the proposal will meet that end.

	birds and other wildlife, that global warming's impacts could lead to the loss of 1/4 to 1/3 of all species on Earth, including many bird species. Carbon emissions from power plants will magnify these risks. We urge DEQ to draft stringent, science-based emission caps that move the state toward greater use of cleaner, renewable energy sources.	
10. CarbonShare.org	My comments focus on design elements of a carbon pricing system. The most comprehensive and easiest to administer point of regulation would be upstream. An upstream system would require only upstream companies to hold permits. They would be the buyers at the permit auction. An upstream system is the most comprehensive, and requires the least amount of administration from DEQ. An upstream system would also encompass transportation fuels, an important source of emissions. Because of the European Emissions Trading System (ETS) choice of administrative (free) allocations to emitters based on historic emissions instead of auctioning, the ETS had to figure out the change to the baseline to the aviation industry due to the volcano in Iceland. Virginia would have to recalculate free allocations to industry after every perturbation in the fuel and electricity markets. The ETS is overallocated, and the price of permits is low, yielding few emission reductions. By auctioning, Virginia could avoid subjecting DEQ to lobbying and political manipulation that free allocation entails. Administratively, it would be easier to just let companies figure out for themselves how many permits they need and let them buy them for themselves at auction. Auctioning is an important lesson from California's Cap & Trade program. The auction and price floor are primary factors	Linking to the successful, well-established RGGI program utilizing a revenue-neutral consignment auction has been selected as the most efficient and expeditious means of reducing carbon pollution in Virginia. Unlike the "nonregulated" RGGI states, Virginia is a "regulated" state and as such relies on the Virginia SCC to safeguard Virginia's electricity consumers. In other words, the distinct regulatory roles of DEQ and the SCC work in harmony such that pollution will be reduced from electric generating units while protecting the users of that electricity.

	contributing to the success the program has had thus far. The program would have had the disappointing results of the ETS without them. However, the California program is not perfect. It has missed opportunities to increase the amount of allowances auctioned, reducing the free allowances to industrial emitters, and returning more revenues collected back to households. Return carbon price revenues to households as a "climate dividend." The best way to return the value to consumers is through a dividend. The formula to do so is simple: auction allowances and return the funds to people. One problem with using funds on large infrastructure projects to reduce emissions is that the emission reductions may reduce the price of allowances, or change relative price of emissions between sectors, but result in no net emission reduction because the reductions achieved only create space for new emissions from other sectors under the cap. In other words, the space below the cap created by the infrastructure investment is simply filled up by emissions in other sectors. The goal of a carbon pricing program is not to build big capital projects. It is to provide an economic incentive to Virginians to change their economic behavior. Behavior change is better accomplished by returning the funds to Virginia households through a dividend. Spending revenues only on projects would neglect the regressive impacts of a carbon price on low-income families. Fossil fuel companies may use the sky, but we all own it together. It's a Commons. The equitable ownership of the commons should be a central theme in the design of a cap and trade system. The fossil fuel industry and other large	

	emitters should pay to use the atmosphere. If the sky belongs to us all, but its use becomes limited, then companies who use the sky should compensate citizens for its use. As long as pollution is free and has no price, companies may externalize those costs onto society. In many areas of environmental policy, fees on companies are used to raise funds to pay for clean-up and also made less-polluting alternative technologies more cost-effective. Technology alone is insufficient – We need an escalating carbon price: 1) Price on carbon 2) Dividends returned to people 3) Political acceptability for higher price on carbon 4) Actually affecting economic choices across all sectors, giving incentives to companies to produce lower carbon products, and for people to buy them 5) New technologies, transform the economy.	
11. Ceres BICEP (Business for Innovative Climate and Energy Policy) Network	An emissions trading program should create policy certainty and be stringent enough to send a strong and clear market signal for the transition to a low-carbon economy. Businesses need strong market signals and policy certainty in order to make decisions and investments for the long run. The program must be strong enough to drive emissions reductions and incentivize the uptake of clean energy. In addition, the program's design must be well thought-out and able to stand up to legal challenges in order to further foster certainty in the electricity market. A strong emissions reduction program would also encourage utilities to move in the direction their investors and customers increasingly want them to go. This year, an unprecedented size and scope of investors have engaged with investor-owned electric utilities, encouraging them to take climate change into account in their business decisions.	By linking to RGGI, Virginia will be taking part in a proven effective emissions reduction program that addresses the goals listed by the commenter.

12. Ceres	Linking emissions reduction programs with neighboring states would benefit Virginia ratepayers. A larger emissions trading market, as opposed to a one-state market, would create greater flexibility for compliance and more opportunities to achieve cost-effective emissions reductions. Interstate emissions trading markets have proven to be workable and economically feasible for participating states. RGGI, for example, is designed so that the participating states are able to maintain their autonomy and decide on their own whether to remain in the program and how to invest their RGGI auction revenues. RGGI states that have had the most economic and emissions-reduction success to-date are those that reinvest the largest portion of their auction revenues in clean energy projects and programs. Programs such as revolving loan funds, utility energy efficiency programs, and other innovative financing initiatives provide a smart option for reducing electricity bills while simultaneously helping states meet their carbon reduction goals. As early adopters of clean energy technologies, RGGI states have been able to unlock the economic benefits of the clean energy economy—innovation, investment, and jobs—very effectively. Virginia has an opportunity to reap the benefits of the clean energy economy as well.	DEQ agrees that interstate emissions trading markets are a workable and economically feasible means of reducing emissions. Joining RGGI will enable Virginia to use that market mechanism to reduce carbon emissions.
13. Ceres	An emissions reduction program should aim to maximize benefits to ratepayers through increased investments in renewable energy and energy efficiency. Virginia has an opportunity to seize the benefits of increasingly low-cost clean energy technologies and the investments, local jobs, and tax revenue that accompany the transition to a low-carbon economy. Clean energy can lower electricity costs and provide a valuable hedge against the volatility of fossil fuel prices. Meanwhile, energy	DEQ agrees that renewable energy and energy efficiency are important factors in the reduction of carbon emissions. Also noted elsewhere is the observation that Virginia is a "regulated" state and as such relies on the Virginia SCC to safeguard Virginia's consumers. The distinct regulatory roles of DEQ and the SCC work in harmony such that pollution will be reduced from electric generating units while protecting the users of that electricity. Renewable energy and energy efficiency projects are under the purview of the primary state agency for such projects, DMME.

	efficiency investments can provide quick paybacks, reduce overall demand for energy, and decrease energy bills. While auctioning emissions credits would provide an effective source of funding for reinvestments, if emissions credits are allocated, they should be allocated in a way that incentivizes investment in clean energy and the most cost-effective means of reducing emissions. Likewise, any value or revenue derived from the allocation or auctioning of credits should be used primarily to incentivize renewable energy and energy efficiency projects; such projects will best benefit ratepayers and the economy and will contribute to further emissions reductions in Virginia. An advisory board including legislators and key stakeholders would be prudent to determine the structure of allowance allocations. Furthermore, in order to protect Virginia's forests and foster a truly sustainable low-carbon economy, qualifying renewable energy projects should not include forest biomass for electricity projects.	
14. Ceres	Virginia should simultaneously unlock policy barriers to clean energy deployment. Thanks to Governor McAuliffe, Virginia has made strides in renewable energy deployment in recent years—but there is still significant untapped potential for energy efficiency and renewable energy investments. The state should remove barriers to corporate procurement of renewable energy. BICEP Network members and other major companies are increasingly making sustainability commitments and using renewable energy to power their operations. Clean energy allows businesses to hedge against the volatility of fossil fuel prices, lock in fixed rates, and reduce energy bills. Today, more than 63% of the Fortune 100 and nearly half	The SCC manages Virginia's electric generating and distribution, and the Department of Mines, Minerals and Energy (DMME) manages energy efficiency and renewable energy projects.

	of Fortune 500 companies have made commitments to reduce GHG emissions, procure more renewable energy, or invest in energy efficiency. By allowing large customers to participate in power purchase agreements, community solar projects, direct arrangements, third-party solar leasing, commercial clean energy financing, and cost-competitive, utility-administered green tariff programs (among other options), Virginia can continue to attract corporate investments while simultaneously lowering emissions. Furthermore, Virginia ratepayers could enjoy lower electricity bills by unlocking barriers to utility-administered energy efficiency projects and programs. Energy efficiency is low-hanging fruit in Virginia. The state has substantial opportunities to reduce energy waste. While the largest 30 electric utilities in the U.S. are saving, on average, almost 1% of retail sales annually through utility energy efficiency programs, Virginia's largest electric utility, Dominion Energy, only helped customers save 0.1% of sales in 2014.6 As a result, Virginia's utility energy savings are among the lowest in the country, causing ratepayers and businesses to miss out on the cost savings associated with decreased energy use.	
15. Chesapeake Physicians for Social Responsibility (83 signatures)	A well-designed program to reduce CO_2 emissions from power plants will allow Virginia to realize economic, environmental and public health benefits. Such a program will lead to reductions in the emissions of a large array of hazardous pollutants from coal-fired power plants, providing immediate public health benefits. Evidence shows that a well-designed carbon reduction program will help reduce electricity bills, boost local economies, and create local jobs. Reducing carbon emissions will help slow the pace of climate	ED 11 directs the department to develop a regulation that is "trading-ready" to allow for the use of market-based mechanisms and the trading of CO_2 allowances through a multi-state trading program, and we believe that linking to RGGI is the most realistic and effective means to accomplish this.

	change, which is a threat to public health and the economy of Virginia. This array of benefits has already been realized by the states that participate in RGGI, a program that has been reducing CO_2 emissions from power plants since 2009. RGGI has achieved an impressive reduction in pollution even as the economies of the member states grew. Between 2009-2014, RGGI states received $1.79 billion from the quarterly auctions of pollution allowances and have invested $1.37 billion. Most of these funds were spent to increase energy efficiency and support renewable energy, which created 30,000 job-years and produced additional economic benefits. Investments in energy efficiency programs have saved consumers $618 million on their electricity bills, and will provide future benefits of over $4.5 billion as the investments in energy efficiency continue to save power. By ensuring that the carbon regulation is trading-ready, Virginia will have the opportunity to join RGGI. One study estimates that by joining RGGI, Virginia could bring in $2.8 billion of revenue by 2030. This would mean more resources to protect the coastline, stronger energy efficiency programs, an increase in the use of renewable energy, more jobs, and better health outcomes.	
16. Dominion	To the extent the state pursues the development of state-specific regulations to address CO_2 emissions from power plants by establishing a statewide emissions cap, we generally support the concept of designing a program that would allow for emissions averaging and trading and would position the program to be trading-ready with linkages to either existing or future multistate trading programs as put forth by ED 11. However, we do not believe the directive compels the state to join a particular multi-state program, such	ED 11 directs the department to develop a regulation that is "trading-ready" to allow for the use of market-based mechanisms and the trading of CO_2 allowances through a multi-state trading program, and we believe that linking to RGGI is the most realistic and effective means to accomplish this.

	as RGGI, and urge the state to proceed cautiously but thoroughly in evaluating whether direct participation in existing trading programs would meet state environmental and energy goals and ensure the continued diversity, reliability and affordability of electricity.	
17. Dominion	The baseline and targets must accommodate for the dynamics of power imported into Virginia. The baseline must reflect and account for the fact that Virginia is a net importer of energy from more carbon-intensive out-of-state resources. The emission targets must allow for reasonable expansion of lower-emitting cleaner generation in the state to address energy needs and reduce imports of electricity in accordance with state energy policy. Setting a stringent cap on already cleaner generation in Virginia absent a similar level of reductions from neighboring states would increase the cost burden to Virginia generators and would likely encourage lower cost electricity imports from out-of-state sources that are more carbon-intensive and not subject to a carbon cost adder. This could result in the unintended consequence of curtailing or limiting the dispatch of highly efficient and lower emitting NGCC facilities in Virginia and encouraging the dispatch of higher emitting resources in neighboring states. With federal regulations currently stayed and under administrative review, few states outside of the RGGI program and along the west coast have or are proceeding with definitive carbon regulations. This includes all of the remaining states that are part of the PJM Interconnection (except Maryland and Delaware which are part of RGGI), which is the regional transmission organization that operates the wholesale electric grid in the mid-Atlantic region. At a minimum, any consideration of	Recent data shows that there is a general trend away from energy imports. Regardless, an updating output system incentivizes in-state generation, thus also addressing leakage. Indeed, the RGGI program is designed to track and avoid leakage through routine program review. DEQ agrees that other state and federal actions are important, and these activities are closely monitored and tracked. There is nothing to be gained by ignoring activities and trends outside the state, the PJM Interconnection, RGGI, and elsewhere. The baseline year is currently set at 2020, which will ensure that the Brunswick and Greensville units will be accounted for. Market-based programs are technology-neutral: a cap is set, and affected units have the flexibility to use whatever means they prefer to meet that cap. The commenter may consider any emissions reduction opportunities.

	reduction targets for Virginia should include an evaluation of what surrounding states are doing in the absence of federal requirements and impacts that may have on power markets, trading opportunities, leakage and economic growth. The baseline must also account for emissions from new generation projects, such as Dominion's Brunswick and Greensville natural gas-fired combined cycle (NGCC) facilities that have already received air permits and either already commenced commercial operation or are under construction. These facilities, each with capacity in excess of 1,300 MW, will operate some of the most efficient NGCC units with the most stringent GHG limits in the country and will serve as base load facilities. These units are critical in transitioning to a cleaner and less-carbon intensive generating fleet in Virginia. Emission targets should be based on the deployment of existing, commercially available technologies. Dominion continues to analyze emissions reduction opportunities and finds that the following measures hold the potential for ongoing emission improvements: • Heat rate efficiencies at existing coal-fired units; • Capacity improvements at existing NGCC units; • Maximize the dispatch from carbon-free nuclear and renewable sources first and then from lower-carbon NGCC units and other dispatchable resources; • Co-firing coal units with natural gas where economical at appropriate units with proximity to natural gas pipelines; Efficiency improvements within the electric transmission and distribution system; • Deployment of smart grid technologies such as voltage optimization software platforms.	

	We are also evaluating pumped hydroelectric storage, to be powered at least in part by renewable energy, as an additional energy supply for the state.	
18. Dominion	Although the intent of the Governor's directive is to set Virginia on a path to regulating carbon in the absence of federal action and the apparent demise of EPA's CPP, it does not, nor should it compel the state to establish emission targets equivalent to levels that would have been imposed under the CPP. We believe that the mass-based carbon emissions target EPA established under the CPP underestimated potential future growth to meet energy demand and was the most costly compliance alternative identified in the company's IRP. This type of program, particularly if implemented without flexible program designs including interstate trading, would be constraining for a state like Virginia which forecasts economic growth and an electric capacity deficit. Although established at the state-level, the limits required under the CPP presumed and envisioned a robust nationwide emissions trading program. Virginia should not impose more stringent emission reduction requirements to address a global environmental issue while other surrounding states we compete with economically have no established emission reduction goals or requirements. To the extent the CPP-based emission caps are considered, the caps should not be more stringent than the levels that would have been imposed under the CPP.	The intent of the regulation is to enable Virginia to link to RGGI, which establishes CO_2 emission reduction targets independently of the CPP or any other federal programs.
19. Dominion	The program should allow for realistic timeframes to achieve emission reduction goals. This will provide needed time for the ramp-up of new renewables, energy efficiency programs, and infrastructure improvements in order to maintain the state's fuel diversity and its goal to become more energy independent.	DEQ has worked diligently to ensure that its proposed timeframes are realistic.

	Reduction goals and implementation timelines must avoid premature retirement of remaining existing coal not otherwise shut down for compliance with other regulatory requirements.	
20. Dominion	The program must also recognize the critical role of extending the operation of Virginia's existing fleet of carbon-free nuclear generation. U.S. Nuclear Regulatory Commission (NRC) licenses for Dominion's existing nuclear stations begin to expire in 2032. The loss of approximately 3,500 MW of existing zero-emitting nuclear would significantly complicate compliance with any carbon reduction program in the post-2030 timeframe. To achieve electric output compatible with Dominion's North Anna and Surry nuclear power stations would require over 98,000 acres of solar panels. In addition, generation from nuclear units provide a critical and stable source of electricity in all weather conditions and are increasingly needed to maintain the reliability of the electric grid. Dominion is working with the NRC on evaluating and applying the current regulations as the basis for nuclear units to apply for a subsequent license extension to operate beyond 60 years. These existing regulations will be supported with enhancements to existing license renewal tools and guidance documents, adding additional aging-related system reviews and associated upgrades. The continued operation of these zero-emitting resources will require significant financial investments that are comparable to building new combined cycle gas units, the only other large base load source of generation, yet with the associated carbon emissions	As discussed elsewhere, the market-based cap-and-trade program is technology neutral. Although DEQ recognizes the value of all low- and zero-carbon generating sources, DEQ is specifically tasked with regulating fossil fuel generation.
21. Dominion	The state's reduction targets should not be based on a presumption that energy efficiency potential from policies in neighboring states can be repeated and achieved in Virginia.	Dominion's energy efficiency programs are recognized and appreciated.

	Energy efficiency programs historically have been financed by utilities. Dominion continually works to achieve operating efficiencies in our existing generating units to get more output with fewer emissions. We also offer a number of end-use energy savings programs to our customers. We continue to build upon our best in class energy efficiency and energy assistance program facilitated by the Governor's 2015 amendments to Senate Bill 1349 requiring the establishment of an energy assistance and weatherization program to serve low-income, elderly, and disabled customers as well as veterans. There remains significant potential for energy savings from consumer-side energy efficiency program and we remain committed to expanding participation in the current programs and offering consumers more choices to achieve energy savings. However, the expansion and consumer use of these programs depends on state laws and regulations that allocate resources and approve of demand-side programs. In Virginia, energy efficiency and demand side management programs must be approved by the SCC based on cost-benefit studies and strict measurement and validation processes. The ultimate successes of energy efficiency programs are generally within the control of the customer, not the utility. While utilities offer a range of consumer-friendly energy efficiency programs, they must nevertheless be prepared to serve their native load should such programs not be as successful as hoped. Accordingly, the state target should be based on well thought out and reasonable expectations of achievable energy savings and the compliance timelines must provide adequate time for the development,	

	approval and implementation of the energy efficiency programs required to achieve such objectives.	
22. Dominion	Renewable energy needs to be part of the solution and additional renewable generation sources of solar, on-shore and off-shore wind and pumped hydroelectric renewable energy with back-up generation support from our highly efficient natural gas units have a strong place in our future investment strategy. In 2013, Dominion had no generation from solar or on-shore wind sources. The company now has 423 MW of large-scale solar in Virginia either in operation, under construction, or under development, including power purchase contracts. All together, these facilities will produce enough electricity at peak output to power 105,000 homes. Our analysis shows that this rapid expansion of renewable energy, particularly highly cost effective solar energy, will continue to increase rapidly. Renewable energy, however, has some challenges. It requires a reliable source of backup for when it is not available. While we continue to see advancements with respect to battery storage technology, further innovation is needed to achieve both the scale and cost-effectiveness necessary for storing the vast amount of electricity that would be required for renewables to reliably power our economy. Natural gas is the lowest cost, cleanest and most reliable form of dispatchable generation to complement the integration of renewables to the electric grid. We will need our gas plants more and more to ramp up and down as Virginia grows its solar fleet. As noted previously, Virginia is home to some of the most efficient NGCC units with the most stringent GHG limits in the country. This technology will also serve to	Dominion's efforts to promote renewable energy are recognized and appreciated. There are indeed issues associated with renewable resources that, as discussed elsewhere, are more appropriately dealt with by other agencies (such as SCC and DMME) in a different context from this specific regulatory action.

	provide baseload generation to replace retiring coal plants. Another issue with renewables is the vast amount of land needed to produce sufficient power to meet energy needs. For example, 1 MW solar requires about 8 acres of real estate. In addition, significant grid improvements will be needed to accommodate growth in renewable energy. All of these challenges should be factored into assumptions regarding the expansion capability of renewable energy onto the electric grid in setting emission reduction targets.	
23. Dominion	The company is also examining the needed grid improvements to accommodate growth in renewable energy. Grid modernization is a national trend, and Dominion has taken an important first step with its strategic undergrounding program, an industry leading initiative to improve reliability which has received legislative support and approval from Governor McAuliffe in both 2014 and 2017 legislation. Building on these grid modernization efforts offers the opportunity to both better accommodate renewable energy and to improve customer reliability.	Dominion's grid improvement efforts are recognized and appreciated.
24. Dominion	In setting emission targets for the EGU sector, the state must recognize and account for the role and opportunity electrification of other sectors of the economy, such as transportation and cities, can play to reduce carbon emissions economy wide in the state. For example, Virginia intends to devote a significant amount of the environmental trust funds provided under the recent Volkswagen Consent Decree with EPA for promoting clean transportation technologies including the deployment of zero emission vehicle supply equipment, such as electric vehicle charging stations, as well as repowering large and medium-sized freight trucks, school and transit buses, port drayage trucks, locomotives, ferries and	DEQ agrees that the reduction of carbon must be approached holistically. The specific purpose of the regulatory proposal is to address one element of that goal.

	airport ground support and cargo handling equipment. Sale focus on the electric generation sector and establishing too stringent an emission cap on in-state generation could impact the ability of the state to holistically reduce carbon from other sectors of the economy.	
25. Dominion	In terms of affected EGUs subject to compliance obligations, the regulations should limit compliance applicability only to fossil fuel-fired EGUs that are greater than or equal to 25 MW. Small combustion turbines and boilers below this threshold should not be subject to compliance obligations under the program. This is consistent with many existing federal and state-level EGU-based emission reduction programs including EPA's Acid Rain program, CSAPR, MATS, and the northeast RGGI program. In addition, the program should not impose any compliance obligations upon units that burn biomass as their primary fuel. No emissions attributed to biomass firing should require allowances. This would be consistent with EPA's approach in developing the CPP which did not include biomass generation in establishing the baseline and state emission reduction targets and did not require biomass units to hold emission allowances or surrender emission rate credits under the proposed mass-based and rate-based model trading rules. This compliance exemption should also apply to the emissions apportioned to the burning of biomass for fossil fuel-fired units that co-fired with biomass. In 2013, Dominion made significant investments to converted three 51 MW units that used coal to 100% biomass, encouraged by EPA's prior determination that biomass was carbon neutral for PSD permitting. Close proximity to an ample supply of waste wood biomass as well as EPA's "carbon-neutral" policy for permitting under	The proposal limits compliance applicability only to fossil fuel-fired units that are greater than or equal to 25 MW, as is consistent with RGGI. Biomass-only units are not covered by this regulation, as it applies only to fossil fuel-fired generation. Fossil fuel-fired units that co-fire biomass must account for their CO_2 emissions and obtain allowances accordingly.

	the PSD effective at that time were key economic drivers for these projects. Given Dominion's significant investment in renewable wood waste and forest residuals biomass, it is important for our customers that biomass emissions be considered carbon neutral.	
26. Dominion	The state program should provide for maximum compliance flexibility including the following: • Use of emission trading with unlimited banking of allowances. The state should explore trading opportunities with other states and, where feasible, allow for linkages with other state programs to maximize market-based trading options. • Allow for multiple-year averaging to demonstrate compliance with any interim and final target. This concept was allowed in the final CPP and the RGGI programs allow for a tiered surrender of allowances over a three-year period. • Allow flexible resource options for use in demonstrating compliance with emission reduction requirements. These options should include: co-firing coal with natural gas or biomass; uprates at existing nuclear units; demand side and supply-side energy efficiency improvement programs, including voltage optimization and other electricity transmission and distribution efficiency improvements; generation from pumped storage.	Linking to RGGI will allow for these compliance flexibility goals.
27. Dominion	Although we have experience with RGGI though current and former assets in New England, we have serious concerns about potentially implementing the RGGI program in Virginia. • Although RGGI states have reduced carbon, the level of reductions achieved that can be attributed to RGGI itself is questionable. Emission reductions nationwide, including in Virginia, have been comparable to the reductions achieved in the RGGI states and have been primarily driven by fuel economics (low gas	As discussed elsewhere, linking to RGGI--a well-established, effective program--is the best means of quickly addressing carbon pollution in the most efficient way possible. ED 11 specifically tasks DEQ with controlling carbon generation by linking to an established state trading program, and the only such reasonably available and operating trading program is RGGI. One of RGGI's attractive features is that it is committed to ensuring a stable price structure, and utilizes routine program reviews to identify and improve means of accomplishing this goal.

	prices) and the corresponding shift from coal to natural gas as well as lower load growth due to the 2008 recession. • Although allowance prices in RGGI are currently around \$3.50/ton CO_2, the program is under an ongoing review and the RGGI states are exploring mechanisms that would set a trigger price, below which a certain amount of allowances would be held back from the auction in an effort to reduce amount of the allowance bank, increase the price and force more emission reductions. • RGGI is considering increasing the stringency of the regional emissions cap post-2020, reducing the cap by as much as 3.5 to 5% per year. Currently, the cap is reduced by 2.5% per year. • We have concerns about leakage if Virginia were to join RGGI and that our generating resources may not get dispatched if they are priced higher than other assets. As noted previously, we sell and buy our power into the PJM market which, with the exception of Maryland, consists of states that, to date, are not considering and have not developed or implemented carbon regulations. Accordingly, most other generators in the PJM market would not be subject to a carbon cost adder that generating units in Virginia would incur. This could result in curtailing or limiting the dispatch of lower emitting NGCC facilities in Virginia and encouraging the dispatch of higher emitting resources in neighboring states.	The commenter correctly states that RGGI is currently undergoing program review and the cap is being reconsidered. As of this writing, a regional cap trajectory that will provide an additional 30% cap reduction by the year 2030, relative to 2020 levels; the cap is expected to be, at this point, 3.5%. The proposed changes also include the addition of an Emissions Containment Reserve (ECR) wherein states can withhold allowances from auction if emission reduction costs are lower than projected. DEQ agrees that leakage is a concern; however, RGGI is structured such that leakage is monitored for and the program is adjusted as needed. As discussed elsewhere, an updating output system incentivizes in-state generation, thus also addressing leakage. RGGI is also designed to minimize economic impacts and keep compliance costs low, and DEQ believes that the market-based trading mechanisms in the proposal will accomplish the same. Routine program review will identify and correct problems should they occur.
28. Environmental Defense Fund (EDF)	A strong market-based mechanism for reducing carbon pollution from electric generating facilities will enable Virginia to achieve significant and cost-effective emission reductions. Market-based mechanisms that enable compliance with sector or economy-wide limits on CO_2 emissions with tradable compliance instruments are a cost-effective approach to achieve carbon pollution reductions	The proposal will enable the implementation of a strong, market-based mechanism for controlling carbon, i.e., linking to RGGI and establishing a consignment auction. The benefits of such an approach, as discussed by the commenter, are recognized. DEQ agrees that the reduction of carbon must be approached holistically. The specific purpose of the regulation is to address one element of that goal.

	with flexibility for regulated entities to pursue the lowest-cost abatement opportunities. EDF encourages DEQ to incorporate such a market-based mechanism into their regulatory proposal, setting a clear cap on carbon pollution from both new and existing units, issuing tradable allowances for every ton of carbon under the cap, and requiring owners of affected units to hold an allowance for every ton of carbon emitted. The regulation should cover all existing and new electric power facilities in Virginia that emit CO_2. Further, although this regulation will apply only to electric power facilities in Virginia, EDF encourages DEQ to pursue a market-based program design with flexibility to accommodate economy-wide expansion, noting electric power facilities contributed 30% of Virginia's CO_2 emissions in 2014. • DEQ should set stringent carbon emission limits over a transparently determined baseline. Emission limits (the cap) should result in concrete reductions in CO_2 emissions from the electric power sector below a business-as-usual baseline over the course of the program. DEQ should work with stakeholders to incorporate robust and reliable assumptions into a credible energy and economic modeling framework to establish a business-as-usual emissions baseline and to analyze the impacts of the policy in comparison to the baseline. The cap should ensure meaningful reductions in carbon pollution that safeguard public health and mitigate the impacts of climate change. • Data on prices, carbon emissions, and compliance behavior should be transparent and accessible. Transparent market design and implementation is important to assure fairness and certainty, and reduce transaction costs for market participants. Stakeholders,	As discussed elsewhere, leakage is an issue that is addressed by the updating output approach, which incentivizes in-state generation. RGGI also monitors for leakage via its regular program review process. Other market-based programs may become attractive in the future and will be considered at the appropriate time; at this stage, linking with RGGI is the most secure and reasonable approach.

	evaluators, and members of the public should be able to assess the progress toward achieving real emission reductions over time, along with other metrics of the program's success. For example, RGGI posts the results of its quarterly auctions, secondary markets, and yearly emissions data, and California posts a variety of market information about its program. • DEQ should evaluate program features that will mitigate leakage of emissions to surrounding states, including engaging with other states in the same market region on robust and aligned program design. Emissions leakage, or increases in carbon emissions in surrounding states due to shifting of facilities or other factors, would weaken effectiveness of the program in achieving real emission reductions. • EDF also encourages DEQ to explore program design features that can facilitate efficiencies through linkages with other market-based carbon reduction programs, including but not limited to RGGI. Virginia could develop a regulatory proposal aligned with the RGGI model rule and seek to formally join the RGGI program as a full participant, or could instead explore linkage opportunities where Virginia is not a full participant but DEQ accepts RGGI allowances for compliance with the Virginia program. Virginia should evaluate both options, as well as to evaluate opportunities to align a carbon regulatory framework in Virginia with carbon reduction efforts in additional states, particularly those states that are part of the PJM energy market. Virginia should also explore the potential to integrate with or use existing trading platforms.	
29. EDF	DEQ should engage with and address concerns of environmental justice and disadvantaged communities throughout development and implementation of the program. EDF urges DEQ to	DEQ will, as provided in the Public Participation Guidelines, provide opportunity for public comment on the impacts of the proposal. It is important to note that CO_2 is not a criteria

	meaningfully engage with disadvantaged communities--including communities situated near fossil fuel-fired power plants and communities with higher concentrations of low-income people, people of color, and otherwise vulnerable groups--throughout the process, by providing ample and accessible opportunities for public comment and other means of participation. DEQ should analyze impacts of the program on these communities and incorporate their recommendations to ensure the program does not impose disproportionate burdens on communities already vulnerable to the impacts of air pollution, climate change, and other factors.	pollutant and is thus not subject to a health-based standard. Unlike a conventional criteria pollutant such as NO_X or SO_2, CO_2 disperses quickly and does not create "hot spots" or localized problems. Fossil fuel-fired units are also subject to a host of other regulatory and permitting requirements that control emissions of criteria pollutants. Ultimately, the control of CO_2 will reduce global warming impacts and concomitant welfare impacts on disadvantaged communities. Also note that Virginia is a "regulated" state and as such relies on the Virginia SCC to safeguard Virginia's electricity consumers.
30. Lena Lewis	The cap must be set to reduce carbon emissions significantly. Virginia is a part of the Climate Alliance of States that have pledged to uphold the Paris Climate agreement, under which the U.S.'s was to reduce GHG by 26% of 2005 levels by 2025. This level of reduction puts Virginia on a path toward an 80% reduction. This pledge should determine the setting of the Virginia's carbon cap. Given that no other regulation has been put forward yet to reduce carbon emissions or other GHG emissions from other sectors of Virginia's economy, the majority of emissions cuts must come from the electricity sector. Some business-as-usual projections indicate that power sector carbon emissions will drop even without regulation. However, decreasing the rate of yearly emissions will not avert climate change if the emissions per year exceed the capacity to remove CO_2 from the atmosphere. The purpose of the cap is to put downward pressure on carbon emissions. The cap should decrease predictably and annually so that utilities can make long-term plans to reduce carbon. Reliable data is essential to setting the cap and allocating emission allowances effectively. Data must be sourced and	The cap will be set to reduce carbon emissions significantly, as consistent with the RGGI program. The updating output approach as well as the RGGI program review process will ensure that Virginia's carbon reductions are monitored and demonstrate continual effectiveness.

	analyzed by an independent, objective entity.	
31. Lena Lewis	Allowances should be distributed so that new generators, especially those that do not emit CO_2, are able to enter the market on a level playing field with incumbent generators. Locking in allowance distribution based on historic emissions rates of incumbent generators would fail to shift Virginia's power sector to lower carbon emissions in a fair, effective, or economically efficient manner. Distributing allowances based on updated energy output rather than on historic carbon emissions would create the incentive to lower carbon emissions. Each year, an energy generator would receive carbon allowances proportional to the previous year's energy output, while decreasing over time as the cap is lowered. Generators that generate a lot of low-carbon energy would receive more allowances than they would need, and could earn revenue by selling allowances to generators that emit more carbon. As the cap is lowered and allowances become more expensive, high-carbon generators will have the financial incentive to find a less carbon-intensive method of electricity generation. Energy output should be measured based on electricity consumed by customers, rather than all electricity generated by the supplier. This encourages generators to burn only enough fuel to meet consumer demand, while discouraging them from burning excess fuel for the purpose of increasing the next year's allocation of allowances. Generators receiving free allowances from the government must be required to sell all of their allowances, and then buy back their needed allowances. Linking with a preexisting carbon market would minimize emissions leakage and reduce costs to	Consistent with RGGI, the proposal is based on an updating output distribution approach, not historical. The benefits of an updating output approach are discussed elsewhere. Generally, Virginia's program will align with RGGI and its 3-year program review in order for the programs to operate in sync and, therefore, efficiently and effectively. Conditional allowances will be distributed to CO_2 budget units and DMME. These conditional allowances will then be consigned into auction, after which the conditional allowance becomes an allowance to be used for compliance purposes. DEQ agrees with the commenter that linking with RGGI will minimize leakage and stabilize costs. Linking to a market will increase the number of allowance trades, which will lead to price discovery of the true value of an allowance and increase economic efficiency; this is also true of the proposed consignment auction for the distribution of allowances.

	ratepayers, assuming that revenue is used to benefit ratepayers. Linking to a market will increase the number of allowance trades, which will lead to price discovery of the true value of an allowance and increase economic efficiency.	
32. Lena Lewis	The size of one carbon allowance, the timing of allocation distribution, the 3-year period in which power plants have to retire their allowances, a price floor, a program review, and other characteristics should synch with RGGI's schedule and parameters. Virginia must work with RGGI states to ensure that linking with their carbon market does not adversely affect their own emissions reductions or economies. Program review at regular intervals is needed to ensure that the cap is at an effective level to apply pressure to reduce carbon emissions and to improve program design.	By linking to RGGI, Virginia is committing to meet RGGI's overall structure and goals, including program review.
33. Lena Lewis; SELC	Allocation of tradable carbon allowances should be designed to lower carbon emissions in an economically efficient manner while also protecting residents from increased energy costs. Investor-owned utilities need to use revenues from allowance sales to keep rates low for customers, rather than add to their profits. Co-ops can use their allowance revenues to the benefit of their member-owners. The creation of a new market means the creation of new revenue. In no way should this revenue be permitted to increase investor-owned utility profits at the expense of ratepayers. Allowance recipients must consign all of their allowances to an auction. Allowances can be granted to generators based on the previous year's electricity output (not carbon emissions), and generators would be required to sell all of their allowances. Generators that use carbon-intensive sources would have to buy back allowances from the market. Generators with lower-carbon or zero-carbon	As discussed elsewhere, the energy market is regulated in Virginia by the SCC. The EO 57 Work Group recommended that the Governor convene an Environmental Justice Advisory Council (EJAC); see the response to comment 29.

	sources would not have to buy back so many allowances from the market, lowering their costs and increasing their revenue. Utilities must be required to report revenue from the carbon market to the SCC, and then apply that revenue toward offsetting the costs of buying allowances, thus keeping electricity rates as low as possible. Some of the revenue from allowance sales may need to be designated to offset the disproportionate effect of higher electricity rates on low-income customers. Any utility company claiming that carbon allowances are causing their electricity rates to increase must use carbon-market revenue to create utility-funded programs paying for energy efficiency improvements for low-income customers. Should electricity rates pass a certain threshold, utility companies should be required to provide direct assistance on electricity bills of low-income customers. Positive or neutral Impact on frontline communities is essential. As the cap for carbon emissions is lowered, it will create additional benefits of reducing associated co-pollutants that cause health problems in communities close to their source. DEQ needs to listen to and address the concerns of environmental justice advocates.	
34. Lena Lewis	Allowances should be fully bankable. Once generators have sold their allocated allowances, allowance owners should be permitted to save their allowances to use or sell when the price increases. Reducing emissions today will have the biggest environmental impact. CO_2 stays in the atmosphere a long time, and GHGs create an ever-accelerating greenhouse effect. If an owner of an allowance banks it, that is one unit of CO_2 not released today, which is more beneficial than a unit	The benefits described by the commenter will be realized in Virginia through linkage with RGGI.

	of CO_2 not released in the future. Virginia must have a reliable long-term market so that generators, utilities, residents and traders on the secondary market can make long-term plans to reduce carbon. Faith in continued existence of carbon cap-and-trade will reduce price volatility, encourage banking, and encourage investment in long-term in emissions reduction strategies . Transparency of prices, emissions, and compliance behavior will protect residents and build trust in the efficacy of the system. Buyers, sellers, and interested observers need to know prices on both the primary and secondary markets. The public needs proof that the program is working to lower emissions over time. For example, RGGI posts the results of its quarterly auctions, secondary markets, and yearly emissions data.	
35. Lena Lewis	Allowances should be fully tradable between power plants and any public or private entity, including individuals, both in-state and out-of-state. More trading leads to price discovery and a more economically efficient use of allowances.	A consignment auction has been determined to be the best method of dealing with allowances in Virginia.
36. Lena Lewis	Units that co-fire eligible biomass should be required to purchase allowances for all CO_2 emitted. The climate will react the same way to increased concentrations of CO_2, irrespective of its source. Likewise, waste-to-energy units that burn otherwise recyclable trash should fall under the same regulations.	Units that co-fire eligible biomass will be required to purchase allowances for all CO_2 emitted. Waste-to-energy units are not addressed in the RGGI model rule, and DEQ believes it is not appropriate to cover them in this rule at this time.
37. Lena Lewis	Carbon offsets are needed in addition to emissions reductions, not in place of them.	Although carbon offsets are allowed for, they have never been used in RGGI. Offsets were therefore not considered for the Virginia program.
38. LoudounPACE	Create rules that require reduction of use of all energy from Virginia's carbon producing power plants and reduces carbon pollution from those plants. Address disproportionate environmental and financial effects experienced by vulnerable communities by developing and promoting residential PACE	Linking to RGGI will effect carbon pollution reductions from Virginia's power plants. Other suggestions offered by the commenter are not directly germane to the goal of meeting ED 11 and linking with RGGI. Because RGGI is a market-based cap-and-trade program, the commenter's other suggestions are best addressed via the SCC and DMME. Additionally, consumer concerns are also

	programs to dramatically reduce energy consumption, thus lowering carbon footprints and energy costs. Grow the economy and reduce carbon pollution by maximizing investments in energy efficiency. Delete requirements for RECs and replace them with cost indexed carbon credits. Low cost per credit carbon reduction should sell for highest prices, preferably solar and wind. Work toward a Virginia carbon tax and dividend plan as put forward by the Citizens Climate Lobby.	discussed in greater detail in the response to comment 29.
39. Joy Loving	Monies derived from the cap must not go to the utilities, but should be distributed to all Virginians, with the following exceptions: A. Specify that the funds be designated for programs through which utilities will provide direct fuel assistance to those in need. B. Require utilities to establish and maintain effective energy efficiency programs enabling customers to cost-effectively reduce their energy usage; such programs should provide on-bill financing for such customers and should provide to those in need no/low cost energy efficiency upgrades. C. Require utilities to establish programs to offer options for renewable energy, including customer-owned community solar and other distributed renewable energy methods. Authorize utilities to facilitate customer participation through such mechanisms as on-bill financing. D. Require utilities to fund resilience programs to enable vulnerable communities to prepare for and ameliorate the worst effects of severe weather and other consequences of climate disruption. E. Require utilities to establish re-training to employees displaced by the transition from fossil fuel to renewable programs, by sponsoring and funding educational opportunities in affected communities, working through the Virginia colleges and universities. The regulations must provide that	A consignment auction is revenue neutral, which is why it was selected for the Virginia program. Utility programs as described by the commenter are directly managed by the SCC and DMME.

	utilities cannot charge customers who participate in any of these programs extra fees such as standby charges, net metering caps, or similar disincentives. If monies from the cap don't flow to utilities, then the state of Virginia should establish the programs described above.	
40. Joy Loving	Examine all available models for regional and state cap and trade or fee and dividend programs to identify strengths and weaknesses. Such programs include RGGI, the Western Climate Initiative, Southwest Climate Change initiative, etc. Work to find the best design from all models. Consult with PJM and representatives of all of its utilities, including municipals and co-ops.	It has been determined that linking to RGGI will be the most expeditious, practical, and effective means of reducing carbon emissions via a trading program. Although future participation in other programs is not ruled out and may occur at some later date when conditions warrant, ED 11 currently requires that Virginia link to RGGI.
41. Natural Resources Defense Council (NRDC)	The emissions limit must reduce emissions significantly below business-as-usual over the course of the program. To determine business-as-usual emissions and annual reduction levels, reliable, non-biased data and projections must be used to establish a baseline that is not artificially high, and to set a cap and meaningful annual reductions that protect human health. DEQ should rely on transparent estimations of least-cost estimates of what Virginia's business-as-usual emissions will likely be in year 1 of the program. Similarly, DEQ should avoid biased emissions projections that appear to be set unrealistically high.	Virginia is linking to RGGI, which, at this time, has proposed a regional cap trajectory that will provide an additional 30% cap reduction by the year 2030, relative to 2020 levels.
42. NRDC	Ensure the economic efficiency of the program by directing allowance value to consumer benefit, rather than toward utility or generator profit. Avoid imposing costs on ratepayers by awarding allowances directly to emitting generators for free. Doing so would allow the ultimate price of those allowances to flow to ratepayers in the form of higher wholesale electricity costs, while providing an unreasonable windfall profit to generators. To ensure economic efficiency and a transparent, undistorted allowance price that levels the playing field for	Virginia's consignment auction is revenue neutral. Also note that Virginia is a "regulated" state and as such relies on the Virginia SCC to safeguard Virginia's consumers. The distinct regulatory roles of DEQ and the SCC work in harmony such that pollution will be reduced from electricity generating units while protecting the users of that electricity.

	all generators, and to achieve maximum economic efficiency for citizens through allowance allocation, a standing Clean Energy Virginia Stakeholder Advisory Group should be established. The group's purpose would be to ensure the overall program and use of revenue is functioning transparently, efficiently, and effectively.	
43. NRDC	Maximize the environmental and climate change benefits of the program while avoiding market distortions and program inefficiency by including carbon emissions from forest-derived biomass generation within the carbon program and related emissions budgets. When establishing the statewide limits on CO_2, ensure that emissions from the combustion of forest-derived biomass to produce electricity - either through cofiring or in stand-alone plants - fall under the statewide emissions cap. EGUs that burn forest-derived biomass must hold allowances equal to stack emissions from that combustion, for several reasons. Forest-derived biomass is not a carbon neutral fuel and its emissions cannot be discounted based on anticipated future mitigation through forest regrowth or avoided decay. In addition, forest sustainability certification schemes or other standards offer little information about carbon emissions from biomass burning and are in no way a proxy for carbon neutrality. Moreover, interstate trading of allowances with RGGI states does not prevent Virginia from including biomass under its own carbon emissions limit.	Consistent with RGGI, biomass-only generating units are not covered by this rule. Fossil fuel-fired units that co-fire biomass must account for their CO_2 emissions and obtain allowances accordingly.
44. NRDC	Ensure integrity of the program is not eroded by emissions leakage by designing an economically efficient program with minimal market distortions; that maximizes consumer benefits through efficiency investments; and drives significant levels of in-state renewable energy development.	As discussed elsewhere, the output updating approach will encourage in-state power development, thus reducing the possibility of leakage; RGGI's program is review is also designed to detect and address leakage issues.

	These will deliver least-cost carbon reductions and lessen the impact of carbon prices on carbon-based power flows across state lines. Leakage can be minimized through development of Virginia's untapped, clean resources like solar and energy efficiency. As indicated in NRDC's modeling, imports of electricity decrease under a carbon limit, rather than increase, largely due to a buildout of native energy resources, rather than more costly electricity imports. Achieving this energy independence helps prevent leakage by obviating the need for electricity from outside the state. To ensure the program does not inadvertently lead to increased fossil-based electricity imports from out-of-state, DEQ should establish an annual program review process for the duration of the program, to assess whether interstate power flows are shifting as a result of the carbon price. This work could be incorporated into the Clean Energy Virginia SAG.	
45. NRDC	Allowances should comport with and be fully tradable on RGGI's pre-existing platform, which has low administrative costs and robust cybersecurity.	RGGI's platform does have low administrative costs and robust security, which is one of RGGI's several attractive features.
46. NRDC	Climate change is a fundamental environmental justice issue, as coastal communities and low-income communities ultimately bear the worst brunt of its impact. Therefore, the program should make significant cuts to CO_2 and ensure the consumer and energy efficiency benefits flow to the low-income citizens most impacted by climate change and energy costs. Additionally, because CO_2 is not harmful in locally higher concentrations, and there do not appear to be specific Virginia plants in proximity to at-risk communities whose capacity factors would increase under a carbon program, a carbon market in Virginia appears unlikely to create hot spots in frontline communities. As the cap for carbon emissions is lowered, it	As discussed in the response to comment 29, the EO 57 Work Group recommended that the Governor convene an Environmental Justice Advisory Council (EJAC). Also note that CO_2 standards are not a health-based, and that CO_2 does not create localized pollution problems; rather, control of CO_2 will help control global warming and its impacts on disadvantaged communities. The commenter correctly asserts that CO_2 is not harmful in locally higher concentrations. Additionally, routine program reviews provide the opportunity for any affected communities to bring attention to any potential issues.

	can also create additional benefits of further reducing associated co-pollutants in communities close to their source. The regular program review must incorporate an environmental justice review, to confirm that local co-pollutants are being reduced as predicted and that the program is not imposing an impact on any local community.	
47. NRDC	Any new market will need to be adjusted to ensure it is functioning efficiently and is driving significant and additional carbon pollution reductions. Program reviews can ensure that the cap is set at the correct level to reduce carbon emissions well beyond business as usual, while maximizing the development of a clean energy economy in the state. Virginia's program should undergo internal review on a regular basis, consistent with RGGI.	Virginia's program will undergo internal review on a regular basis, compatible and consistent with RGGI's program review process.
48. NRDC	NRDC retained ICF International to conduct NRDC's analysis of a RGGI-linked Virginia carbon cap and subsequent reductions, by utilizing ICF's Integrated Planning Model. NRDC's modelling indicates that capping carbon in Virginia with a well-designed program will significantly reduce carbon emissions, and at the same time drive significant economic benefits for families and ratepayers; promote energy diversity and independence; and improve public health by lowering total co-pollutants across the state.	These objectives will be achieved via linkage with RGGI.
49. NRDC	The program should be assessed by the consumer benefit delivered from such a plan: all emissions allowances have a dollar value as "discovered" in the marketplace. In a freely-transferrable market, a dollar value for emissions allowances will develop without government intervention. After allowance allocation, buyers and sellers, often with the help of emissions brokers, set a market price. The market then leaves plant	Virginia's participation in RGGI is posited on a revenue-neutral consignment auction. Also note that Virginia is a "regulated" state and as such relies on the Virginia SCC to safeguard Virginia's electricity consumers.

	owners with 2 options: (1) maintain emissions levels and purchase allowances or (2) reduce emissions levels and sell allowances to other plant operators for whom it is more cost effective to purchase allowances. In this market-based approach, the emissions reductions occur where cost-effective, and the allowances flow to the plants that will use them in a way that minimizes overall costs, while ensuring flexibility and reliability. Regardless of how the allowance was procured, the dollar value of each held allowance must be included by generators in their wholesale market bids to PJM. The value of allowances utilized by carbon emitters are then recouped by the generator when the electricity is sold. If DEQ does not design a carbon regulation and allocation method that ultimately delivers that allowance value back to the consumer, such a giveaway would serve as a publicly-subsidized windfall to generators, while consumers are saddled with higher costs. The program should be judged by the standard of whether or not the inherent full market value of allowances can be recovered from the generator that receives the electricity payment, and then reinvested in rebates, renewable energy, energy efficiency, and other investments that minimize compliance costs and maximize benefits to Virginia families. Conversely, the program should not allow the market value of allowances to accrue directly to generators as windfall profit, with no benefit to consumers to offset the higher wholesale electricity cost.	
50. NRDC	DEQ must decide in advance how it will initially allocate allowances. DEQ should ensure the inherent market value of the allowances accrues to Virginians and the Virginia economy, rather than result in a windfall to generators by distributing them to polluters for free; such an outcome would	Conditional allowances in the Virginia program will be allocated to fossil fuel-fired units as they are the regulated entity in the program. Consumer protections and energy efficiency efforts are under the purview of the SCC and DMME.

	equate to customers in Virginia transferring millions of dollars from their pockets to the balance sheets of generators. For example, according to the projected carbon allowance price of $3.90 in 2030, the value of Virginia's allocated 23.5 million allowances in 2030 would be over $90 million in that year. Generators will likely claim that they need allowances to fund their investments in equipment to reduce emissions, but because they are reimbursed for the allowance cost in the wholesale market, free allocation would result in "double payment," at the expense of the consumer.	
51. NRDC	DEQ could allocate allowance value on a pro rata basis to consumers via a consignment auction on behalf of electric distribution companies. Allowances would be distributed based on each company's percentage of total state load. In this approach, the dollar value of the allowances (as determined in the consignment auction) can return to electric billpayers via their distribution company, under the oversight of state regulators and other oversight bodies. The allowances are allocated on a pro rata basis to consumers via the distribution companies, based on each company's percentage of total state load. How those allowances are utilized would be overseen by the SCC, in consultation with DEQ, utilities, efficiency providers, DMME, consumer advocates, and other stakeholders. Given the range of generator types and ownership structures, allowances should be sold in a transparent and open manner, with regulated monopoly generators competing in an open, transparent market with merchants. Sale and transfer of money from any one regulated monopoly affiliate to another should be supervised by the SCC. The SCC would ensure that revenues from any allowances sold accrue to utility bill payers' benefit.	The SCC, as the commenter correctly asserts, monitors generation and related consumer issues.

	The SCC likely has sufficient authority to decide directly how the allowance revenues are utilized, to ensure maximum ratepayer benefit. Such benefits could take the form of cost-effective energy efficiency investment to lower customer bills (as well as further reduce carbon emissions from that distribution company); direct bill crediting; or investment in the most cost-effective zero-emissions resources to further reduce emissions and thus free up additional allowances. In RGGI, there have been significant benefits delivered to consumers as a result of investments of allowance proceeds. In the event Dominion or APCo must purchase allowances to meet the permitting obligations of one of their generators, SCC oversight can assure that such a decision to comply was the least-cost means available to the utility for meeting its generator's emissions obligations. Municipal boards and co-op boards would serve in a similar capacity, ensuring that any revenues or costs associated with allowances serve the best interests of their bill payers. Merchant generators would be assured access to allowances through sale of allowances by the distributions companies and the subsequent open allowance market. This approach is preferred for its efficiency. Administratively, DEQ already has experience with a similar NO_X allowance allocation and auction. Oversight bodies (the SCC and muni and co-op boards) are in place to ensure that allowance costs and related generation and compliance decisions are prudently incurred, and that any revenues are re-invested in such a way that serves the bill payers' best interests.	
52. NRDC	Another approach to maximize economic value of allowances is to allocate them to all generators of electricity or electric savings,	In order to meet the requirements of ED 11 and to link with RGGI, only fossil fuel generators are subject to the rule. Consumer protection is the purview of the SCC, not

	including fossil generators, non-emitting generators, and verifiable energy efficiency providers. The marketplace would determine the allowance prices, with additional revenue through allowance trading and the energy markets flowing from higher carbon emitters to zero-emitting resources. In that way, the value of the allowances flows indirectly to the consumer, through the lower energy costs of additional zero-emitting resources and additional energy efficiency. However, electricity customers would not directly receive the benefit of allowance-related revenue, nor receive the benefit of oversight of the disposition of such revenues.	DEQ. Note that no new source set-aside is being proposed. This will ensure a level playing field for renewable energy projects when they enter the market.
53. NRDC	Allocation of allowances directly to fossil emitters would allocate allowances directly to fossil generators, based on each generator's share of total emissions. This is the least economical method, because neither the state nor the bill payers recover any value; that value remains a windfall to generators and utilities. While the value of allowances would be included in PJM wholesale bids, no mechanism exists to ensure that recouped value is returned to the final electricity customer. This windfall would create transfer payments from customers to generators. If DEQ pursues this approach, it should be acknowledged that the state has made a direct decision to transfer the potential $90 million value of allowances in 2030 from the businesses and families of the state directly to the pockets of the power plant owners.	As discussed elsewhere, Virginia's consignment auction will be revenue neutral and no windfalls of any kind are expected. It is the role of the SCC role is to ensure that electricity customers are protected.
54. Southern Environmental Law Center (SELC) and the Virginia League of Conservation Voters	The regulation should cover any electric power facility that emits CO_2, regardless of fuel type, size, or date of construction and operation. EO 11 clearly states that the proposed regulation should "abate, control, or limit CO_2 emissions from electric power facilities." The only way to meaningfully achieve reductions in	As required by ED 11 and RGGI, fossil fuel-fired electric generation is the only type of generation covered by the rule; however, also note that there is no new source set-aside. By linking to RGGI, all fossil fuel-fired carbon-emitting electric generating units above 25 MW will be required to comply with the cap. Fossil fuel-fired units that co-fire biomass must account for their CO_2 emissions and

	total statewide carbon emissions is to cover all sources of carbon emission. If the regulation covers only currently-operating power plants, it will create a market perversion that incentivizes shifting generation to new power plants that the regulation does not cover. Not only will this shift undercut the fundamental purpose of reducing total emissions, it will also impose wholly unnecessary construction costs on Virginia electric customers as power generators invest billions of dollars of capital in otherwise redundant power plants. Likewise, the regulation should be blind to fuel type. To ensure complete reductions, the regulation should apply with equal force to any power plant that emits carbon. Finally, the regulation's scope should apply more broadly than the federal CPP. As can be seen from Dominion's 2017 IRP, it now proposes to build between 1,374 MW and 2,290 MW of new gas-powered combustion turbines (CTs). CTs are far less efficient than state-of-the art natural gas combined cycle plants, but because the now-defunct CPP did not apply to CTs, there existed a perverse incentive to build less-efficient power plants solely because they fell outside the CPP's orbit. DEQ should not allow this regulation to create similar market distortions and should cover all substantial carbon-emitting power plants. For instance, DEQ could follow RGGI and require all carbon-emitting power plants above 25 MWs to comply with the cap.	obtain allowances accordingly.
55. Sierra Club	The rule should apply to both new and existing sources and implement a declining mass-based cap that reduces CO_2 emissions from covered electric generation.	In order to link to RGGI, the proposal meets these criteria.
56. Sierra Club	The cap should decline steadily from the beginning of the program, and early CO_2 reductions should be incentivized. The aggregate cap should reduce emissions by the	The RGGI states have proposed, as of this writing, a regional cap trajectory that will provide an additional 30% cap reduction by the year 2030, relative to 2020 levels. The proposed regional program changes include

	greater of (a) 33-40% from 2015 levels by 2030 or (b) the level required to join a trading regime. The rule should require continued steady reductions through 2050 (to 80-95% of 2015 levels) subject to the possibility that the rate of reduction may be adjusted based upon experience new scientific evidence. An annual reduction of the cap for new and existing generation by approximately 1MM tons from a starting point based on 2015 emissions from covered sources illustrates a reasonable reduction path for interim (2030) and long-term (2050) purposes. Long-term investments (40-60 years for much generation) need long-term guidance.	the addition of an Emissions Containment Reserve (ECR) wherein states can withhold allowances from auction if emission reduction costs are lower than projected. The proposed ECR is an innovative way to adaptively respond to supply and demand in the market. When this program is finalized, Virginia will align the regulation to meet any new requirements of RGGI states.
57. Sierra Club	The basic elements of the proposed rule should be compatible with the operations and standards of RGGI. This would include the definitions of allowances (one short ton of CO_2), retirements matching emissions, adoption of key elements of RGGI's tracking and accounting system, etc. This would enable Virginia generators to trade within the state from the start (whether or not we join or link to RGGI), and within RGGI if a linkage or membership agreement is reached. Creating an incompatible program would be costly and not trading ready.	The commenter is correct that linking to RGGI is desirable, and that has been selected as the optimal path forward.
58. Sierra Club	Allowances can be allocated in several possible ways. We recommend that allowances be auctioned to all generators, with revenues being allocated among utilities or others in a manner that helps to achieve the rule's objectives. Some allowances should be held in reserve for possible distribution in order to stabilize markets or address other emergencies.	Conditional allowances will be allocated to the covered units via an update output approach. As discussed elsewhere, RGGI has built various protections into the program, such as the ECR, to ensure a stable market. Conditional allowances will be distributed to CO_2 budget units and DMME for consignment an auction, after which the conditional allowance becomes an allowance that can be used to demonstrate compliance.
59. Sierra Club	Program progress must be closely monitored and reported. This includes, for example, for results (prices, transfers, banks, and emissions), procedures and unintended consequences (e.g., pollution hot spots, market manipulation, emergencies, etc.).	DEQ agrees that program progress must be closely monitored and reported. RGGI's review process is robust and transparent, which is one of the reasons linking to RGGI is desirable.

	There should be periodic evaluations and, if needed, amendments should be made to reflect market experience and to improve outcomes.	
60. Sierra Club	Efforts should be made to join or link to a mass-based trading market, such as RGGI. A larger market will lower the costs and provide greater flexibility for market participants.There is no merit to the suggestion that RGGI is problematic because its members retail rates are higher than Virginia's. If anything, their higher energy prices will put downward pressure on CO_2 prices that markets will tolerate and that would benefit a lower cost state such as Virginia. Nor would there be loss of control as RGGI is a voluntary, collaborative organization.	Linking to RGGI has been determined to be the best path forward for effectively controlling carbon emissions.
61. Sierra Club	The final rule should be completed in 2018 and implemented in 2019.	The regulation is being developed as expeditiously as possible under the requirements of the Administrative Process Act.
62. Sierra Club	Issues pertaining to leakage – growth in GHG emissions incentivized but not covered by the rule – should be addressed in separate proceedings.	As discussed elsewhere, there are several safeguards built into the proposal and consistent with RGGI that will limit leakage.
63. Sierra Club (1,269 sponsored emails)	I am glad to see Virginia taking steps to cut carbon pollution to combat climate change, despite Trump's continued attacks on environmental protections. I am eager to see the state produce a strong, equitable, and scientifically sound plan to reduce greenhouse gas emissions. I request that DEQ use its authority to: Create a rule based on the strongest available science that significantly reduces carbon pollution from Virginia's power plants; ensure that Virginia residents benefit from any profits from carbon standards, especially front-line communities; address the disproportionate environmental burdens experienced by vulnerable communities; grow the clean energy economy by maximizing investments in zero-carbon wind, solar, and energy efficiency; and provide accessible public hearing opportunities in the evenings in	Support for the regulatory action is appreciated.

	multiple parts of the state to ensure all Virginians can fully participate in the rule-making process.	
64. 350 Central Virginia	Support limiting carbon pollution of power plants via a cap and trade program. The rule should use the best science available, and set up a capping system that will reduce carbon emissions over time as stringently as RGGI does, after a short lead-in period, in order to be effective. A rule that mandates that allowances received must be traded rather than directly used would be preferable. Apportionment of allowances should be based on amount of power supplied to ratepayers the previous year, not on emissions, and non-fossil fuel plants should receive allowances equally with fossil fuel plants. If possible, the rule should mandate that the net financial benefits of trading allowances be returned to the ratepayers.	Virginia is linking to RGGI, which is a well-established, effective cap-and-trade program. As discussed elsewhere, conditional allowances will undergo a consignment auction in order to become an allowance that can be used to demonstrate compliance.
65. University of Virginia Environmental and Regulatory Law Clinic	The Clinic presented to the Governor's EO 57 Work Group on "Opportunities to Address Carbon Pollution Under Existing State Law." The Clinic followed its presentation by submitting written comments to the Work Group. State law establishes a process for the adoption of regulations that are more stringent than applicable federal requirements. See Va. Code § 10.1-1308 A. Correspondingly, the federal Clean Air Act contains a states' rights savings clause, which allows states to promulgate their own, more stringent, air pollution regulations. See 42 USC 7416. The Act's citizen suit provision, 42 USC 7604(e), confirms that federal law does not restrict any right to enforce state standards. The Clinic's comments, however, also caution that establishing a multi-state trading program might present challenges, especially if the program were directly regulating out-of-state sources in a manner that conflicted with the law of the source state. In North Carolina, the Fourth Circuit found that regulated	Virginia will not be regulating out-of-state electric generating units.

	sources covered by a state-specific program must be within the state's boundaries: "only source state law … could impose more stringent emission rates than those required by federal law on plants located in those … jurisdictions." The court relied, in part, on International Paper Company v. Ouellette, which held that the Clean Water Act "precludes a court from applying the law of an affected State against an out-of-state source. … If a New York source were liable for violations of Vermont law, that law could effectively override both the permit requirements and the policy choices made by the source State." The state would need to consider the impact of this case law as it evaluates options for developing a trading-ready program that accounts for CO_2e allowances in a multi-state trading program. Dominion's Mount Storm Power Station in West Virginia, for example, might need to be excluded from such a program.	
66. Virginia Conservation Network (551 sponsored emails)	As Virginians, we appreciate the initiative taken by Governor McAuliffe/support Governor McAuliffe's leadership in the fight against climate change, but we know our work does not stop here. We request that DEQ use its authority to: Create a rule--based on the strongest available science--that significantly reduces carbon pollution from Virginia's power plants; ensure that Virginians--not utilities--benefit from any profits from carbon regulations; address the disproportionate environmental effects experienced by our most vulnerable communities; and reduce carbon pollution by incentivizing investments in zero-carbon solar, wind and energy efficiency.	Support for the regulatory action is appreciated.
67. Virginia Conservation Network (349 sponsored emails)	I am glad to see Virginia taking steps to cut carbon pollution in an effort to comply with the Paris Climate Accord. I am very excited for the state to create a plan that provides an equitable and just cap	Support for the regulatory action is appreciated.

	that will significantly reduce greenhouse gas emissions. To ensure that the policy best benefit Virginians, DEQ should: create a rule based on the strongest available science that significantly reduces carbon pollution from Virginia's new and existing power plants; ensure that Virginians--not utilities--benefit from any profits from carbon regulations especially our frontline communities; address the disproportionate environmental effects experienced by our most vulnerable communities; grow the economy and reduce carbon pollution by maximizing investments in zero-carbon wind, solar, and energy efficiency; and provide a transparent and accessible public process where all concerned Virginians can fully participate in the rulemaking process.	
68. Virginia League of Conservation Voters (214 sponsored emails)	I'm writing today to voice my support of a regulation in Virginia that cuts carbon pollution from power plants and allows us to trade carbon allowances with other states. With no help coming from the federal level in addressing climate change, it's up to states like Virginia to act. By cutting carbon emissions in Virginia, we have the opportunity to protect public health and safety while also creating jobs in the carbon-neutral renewable energy and energy efficiency sectors. And because we're joining up with a coalition of other states with carbon caps, action we take here in Virginia is greater than the sum of its parts. Carbon trading also creates the opportunity to bring revenue back to the state to aid in clean energy deployment and resiliency, money we shouldn't leave on the table or gift to our utilities. I urge you to proceed with a strong regulation that shows Virginia is a leader in addressing climate change and takes its responsibility seriously.	Support for the regulatory action is appreciated.
69. Virginia Poverty Law Center (VPLC)	The VPLC is glad there will be more opportunities for jobs and growth moving forward. We hope that low-income Virginians will benefit from	The consignment auction under which allocations will be traded is designed to be revenue neutral. In other words, utilities will be allocated a share of conditional allowances

	the jobs and opportunities, not be left behind in the new energy economy. This is an opportunity to help those struggling to find well-paying jobs to secure a brighter future. We will not comment on how to allocate carbon credits or the levels or limits on those allocations. Our comments focus on what happens if and when there are excess credits when Virginia participates in a regional CO_2 trading system. We are not experts in energy, but from our analysis, there may be a day when Virginia utility monopolies have an excess of credits which when sold, would generate revenue. If funds are generated from the sale of such credits, any regulation should contemplate how those funds are used. What happens to the funds generated is of keen interest to us. Regulations should ensure such proceeds should not be ceded to the utility monopolies for distribution to their shareholders, rather, any proceeds should be returned to the electricity consumers, particularly low-income rate-payers. Whether by programs that help with energy efficiency, or direct rebates on bills, the regulations should return any excess profits go to the consumer. As energy costs are expected to increase over time, the VPLC has been working to ensure more programs are in place to help weatherize and make homes of low-income families more energy efficient to help stabilize utility costs. We believe that either programs that help with energy efficiency, or direct rebates to consumers, should be the focus of any funds generated by trading.	that they must sell into the auction, and auction revenue is returned to the consignee. The consignment auction helps set the price of an allowance, not realize profits. While DEQ agrees that protecting electricity customers is important, that role properly belongs to the SCC.
70. Virginia Clinicians for Climate Action	A warming world poses significant risks to human health: extreme weather events; heat illness; air pollution; allergies; food and water contamination and infectious diseases. These effects are felt disproportionately in vulnerable populations, including children, the elderly and the disadvantaged. Federal Agencies have issued	The commenter's concerns are well taken. EO 57 and ED 11 are a direct result of concern around these issues, which is why DEQ has begun the process of preparing a regulation that will control carbon pollution in Virginia via linkage to RGGI. Support for the regulatory action is appreciated.

	reports and programs that address the health threats posed to humans by a changing climate. Leading national medical organizations including the American College of Physicians, American Academy of Pediatrics, American Public Health Association, and others have published statements and resolutions recognizing the threat that the changing climate poses to human health and promoting physician engagement. Health systems and hospitals in Virginia are vulnerable to extreme weather events and storm surges, which can significantly compromise patient safety and access to care. Regions of coastal Virginia, some of which are sites of major military installations, are at high risk to sea level rise and storm surge associated with climate change. Climate change is likely affecting plant and animal species in Virginia. Reported cases of several vector-borne diseases increased by 2-14 fold between 2006-2015 in Virginia. Changes in the natural world ultimately affect the health, prosperity and quality of life. Summer heat is becoming more oppressive in Virginia and heat-related injury is a cause of illness and death in Virginians, with young athletes, outdoor workers and the elderly at particularly elevated risk. For these reasons, Virginia Clinicians for Climate Action, a coalition of over 100 clinicians across the state, supports the Governor's plan as protective of public health.	
71. Jon Ward	I encourage Virginia to implement a CO_2 cap-and-trade system that includes an Emissions Containment Reserve, such as that being discussed among the RGGI states, to reduce the allotment of CO_2 allowances if their price falls to a specified level, incentivizing the market to reduce emissions below	The RGGI states have proposed, as of this writing, a regional cap trajectory that will provide an additional 30% cap reduction by the year 2030, relative to 2020 levels. The proposed regional program changes include the addition of an Emissions Containment Reserve (ECR) wherein states can withhold allowances from auction if emission reduction costs are lower than projected. The proposed

	the cap if market conditions allow. In working with other states in setting the cap's aggressiveness, recognizes the particular vulnerability of Virginia's tourist, fishing, military, and agricultural industries to worsening climate change and sea-level rise. Follow and regularly adapt to guidance from global climate-science experts as to the level of emissions reduction needed to restrict GHG concentrations to internationally agreed upon targets. Consider well-to-plant methane leakage in the calculation of GHG emissions attributable to power plants. Direct proceeds of CO_2 allowance sales to energy-efficiency projects and fossil-industry-worker retraining, and not to electric utilities. Utilities earn a return on equity to cover risks such as regulatory changes, and Virginia utilities have continued to build gas and coal plants in the face of climate consensus and clear likelihood of future federal and state regulations.	ECR is an innovative way to adaptively respond to supply and demand in the market. When this program is finalized, Virginia will align the regulation to meet any new requirements of RGGI states. This proposal is a CO_2 rule, not a greenhouse gas rule, and as such methane will not be addressed in this rulemaking. Methane may be addressed in other venues in the future as appropriate. Energy efficiency projects are managed and evaluated by DMME. Utilities are governed by the SCC.

Family impact

Please assess the impact of this regulatory action on the institution of the family and family stability including to what extent the regulatory action will: 1) strengthen or erode the authority and rights of parents in the education, nurturing, and supervision of their children; 2) encourage or discourage economic self-sufficiency, self-pride, and the assumption of responsibility for oneself, one's spouse, and one's children and/or elderly parents; 3) strengthen or erode the marital commitment; and 4) increase or decrease disposable family income.

It is not anticipated that the proposal will have a direct impact on families.

Detail of changes

Please list all changes that are being proposed and the consequences of the proposed changes; explain the new requirements and what they mean rather than merely quoting the proposed text of the regulation. If the proposed regulation is a new chapter, describe the intent of the language and the expected impact. Please describe the difference between existing regulation(s) and/or agency practice(s) and what is being proposed in this regulatory action. If the proposed regulation is intended to replace an emergency

*regulation, please list separately: (1) all differences between the **pre**-emergency regulation and this proposed regulation; and 2) only changes made since the publication of the emergency regulation.*

Section number	Proposed requirements	Other regulations and law that apply	Intent and likely impact of proposed requirements
Article 1 - CO_2 Budget Trading Program General Provisions.			
9VAC5-140-6010	Purpose	None.	Establishment of the Virginia component of the CO_2 Budget Trading Program. Needed to provide clarity.
9VAC5-140-6020	Definitions	None.	Terms defined. Needed to assure that the regulation is understood and will operate properly.
9VAC5-140-6030	Measurements, abbreviations and acronyms.	None.	Needed to assure that the regulation is understood and will operate properly.
9VAC5-140-6040	Applicability		Defines sources to which the regulation applies. Needed in order that the regulation apply to certain affected sources. Implementation of this regulation will have an impact on those sources that are directly subject to the requirements of the rule. Note that the board is seeking comment on whether any fossil fuel power generating unit owned by an individual facility and located at that individual facility that generates electricity and heat from fossil fuel for the primary use of operation of the facility should be exempt from the requirements of this regulation (subsection B).
9VAC5-140-6050	Standard requirements	None.	General requirements for permits, monitoring, holding and management of CO_2 allowances, excess emissions, recordkeeping and reporting, and liability. Needed in order for the program to operate properly.
9VAC5-140-6060	Computation of time	None.	How to define the beginning and ending of an activity. Needed in order for the program to operate properly.
9VAC5-140-6070	Severability	None.	Clarifies that the remainder of rule is not rendered invalid by the invalidity of another part of the rule. Needed in order for the program to operate properly.
Article 2 - CO_2 Authorized Account Representative for CO_2 Budget Sources.			
9VAC5-140-6080	Authorization and	None.	Details how this individual is

	responsibilities of the CO_2 authorized account representative		selected and authorized, and their key roles. Needed in order for the program to operate properly.
9VAC5-140-6090	Alternate CO_2 authorized account representative	None.	Details how this individual is selected and authorized, and their key roles. Needed in order for the program to operate properly.
9VAC5-140-6100	Changing the CO_2 authorized account representatives and the alternate CO_2 authorized account representative; changes in the owners and operators	None.	How changes are made to account representatives, and owners and operators. Needed in order for the program to operate properly.
9VAC5-140-6110	Account certificate of representation	None.	How account representatives are to be certified. Needed in order for the program to operate properly.
9VAC5-140-6120	Objections concerning the CO_2 authorized account representative	None.	How to deal with any disputes relevant to the account representative. Needed in order for the program to operate properly.
9VAC5-140-6130	Delegation by CO_2 authorized account representative and alternate CO_2 authorized account representative	None.	Enables the account representatives to delegate their authority to other persons. Needed in order for the program to operate properly.
Article 3 - Permits.			
9VAC5-140-6140	General CO_2 budget permit requirements	None.	References pertinent permitting regulations. Needed to assure that existing permitting requirements are met.
9VAC5-140-6150	Submission of CO_2 budget permit applications	None.	Requires a budget permit application by a certain date. Needed in order for the program to operate properly.
9VAC5-140-6160	Information requirements for CO_2 budget permit applications	None.	Lists elements concerning the CO_2 budget source for which the application is submitted. Needed in order for the program to operate properly.
Article 4 - Compliance Certification.			
9VAC5-140-6170	Compliance certification report	None.	Requires the source to certify whether each CO_2 budget unit was operated in compliance with the requirements of the CO_2 Budget Trading Program. Needed in order for the program to operate properly.
9VAC5-140-6180	Action on compliance certifications	None.	Explains how the compliance certification is reviewed. Needed in order for the program to

			operate properly.
Article 5 - CO_2 Allowance Allocations Note that two versions of 9VAC5-140-6190 and 9VAC5-140-6210 are provided for comment. The board seeks comment on whether the base budget should be 33 million tons or 34 million tons, with corresponding 3% per year reductions. The first version represents a 33 million ton base budget, and the second version represents the 34 million ton base budget.			
9VAC5-140-6190	Base budgets	None.	Base budgets are established from 2020 onward. The board is seeking comment on whether the initial Virginia CO_2 Budget Trading Program base budget for 2020 should be 33 million tons or 34 million tons, and declining accordingly by 3% per year. Needed to effect the carbon pollution reduction that ED 11 require of this regulation.
9VAC5-140-6200	Undistributed and unsold CO_2 allowances	None.	Explains how the department may retire undistributed and unsold allowances. Needed for the program to operate properly.
9VAC5-140-6210	CO_2 allowance allocations	None.	Describes how the department will allocate allowances. CCR and ECR allowances as described in Tables 140-5A and B are tied to the 2020 base budget and as such the board is seeking comment as to whether these numbers should be tied to a base budget of 33 million tons or 34 million tons. Needed to effect the carbon pollution reduction that ED 11 requires of this regulation.
9VAC5-140-6215	CO_2 allocation methodology		Describes the methodology for allocating allowances using net electric output. Needed for the program to operate properly.
Article 6 - CO_2 Allowance Tracking System			
9VAC5-140-6220	CO_2 Allowance Tracking System accounts	None.	Establishes a system in order for tracking compliance accounts. Needed in order for the program to operate properly.
9VAC5-140-6230	Establishment of accounts	None.	Explains how compliance accounts are established and managed. Needed in order for the program to operate properly.
9VAC5-140-6240	CO_2 Allowance Tracking System responsibilities of CO_2 authorized account representative.	None.	Requires that all submissions pertaining to the account are made only by the authorized account representative. Needed in order for the program to operate properly.
9VAC5-140-6250	Recordation of CO_2 allowance allocations	None.	Describes how the department records allowances. Needed in

			order for the program to operate properly.
9VAC5-140-6260	Compliance	None.	CO_2 allowances that meet certain criteria are available to be deducted in order for a source to comply with the CO_2 requirements for a control period. Needed in order for the program to operate properly.
9VAC5-140-6270	Banking	None.	Requires that CO_2 allowances remain in account until deducted or transferred. Needed in order for the program to operate properly.
9VAC5-140-6280	Account error	None.	Allows corrections to be made. Needed in order for the program to operate properly.
9VAC5-140-6290	Closing of general accounts	None.	Describes how to close an account. Needed in order for the program to operate properly.
Article 7 - CO_2 Allowance Transfers			
9VAC5-140-6300	Submission of CO_2 allowance transfers	None.	Specifies how to submit transfers. Needed in order for the program to operate properly.
9VAC5-140-6310	Recordation	None.	Describes the recordation of transfers. Needed in order for the program to operate properly.
9VAC5-140-6320	Notification	None.	Explains notification of transfers to each party. Needed in order for the program to operate properly.
Article 8 - Monitoring and Reporting			
9VAC5-140-6330	General requirements	None.	Generally requires a source to comply with monitoring, recordkeeping and reporting requirements as provided in this regulation and 40 CFR Part 75. Needed to assure that all pertinent state and federal requirements are met.
9VAC5-140-6340	Initial certification and recertification procedures	None.	Facilities may be exempt under certain circumstances. Needed in order for the program to operate properly.
9VAC5-140-6350	Out-of-control periods	None.	What to do when a monitoring system fails to meet QA/QC or other requirements. Needed to assure compliance.
9VAC5-140-6360	Notifications	None.	Notification requirement. Needed in order for the program to operate properly.
9VAC5-140-6370	Recordkeeping and reporting	None.	Monitoring plan recordkeeping and reporting requirements. Needed to assure compliance.
9VAC5-140-6380	Petitions	None.	How to request approval for an

			alternative to any requirement of 40 CFR Part 75. Needed to assure compliance.
9VAC5-140-6390	Reserved	None.	
9VAC5-140-6400	Additional requirements to provide output data	None.	Additional steps to be taken when determining output. Needed in order for the program to operate properly.
Article 9 - Auction of CO_2 CCR and ECR allowances			
9VAC5-140-6410	Purpose	None.	General purpose of the article. Needed to provide clarity.
9VAC5-140-6420	General requirements	None.	Describes information required in the auction notice, rules for sale of allowances, information on the reserve price, and withholding ECR allowances from an auction. Needed in order for the auction to operate.
9VAC5-140-6430	Consignment auction	None.	How conditional allowances are auctioned at consignment and converted to allowances used for compliance. Needed in order for the auction to operate.

Proposed Regulation
Agency Background Document

Agency name	State Air Pollution Control Board
Virginia Administrative Code (VAC) citation(s)	Part VII, 9VAC5-140
Regulation title(s)	Regulation for Emissions Trading
Action title	Establish a new regulation to reduce and cap carbon dioxide (CO_2) from fossil fuel fired electric power generating facilities by means of an interstate trading program (Revision C17)
Date this document prepared	

This information is required for executive branch review and the Virginia Registrar of Regulations, pursuant to the Virginia Administrative Process Act (APA), Executive Order 14 (as amended, July 16, 2018), the Regulations for Filing and Publishing Agency Regulations (1 VAC7-10), and the *Virginia Register Form, Style, and Procedure Manual for Publication of Virginia Regulations.*

Brief Summary

Please provide a brief summary (preferably no more than 2 or 3 paragraphs) of this regulatory change (i.e., new regulation, amendments to an existing regulation, or repeal of an existing regulation). Alert the reader to all substantive matters. If applicable, generally describe the existing regulation.

The purpose of the re-proposed new regulation is, in accordance with Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from Electric Power Facilities and Growing Virginia's Clean Energy Economy," (i) ensure that Virginia is trading-ready to allow for the use of market-based mechanisms and the trading of carbon dioxide (CO_2) allowances through a multi-state trading program, and (ii) establish abatement mechanisms that provide for a corresponding level of stringency to CO_2 limits imposed in other states with such limits. The re-proposed regulation includes a base budget of 28 million tons, which will determine, based on a 3% annual reduction, the annual budgets and allocations for future years. In accordance with ED 11, the report of the Executive Order 57, and a formal determination by the Office of Attorney General, these requirements apply to fossil fuel-fired electric generating facilities.

The original proposal, which underwent public comment from January 8 through April 9, 2018, included two options on the base budget of 33 and 34 million tons. DEQ proposed and the board approved a new base budget of 28 million tons based on new modeling and other information. Other substantive changes include the recognition of offsets from other participating states, exemption of fossil fuel units that co-fire

with biomass from CO_2 accounting, a more detailed description of exempt industrial sources, a more detailed description of how the cost containment reserve will be managed, a new section allowing for participation in a non-consignment auction, and a new section requiring program monitoring and review. The proposal was also updated to reflect the latest version of the RGGI model rule.

Acronyms and Definitions

Please define all acronyms used in the Agency Background Document. Also, please define any technical terms that are used in the document that are not also defined in the "Definition" section of the regulations.

CO_2 - carbon dioxide
CPP - Clean Power Plan
CSAPR - Cross-State Air Pollution Rule
DMME - Department of Mines, Minerals and Energy
EGU - electric generating unit
ED 11 - Executive Directive 11
EO 57 - Executive Order 57
EPA - U.S. Environmental Protection Agency
GHG - greenhouse gas
IRP - Integrated Resource Plan
MW - megawatt
NGCC - natural gas-fired combined cycle
PJM - PJM Interconnection
PSD - Prevention of Significant Deterioration
RGGI - Regional Greenhouse Gas Initiative
SCC - State Corporation Commission

Mandate and Impetus

Please identify the mandate for this regulatory change, and any other impetus that specifically prompted its initiation (e.g., new or modified mandate, petition for rulemaking, periodic review, board decision, etc.). For purposes of executive branch review, "mandate" has the same meaning as defined in Executive Order 14 (as amended, July 16, 2018), "a directive from the General Assembly, the federal government, or a court that requires that a regulation be promulgated, amended, or repealed in whole or part."

The mandate for this regulation is Executive Directive 11 (2017).

Legal Basis

Please identify (1) the agency or other promulgating entity, and (2) the state and/or federal legal authority for the regulatory change, including the most relevant citations to the Code of Virginia or Acts of Assembly chapter number(s), if applicable. Your citation must include a specific provision, if any, authorizing the promulgating entity to regulate this specific subject or program, as well as a reference to the agency or promulgating entity's overall regulatory authority.

Section 10.1-1308 of the Virginia Air Pollution Control Law (Title 10.1, Chapter 13 of the Code of Virginia) authorizes the State Air Pollution Control Board to promulgate regulations abating, controlling and prohibiting air pollution in order to protect public health and welfare. Written assurance from the Office of the Attorney General that the State Air Pollution Control Board possesses the statutory authority to promulgate the proposed regulation amendments is available upon request.

Promulgating Entity

The promulgating entity for this regulation is the State Air Pollution Control Board.

State Requirements

Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from the Electric Power Sector and Growing Virginia's Clean Energy Economy," directs the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural Resources, to take the following actions in accordance with the provisions and requirements of Virginia Code § 10.1-1300 et seq., and Virginia Code § 2.2-4000, et seq.:

1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit CO_2 from electric power facilities that:

a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of CO_2 allowances through a multi-state trading program; and

b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on CO_2 emissions imposed in other states with such limits.

2. By no later than December 31, 2017, present the proposed regulation to the State Air Pollution Control Board for consideration for approval for public comment in accordance with the Board's authority pursuant to Virginia Code § 10.1-1308.

Additionally, on May 12, 2017, the Attorney General issued an official advisory opinion that concluded the board is legally authorized to regulate GHG: "The Board has the authority to establish a statewide cap on GHG emissions for all new and existing fossil fuel electric generating plants as a means of abating and controlling such emissions."

Purpose

Please explain the need for the regulatory change, including a description of: (1) the rationale or justification, (2) the specific reasons the regulatory change is essential to protect the health, safety or welfare of citizens, and (3) the goals of the regulatory change and the problems it's intended to solve.

The regulation is needed to control CO_2 emissions in order to protect the public's health and welfare. The proposed regulation is being developed in order to meet the direction of Governor McAuliffe's Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from the Electric Power Sector and Growing Virginia's Clean Energy Economy," which states:

> There is no denying the science and the real-world evidence that climate change threatens the Commonwealth of Virginia, from our homes and businesses to our critical military installations and ports. Rising storm surges and flooding could impact as many as 420,000 properties along Virginia's coast that would require $92 billion of reconstruction costs.
>
> The challenges and costs of bolstering resilience and minimizing risk are too great for any locality to bear alone. While the impacts are significant, there are technologies in the clean energy sector that could help mitigate these impacts while simultaneously creating jobs in twenty-first century industries. The number of solar jobs in Virginia has grown by 65 percent in the last year alone, and Virginia is now the ninth fastest growing solar jobs market in the country. Revenue for clean energy businesses in Virginia has increased from $300 million in 2014 to $1.5 billion in 2016. Through state leadership, Virginia can face the threats of climate change head on and do so in a

way that makes clean energy a pillar of our future economic growth and a meaningful part of our energy portfolio.

With these considerations in mind, I issued Executive Order 57 (EO 57) on June 28, 2016. Under EO 57, I directed the Secretary of Natural Resources to convene a work group to study and recommend methods to reduce carbon dioxide emissions from electric power facilities and grow the clean energy economy within existing state authority. The group consisted of the Secretary of Natural Resources, the Secretary of Commerce and Trade, the Director of the Virginia Department of Environmental Quality, the Director of the Virginia Department of Mines, Minerals and Energy, and the Deputy Attorney General for Commerce, Environment, and Technology. This group facilitated extensive stakeholder engagement over the last year, including six in-person meetings and a ninety-day public comment period, before compiling its recommendations and submitting a final report to me on May 12, 2017.

Among the most significant recommendations from the group is the need to develop regulations limiting the total amount of carbon dioxide emitted from electric power facilities. Given the nature of the climate change threat and the promise of clean energy solutions, I agree with this recommendation.

Accordingly, pursuant to the authority vested in me as the Chief Executive Officer of the Commonwealth, and pursuant to Article V of the Constitution and the laws of Virginia, I hereby direct the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural Resources, to take the following actions in accordance with the provisions and requirements of Virginia Code § 10. 1-1300, et seq. and Virginia Code § 2.2-4000, et seq.:

1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit carbon dioxide emissions from electric power facilities that:

a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of carbon dioxide allowances through a multi-state trading program; and

b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on carbon dioxide emissions imposed in other states with such limits.

2. By no later than December 31, 2017, present the proposed regulation to the State Air Pollution Control Board for consideration for approval for public comment in accordance with the Board's authority pursuant to Virginia Code § 10. 1-1308.

Additionally, Executive Order 57 Work Group's "Report and Final Recommendations to the Governor" states that:

The Work Group received a number of presentations and written comments from stakeholders advocating for a regulation to limit carbon dioxide from power plants. These comments included recommendations that the Commonwealth join or participate in the Regional Greenhouse Gas Initiative (RGGI) or another regional trading program, that a price be put on carbon, and that Virginia strive to reduce its greenhouse gases by 30 to 40 percent by the year 2030. . . . Although many stakeholders provided feedback focused on specific in-state targets (such as 30x30), the Work Group believes that it is important and necessary that Virginia work through a regional model, like the established and successful RGGI, in order to achieve lower compliance costs and address the interstate nature of the electric grid.

The Work Group recommends that the Governor consider taking action via a regulatory process to establish a "trading-ready" carbon emissions reduction program for fossil fuel fired electric generating facilities that will enable participation in a broader, multi-state carbon market.

Substance

Please briefly identify and explain the new substantive provisions, the substantive changes to existing sections, or both. A more detailed discussion is provided in the "Detail of Changes" section below.

1. The primary purpose of the regulation is to implement a declining cap on carbon emissions. The administrative means of accomplishing this will be effected by linking Virginia to RGGI, which is an established emissions trading program. An allowance will be issued for each ton of carbon emitted by an electricity generating facility. The company must then decide if it will reduce carbon emissions and sell the resulting additional allowances, or if it will not reduce carbon emissions and make up the difference with purchased allowances. The original proposal included two options on the base budgets, 33 million tons and 34 million tons. The board selected 28 million tons, which will determine, based on a 3% annual reduction, the annual budgets and allocations for future years.

2. The mechanism for determining the cost of allowances will be a consignment auction.

3. A cost containment reserve allowance will be offered for sale at an auction for the purpose of containing the cost of CO_2 allowances in the event of higher than anticipated emission reduction costs. An emission containment reserve allowance will be withheld from sale at an auction for the purpose of additional emission reduction in the event of lower than anticipated emission reduction costs.

4. Monitoring, recording, and recordkeeping requirements will be implemented to track compliance.

5. Conditional allowances will be allocated to the Department of Mines, Minerals and Energy (DMME) in order to assist the department for the abatement and control of air pollution, specifically, CO_2.

6. In conjunction with program monitoring and review, impacts specific to Virginia will be evaluated, including economic, energy and environmental impacts, and impacts on vulnerable and environmental justice communities.

Issues

Please identify the issues associated with the regulatory change, including: 1) the primary advantages and disadvantages to the public, such as individual private citizens or businesses, of implementing the new or amended provisions; 2) the primary advantages and disadvantages to the agency or the Commonwealth; and 3) other pertinent matters of interest to the regulated community, government officials, and the public. If there are no disadvantages to the public or the Commonwealth, include a specific statement to that effect.

1. Public: The primary advantage to the public would be health and welfare benefits associated with controlling carbon pollution. The program is designed to avoid any significant economic impacts.

2. Department: No significant advantages or disadvantages to the department have been identified. There may be a minor impact in terms of administering a new program.

Requirements More Restrictive than Federal

Please identify and describe any requirement of the regulatory change which is more restrictive than applicable federal requirements. Include a specific citation for each applicable federal requirement, and a rationale for the need for the more restrictive requirements. If there are no applicable federal

requirements, or no requirements that exceed applicable federal requirements, include a specific statement to that effect.

There are no applicable federal requirements. DEQ notified the Senate Agriculture, Conservation and Natural Resources Committee, the Senate Commerce and Labor Committee, the House of Delegates Agriculture, Chesapeake and Natural Resources Committee, and House of Delegates Commerce and Labor Committee of this regulatory action in November 2017.

Agencies, Localities, and Other Entities Particularly Affected

Please identify any other state agencies, localities, or other entities particularly affected by the regulatory change. "Particularly affected" are those that are likely to bear any identified disproportionate material impact which would not be experienced by other agencies, localities, or entities. "Locality" can refer to either local governments or the locations in the Commonwealth where the activities relevant to the regulation or regulatory change are most likely to occur. If no agency, locality, or entity is particularly affected, include a specific statement to that effect.

There is no locality that will bear any identified disproportionate material air quality impact due to the proposed regulation which would not be experienced by other localities. None of the affected sources is owned or operated by a locality, and it is the generation of electricity that is directly subject to the regulation, not its end users. The Department of Mines, Minerals and Energy (DMME) will be responsible for managing the 5% allocation set-aside required by 9VAC5-140-6430.

Economic Impact

Pursuant to § 2.2-4007.04 of the Code of Virginia, please identify all specific economic impacts (costs and/or benefits), anticipated to result from the regulatory change. When describing a particular economic impact, specify which new requirement or change in requirement creates the anticipated economic impact. Please keep in mind that this is change versus the status quo.

Impact on State Agencies

For your agency: projected costs, savings, fees or revenues resulting from the regulatory change, including: a) fund source / fund detail; b) delineation of one-time versus on-going expenditures; and c) whether any costs or revenue loss can be absorbed within existing resources	The Joint Legislative Audit and Review Commission (JLARC) estimates that the cost to DEQ for administering the regulation and the cap and trade program would be approximately $95,000 per year to cover the salary and benefits for one staff position. The sources of department funds to carry out this regulation are the general fund and the federal trust (grant money provided by EPA under § 105 of the federal Clean Air Act or permit fees charged to affected entities under the permit program). The activities are budgeted under the following programs (codes)/subprograms (codes): Air Protection Permitting (513025); Air Protection Compliance and Enforcement (513026); Air Protection Planning and Policy (513028); and Air Protection Monitoring and Assessment (513029). The costs are expected to be ongoing, and any costs or revenue loss can be absorbed within existing resources.

For other state agencies: projected costs, savings, fees or revenues resulting from the regulatory change, including a delineation of one-time versus on-going expenditures.	JLARC estimates that the cost to DMME for administering the allowances it receives each year is approximately $105,000 to cover the salary and benefits for one staff position. The costs are expected to be ongoing.
For all agencies: Benefits the regulatory change is designed to produce.	To quote ED 11, "The challenges and costs of bolstering resilience and minimizing risk are too great for any locality to bear alone. While the impacts are significant, there are technologies in the clean energy sector that could help mitigate these impacts while simultaneously creating jobs in twenty-first century industries. The number of solar jobs in Virginia has grown by 65 percent in the last year alone, and Virginia is now the ninth fastest growing solar jobs market in the country. Revenue for clean energy businesses in Virginia has increased from $300 million in 2014 to $1.5 billion in 2016. Through state leadership, Virginia can face the threats of climate change head on and do so in a way that makes clean energy a pillar of our future economic growth and a meaningful part of our energy portfolio." It is expected that the regulation will address the health and welfare impacts of climate change in an efficient, cost-effective manner. RGGI has successfully reduced carbon emissions with no negative economic impacts; see https://www.rggi.org/rggi_benefits. Emissions trading programs have proven to be very effective--with both traditional pollutants such as NO_X, and with more recently regulated pollutants such as CO_2--and an affiliation with RGGI will enable Virginia to quickly take advantage of a proven trading program.

Impact on Localities

Projected costs, savings, fees or revenues resulting from the regulatory change.	The projected cost of the regulation on localities is not expected to be beyond that of other affected entities. Essentially, every individual and every organized entity--whether government or private-- uses electricity, and it is the generation of that electricity that is directly subject to the regulation, not its end users. Furthermore, none of the affected sources is owned or operated by any locality.
Benefits the regulatory change is designed to produce.	See the description of benefits as described under "Impact on State Agencies."

Impact on Other Entities

Description of the individuals, businesses, or other entities likely to be affected by the regulatory change. If no other entities will be affected, include a specific statement to that	Electric power facilities with a capacity of >25 MW that operate on some form of fossil fuel (coal, natural gas) will be directly affected by the regulation.

effect.	
Agency's best estimate of the number of such entities that will be affected. Please include an estimate of the number of small businesses affected. Small business means a business entity, including its affiliates, that: a) is independently owned and operated and; b) employs fewer than 500 full-time employees or has gross annual sales of less than $6 million.	There are currently up to 31 electric power facilities with a capacity of >25 MW operated by 12 companies located throughout the state that will likely be directly affected by the regulation. None of these entities is a small business. There may be limited indirect impacts on small businesses in general as discussed in greater detail below.
All projected costs for affected individuals, businesses, or other entities resulting from the regulatory change. Please be specific and include all costs including, but not limited to: a) projected reporting, recordkeeping, and other administrative costs required for compliance by small businesses; b) specify any costs related to the development of real estate for commercial or residential purposes that are a consequence of the regulatory change; c) fees; d) purchases of equipment or services; and e) time required to comply with the requirements.	The primary purpose of the regulation is to implement a declining cap on carbon emissions. The administrative means of accomplishing this will be effected by linking Virginia to RGGI, which is an established emissions trading program. An allowance will be issued for each ton of carbon emitted by an electricity generating unit. It will then be up to the company to decide if it wants to reduce carbon emissions and sell its additional allowances, or or if it will not reduce carbon emissions and make up the difference with purchased allowances. Because there will not be a significant change to the allowance values RGGI already has in place, adding Virginia to the equation will not change compliance costs. The cost of allowances will be administratively managed by means of a consignment auction. In general, auctions have been known to decrease costs because the process is transparent (costs and prices are known), and the secondary market is not involved. Consignment auctions are revenue neutral, so the only actual cost to a facility would be the administrative cost of managing its consignment auction activities. Based on department experience with emissions trading programs and traditional auctions in the past (for example, under 9VAC5-140 for the NO_X Trading Rule, and CAIR), it is expected that these costs will be minor, unless a facility generates enough allowances to sell and realizes a profit from that sale. Generally speaking, wholesale electricity costs may go up or down depending on the price of allowances. Any impacts to residential consumers will be very small because wholesale costs are only a very small portion of a residential consumer's bill. Rates for commercial users may fluctuate more because wholesale costs are somewhat higher for commercial users, and industrial users, which pay rates close to wholesale, will experience the greatest of any potential impact. The most recent bill impact analysis on the re-proposed rule indicates that bills for all customers will slightly decrease as a result of the rule.

	It is important to note that Virginia's energy market is regulated. This means that the Virginia SCC is responsible for monitoring electric rates such that Virginia's consumers (whether businesses, institutions or individuals) are protected from any dramatic changes to the electricity market. Regardless of what business decisions the affected utilities make in the future to comply with the carbon cap, Virginia's utility structure is designed to accommodate this type of pollution control program. The RGGI program is designed to avoid dramatic fluctuations in consumer costs. Thus far, electricity rates for RGGI customers have been stable over the life of the program, and this stability is expected to continue. JLARC estimates that the fiscal impact (negative and positive) of the proposed regulation (in 2017 dollars) will be approximately $1.3 million in 2020, when the regulation would take effect, and $1.9 million in 2031. JLARC notes that the latter cost equates to approximately 1% of projected state electricity costs in 2031.
Benefits the regulatory change is designed to produce.	See the description of benefits as described under "Impact on State Agencies."

Alternatives

Please describe any viable alternatives to the regulatory change that were considered, and the rationale used by the agency to select the least burdensome or intrusive alternative that meets the essential purpose of the regulatory change. Also, include discussion of less intrusive or less costly alternatives for small businesses, as defined in § 2.2-4007.1 of the Code of Virginia, of achieving the purpose of the regulatory change.

Alternatives to the proposal are being considered by the board. The board has tentatively determined that the first alternative is appropriate, as it is the least burdensome and least intrusive alternative that fully meets the purpose of the regulatory action. The alternatives being considered by the board, along with the reasoning by which the board has rejected any of the alternatives being considered, are discussed below.

1. Amend the regulations to satisfy the provisions of the law and associated regulations and policies. This option is being selected because it meets the stated purpose of the regulatory action: to develop a carbon trading regulation in accordance with ED 11 (2017).

2. Make alternative regulatory changes to those required by the provisions of the law and associated regulations and policies. This option is not being selected because it would not meet the specific requirements of ED 11.

3. Take no action to amend the regulations and continue to not control carbon emissions via a trading program. This option is not being selected because it it would not meet the specific requirements of ED 11.

Regulatory Flexibility Analysis

Pursuant to § 2.2-4007.1B of the Code of Virginia, please describe the agency's analysis of alternative regulatory methods, consistent with health, safety, environmental, and economic welfare, that will accomplish the objectives of applicable law while minimizing the adverse impact on small business. Alternative regulatory methods include, at a minimum: 1) establishing less stringent compliance or reporting requirements; 2) establishing less stringent schedules or deadlines for compliance or reporting requirements; 3) consolidation or simplification of compliance or reporting requirements; 4) establishing performance standards for small businesses to replace design or operational standards required in the proposed regulation; and 5) the exemption of small businesses from all or any part of the requirements contained in the regulatory change.

This regulation meets the requirements of Executive Directive 11. Any less stringent compliance requirements, any delays in adopting the standards, any different compliance or reporting requirements, any substitution of performance standards, and any exemption of small businesses from these requirements will not meet the minimum requirements of ED11. Any such changes would compromise the effectiveness of the regulation in protecting the health and welfare of the public.

Public Comment

Please summarize all comments received during the public comment period following the publication of the previous stage, and provide the agency response. Ensure to include all comments submitted: including those received on Town Hall, in a public hearing, or submitted directly to the agency or board. If no comment was received, enter a specific statement to that effect.

Commenter	Comment	Agency response
1. About 155 individual commenters	General support for the proposal was expressed.	Support for the proposal is appreciated.
2. About 415 emails, cards and petition sponsored by Faith Alliance for Climate Solutions and Interfaith Power and Light; petition sponsored by Virginia Chapter of the Sierra Club, 2717 signatures	Climate disruption poses increasing threats to Virginians' public health, national security, environment and economy. Virginia has joined states, cities and counties across the country that understand all levels of government must act on climate if we are to protect our communities in light of the Trump administration's continued attacks on environmental protections. I support setting the strongest possible standard to cut Virginia emissions from power plants through participation in a carbon market. This is a critically important step toward carbon pollution reductions. I request that DEQ use its authority to adopt and implement a final standard that caps and reduces carbon pollution as rapidly as possible, beginning as soon as possible. The 2020 base year should be less than 33 million tons. Cover carbon pollution from biomass, which can be worse than energy generated by fossil fuels. Set the expectation of continued carbon reductions after 2030. Monitor implementation in order to respond to disproportionate environmental burden experienced by front-line, low-income and vulnerable communities.	Support for the proposal is appreciated. Specific issues identified by the commenters are discussed in further detail below.
3. About 550 sponsored	I am thrilled to see that the board has approved draft regulations to cap carbon emissions. Without immediate	Support for the proposal is appreciated. Specific

Commenter	Comment	Agency response
emails and Town Hall comments	and bold action, climate change will present unprecedented challenges to our coastal communities and would harm communities of color at a much higher rate than others. I support a final carbon rule that has the strongest possible cap on carbon emissions from Virginia's power plants through a carbon market. I also support supplemental legislation that would allow Virginia to invest a portion of the carbon market revenue in coastal resilience. The 2020 base year emissions cap should be between 30 and 32 million tons. The cap should cover biomass facilities, which can be worse for the climate than fossil fuel power plants. Carbon emission reductions past 2030 should be addressed. The plan should address the needs of low-income and frontline communities by establishing implementation monitoring and rapid response guidelines that can detect any instances of disproportionate environmental burdens.	issues identified by the commenters are discussed in further detail below.
4. About 45 sponsored emails and Town Hall comments	I'm writing to voice my support of a regulation that cuts carbon pollution from power plants and allows us to trade carbon allowances with other states. With no help coming from the federal level in addressing climate change, it's up to Virginia to act. By cutting carbon emissions in Virginia, we have the opportunity to protect public health and safety while creating jobs in the carbon-neutral renewable energy and energy efficiency sectors. And because we're joining a coalition of other states with carbon caps, action we take in Virginia is greater than the sum of its parts. Carbon trading also creates the opportunity to bring revenue back to the state to aid in clean energy deployment and resiliency, money we shouldn't leave on the table or gift to our utilities. I urge you to proceed with a strong regulation that shows Virginia is a leader in addressing climate change and takes its responsibility seriously.	Support for the proposal is appreciated.
5. 4 emails	I support Governor Northam's Clean Energy Virginia Initiative. To address the threat of climate change to our coast and public health, the state must reduce pollution from fossil fuel-fired power plants and expand renewable energy. The initiative calls for a 30% reduction in carbon emissions by 2030 and will enable Virginia to trade carbon allowances with 9 other states, a market-based mechanism that will bring revenue back to Virginia while also cutting harmful air pollution. That is why I urge the board to adopt the plan to fight climate change, protect health, and create economic growth.	Support for the proposal is appreciated.
6. 5 emails	I am profoundly proud Virginia is preparing an initiative to reduce carbon and other toxic pollutants from utility power plants. Yet, how Virginia implements this program is critical to its success. And I expect success. A successful plan will: improve public health, expand clean energy development, save all electric customers money and improve our state's competitiveness, protect living creatures and reduce climate change burdens on future generations of Virginians, ensure Virginia is "carbon	Support for the proposal is appreciated.

Commenter	Comment	Agency response
	trading ready," and require that baseline measures of carbon emissions be real and annual reductions be real and ambitious.	
7. Petition sponsored by Natural Resources Defense Council (NRDC), 884 signatures	I urge DEQ to put a strong limit on carbon pollution and to reduce that pollution as rapidly as possible, in a way that grows the state's renewable energy economy and reduces energy bills through energy efficiency. Virginians are ready for strong action and we--along with future generations--applaud you for stepping up on climate and support your work to finalize a strong statewide carbon rule.	Support for the proposal is appreciated.
8. Petition sponsored by Virginia League of Conservation Voters (LCV), 1551 signatures	To address the climate change that threatens our coast and public health, Virginia must reduce pollution from fossil fuel-fired power plants and expand renewable energy. Governor Northam's Clean Energy Virginia Initiative is the solution for addressing climate change while growing Virginia's economy, reducing greenhouse gas (GHG) emissions, and protecting Virginias' air. The initiative calls for a 30% reduction in carbon emissions by 2030 and will enable Virginia to trade carbon allowances with 9 other states, a market-based mechanism that will bring revenue to Virginia while cutting harmful air pollution.	Support for the proposal is appreciated.
9. Petition sponsored by Environment Virginia, 207 signatures	From dozens of smog-ridden days to rising sea levels, Virginians are feeling the impacts of climate change. Virginia needs to move forward with plans to protect our communities from climate change and follow the steps that other states have taken to cut pollution while the federal government stalls. I request that DEQ adopt the strongest possible standard to cut carbon emissions by ensuring that Virginia cuts carbon pollution as quickly and as soon as possible. The 2020 emissions cap should be between 30 and 32 million tons. This cap should mirror the cap that states in RGGI, the nation's most successful regional climate program, are taking to reduce emissions 30% by 2030. The rule should set the expectation that carbon pollution will continue to be reduced after 2030. This standard should take into account Virginia's untapped energy efficiency potential and all planned renewable energy developments in Virginia.	Support for the proposal is appreciated. Specific issues identified by the commenters are discussed in further detail below.
10. Gianluigi Ciovati	I encourage a base budget of 33 million tons, and applicability to all fossil fuel power generating units. I request DEQ to include biomass into the fossil fuel category as recent expansion of such power generating units highlighted the issues of the long timeframe required to capture the emitted CO_2 by re-forestation and that, in order to meet increasing demand, not all the material used to make the fuel comes from waste but from an increasing fraction is coming from tree logging. The regulation should result in a greater economic benefit than cost: energy efficiency is the lowest cost resource to reduce CO_2 pollution while meeting energy demand. Dominion ranks 50th in efficiency efforts among the 51 largest electric utilities in the nation. Strong	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.

Commenter	Comment	Agency response
	energy efficiency policies would result in close to 40,000 new jobs by 2030. More jobs are predicted to be created by further increase in true renewable energy sources such as wind and solar. As the disruptive effects of climate change are becoming more evident, the risk and the cost of inaction on reducing CO_2 emission is too high and the regulation is a positive step in the right direction.	
11. Virginia Clean Cities (VCC)	Regulation of carbon emissions is critically important for Virginia, a coastal state with a wide distribution of energy sources. VCC is an alternative fuel vehicle coalition, working with governments at state, regional, local, and federal level with businesses and vehicle operators in an effort to reduce GHG emissions in transportation. While Virginia's largest source of CO_2 and GHGs is the transportation sector, we recognize the value of reviewing our existing electricity portfolio and working toward cleaner sources of domestic fuels. VCC strongly supports involvement in RGGI. Many RGGI states have advanced transportation projects to mitigate the significant GHGs from transportation. VCC include electric vehicles in our portfolio, as well as hydrogen, ethanol and natural gas vehicles all utilizing electricity from the grid in some manner. Further, by using cleaner domestic fuels such as biomass, natural gas, or renewable energy for Virginia's electricity, we can benefit our economy and move Virginia forward.	Support for the proposal is appreciated. Although the transportation sector is not directly addressed in this proposal, DEQ agrees that it is an important consideration in controlling carbon emissions.
12. B. Eli Fishpaw	It is a breath of fresh air that Virginia is embarking on an effort to reduce GHG from power production. Recognizing the measure of what causes climate change is essential to learning to live within the Carbon Cycle. Without active recognition that the license to emit carbon into the atmosphere must be limited, it is difficult to imagine meeting the challenge. We focus our efforts to address human caused climate change with an acceptance that excess carbon emissions (primarily CO_2) is the problem. Therefore, all solutions must have a goal of limiting carbon emissions to less than the amount that can be sequestered out of the atmosphere. Most human carbon emissions are sequestered by nature. These emissions are in the Carbon Cycle. Under a Net Zero Carbon Emissions Economy, human emissions would equal the amount that can be sequestered. At this level, we stop adding CO_2 concentration to the atmosphere. However, we are not reducing the CO_2 concentration either. When our emissions are higher than what nature can sequester, the over emissions are added to past years over emissions. We need to limit our emissions to less than what can be sequestered to live in the carbon cycle. This must be understood before the policies that can meet the challenge are combined with a determined effort by the public to meet this challenge. The license to emit CO_2 into the atmosphere should be shared fairly. Using the data from 2007 IPCC on natural and human emissions,	The information provided by the commenter is appreciated. The primary purpose of the regulation is to address carbon pollution via linking to RGGI in accordance with ED 11; therefore, no fee-and-dividend approach is being considered under this regulatory action.

Commenter	Comment	Agency response
	to achieve net zero (balanced budget) average per person emissions need to be limited to 2.6 tons CO_2/year. This would be a "Fair Share." At this level, all emissions are sequestered to achieve a Net Zero Carbon Emissions Economy. Cap and Trade allows emissions in exchange for supporting some activity that reduces CO_2 emissions, not from net zero, but from our historically high rate of emissions. In the proposal it provides financial support for high emissions electric production to reduce their emissions through technology. The cap and trade model for pricing carbon has the advantage of functioning in the background without asking sacrifice or understanding of the individual. Getting the public to understand that there is a demand by nature to limit to the amount of carbon emissions is essential to achieving it. Existing high emissions electric generation should not be rewarded by the entitlement license to emit that they can sell by reducing. I promote a continually escalating carbon tax with a rebate for the fair share of emissions and paying people to carbon capture and permanently store in the ground. A carbon tax can be similar to that proposed by Citizens Climate Lobby that charges a fee/ton CO_2 at the source and returns that fee equally to all citizens. By creating a modest fee, financial incentives are created for reducing energy and reward the development of renewable energy. As households and businesses evaluate future investments, their spreadsheets will show that investing in improvements offers the highest rate of return. This creates economic growth in the conservation, regeneration and renewable energy sectors. However, because all fees are redistributed equally, there is no money for sequestering carbon through technology. With a tax similarly structured, with a rebate for the tax on the Fair Share, creates funding for paying people to sequester carbon and preserving existing inventories of terrestrial carbon such as mature forest. Biochar is a way of permanently capturing carbon through pyrolysis. Adding the resulting charcoal to the ground increases retention of moisture, micronutrients and microorganisms. I propose that we pay people to create biochar at half the current rate of the carbon tax. This will insure a net reduction in CO_2 for the whole process. As promising as this is, biochar is not substitute for reducing emissions.	
13. L. David Roper	Deploying wind energy and solar energy in the U.S. can supply the demand. Using time-of-day availability of solar, on-shore wind and off-shore wind power in the four U.S. time zones and reasonable values of availability, wind and solar power can closely supply the time-of-day demand for electricity. Modest battery storage can fill in the small differences between solar/wind electricity	The commenter's remarks on renewable energy are appreciated. The specific suggestions for developing renewable technologies is not directly within the purview of the board or this

Commenter	Comment	Agency response
	production and demand. John Randolph of Virginia Tech has provided the following data about the economic favorability of renewable energy: Nuclear: $148/MWh; Coal: $102/MWh; Natural-gas-combined cycle: $60/MWh; Utility solar: <$50/MWh; Wind: <$45/MWH; Efficiency: <$25/MWh; Lithium-ion batteries: $209/kWh in 2017 and expected to be $100/kWh by 2025. Virginia has moderate experience with solar farms and no experience with wind farms compared to its neighboring states. Virginia would do well to study and emulate renewable energy development in North Carolina, which has similar topology to Virginia. Virginia's coal counties could lead in this. The major fossil-fuels state of Texas is way ahead of Virginia in solar energy and wind energy. It is not wise to depend on natural gas for electricity production over the long-term. Methane leaks from drilling sites and pipelines, over a 100-year period, is 34 times more potent that CO_2 at trapping heat. Extracting and burning methane may be as potent for global warming as mining and burning coal to produce electricity depending on the amount of fugitive methane. Increase the percent of electricity generation that AEP and Dominion allow for rooftop net metering. Do not charge for transmission for net metering because local solar generation greatly reduces the need for transmission lines. In fact, the price paid for rooftop solar should be greater than the cost of grid electricity. Allow communities to create solar farms or purchase from commercial solar farms that produce a given fraction of electricity for the community. Require power companies to build or buy more solar/wind energy, build community microgrids for grid resiliency, build battery backup in microgrids for renewable-energy smoothing and grid resiliency. Virginia needs to develop offshore wind farms.	regulatory action, although DEQ agrees that they are important tools for carbon control. The commenter's concerns about methane are acknowledged; however, as the specific purpose of this regulation is to enable linking to RGGI, methane is not addressed in this regulation.
14. Rees Shearer, Energizing Renewable Growth in Holston Valley and Emory Climate Collaborative; Hannah Ingram	I am pleased and proud that Virginia is preparing an initiative to reduce carbon and other toxic pollutants from utility power plants over time. How Virginia implements this program is critical to its success. Success means improving public health, expanding clean energy employment, saving electric customers money, improving competitiveness, protecting the creatures which share this land with us, and beginning to reduce climate burdens that we have been placing on the backs of future generations. In order to achieve success, DEQ must ensure that Virginia's carbon reduction regulation is trading ready by adopting a market-based approach. Joining RGGI is the best way to make this happen. DEQ will also need to prepare to auction carbon credits, if the General Assembly refuses to join RGGI. The baseline must not be inflated, and must include large industrial boilers. The 2020 base year emissions cap should be no	Support for the proposal is appreciated. DEQ agrees that energy efficiency and renewable energy are important tools for controlling carbon pollution, and the 5% set-aside is intended for this purpose. Specific issues identified by the commenter are discussed in further detail below.

Commenter	Comment	Agency response
	more than 32 million tons and initiate meaningful and deliberate carbon pollution reductions of 3% per year. To protect our forests, the program should include biomass burning facilities. Virginia is ripe for improvements in energy efficiency and solar energy. A 2015 study determined that if Virginia reduced carbon pollution by embracing energy efficiency and clean energy, households could save a yearly average of $415. Adoption of strong customer energy efficiency improvement standards benefits all customers, but especially those with low or moderate incomes. According to the Solar Foundation's 2017 Solar Job Census, Virginia could create over 50,000 new solar energy jobs. But that's if we adopt solar-friendly policies, sufficient to meet just 10% of residential electric load over the next five years. In 2017, Virginia already boasted 3565 jobs in the solar industry - already triple that of coal mining. In southwest Virginia we desperately need clean energy jobs to replace lost coal employment. But Virginia's utilities quietly thwart pro-clean energy policies and job growth. A current example is legislation that would allow power purchase agreements to finance and install solar facilities, but the bill excludes all residential, commercial and industrial customers. Only non-profit organizations would benefit. We have the resources to make clean energy bloom in southwest Virginia--a ready workforce of trained solar technicians graduating from our community colleges and a healthy number of experienced building contractors; developable unreclaimed mine lands and rural electric infrastructure orphaned by the coal industry; and communities accustomed to living alongside the energy industry. These resources offer prime opportunity for both dispersed and utility-scale solar development and employment right here. Systematically cutting carbon pollution cuts toxic pollutants from electric generating stations as well, offering a dividend in public health improvements. Enhanced public health makes the case for a program of utility carbon reductions by itself. A healthy carbon-cutting program also keeps physically vulnerable Virginians healthy. A strong carbon reduction program for Virginia, shows that we are doing our part to slow the ravages of sea level rise, storm volume and intensity, drought, heat wave, habitat loss, and disease spread, all of which are the marks of a changing climate.	
15. Pam Clough, Environment Virginia	I am concerned about climate change because it threatens our environment and health. My family and friends have experienced extreme weather events that were likely made worse by climate change. Though this is a national and global problem, change starts at home. I support setting the strongest possible standard to cut	Support for the proposal is appreciated. The commenter's concerns about climate change and discussion of the health benefits of RGGI are well

Commenter	Comment	Agency response
	Virginia emissions from power plants and join RGGI, the most successful regional climate and clean energy program in the country. We can work across party lines to cut pollution and protect our climate while the federal government stalls on climate action. RGGI states have seen pollution decrease by half since 2005 and consumers have saved over $773 million on their energy bills. I request that DEQ adopt and implement a final standard that cuts carbon pollution as quickly and as soon as possible. The 2020 base year cap should be 30-32 million tons with a baseline at the lower end of that range. The cap trajectory should parallel the model that other states in RGGI have implemented to reduce emissions 30% by 2030. The cap should incorporate all planned renewable energy developments in Virginia. The program should set the expectation of continued annual carbon pollution reductions after 2030. Virginia's baseline should also account for the state's untapped energy efficiency potential and incorporate savings that can reasonably be achieved between now and 2020. The American Council for an Energy Efficient Economy ranked Virginia 29th in its most recent State Energy Efficiency Scorecard, placing Virginia well behind all of the RGGI states. Global warming is exacerbating pollution and harming our health. In 2015 Roanoke residents breathed elevated levels of smog pollution 31 days out the year. Residents in the RGGI states are living longer and healthier lives thanks to cleaner air. The program is estimated to have saved 600 lives and prevented 9,000 asthma attacks in 6 years. An Abt Associates report shows that Virginia has already secured $380 million worth of health benefits because pollution across the region has gone down. Virginia's participation would significantly reduce pollution even further, accelerating the health benefits we have already seen.	taken. Specific issues identified by the commenter are discussed in further detail below.
16. Drema Khraibani, Hannah Funk, Lindsey Mendelson; Environment Virginia	Climate change poses increasing threats to Virginians' environment and health. In 2015 residents of northern Virginia breathed elevated levels of smog pollution 99 days out the year. Smoggy skies are expected to grow worse as temperatures rise. This means that we can anticipate more code red days and asthma attacks. The blacklegged tick that can transmit Lyme disease is expanding its presence in Virginia and reported cases of Lyme disease are on the rise. As noted in the Executive Directive, rising storm surges and flooding could impact as many as 420,000 properties along Virginia's coast that would require $92 billion of reconstruction costs. These health concerns can be prevented if we join RGGI. Residents in the 9 member states are living longer and healthier lives thanks to less pollution and cleaner air. The program has been estimated to have	Support for the proposal is appreciated. The commenter's concerns about health issues are well taken. Specific issues identified by the commenter are discussed in further detail below.

Commenter	Comment	Agency response
	saved 600 lives and prevented 9,000 asthma attacks in just 6 years. Because of the health benefits and the many climate impacts this program can provide our state, the strongest possible standard should be set to cut Virginia emissions from power plants and join the region's market of capping and reducing emissions. I implore you to set the 2020 base year emissions cap to be 30-32 million tons with a baseline at the lower end of that range. This cap should mirror the cap that states in RGGI are taking to reduce emissions 30% by 2030. The rule should set the expectation that carbon pollution will continue to be reduced after 2030, and take into account Virginia's untapped energy efficiency potential and all planned renewable energy developments in Virginia. If Virginia links with RGGI, it would be tied to the most successful regional climate and clean energy program in the country. As we have seen across northeast and mid-Atlantic states, we can work together across party lines to cut pollution, clean our air, and protect our climate while the federal government stalls on climate action. RGGI states have seen their pollution decrease in half since 2005, generated $2.7 billion in revenue, and saved consumers $773 million on the energy bills by directly auctioning their emissions. If Virginia follows a similar model it would generate $2 billion that it could use for clean energy, energy efficiency, and coastal resilience programs.	
17. Dr. Kathleen Price and Dr. Samantha Ahdoot, Virginia Clinicians for Climate Action	Patients with Lyme disease suffer from pain and inflammation in their joints, facial nerve palsies, heart arrhythmias, and chronic fatigue. Sometimes even with antibiotics, they do not recover completely. Warmer winters and earlier springs create favorable environments for tick and mosquito survival, reproduction and disease transmission. As a result, tick-borne infections across the country are soaring, including in Virginia. Between 2006-16, cases of Lyme disease increased in Virginia over 3 fold. Other tick-borne illnesses have increased, including Rocky Mountain Spotted Fever. Mosquito-borne illnesses such as West Nile Virus, and possibly Zika in the future are a threat as well. February 2017 was the warmest February on record for our state. In 2018 we had dramatic temperature anomalies, with numerous days reaching 60-80 degrees. Early onset of spring warmth causes many trees and flowers to start blooming earlier and brings earlier onset to the allergy and asthma season. According to pollen count data, the tree pollen season in Richmond is now peaking one week earlier than it did in the 1980s and the peak tree pollen count is now over 50% higher. CO_2 acts as a fertilizer that makes many plants produce more	Support for the proposal is appreciated. The commenter's observations about health issues are well taken. Specific issues identified by the commenter are discussed in further detail below.

Commenter	Comment	Agency response
	pollen. Higher tree pollen increases ER and urgent care visits for allergies. As a result of decreasing air pollution, RGGI states have prevented up to 800 premature deaths and 390 non-fatal heart attacks. Policy that protects our air protects our health, and saves the public and the government money that otherwise goes to healthcare. RGGI states have avoided between $3-8 Billion in health effects costs. By participating in RGGI, Virginia can reduce the carbon pollution that is causing these changes in our climate, natural world and health. RGGI would also enable Virginia to reduce other air pollutants that threaten public health. As a result of decreased particulate matter, RGGI states have prevented 8000-9000 asthma attacks, over 200 asthma ER visits and 400-500 cases of acute bronchitis. I support the strongest possible standard to cut carbon emissions through participation in a carbon market. I ask DEQ to use its authority to adopt and implement a standard that caps and reduces carbon pollution as fast as possible. The 2020 cap should be between 30-32 million tons. The cap should include carbon pollution from biomass facilities which can be more climate-polluting than fossil fuel power. DEQ should monitor implementation so that it can rectify instances of communities being disproportionally affected by pollution.	
18. Dr. Douglas Hendren, Physicians for Social Responsibility	RGGI makes good medical sense as well as business sense for Virginians. Sourcing our energy from dirty sources carries very high costs. Abt Associates has analyzed the public health impacts of RGGI over a 5-year period, finding hundreds of avoided premature adult deaths, hundreds of avoided heart attacks, thousands of avoided asthmatic episodes, hundreds of emergency room visits and hospital admissions, tens of thousands of lost work days, and savings of $3-8.3 billion. Fossil-fuel energy imposes many hidden costs on Virginians. It shortens our lives and sickens our children. It fouls our air, congests our emergency rooms and raises our medical bills. Changes in the atmosphere have brought higher oceans and violent storms threatening coastal cities. The cost to the U.S. of extreme weather events in 2017 came to $306 billion. Virginians cannot afford to be held hostage by the fossil-fuel sector and their political operatives. It is time to make policy decisions based on scientific assessment and common sense. I support setting the strongest possible standards for cutting Virginia emissions, including an initial cap of 30 million tons, with periodic downward adjustment; continuation of the program after 2030, unless superseded by a carbon tax; no exclusion for biomass plants; and no exclusion for methane. Natural gas is worse for our health and for global warming than burning coal. Nearly all of our	Support for the proposal is appreciated. The commenter's observations about health issues are well taken. The commenter's concerns about methane are acknowledged; however, as the specific purpose of this regulation is to enable linking to RGGI, methane is not addressed in this regulation. Specific issues identified by the commenter are discussed in further detail below.

Commenter	Comment	Agency response
	natural gas is obtained by fracking, which virtually all independent studies have found is associated with a greater than 5% rate of fugitive methane emissions. This makes gas worse than coal with regard to GHG emissions.	
19. Roy Hoagland	Referencing Virginia Clinicians for Climate Action information: Clinicians across the state support linking with RGGI. ED 11 will help protect the health of Virginias while also saving money for the state and taxpayers. Summary of cumulative RGGI health benefits, 2009-2014, avoided health effects: 300-830 premature adult deaths, 35-390 non-fatal heart attacks, 420-510 cases of acute bronchitis, 8200-9900 asthma exacerbations, 13,000-16,000 respiratory symptoms, 180-220 hospital admissions, 200-230 asthma ER visits, 39,000-47,000 lost work days, 240,000-280,000 days of minor restricted activity. Value of avoided health effects between $3-$8.3 billion.	The information provided by the commenter is acknowledged.
20. Deborah Kushner	I'm proud to celebrate Virginia's position as the first southern state to consider joining the RGGI. Not only would overall pollution levels decline, but new clean energy jobs would help the labor sector and we would have a new funding source for energy improvements and assistance for low-income customers. Joining RGGI means the road map for Virginia is already in place. RGGI has proven successful in cutting emissions without costing too much. Emissions from power plants in RGGI states fell 5% from 2015 to 2016, and have fallen 40% from 2008, when the initiative began. I urge DEQ to adopt a much lower cap than the 33-34 million that's proposed. We need to clean air quickly, and Virginia's emissions are already very close to the 33-34 figure. All sources of carbon emissions should be included in calculations. Biomass should be included, since 3 coal powered power plants have already been converted to burn wood, and we cannot afford to have others follow suit. Our forests are being harvested at an alarming rate to produce wood pellets and shipped overseas. The Partnership for Policy Integrity calls biomass "the new coal." Wood burning power plants are estimated to put 50% more carbon into the atmosphere than coal burning plants, per megawatt hour. Wood is not carbon neutral, since regrowing forests is anything but quick. Additionally, the plan should continue past 2030.	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.
21. Michael Keegan	The plan should cap and reduce carbon pollution as rapidly as possible, beginning as soon as possible. We are already way behind where we need to be. Based on starting as quickly as possible, the base year should be 2019 and the base year emissions cap should be 20 million tons. The plan should cover carbon pollution from all power plants including from biomass facilities, which can be more climate polluting than fossil fuel power plants. The plan should continue annual carbon pollution reductions in Virginia after 2030. The plan should allow for closely monitoring the implementation in order to	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.

Commenter	Comment	Agency response
	respond to instances of disproportionate environmental burdens experienced by any communities, especially low-income and vulnerable communities that have traditionally borne the brunt of pollution.	
22. Kiquanda Baker	I ask that the regulations be set at a realistic yet aggressive limit in order for these regulations to have the desired impact on GHG emissions. It is a proven fact that climate change exists and that humans are the main perpetrators. The practices that have led us to this point should be discontinued. Obviously we can't shut every fossil fuel dependent industry down, but we can cut back. The regulation is essential in pioneering the clean energy transition in Virginia. The cap should be set at least between 30-32 million tons. Biomass emissions should be included because it is a fuel source more unclean than fossil fuels. Decreasing our contribution to global warming and thermal expansion would help alleviate sea level rise in Hampton Roads while we continue to create solutions for resiliency. By embracing clean and renewable energy, Virginia can mitigate the negative impacts of burning fossil fuels while boosting the economy. With low income families and communities of color being the most vulnerable to fossil fuel pollutants and the effects of climate change, we need clean energy sources that benefit all people.	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.
23. Garry Harris, Center for Sustainable Communities	We demand healthy communities and a healthy economy, where workers receive the good-paying, family sustaining clean energy jobs, and their livelihoods are protected in the meantime. There is no reason those jobs can't grow right here, and this legislation offers a path to do so. We have worked for years to help lower income communities reduce energy burdens caused by disproportionate impacts of electricity costs and its effects on the quality of life, creating choices between food, energy, and housing adequacy. ED-11 protects the health of families and communities by curbing carbon pollution that has shown to have a direct link with enhancing climate change and is exacerbating extreme weather events. On a personal note, I have to take asthma medication on a daily basis. Implementing ED 11 will reduce harmful pollutants that contribute to dangerous smog and soot, causing heart attacks, respiratory illnesses, and even premature deaths. Virginia is the first southern state to take initiative on limiting and capping carbon pollution from fossil fuel power plants. We can take pride pushing to have energy companies take responsibility for toxic emissions that are damaging the health and environment of our communities at a time when the federal government is dismantling regulations that protect us from corporate polluters. Burning coal releases harmful toxins into the air and water, causing respiratory illnesses like asthma. RGGI states, by reducing toxic emissions and switching to cleaner energy, have	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.

Commenter	Comment	Agency response
	successfully prevents 8,200 asthma attacks and saved 300 to 830 lives, in a five year period. The starting cap should be between 30 and 32 million tons of emissions by 2020 and continued reduction of the cap beyond 2030. Another significant polluter is biomass; biomass GHG emissions are higher than those from burning fossil fuels. ED 11 contains a woody biomass loophole, which exempts woody biomass plants from the regulation. Such giveaways to industrial polluters render Virginia's program less efficient and give Dominion an unfair economic advantage. Carbon reduction plans have vast potential to reduce climate changing, harmful emissions and expand the economy. Between 2009-14, RGGI states have successfully reduced CO_2 emissions by 35% (compared to 12% in non-RGGI states) by switching from dirty fossil fuels to clean energy. Additionally, the region saw a 21.1% economic growth (compared to 18.2% in non-RGGI states). Virginia's decision to cap carbon emissions through a market-based approach offers a great opportunity to improve the livelihood and health of low-income families and communities of color who are most vulnerable to climate change and dirty fossil fuel pollutants. ED 11 should ensure that there are emission reductions in environmental justice communities and that there is a mechanism that ensures reductions of GHG co-pollutant emissions by facilities located in or near environmental justice neighborhoods.	
24. Kiquanda Baker, Garry Harris	In 2016, the number of solar jobs in Virginia increased by 65%. If the state received 10% of its power from the sun by 2023, Virginia would see over 50,400 more jobs. Virginia's coasts can support offshore wind turbines. Renewable offshore wind energy would produce clean energy and protect the coast from catastrophic oil and gas spills that threaten fish, tourism, and recreation. The wind industry could provide 1.5 times more jobs that offshore oil and gas, creating almost 14,000 offshore wind jobs and 5,000 manufacturing jobs by 2030.	The commenters' views on renewable energy are appreciated.
25. Joy Loving and Anne Nielsen, Climate Action Alliance of the Valley	Overall, this is a good regulation. It will lower Virginia's carbon emissions below what we would emit without this rule, and do it in a way that is efficient and cost effective. Virginia can reduce carbon emissions while also reducing energy costs. Linking Virginia with RGGI allows Virginia to join other RGGI states in a program with a proven track record of success in reducing carbon emissions while allowing our economy to grow. The member states of RGGI are serious about lowering their carbon emissions and would not allow Virginia to link with them if they didn't believe it would be good for them and also lower overall emissions. By linking to these RGGI states, Virginia will need to coordinate with them to	Support for the proposal is appreciated. Note that it is not possible to conduct both a consignment auction and a direct auction at the same time, and the rule will continue to implement the consignment approach while allowing for future potential participation in a conventional auction. The commenters' concerns about methane are

Commenter	Comment	Agency response
	not only lower our own carbon emissions, but also to ensure that member RGGI states continue to lower their carbon emissions and maintain funding for their renewable energy and energy efficiency initiatives. Unless prohibited under Virginia law, DEQ should directly auction carbon allowances, in addition to the proposed consignment format. This approach should allow market forces to operate more effectively. Distribute allowances based on energy output, not historic carbon emissions. The initial cap should be 30-32 million tons. Allowing emissions to increase makes no sense. If allowances are given to power plants based on historic carbon emissions, it will still achieve the goal of carbon emission reductions. But it will not provide a new source of income to zero-carbon energy generators. Instead, allowances should be distributed based on updated energy output. This method gives some allowances to zero-carbon energy sources, who can sell the allowances as a new source of revenue. Do not exempt any fossil fuel power generating unit owned by and located at an individual facility that generates electricity and heat from fossil fuel for the primary use of operation of the facility. Do not exempt power plants that use biofuels. The climate responds to all CO_2 molecules, regardless of their origin. Excluding biofuels would give the power industry an incentive to cut down trees to burn in power plants to avoid buying carbon allowances. Even though RGGI states exempt biofuels, Virginia has many wood-based biofuel generators. DEQ should not read the language of ED 11 too narrowly when it is clear that the impetus behind its issuance is to reduce GHG emissions. Methane, a powerful GHG about 25 times more potent than CO_2, accounts for 9% of all U.S. GHG emissions, and almost one-third of that is estimated to come from oil and gas operations. DEQ should interpret ED 11 broadly so as to bring about as much reduction in GHG pollution as possible. The fact that the other RGGI states do not include methane does not prevent Virginia from doing so. Even if exact numbers beyond 2030 are not now known, the regulation needs language that the cap will not increase going forward. Virginia's citizens, agencies and businesses need to know what to expect for their planning purposes. If the regulation leaves open the possibility that the cap will go away or be relaxed, different long-term plans would surely result. The regulation should require close monitoring of implementation to respond to instances of disproportionate environmental burdens experienced by	acknowledged; however, as the specific purpose of this regulation is to enable linking to RGGI, methane is not addressed in this regulation. Additional specific issues identified by the commenter are discussed in further detail below.

Commenter	Comment	Agency response
	any communities, particularly low-income and vulnerable communities that have traditionally borne the brunt of pollution.	
26. April Moore	The regulations will be extremely important in reining in climate-damaging emissions from fossil fuel-burning power plants. With more than 99% of climate scientists around the world warning that we must get our CO_2 emissions down. Linking Virginia to RGGI is a smart, effective way to significantly reduce GHG emissions. The cap-and-trade approach relies on the free market to do what it does well, with a minimum of government involvement. We know that a cap-and-trade approach works. The RGGI states that are using it have already reduced their power plant carbon emissions by 30% since they adopted cap-and-trade in 2008. And during that time, the economies of these states have increased faster than those of the rest of the country. RGGI states have also lowered their average electricity rates by 3.4%, while the rest of the country's rates have increased by an average of 7.2%. The regulation should include a strong incentive for forest carbon offsets. Because trees take in CO_2 during photosynthesis, they sequester carbon in wood, roots, and soil. Trees are the best technology yet discovered for carbon capture and storage. In fact, scientists rank forests as the single best climate change solution. Some cap and trade programs include forest carbon offsets as a mechanism for transferring money from fossil fuel-burning utilities to forest owners as an incentive to manage their forests for increased carbon sequestration instead of timbering. Given that 62% of Virginia is forested, Virginia should follow the example of cap-and-trade programs that include forest carbon offset credits.	Support for the proposal is appreciated. Although the RGGI model rule does offer states the option to award offset allowances for projects outside of the electric power generation sector, only a single offset project has been implemented in the entire RGGI region since the program's inception. Given the uncertainty of any benefits associated with a complex offset program, DEQ will not, at this time, implement the offset option. However, DEQ does intend to recognize offset allowances generated in other RGGI states in accordance with the RGGI Model Rule, and the proposal has been amended accordingly. The issue of whether or not to implement offsets in Virginia may be addressed in ongoing program reviews.
27. Kim Hafner	We are grateful to DEQ for taking measures to save our lives by enforcing strict regulations on carbon emissions, and by creating a cap and trade initiative which will protect the environment and public health. Legislation that will lead us toward 100% renewable, sustainable energy is our best hope. The initial base budget should be 33 million tons or less and decline 3% per year. Methane should be capped. Nothing that is being proposed is actually stringent enough based on the dangers incurred by daily carbon emissions. No fossil fuel power generating unit owned by an individual facility and located at that individual facility that generates electricity and heat from fossil fuel for the primary use of operation of the facility should be exempt. DEQ should be allowed to directly auction carbon allowances in addition to the proposed consignment auction format. On our small family farm, we are working to sequester carbon by planting trees, and by perennially keeping our pasture in grass. Soil that has higher amounts of carbon as a result of such sequestration holds moisture better	The commenter's concerns about methane are acknowledged; however, as the specific purpose of this regulation is to enable linking to RGGI, methane and natural gas are not addressed in this regulation. As discussed in comment 28, for example, cap-and-trade programs in general, and RGGI in particular, are proven effective emissions reduction programs.

Commenter	Comment	Agency response
	and lessens the ground's susceptibility to drought. Soil that has sequestered carbon also has green growth that helps the earth maintain lower temperatures. How might we reward farmers for farming practices which lower carbon emissions by sequestering the carbon in similar ways? It is imperative that you establish an aggressive carbon reduction program. Ideally, this would mean bypassing natural gas and all fracking extraction and transitioning directly to renewable energy. While cap and trade initiatives are positive in that they move us away from coal, they are dangerous compromises. None of us knows if the strictest regulations on carbon will be enough to mitigate the damage that we've done in time to make a significant difference, but we do know that compromises like the RGGI cap and trade, which encourages and rewards fracking, will only guarantee more suffering. In a burning building, there is no time to agree we can try buckets when all that can save us is a fire hose.	
28. Jennie Moody	For 30 years I was engaged in research tracing anthropogenic chemical signatures in the atmosphere, using observations of precipitation, aerosols, and atmospheric gases like ozone to study how pollutants are transported. Working at the University of Virginia, I evaluated the origins of sulfur and nitrogen in Charlottesville precipitation, using meteorological data and atmospheric transport models and was able to establish that higher concentrations of sulfate were associated with atmospheric transport. I am proud to think that this work, along with work I did on my Ph.D. may have contributed in some small but tangible way to the successful cap and trade program instituted by the Clean Air Act that reduced precipitation acidity by reducing atmospheric sulfates. Research published with colleagues at the University of Virginia illustrates that sulfate concentrations dropped substantially, as much as 85% from 1980 to 2009 measuring sulfate concentrations in precipitation and aerosols downwind of North America. This is simply to say, cap and trade works, we can lower emissions and their environmental impact. I support DEQ in the position of being the first southern state to formulate a program to encourage the reduction of CO_2 emissions. Since 1978 we have seen a 70 ppm concentration increase from 335 to 405 ppm. The proposal to cap carbon emissions in Virginia is a positive step toward reducing the atmospheric concentration of CO_2. Because the concentration of atmospheric methane has also been increasing, and methane contributes significantly to the aggregate GHG index, transitioning to energy sources that result in higher fugitive methane emissions are less desirable than transitioning to zero-	Support for the proposal is appreciated. DEQ agrees that emissions trading programs are a demonstrated, effective means of controlling air pollution.

Commenter	Comment	Agency response
	carbon energy sources. Despite concerns regarding methane, I support a statewide declining cap from 2020-30. Capping CO_2 from Virginia fossil-fuel fired electric generating facilities should allow for the pursuit of multiple pathways to attain lower emissions. A carbon trading market force that creates incentives for energy efficiency and development of zero-emission renewable energy sources would be a positive step forward. However, setting the baseline emission cap below 33 MT should be explored. It is important that models reflect the impact of proposed fossil fuel retirements and account for proposed renewable projects or energy efficiency gains that will be realized on or before 2020. Virginia's participation in RGGI, along with the reentry of New Jersey, means that 20% of the 50 states are creating incentives to lower CO_2 emissions. The implementation of this program should have enhanced benefits, including air quality improvements beyond CO_2 particularly to the extent that present fossil fuel generation is replaced by zero-carbon renewable sources like wind and solar.	
29. Randall Freed, Citizens Climate Lobby (CCL)	Virginia's GHG profile is like most other states, in that by far the biggest source is burning fossil fuels. The best way in the long run to reduce emissions is to introduce a carbon fee-and-dividend approach where we put a fee on carbon in fuels, and refund the money directly to households as a dividend. CCL advocates for this approach. In the short run, the most cost-effective and straightforward way to reduce our emissions is to focus on power plants. The RGGI system works--it reduces millions of tons of emissions per year without harming states' economies. Joining RGGI will provide a clear path for utilities to invest in a way that protects ratepayers and the environment. Most of the RGGI states use these revenues for energy efficiency programs or technology upgrades. The Grid Transformation and Security Act will create a structure for Dominion and Appalachian Power to invest $1 billion in efficiency programs over the next decade. It commits those utilities to make 5,000 MW in solar, wind, and grid technology upgrades, and provides a financial mechanism to recoup costs. Instead of plowing allowance money back to the utilities, let's demonstrate how a fee-and-dividend approach works, where environmental fees from sales of allowances get distributed evenly to all households. This approach, which CCL advocates for an economy-wide carbon fee and dividend, offers the best long-term solution.	Support for the proposal is appreciated. Virginia's utilities are regulated by the SCC, which ensures that ratepayers are protected. The primary purpose of the regulation is to address carbon pollution via linking to RGGI in accordance with ED 11; therefore, no fee-and-dividend approach is being considered under this regulatory action.
30. Ivy Main, Virginia Chapter of the Sierra Club	Putting Virginia on a carbon diet opens up opportunities for the growth of Virginia businesses that develop carbon-free renewable energy or that reduce energy use. The more we displace fossil fuels that emit carbon, like coal and fracked gas, the more room we make for wind	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.

Commenter	Comment	Agency response
	and solar, and the more we reward energy efficiency. The timing is ideal. Solar is now the cheapest form of energy in Virginia, and offshore wind is maturing into a powerhouse industry. DEQ proposes to begin our carbon diet in 2020 from a baseline of 33-34 million tons of CO_2. That makes 3% annual reductions less difficult than if we start from a lower baseline. However, modeling suggests a more realistic baseline would be 30-32 million tons. We should use this lower baseline to send the right signal to our market participants. We don't want our utilities to bulk up on carbon between now and 2020, when our carbon diet begins. We want them to start putting healthier practices in place now, so by 2020 they have already begun shedding carbon by employing renewable energy and energy efficiency. Another way to cheat on a diet is to kid yourself about what you're consuming. Burning biomass is the empty calories of the renewable energy sector. Unlike wind and solar, biomass emits carbon pollution, more than coal. Dominion went down a blind alley with biomass, thinking it could meet renewable energy goals while burning stuff. That's bad for Virginia forests, the health of residents, the wind and solar industries and the climate. When you put CO_2 into the atmosphere by burning trees, it doesn't do the planet any good to pretend it's carbon neutral. DEQ also proposes to exclude sources of carbon pollution under 25 MW. That's consistent with RGGI, but the exclusion should minimize the incentive for generators to structure operations in a way that will use this exemption. In conclusion, I commend DEQ for developing this carbon diet, and encourage you to make it rigorous.	
31. Earle Mitchell	It is commendable that the board is addressing the problem of burning of dirty fossil fuels to generate electricity. RGGI auctions generate proceeds, which participating states are able to invest in energy and consumer benefit programs. Programs funded have included energy efficiency, clean and renewable energy, GHG abatement, and direct bill assistance. Virginia could allocate some of these proceeds directly to the southwestern part of our state to provide economic development, education and workforce training to those who have been affected by the decline of coal production. Since RGGI started those participating have realized $ 2.3 Billon in lifetime energy bill savings, 9 million MWh of electricity use avoided and 5.3 million tons of CO_2 emissions avoided. Through 2015, $40.4 million has been returned to consumers through rebates. Rather than suppressing economic growth the participating states have outpaced the remainder of the U.S. during the time that RGGI has been operating. RGGI provides technical and administrative services to all participating states; it is a non-profit organization.	Support for the proposal and the commenter's discussion of RGGI are appreciated. Specific disproportionately affected community issues are discussed in the response to comment 55.

Commenter	Comment	Agency response
	There is no glory in re-inventing the wheel when other states have already done much research and have come up with a workable, cost effective system that will clean the air and add good paying jobs at the same time. We in Virginia have already embraced a cooperative structure in that we belong to the PJM system. The function of PJM is to coordinate the movement of wholesale electricity in 13 states. Note the similarity of PJM and RGGI: two organizations working for the common good of the participants. From a humanitarian standpoint we need to confront a truth that has not been adequately addressed. The Journal of the American Medical Association published a report which states that miners working in the Appalachian coal country are now experiencing the highest levels of black lung disease that have ever been reported. We need to phase out coal as soon as possible.	
32. 301 emails sponsored by the National Wildlife Federation	Thank you for taking steps to create a new carbon market in our state with the potential to link to RGGI and make Virginia a national leader in confronting the threat of a changing climate. Virginia communities and wildlife are already on the frontlines of a changing climate, and impacts like extreme weather and sea level rise are only expected to get worse, unless we act now. Wildlife like the Carolina northern flying squirrel need your help. This endangered species is now living on "sky-islands" on nine isolated mountain peaks in the southern Appalachians. The impacts of a changing climate threaten this special species' last remaining strongholds in the state. CO_2 pollution is the leading cause of climate change, which is already fueling phenomena like massive storms, floods, and megafires. It is critical that we reduce this pollution as quickly as possible. By creating a carbon market and linking to RGGI, we can use a proven, effective market-based solution to reduce carbon pollution from the power sector while generating revenue at the same time. This revenue can then be invested in additional climate solutions such as energy efficiency measures and renewable energy. My family, our wildlife, and our environment desperately need effective solutions from the growing threat of climate change. It is your duty to protect us, so please do everything you can to make our state a leader in climate action and carbon markets.	Support for the proposal is appreciated. The commenters' concerns are well taken.
33. Tyler Privott	I am in favor of passing this regulation. However, I wanted to point out some information that the DEQ failed to utilize in their models when coming up with a cap of 33-34 million tons. This information, if implemented, would further reduce the proposed cap below 33 million tons. To start, the models did not accurately depict the amount of current solar power and amount of future solar power used in Virginia. The state already has more than 360 MW of solar power, even though the model used a	Modeling is a decisionmaking tool that captures a set of information at a certain point in time. Assumptions and inputs that are used to develop a model can vary infinitely; therefore, it is important that every effort

Commenter	Comment	Agency response
	current estimate of 274 MW. In addition, the model used to calculate a reasonable cap had an extremely slow growth rate for solar energy in Virginia; however, the amount of solar energy in queue for the next few years will increase the total output by at least 1000 MW, including a 500 MW plant that is being built in Spotsylvania. In addition, DEQ assumes a growth rate in electricity demand of 1.9-3%, but the expected demand growth over the next 15 years is only roughly 1%. Also, DEQ is using information that power plant CO_2 emissions have been overall increasing since 2012. 2012 was an anomaly in terms of weather, with a relatively warm winter and cool summer, which means the overall energy consumption would be low compared to other years; therefore, the total power plant CO_2 emissions would be lower relative to neighboring years. Virginia has also reduced the amount of electricity imports from other states by creating more power plants in the state; because of this, Virginia is now responsible for these emissions since the electricity was made in-state versus out-of-state, which would result in skewed data and growth. Either new models should be created or the regulation should include a lower cap than 33 million tons.	be made to make them as reasonable and accurate as possible for the time period under consideration. In order to accomplish this goal, DEQ availed itself of modeling expertise provided by the Georgetown Climate Center. The assumptions provided by DEQ were based on reference cases obtained directly from RGGI, coupled with adjustments made for specific Virginia circumstances. The load growth and renewable energy projections provided were the best available information at the time the models were developed. Since the regulatory action was initiated, other modeling and forecasting exercises have been undertaken by a variety of parties, including DEQ, using updated data. It is important to note that the implementation of the 2018 Grid Transformation and Security Act (see response to comment 51) was one of several factors pointing to the need for additional modeling based on new circumstances. 28 million tons has been chosen for the base year cap based on new modeling data performed for DEQ by the Georgetown Climate Center as well as public input; see response to 37 for additional detail. Given the fluid nature of modeling, it is important to note that additional modeling will be performed by RGGI in concert with

Commenter	Comment	Agency response
		Virginia as the program progresses in order to assure that the program is operating properly and meeting its goals. Virginia also has the capability to conduct modeling at any time if needed.
34. Mike Sandler, Carbon Share	It is society's responsibility to pass along a livable planet to the next generation. Climate change is a dangerous threat to health, the environment, agriculture, the economy, and national security. Auctioning is important because we have seen in other carbon trading programs the tendency to overallocate permits, leaving the price at the minimum. In RGGI's case, power plants switched from coal to natural gas, leaving the program overallocated and the permit price at $2/ton. In the next 10 years, solar and battery storage will undercut the business as usual case, and make current baselines obsolete. This can be partially remedied with an escalating price floor on the permit price (what California did), but auctioning 100% of permits is better because it lets the market determine the impact of innovation on the permit price. DEQ should study how a "consigned auction" differs from a non-consigned auction. Is the purpose of the consignment to protect the companies from the price signal? A climate dividend is important. Some environmental groups would prefer revenues to be used to invest in solar and wind technologies. But this is the people's money. If companies are going to have to buy permits to pollute, that money belongs to all of us. An equal per capita dividend addresses the regressive impacts of the carbon price on low-income households, and encourages support for the program. In an age of economic inequality, a climate dividend could unify the public to fight climate change. A climate dividend could become part of a basic income, addressing unemployment and social justice aspects. In addition to a price floor on permits, DEQ should consider limiting or banning offsets. There should be no exemption for onsite fossil fuel plants. Virginia should adopt its own cap and rules before joining RGGI. Once in RGGI, it may be difficult to change. I have heard that many RGGI states would prefer a tighter cap but are unable to get consensus. Virginia’s cap should be less than 33 million tons. Virginia should look at an economy-wide cap, not just on the electricity sector. A good first step would be joining the Transportation and Climate Initiative (TCI). Finally, the Department of Mines, Minerals and Energy should change its name to the Department of Sustainable Energy.	Support for the proposal is appreciated. The primary purpose of the regulation is to address carbon pollution via linking to RGGI in accordance with ED 11; therefore, no fee-and-dividend approach is being considered under this regulatory action. See the response to comment 65 for a discussion of the industrial exemption. As discussed in the response to comment 26, DEQ will not implement the offset option although offset allowances from other RGGI states will be recognized. See the response to comment 37 for a discussion of the cap.

Commenter	Comment	Agency response
35. Mark Belleville	I am a professor at the Appalachian School of Law, and I teach energy related courses. I strongly support efforts to create an trading-ready GHG emission reduction program for new and existing power plants, with the goal of joining RGGI. It has been 30 years since James Hansen testified before the Senate on the risks of climate change, 26 years since the UN Framework Convention on Climate Change, 11 years the Supreme Court handed down Massachusetts v. EPA, and 5 years since President Obama's Climate Action Plan and we still have no federal law or rule addressing the emission of GHGs like CO_2 and methane. Into that void, states must step. There are many ways to internalize the externalities associated with emitting GHGs; while the RGGI program may not be my first choice, it has grown to work fairly well. One of the benefits Virginia enjoys in entering RGGI at this stage is that it has some empirical data on which to judge the program's efficacy and its fit with Virginia's goals and policies. I'd like to point out some features of the RGGI program that should help inform Virginia's decision, most of which weigh in favor of joining. The serious design flaw of the RGGI program was an initial overallocation of allowances. The spread between allowances and actual emissions was exacerbated by a decrease in energy consumption caused by the economic downturn, the displacement of coal by newly available cheap natural gas, and increased renewable energy deployments. This overallocation led to floor-level prices for allowances, and the absence of a robust trading program. The allowance auctions operated as a small carbon tax, an expense that utilities and their customers barely noticed. This problem has been addressed. By retiring a number of allowances and setting new reduced cap levels, the program is in a position to effectuate behavioral changes to the tune of a 3% reduction from current levels each year going forward. While the price of allowances has risen, as it was designed to do, it is still fairly low compared to other cap-and-trade programs around the globe, and mechanisms exist to prevent it from rising too much. Even as the overallocation caused depressed allowance prices, the program has always been successful at raising revenue for the participating states. More than 90% of the allowances have been auctioned off, raising nearly $3 billion for participating states. While it is for member states to decide on how to allocate allowances and spend proceeds, all states have auctioned the bulk of their allowances and utilize the bulk of the proceeds on energy efficiency, clean and renewable energy, and direct bill assistance. Thus, even if the allowance prices were not enough to change utility behavior, these	Support for the proposal is appreciated, as is the commenter's discussion of RGGI and Virginia issues. The commenter's concerns about the SCC's role in managing rates is well taken. SCC proceedings and audits are all public; this vertically integrated system is complemented by the RGGI program's open and transparent processes. All auction information is tracked and publically available. At the end of a compliance period, it will be possible to determine how many allowances were bought and sold, by whom, and at what price; based on this information one could then determine to what degree program costs are recoverable. DEQ is therefore confident that SCC's oversight role as well as the transparency of the complete process will ultimately protect Virginia's consumers.

Commenter	Comment	Agency response
	expenditures have helped contribute to not-insignificant emission reductions in member states. With 39 auctions behind it, the quarterly regional auctions are mature and seem to function today with little difficulty. The RGGI program applies only to fossil-fuel fired power plants >25 MW. While I would prefer to see greater coverage for broader industry, the limited scope should provide some comfort for policy-makers worried about a broadly negative economic impact. It is possible that the cap-and-trade program could be expanded beyond fossil-fuel power plants, as this has occurred in both California and Europe. The RGGI program has built in enough safeguards to avoid the demise of affordable electricity. It allows only a limited use of offsets. But it allows increasing use of offsets if the prices for allowances reach certain levels. The program allows unlimited banking of allowances, and has a 3-year, both of which help utilities accommodate fluctuating annual electricity demands. And it has a reserve price that will now rise 2.5% per year; this helps assure that the allowances are utilities hold continue to have value. One of the most serious challenges Virginia and RGGI will face is that most of the currently participating states have deregulated their electric utilities far more than Virginia has. I would focus my attention on how much the SCC will allow Dominion and APCo to pass on increased costs to its customers in the SCC-approved tariffs. I urge the rulemakers to be transparent with the public on this issue. As a rate payer, I am comfortable with a small rise in my electric rates associated with joining RGGI. But I also am aware that recent tax cuts have benefited the bottom line of both major Virginia electric utilities, and there is likely enough excess profit there to absorb the additional costs. I appreciate the Attorney General's opinion that this program is achievable under existing law. There will be serious and plausible litigation over Virginia's attempt to effectuate this change without the General Assembly's involvement. The General Assembly will need to pass legislation to determine how allowances are allocated and revenue spent. For this reason, I would urge DEQ and other involved agencies, as well as our delegates and senators, to work to provide explicit approval for this proposal. State leaders must be clear-eyed as to the sea-level and storm-surge threats facing Norfolk/Hampton Roads, including the naval base and export facilities. Hurricanes affecting mid-Atlantic states will continue to grow in frequency and intensity. Studies suggest degradation	

Commenter	Comment	Agency response
	and loss of economic value to the Chesapeake Bay, and loss of fish stock and forest productivity. While climate change is a global problem, self-interest and self-preservation should also motivate the state to reduce its emissions. This is a very good proposal, and I strongly support it.	
36. Coleman Dickerson	This regulation needs to be put in place, but not without some changes to the modeling process and general process of assumptions. The proposal grossly overestimates the projected growth in Virginia's future electricity consumption. This overestimation results from neglecting the strides the state has been making in increasing solar power, and neglecting the reduction of increasing electricity demand given a weakening stream of electricity imports. I insist that the projections for Virginia's future electricity demand be re-modeled and realistic expectations for this growth replace the 1.5% - 3% estimation given in the current report. Updating the models with more relevant and accurate information would support the 33 million ton cap versus the 34 million ton cap. Setting the cap at 33 million tons would provide a more accurate goal for the front end of this regulation's time allotment. Reaching the estimations for our 2030 cap is more feasible when the range between starting goal and ending goal is decreased.	See the response to comment 33 for a discussion of DEQ's modeling efforts and the response to comment 37 for further discussion of how the final cap was established.
37. Victoria Glasgow	While it is a step toward responsible GHG management, the proposed cap is higher than what we can meet under current projections. I urge DEQ to update its baseline scenario to reflect more realistic estimates. The current cap of 33 or 34 million tons CO_2 is based on the assumption that energy demand is going to increase at a rate of 1.9% and 3% for residential/industrial and commercial development. When including solar capacity, residential/industrial demand growth is under 1% for the next 15 years. Moreover, commercial demand is growing only because of the prevalence of server farms. The energy demand of these solar farms is covered by newly-installed solar. For example, a 500 MW plant has been proposed in Spotsylvania, and Microsoft has purchased more than half of the energy it will produce. Spotsylvania's 500 MW solar farm is projected to cut 1 million tons of CO_2 per year, so why is this already-planned projection not accounted for in the cap? Additionally, Dominion has 3 new natural gas plants that will displace coal plants and result in reduced emissions: another reason to lower the cap, since the plants will be able to provide the same amount of energy with lower emissions compared to coal. If DEQ keeps its baseline emissions too high, it inflates the cost of reaching the cap. DEQ should consider including ECR as part of the cap (9VAC5-140-6210) plus output-based allocation (9VAC5-140-6215). The cap should also start in 2019 to effectuate the Executive Order as soon as possible.	As can be seen from this and many other comments, a wide range of caps has been advocated. Recommendations ranged from a low of 20 million tons per year to a high of 37.5 million. Many recommendations fell within a range of 30-32 or 33-34. It has been determined that 28 million tons is the appropriate level for a starting base budget. This initial budget will enable the reduction of CO_2 while enabling Virginia's participation in RGGI to operate smoothly and effectively. Since the regulatory action was initiated, modeling and forecasting exercises beyond the department's original modeling have been undertaken by a variety of parties using updated data. Notably, modeling by NRDC using

Commenter	Comment	Agency response
		updated assumptions projects business-as-usual emissions of 28 million tons in 2020 (see comment 121), and NRDC recommended that the cap be set accordingly. As discussed elsewhere, implementation of the 2018 Grid Transformation and Security Act, which calls for significant utility energy efficiency and renewable energy initiatives from Virginia investment owned utilities, will further lower emissions beyond what was originally proposed. Additionally, new modeling was conducted with updated information on a business-as-usual basis for Virginia and the 9 RGGI states that indicated a cap of 28 million tons was achievable and reasonable; see the response to comment 33. Ultimately, the program needs a starting point, and, having reviewed the new information and considerable public input, DEQ believes that 28 million tons is a reasonable program starting point. More detail on how DEQ's modeling was performed is discussed in the response to comment 33. While DEQ expects to achieve steady emission reductions whatever the starting cap, the state also needs to balance that goal with the reality that there will always be a degree of uncertainty as to the composition and amount of emissions in the future that no model can accurately predict with certainty. Imposing a cap that is too stringent or too

Commenter	Comment	Agency response
		lenient will not help Virginia reach its goals, and DEQ believes the final cap strikes the proper balance. As discussed in greater detail elsewhere, RGGI routinely undergoes comprehensive, periodic reviews to consider program successes, impacts, and design elements. Caps can be modified as needed to ensure long-term program success, not only for RGGI but in the specific interests of the Commonwealth.
38. Chris Bolgiano	I support DEQ's cap and trade proposal as at least a first step to addressing climate change. However, it is so limited in scope that Governor Northam should issue a new Executive Order and expand state authority to address certain shortcomings. The irony of facilitating gas pipelines while promoting a cap and trade program for CO_2 is not lost on us. To avoid subverting addressing climate change, CO_2 equivalents should be calculated for net emissions impact of methane by fracked gas production and transport. These methane-CO_2 equivalents must be included in the CO_2 budgets and allowances, because utilities burning coal or oil will move to gas to claim lower CO_2 emissions. A program based only on CO_2 will stimulate fracking, gas transport, and pipelines. Methane is a greater climate danger than CO_2. The Attorney General has ruled that "The Board has the authority to establish a statewide cap on GHG emissions." GHGs include methane. As Bill McKibben says, moving from coal and oil to gas is like kicking OxyContin by taking up heroin. Fossil fuel utilities should pay for the privilege of damaging our environment and Virginia should apply those revenues toward climate solutions, as RGGI does. According to DEQ staff, "Unlike a conventional auction, such as the one RGGI manages, a consignment auction is revenue neutral, and will enable Virginia to link to RGGI while staying within the bounds of Virginia law." In addition, if Virginia law prohibits the return of auction revenues to the state, or if the General Assembly must approve revenue-positive auctions, then DEQ should outline the appropriate steps to overcome these obstacles, because RGGI states gain billions of dollars from auctions which are then used for climate solutions. The single most powerful natural climate solution is	The commenter's concerns about methane are acknowledged; however, as the specific purpose of this regulation is to enable linking to RGGI, methane and natural gas are not addressed in this regulation. As discussed in the response to comment 26, offsets will not be implemented at this time. Biomass is further discussed in the response to comment 67. For a detailed explanation of how the consignment auction will operate, see comment 136.

Commenter	Comment	Agency response
	forest conservation. Because trees take in CO_2 for as long as they live, which for most of the hardwoods that constitute the majority of Virginia's forests is at least four centuries, trees are the best technology for carbon capture and storage. Yet the proposal does not include forest carbon offset credits, which RGGI allows up to 3% of CO_2 emissions, and the California market allows up to 6%. Given that 62% of Virginia's land base is in forest, and most of that acreage is owned by more than 400,000 private individuals and families, this incentive would benefit all Virginians not only with climate change mitigation but also by long-term protection of water and air quality. To omit forest carbon offsets, and miss the opportunity to encourage retaining forests for the carbon they have already locked up and the amounts they would continue to sequester, would be a strategic mistake. Counting biomass as carbon neutral is another mistake. In a letter to Governor Cooper of North Carolina concerning the increase of biomass burning, more than 100 scientists stated: "Biomass plants emit more CO_2 emissions per unit of electricity than coal or gas plants. In addition, it releases harmful particulate matter and smog precursors.… Removing the CO_2 emitted from burning trees for electricity requires waiting decades to a century for trees to regrow. Forests in the U.S. South are logged at a rate four times that of South American rainforests. A 2016 study showed that logging reduced the potential of the U.S. forest carbon sink by approximately 35%. Increasing carbon sinks by way of forest conservation and restoration plays a significant role in emissions reduction." While logging residues give off CO_2 during decay, removing them for burning depletes soil by removing nutrients, degrading forest productivity including the regrowth of the trees supposed to balance emissions from burning. Whole trees are being harvested for pellets, an industry that has degraded forests in the southeast and is moving into Virginia. There is no mechanism to verify that trees regrow on site, and cutover forests are ripe for development. Even if trees do regrow on site, decades are required for such forests to capture and store as much CO_2 as was emitted by burning, and during that time CO_2 emissions will increase because trees can't grow fast enough to offset them. This proposal covers only one facility that co-fires coal and biomass but should also include the others that burn only biomass, and ideally not allow burning biomass at all.	
39. John Reeves	DEQ and the board deserve wide support for this key initiative. The evidence and science is overwhelming that anthropogenic climate change is very real. Threats to our health, economy, infrastructure, coastline and national security plus carbon pollution from burning fossil fuel is significantly contributing to ramping-up climate change and sea-level rise. Practical, market-based strategies	Support for the proposal is appreciated. See the response to comment 65 for additional discussion about the industrial exemption, and response to comment 67 for further

Commenter	Comment	Agency response
	should be optimized to improve Virginia's poor rankings on energy efficiency plus on renewable energy, especially on solar energy capacity and initiatives. Virginia should expedite steps to partner with RGGI. The legislature may also need to concur, so preparations and good findings must be available to ensure this concurrence. Many benefits await good measurement, especially lowering of wasted energy, swinging demands on power grids and peaking facilities, and cost of power bills. The regulation should include practical, market-based ways to continue CO_2 reductions after 2030. There are few justified exemptions for fossil-fueled heat and electricity generators at a factory. There may be a reasonable compromise on some exemption of blended in biomass/forestry byproducts. It seems that Virginia forestry and pulp and paper facilities can justify levels above 10% blend with fossil fuels--maybe up to 30 or 50%?	discussion of treatment of biomass.
40. Adam Brookman	We have been given a tremendous opportunity to protect our future with this carbon emissions cap. While this program is best we can hope for right now, the choice we have been presented for how many annual millions of tons of CO_2 to be released is simply appalling. I understand that in any negotiation there is a give and take for all parties involved, but why must we give away what has been taken from us for so long. To choose between 33 and 34 million tons of CO_2 is insulting and reeks of nothing but greed. The reason we have these two choices is obviously the representatives from the major power companies of Virginia. Thank you for giving your customers options. I propose a different amount. I propose that there be an annual allotment of no more than 25 million tons of CO_2 with the amount reducing by 8% each year. This goal may be aggressive but easy goals is something we do not have time for. The text of the proposal consistently refers to "fossil fuels" when discussing CO_2 reduction. While fossil fuels are one of the worst contributors of CO_2, they are not exclusive. The burning of wood or biomass produces equal if not more CO_2, so why should it be treated any different? There should be no exemption for any power producing facility on any of their units that produce CO_2 in any way shape or form. Biomass burning power generation must be held accountable for their CO_2 emissions.	See comment 37 for further discussion of the cap and comment 67 for further discussion of the treatment of biomass.
41. Maria Papadakis	I am writing to indicate my strong support for a cap-and-trade allowance system and participation in RGGI. The regulation should include opportunities for CO_2 emission offset allowances in agriculture (forest offsets and avoided methane from agricultural manure management operations). This would enable the farm sector to benefit financially from efforts to protect forests and to afforest, and from efforts to mitigate methane, a highly potent GHG. The regulation must make a provision for the voluntary renewable energy market set-aside allocation mechanism, as allowed for by RGGI. The set aside	Support for the proposal is appreciated. DEQ recognizes the value of voluntary renewable energy market; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME. Given the uncertainty of any benefits

Commenter	Comment	Agency response
	enables the voluntary renewable energy market to contribute to the state's overall CO_2 mitigation goals and compliance opportunities, and are critical for the process of reducing emissions. It is also needed to avoid weakening the in-state economy for renewables. The absence of a set aside could cause Green-E to quit certifying in state green power. The Center for Resource Solutions explains that "If a cap-and-trade program is adopted and implemented without a voluntary renewable energy set-aside mechanism, Green-e may be unable to continue to certify voluntary sales of renewable energy from the state, or the additional cost of allowance retirement to the voluntary purchaser may preclude certified sales from generation in the state. This would mean that voluntary buyers in these states will get their certified renewable energy from outside of the state in the future. A voluntary renewable energy set-aside will allow for this demand to be met by resources in the state--allowing your state the opportunity to maintain the private investment dollars that may otherwise go elsewhere."	associated with a complex offset program, DEQ is not, at this time, proposing to implement offsets; see the response to comment 26. See comment 51 for further discussion of the set-aside.
42. William M. Shobe, University of Virginia	Output-based updating of allocations is appropriate and prevents emission leakage. Model runs show that output-based updating of allowance allocations helps reduce leakage while retaining incentives to shift generation away from high-emitting sources. Free allocation of allowances acts as an implicit subsidy for the generation of electricity by granting to ratepayers the market value of the stream of allowances. Generators take this grant into account when calculating their marginal cost of generation and so can maintain relative competitiveness with the generators in the rest of the PJM region. This prevents generation from migrating out of Virginia and into the uncapped portions of PJM. Output-based allocation seems the appropriate choice given the potential for leakage of emissions into the rest of PJM. The consignment auction improves efficiency and fairness. By enhancing liquidity in the auction, requiring consignment probably improves price discovery in the RGGI market. The act of consignment and the resulting requirement that Virginia utilities purchase back what they need may make allowance prices more salient to market players and the generators. Consignment auctions monetize the value of the grant of allowances to the generators--they establish a clear market value of the grant. This allows the SCC to establish whether allowance value is being transferred to ratepayers rather than being retained by generators. Given the value of the free grant of allowances, it is critical that ratepayers be protected from generators pocketing the value of allowances. The consignment auction helps make this possible. The ECR helps correct over-allocation. In every emission	See the response to comment 33 for a discussion of modeling, and the response to comment 37 for discussion of the cap. The commenter correctly notes that carbon intensity is decreasing.

Commenter	Comment	Agency response
	market established to date, allowances have been over-allocated at first. In the case of RGGI, the cap has been reduced dramatically due to the initial over-allocation. Even after the initial allocation, costs often fall faster than the cap leading to lower than expected allowance prices. The proposed rule continues this pattern of over-allocation, since DEQ has set the initial cap too high. This makes the ECR an important backup mechanism for ensuring that emission reductions will be greater, if the costs of achieving those reductions fall below expectations. The initial cap should be 30 to 31 million tons. DEQ has overestimated business-as-usual emissions over the next 15 years. This makes achieving the reductions for a given cap level appear more expensive than they really are. DEQ's analysis is not off by just a little, it is grossly in error. The agency has provided an analysis that is inconsistent with facts that were readily available to the agency at the time it did its analysis. What is more, the bias is clearly in one direction, overstating the emissions that would occur in the absence of this rule. This, in turn, overstates the cost of achieving a given reduction. "Reference Case 1" (RC1) assumes that Virginia will generate zero electricity with solar PV for the entire forecast horizon. This assumption is false. At the time DEQ did its analysis, Virginia had more than 100 MW of solar PV in operation with more than 250 MW under construction. By the end of 2017, Virginia had just more than 360 MW of solar PV capacity in operation. This capacity can be expected to generate approximately 720 GWh of electricity per year. In addition to the solar already in operation, the PJM interconnect queue has several gigawatts of solar PV slated for Virginia. Two years ago, Dominion had agreed to have 400 MW in place by 2020, but in April 2017 the company announced in its IRP its intention to build around 240 MW per year for the next 15 years. This estimated solar build was for Dominion's "no carbon regulation" case. APCO and ODEC had both announced that they were adding solar capacity as well. There are currently over 700 MW of Virginia solar PV capacity in the engineering and procurement stage. The PJM interconnection queue has close to 6 GW of capacity planned for Virginia in the next few years. Much of this was already on the queue when DEQ assumed zero solar build for Virginia over the next 15 years. At the time of its analysis, DEQ had reason to know that Virginia would probably have at least one GW of solar PV capacity by 2020. Yet the agency assumed in RC1 that there would be zero solar PV built in Virginia before 2031. This inflates the appropriate level of the cap. Reference Case 2 (RC2) is only marginally better; again, understating likely solar PV capacity and generation that would occur in the absence of the rule.	

Commenter	Comment	Agency response
	The agency assumed that, by 2020, Virginia will have a capacity of 344 MW and will generate only 819 GWh of solar PV electricity. This is less than half of what would reasonably have been expected even before ED11 was announced. Taking the current 360 MW and adding 240 MW per year, this implies solar PV generation of about 1300-1500 GWh more per year than estimated in RC2. If the solar PV displaces half coal and half natural gas, then DEQ has overestimated CO_2 emissions by nearly 1.5 million tons per year due to underestimating solar capacity. The mistake is much greater for RC1, where solar PV is incorrectly assumed to be zero. By underestimating the amount of solar PV generation that would have occurred without the rule, DEQ has overestimated business-as-usual emissions by around 1.5 million tons/year. Both scenarios ignore already contracted capacity increases in the short run. Both of DEQ's Reference Case scenarios err by assuming unrealistic rates of growth in electricity generation. This, in turn, results in unrealistically high capacity factors for coal plants in Virginia and unrealistic growth in fossil fuel generation capacity, mostly natural gas. This further inflates expected business-as-usual emissions and is used to justify a higher cap than is necessary. In its April 2017 IRP, Dominion estimates future generation growth to be 1.3% per year. Accepting Dominion's estimate for demand growth, DEQ made a serious error in its modeling of reference case emissions by assuming unrealistically high growth rates in generation. DEQ's generation scenario for RC 1 has generation growing at an average rate of 1.9% per year and RC2 has it growing at 3.4% per year. Dominion represents 70% of generation in Virginia. The APCO region, which is the second largest in Virginia, has flat or declining demand. The remainder of the state is too small to make up the difference, but does not have growth rates higher than Dominion's. DEQ assumed a higher growth rate for generation than the electric utilities are using in their own capacity planning. This inflates the estimated need for fossil fuel combustion in future years. Dominion has over-forecast demand every year since at least 2012. Its forecasts of future generation have fallen dramatically over this same period but are still too high and will continue to fall in the next few years because of a flaw in its forecasting methodology. Generation has grown faster than demand since 2015 because of a Virginia state policy to repatriate generation and reduce imports of electricity. The process of repatriating imports is now essentially complete. Dominion is anticipating small amounts of exports over	

Commenter	Comment	Agency response
	the next few years, given that it is nearing completion of 3 new natural gas generators. Now that the process of repatriating generation is complete, generation and demand will tend to grow at the same rate. Recent growth in electricity demand in Virginia has been less than 1% per year even as the state economy has grown following the last recession. Recent trends in both residential and industrial demand have been negative, that is negative growth in demand. In the industrial sector, this is due to a shift to less energy intensive industries. In the residential sector, this is due to the penetration of energy efficient technologies and improvements in the energy performance of the building shell. The one source of increase in electricity demand in Virginia in recent years has been server farms. This is a small fraction of overall electricity demand in Virginia and is already accounted for in Dominion's forecast. DEQ has no basis for its grossly overstated estimates of future demand growth in Virginia. Many firms building server farms want to cover their energy demand with renewable generation and the firms are increasingly insisting that the generation be local. Server farm demand cannot account for the growth in fossil fuel emissions assumed in DEQ's faulty analysis. DEQ's two reference cases make different assumptions about 2017 total generation: 96,786 for RC1 and 93,305 for RC2. At the time DEQ did this analysis, there was zero chance that demand would be as high as assumed in RC1, but this is consistent with the general pattern of unsupported and erroneous assumptions in its analysis. Actual generation for 2017 was 93,500 GWh. To be conservative, take the higher of the two 2017 generation estimates from DEQ's reference cases, 96,786 GWh (even though it didn't actually happen) and increase it at 1% per year. The resulting generation profile shows that DEQ's assumed generation is in excess of any reasonable expectation by 3,600 GWh per year by 2020 and 10,500 GWh by 2031. If you assume that each GWh displaces half coal and half natural gas, then each 1,000 GWh is associated with on the order of 1 million short tons of CO_2. In light of this, it is clear that DEQ's analysis has grossly overestimated BAU emissions. Combined with the solar PV analysis, the 2020 emission overestimate is on the order of 4 million tons of CO_2 per year. The assumption of half displacement of gas and half coal is somewhat conservative. Chances are that more coal dispatch will be displaced. Dominion's IRP had a BAU scenario and a scenario for operating under a cap under the Clean Power Plan. One of the major differences	

Commenter	Comment	Agency response
	between these two scenarios is the retirement of significant coal capacity in 2020, when the CPP was to come into force. These coal plants were not retired under the BAU scenario. This implies that substantial reductions in coal dispatch can be anticipated under this cap, which will ultimately be tighter than what would have been true under the CPP. And coal dispatch is already falling sharply due to the addition of the new natural gas capacity. Net electricity generation from coal in Virginia fell from 15,600 GWh in 2016 to 10,110 GWh in 2017. This downward trend will continue as Dominion brings its Greensville natural gas power plant online in 2019. DEQ has failed to make a case for a cap greater than 30 million tons per year. In recent years, any increases in generation due to load growth (including repatriating imports) has been offset by reduced emission intensity of generation. Since nearly all increments to generation in Dominion's IRP are solar PV, through to the end of the 15-year planning horizon, emission intensity is bound to fall further. In its reference cases, DEQ assumes a natural gas price of $2.83 in 2017 rising to $3.95 in 2020. In April 2018, the spot price of natural gas hovered around $2.75/MMBtu. To match DEQ's assumption, natural gas prices must rise more than 30% in the next two years. And yet, the futures price for natural gas, as of April 3, 2018, is $2.70. DEQ assumed a high rate of growth in natural gas prices and plugged that assumption into its model even though it was known at the time that there was a substantial probability that the price would be lower. This adds more upward bias in the estimated business-as-usual emissions.	
43. Jonathan Miles, James Madison University	The proposal will not provide any avenues for voluntary market customers to ensure that their renewable energy purchase contributes to emissions reductions beyond the cap set by the program. All RGGI states with the exception of Delaware and California have implemented voluntary renewable energy set-aside mechanisms. Without the set-aside, Virginia generation would be ineligible for participation in the Green-e Energy market, meaning that regional voluntary market customers would have to invest in renewable energy in nearby states in order to have the renewable energy certified. This would benefit neighboring states and discourage increased investment in renewable energy in Virginia. The set-aside mechanism is important to continue to stimulate private investment in renewable energy in Virginia, which in turn will promote local jobs and businesses, and further reduce GHG emissions generated in the state. I strongly encourage the inclusion of the voluntary renewable energy market set-aside allocation mechanism from Section XX-5.3(l) of the RGGI Model Rule.	DEQ recognizes the value of voluntary renewable energy market; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME. See comment 51 for further discussion.

Commenter	Comment	Agency response
44. Christina Luman-Bailey, City Council of Hopewell, Virginia and Chair, GoGreen Virginia	I am concerned that the industry exemption barely passed; although I agree that all major carbon emitters should be held accountable, it is typically the coal-burning utilities sector which is the biggest offender and has a monopoly on the customer market, whereas industry must face more competition and may need more flexibility re cost of production in order to compete in the private sector. The threshold of 90% biomass in order to claim carbon-neutral seems unreasonable. Basing the credit for carbon neutral on the percentage of biomass makes for a more reasonable, scientifically-based formula and is fair. I am glad to see the DEQ moving forward with air pollution controls, but I think that a more reasonable, scientifically-based proposal will be more accepted by all and therefore more successful.	See comment 67 for further discussion of how biomass will be addressed.
45. Mayor Tom Sibold, City of Covington; James H. Hudson, III, Mayor, Town of West Point; William Hodges, Chairman, King William County Board of Supervisors	The WestRock Paper mill in Covington is a significant economic driver for our community providing over 1000 jobs and supporting over $200,000,000 in local investment through supplier purchases, payroll, and taxes every year. If care is not taken, the proposed regulation could have a serious and negative impact on the mill. The West Point Paper Mill has been an important economic driver for the Town of West Point and the broader region for over 100 years. Today, the Mill employs roughly 500 people in good paying jobs. The Mill is the largest taxpayer in the Town of West Point (and one of the largest in King William County), and contributes over $100,000,000 to the regional economy every year. Papermaking is an energy intensive and trade exposed industry, and the mill operates in an intensely competitive business environment. The West Point Paper Mill is of critical importance to King William County. The mill is one of the largest employers, one of the largest taxpayers, and one of the most significant corporate members of the community. The hundreds of jobs that the mill provides, the hundreds more that it supports, and the millions of dollars that it injects into the local economy are irreplaceable. Simply put, the mill is the lifeblood of King William County. DEQ should take great care in crafting the final regulation to ensure the mills are not placed at a competitive disadvantage. Specifically, the regulation should: 1) Maintain the existing exemption for industrial generation. 2) Fully recognize the carbon neutrality of biomass by amending the regulation to allow for the subtraction of biogenic emissions from any covered source. This is an approach that is consistent with established science and the existing RGGI program. 3) Preserve the free allocation of carbon allowances currently in the regulation, as a full auction of allowances could significantly increase the financial impact to	The commenters' concerns are well taken. The cap-and-trade program has been designed to meet the goal of reducing carbon pollution--which will be beneficial to the manufacturing sector--while protecting the economy. Industrial generation and biomass are discussed in greater detail in responses to comments 65 and 67. DEQ agrees that free allocation of allowances is integral in ensuring the smooth function of the consignment auction.

Commenter	Comment	Agency response
	energy-intensive industries.	
46. Virginia Solar Energy Development and Energy Storage Authority	The Authority was established to 1) facilitate, coordinate, and support the development of the solar energy and energy storage industries and storage projects through programs that increase the availability of financing for solar energy and energy storage projects; 2) facilitate the increase of solar energy generation systems and energy storage projects on public and private sector facilities; 3) promote the growth of the Virginia solar and energy storage industries; 4) provide a hub for collaboration between entities, public and private, to partner on solar energy and energy storage projects; and 5) position the state as a leader in research, development, commercialization, manufacture, and deployment of energy storage technology. If carbon emitting generation is reduced, cleaner forms of power generation will become more widespread. The addition of energy storage will allow intermittent renewables to continue providing power at times when conventional generation would typically be required, leading to further carbon reductions. The Authority recommends that a portion of any proceeds resulting from the auctioning of the 5% of allowances set aside for DMME be used to advance renewable energy coupled with energy storage technologies. Legislators and the Governor, through their creation of this Authority, recognized that accelerated deployment of renewable energy and energy storage technologies will support a more robust and secure electric power grid. It will also lead to decreased carbon emissions, help grow the energy storage industry and create economic benefits for Virginia and its citizens.	DEQ recognizes the value of renewable energy coupled with energy storage technologies; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME. See comment 51 for further discussion of the set-aside.
47. About 25 individual commenters.	General opposition to the proposal was expressed.	The commenters' concerns are recognized.
48. 272 emails sponsored by Food and Water Watch	I urge you to drop plans to join RGGI, a short-sighted cap and trade program. It seeks to limit CO_2 emissions, but it incentivizes switching from coal to fracked gas, exchanging methane for CO_2. That's not progress. Implementing RGGI would ultimately mean more fracked gas and pipelines in Virginia. We don't need schemes like RGGI. For over 40 years, the Clean Air Act has succeeded by requiring each source of pollution to meet individual, technology-based emissions controls that minimize emissions without the lack of accountability that purchasing credits and offsets brings. Effectively, cap and trade programs like RGGI just set up a pay-to-pollute scheme that big polluters can take advantage of year after year.	Executive Directive 11 directs DEQ to "1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit carbon dioxide emissions from electric power facilities that: a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of carbon dioxide allowances through a multi-state trading program; and b. Establishes abatement mechanisms providing for a corresponding level of

Commenter	Comment	Agency response
		stringency to limits on carbon dioxide emissions imposed in other states with such limits." (Emphasis added.) In other words, the proposed regulation is designed to meet the Governor's mandate to control CO_2 via participation in an emissions trading program. In the absence of federal action to address climate change, Virginia is therefore taking active steps to address this pollutant--but not starting from scratch. The effectiveness of Virginia's carbon control program will be maximized by linking with the only realistically available program for controlling carbon. The control of methane emissions is indeed important; however, this specific regulatory action is not the means by which that can be accomplished. Methane is controlled elsewhere in the Regulations for the Control and Abatement of Air Pollution as appropriate, and other measures addressing methane may be addressed at a different time in accordance with the federal Clean Air Act and state law. Because the primary purpose of this regulatory action is to enable Virginia to link to the RGGI program, the regulation was drafted to adhere to the RGGI Model Rule as closely as possible within the framework of Virginia-specific administrative requirements. The commenters are

Commenter	Comment	Agency response
		correct that the federal Clean Air Act has been extremely effective in reducing air pollution. Emissions trading programs, which are authorized under §§ 108, 109, 110, and 302 of the Act and implemented under 40 CFR Part 51, are part of the Clean Air Act success story. Emissions trading is a proven means of reducing air pollution; see, for example, comments 28, 113, and 136. Cap-and-trade sets a specific goal and a schedule on which the goal must be met. Clearly, linking to RGGI will ensure additional reductions in carbon pollution not only in Virginia but in the region. Joining RGGI will impose additional controls on each source of pollution beyond other individual, technology-based emissions controls. Note that RGGI specifically addresses CO_2, not methane. RGGI issued the "CO_2 Emissions from Electric Generation and Imports in the Regional Greenhouse Gas Initiative: 2015 Monitoring Report" on April 27, 2018. This market analysis summarizes data from 2005-15 for electricity generation, net electricity imports, and related CO_2 emissions for the participating states. It demonstrates that carbon emissions in the RGGI are decreasing in intensity; essentially, carbon intensity is being decoupled from electricity generation.
49. Elizabeth Struthers Malbon	It appears that the decision to participate in a CO_2 cap and trade program has already been made by the board, the so-called DEQ, Governor Northam, former Governor McAuliffe, or Dominion. The sad thing is that distinctions	See response to comment 48. As discussed in comments 28, 113, 136 and elsewhere, cap and

Commenter	Comment	Agency response
	between these individuals and agencies may be distinctions without a difference. No one can expect the citizens of Virginia to trust these individuals and agencies given their support for pipelines. The evidence for the decision having been made is in the public notice: "In addition to any other comments, the board seeks comment on whether the initial Virginia CO_2 Budget Trading Program base budget for 2020 should be 33 million tons or 34 million tons, and declining accordingly by 3% per year. After considering public comment, the board will make a final selection of either 33 million tons or 34 million tons." So, the public is being asked to comment on whether we want our air polluted by a huge amount or by somewhat more than a huge amount. I would like the board to think about who is pushing for this program in the first place and who will benefit from it. It is disingenuous of McAuliffe and Northam to act as if they are being responsible in thinking about the dangers of the CO_2 that Virginia's power plants are pumping into the atmosphere, hastening global warming with its sea-level rise and extreme weather events. Participating in such a systematic and continued polluting of the atmosphere might give the impression that something is being done to clean up the air or slow down global warming, but this is not the case. What is needed is regulation that would require energy companies to take real steps toward cleaner air and mitigating global warming by moving away from fossil fuels altogether and utilizing the fast-growing and less expensive technologies for solar and wind power. Such a short-sighted cap and trade program has not worked elsewhere. This program creates incentives for switching from coal to fracked gas. Methane from fracked gas is a more powerful driver of global warming than coal. Fracked gas benefits the companies that extract, transport and sell it, and a cap and trade program would pass that advantage along to power companies that burn it--and to any politicians they support. The cap is excessively high, and the price of permits is too low, allowing energy companies to buy or trade their way out of reducing emissions. Such a company could also hold their cheaply-bought allowances to offset future failures to reduce emissions. This program only addresses CO_2 emissions and ignores the impact of methane on climate change and air quality. It would allow switching from coal to fracked gas, effectively worsening climate impact while still complying with the cap and trade agreement. It hardly seems coincidental that two Virginia Governors who were supportive of or tolerant of the building of two interstate pipelines for fracked gas and one state-wide energy monopoly that supported them would now be encouraging a cap and trade program that lets burning	trade programs are proven, effective means of controlling pollution.

Commenter	Comment	Agency response
	this other fossil fuel instead of coal count as environmentally responsible. Money to encourage favorable legislation and regulation has never been a problem for Dominion Energy, and clean air has never been a priority for them. However, the law requires clean air to be the board's priority. You are hardly in a position to pat yourself on the back if you allow only 33 tons of CO_2 pollution instead of 34 tons while turning a blind eye to methane pollution. For over 40 years the Clean Air Act has succeeded by requiring each source of pollution to meet individual, technology-based emissions controls. The citizens of Virginia need and want bold climate solutions that continue to do that and do not compromise the wellbeing of our communities--in terms of air quality, water quality, and overall quality of life in a world feeling the effects of global warming hastened by the use of all fossil fuels. We are not fooled by this pay-to-pollute scheme, and neither should you be.	
50. David Kuebrich	The cap-and-trade polices of RGGI, the E.U., and California have done little to reduce carbon emissions. It's important Virginia learn from the errors of these plans and do better. For example, it would likely be better to impose a flat fee on the use of fossil fuels. This approach would not be nullified by external factors such as an economic decline that kept emissions under a cap. In addition, an imposed fee provides both fossil-fuel users and consumers with predictable price increases. A cap and trade policy can easily lead to disputes, and well-lawyered and politically muscular companies such as Dominion are very savvy at winning disputes. In the past, the benefits of cap and trade have been hyped. Years later, supporters learn the promised reductions in emissions didn't pan out. But for the years between the initial glowing headlines and the later realization of meager results, many citizens and public officials feel a reduced sense of urgency to develop other policies for limiting emissions. Governor Northam may feel if he proves his green creds by creating a cap and trade program, it will then be politically feasible to approve the Atlantic Coast and Mountain Valley pipelines. If so, he's wrong. I ask that DEQ convince our Governor to create a smart plan for reducing carbon emissions and to cancel the pipelines.	See response to comment 48. As discussed in comments 28, 113, 136 and elsewhere, cap and trade programs are proven, effective means of controlling pollution. In addition, RGGI has a proven track record in reducing carbon pollution. We recognize the commenter's concern about methane from pipelines; however, that is not the subject of this regulatory action.
51. 3Degrees Inc.	3Degrees applauds Virginia's decision to implement a CO_2 Budget Trading Program and join RGGI. This will secure the state as a national climate leader, and greatly expand the scope of the regional carbon market, improving market efficiency and lowering costs of compliance across the region. The proposal does not provide an avenue for voluntary market customers to ensure that their renewable energy purchase contributes to emissions reductions beyond	DEQ recognizes the value of the voluntary renewable energy market as an important tool in reducing carbon pollution but has decided not to implement a separate voluntary renewable energy set-aside. The structure of the general 5% set-aside will

Commenter	Comment	Agency response
	regulation. The Voluntary Renewable Energy Market Set-aside allows allowances to be paired with renewable energy at no added cost to the voluntary market. In order to support private investments in renewable energy, 7 RGGI states and California have implemented a renewable energy set-aside. This mechanism sets aside about 2% of the allowances and makes them available for free to be paired with voluntary renewable energy purchases. The renewable energy set-aside will lead to continued demand for Virginia generation in the voluntary market and allow the generation to be eligible for Green-e Energy certification. In addition to the avoided emissions benefit being important in private investment decisions, it is also a requirement of Green-e certification. Green-e certifies tens of millions of megawatt hours of renewable energy every year, including renewable energy generated in Virginia, and, as the only certification for the voluntary renewable energy market in the U.S., is the standard for private purchasing of renewable energy. Where states have introduced cap-and-trade regulation without a renewable energy set-aside, Green-e has required that Green-e certified renewable energy from these states be matched with purchased allowances equal to the generation's emissions reduction benefit on the grid. This adds a significant cost to renewable energy from these states, such that they generally exit the voluntary market. Where private purchase of allowances is not possible, generation from that state is ineligible for Green-e certification. Without Green-e certification, Virginia generation will be less desirable for voluntary purchasing and will lose financial support from the voluntary market. Since Virginia currently only has a RPS goal, the primary markets for Virginia renewable energy generation are adjacent state RPS or the voluntary market. The voluntary market is currently the primary way that high quality renewable energy remains in the state. Local projects risk losing voluntary market support if the renewable energy set-aside is not included. 3Degrees has worked with small-scale and residential solar and wind projects in Virginia, supporting the projects by facilitating the sale of the premium RECs for use by voluntary customers. The voluntary market is generally providing funding for projects that would not receive funding from compliance REC markets, and often providing more funding per MWh. In some cases, the projects would be not financially viable without this revenue stream. If the voluntary renewable energy set-aside is not included, there would no longer be an opportunity for 3Degrees to support projects of this kind in Virginia. We urge DEQ to encourage private capital	be under the purview of DMME, which is the appropriate state agency to implement renewable energy and energy efficiency programs. DMME may, at the appropriate time and in accordance with its regulations and policies, seek to implement a voluntary renewable energy market set-aside or its equivalent. However DMME structures the set-aside, it is important to bear in mind that energy efficiency will be an important tool in the control of carbon pollution. Energy efficiency programs reduce in-state demand, which results in the reduction of carbon pollution and the control of potential leakage. Note that renewable energy projects in Virginia should be considered in the context of the Grid Transformation and Security Act of 2018 (SB966), that: - Requires utilities to make $1.145 billion in investments in energy efficiency projects and low-income energy assistance over the next 10 years. - Authorizes the SCC to deem 5,000 MW of solar and wind energy projects to be in the public interest, paving the way for approval of new clean energy projects. - Commits Appalachian Power to make a separate investment in 200 MW of new solar capacity. - Promotes energy technology including battery storage and pumped storage in southwest Virginia. - Requires review of state

Commenter	Comment	Agency response
	investing in renewable energy by including the renewable energy set-aside.	regulations that hinder clean energy development. - Creates a transparent stakeholder process to expand energy efficiency program offerings. - Creates a transparent stakeholder process to make recommendations for solar program expansion, including net metering, community solar, and siting. DEQ expects that opportunities for voluntary renewable energy projects will be encouraged as a result of this initiative.
52. 3Degrees Inc.	3Degrees encourages DEQ to allow the issuance of CO_2 emissions offsets. High-quality carbon offsets can be an important tool for a successful and economic cap-and-trade program. While offsets have not been used to date for compliance in RGGI, as the cap lowers we believe offsets will be an important tool for achieving emissions reductions cost while encouraging innovative climate solutions. Offset projects can address emissions reductions in uncapped sectors and provide other co-benefits.	Although the RGGI model rule does offer offsets, only a single offset project has been implemented in the RGGI region thus far. Given the uncertainty of any benefits associated with a complex offset program, DEQ is not, at this time, proposing to implement offsets; see response to comment 26.
53. American Council for an Energy-Efficient Economy (ACEEE)	Energy efficiency reduces emissions quickly and at a lower cost than any other CO_2 compliance option by reducing the need for power generation. State energy efficiency policies and projects can be the quickest and cheapest means to reduce generation from fossil fuel-fired power plants. Energy efficiency improves air quality and saves consumers money. It boosts local economies by creating diverse, high-quality jobs across the construction, engineering, financial, environmental, manufacturing, and industrial supply chains. In 2015, RGGI states invested 64% of allowance revenues on energy efficiency, amounting to 60% of cumulative investments. Programs funded by these investments are expected to return more than $1.3 billion in lifetime energy bill savings. Energy efficiency investments through RGGI contributed to reducing the number of premature deaths and illness in the northeast since 2009. DEQ proposes a set-aside of 5% for the control of CO_2. Given the benefits and low-cost CO_2 reductions energy efficiency provides, we recommend that all set-aside revenues be allocated to energy efficiency projects. However, current market and regulatory barriers to investment in energy efficiency can hinder its use as a compliance strategy. DEQ should consider	DEQ recognizes the value of energy efficiency as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement the set-aside. DMME may, at the appropriate time and in accordance with its regulations and policies, implement an energy efficiency set-aside as described by the commenter. The set-aside will be 5% in the early stages of the program; the set-aside may be revised at a later date as the state

Commenter	Comment	Agency response
	methods for allowance distribution to address these barriers. Typically, a set-aside is a small portion of a total cap of allowances, which means that energy efficiency is treated as a resource on the margin. This is not consistent with Virginia's energy efficiency potential, nor does it make economic sense. The incentive in a market-based regulation should drive emission reductions by the lowest cost means, which in this case is energy efficiency. Instead of a set-aside, an allowance approach could preferentially award allowances to energy efficiency programs. Allowances could be allocated on an updating output basis according to kWh generated or saved. Ideally, such an approach would award allowances to zero-emission savings and generation first. The remaining allowances could go to fossil-fueled electric generators. An updating output-based allocation provides a transparent and predictable price signal, and rewards measures that deliver lasting CO_2 reductions. There is untapped potential for non-utility energy efficiency programs in Virginia over the next 10 years. The 5% set-aside does not reflect the level of potential investment in energy efficiency that the state could achieve. We recommend a set-aside of 10% in order to provide a more robust financing stream for energy efficiency projects. Increasing the set-aside would lead more cost-effective emissions reductions. Modeling indicates that increasing the set-aside would not impact rates. Energy efficiency measures also reduce overall customer bills, helping to alleviate any potential rate increases. DMME should use the set-aside to invest in energy efficiency projects that save energy and reduce utility costs for public and private sectors. While ratepayer-funded programs for residential and commercial customers in Virginia will ramp up over the next 10 years, large industrial customers will not be served by these programs. DMME can fill this gap. Technical assistance programs targeted at industrial customers can identify potential projects and guide the implementation process. We encourage DEQ to clarify that combined heat and power (CHP) and waste heat-to-power (WHP) projects are eligible for set-aside funds. Other RGGI states have used their auction revenue to support CHP deployment. DMME can leverage its experience operating the Commonwealth Energy Fund, using revenues to make loans to high growth potential early stage Virginia companies focused on energy efficiency and pollution prevention or establishing a revolving loan fund to finance energy efficiency investments at low interest	gains experience with the program and with the program DMME develops.

Commenter	Comment	Agency response
	rates for other markets, including public entities, residents or businesses. Financing products could be paired with utility rebates in order to further spur investment. Revolving loan funds have several benefits. These programs are sustainable and can have considerable market impact. Virginia currently has a goal to reduce energy consumption in public buildings 15% by 2017. Through the Virginia Energy Management Program (VEMP), DMME helps state agencies, institutions of higher education, and public bodies reduce utility consumption by working with energy savings performance contractors. In parallel with VEMP, Virginia recently launched the Clean Energy Development and Services (CEDS) program to provide grants and loans for energy efficiency, renewable energy, and alternative fuel projects in state and local agencies. In spite of these efforts, the state has only met about one-third of this energy savings target. We recommend that DMME use the set-aside to expand energy efficiency offerings for public buildings, through VEMP or deeper incentives as part of CEDS.	
54. Virginia Advisory Council on Environmental Justice (ACEJ)	Many members of the environmental justice (EJ) community have been skeptical or opposed to market-based solutions to carbon reduction. Many community members believe their voices have not been heard during program implementation in other states. Concerns with carbon trading include the lack of regulation of co-pollutants, hotspots, equity of allowance allocation, and lack of public engagement. Perhaps the most central concern from an EJ perspective is that many EJ organizations prefer guaranteed emissions reductions at the source of polluting facilities in EJ communities, an outcome that market-based solutions can't guarantee directly. DEQ can structure a program with complementary policies that produce outcomes that EJ groups prefer. We urge DEQ to keep this concern at the forefront, and explore ways to carbon reduction that would achieve guaranteed emissions reductions at the source.	The commenter's concerns are acknowledged. In addition to controlling carbon pollution via this regulatory action, DEQ implements a robust permitting and compliance program to ensure that federal and state standards for controlling air pollution are met.
55. Virginia Advisory Council on Environmental Justice (ACEJ)	DEQ should formalize rules for meaningful engagement of EJ communities. The Clean Power Plan required states to demonstrate how they were meaningfully engaging low-income communities, tribal communities, and communities of color. DEQ should likewise set concrete criteria on how the state plans to engage EJ communities throughout the design and implementation of the regulation. DEQ should participate in a dialogue on allowance allocation and the identification of potential hotspots. DEQ should create a plan for sharing the results of the proximity and cumulative impact analysis to the public, including an education and outreach plan to communities that are convenient and understandable. These methods should be targeted to "meet people	Community involvement is important to all DEQ programs, and DEQ has a robust community involvement program. Effective community involvement strengthens public confidence in DEQ, and encourages those who are most concerned with agency decisions to inform and help implement them. In addition to a formal Community Development

Commenter	Comment	Agency response
	where they are" in order to maximize community involvement for specific communities. A toolkit was created by community advocates in coordination with Green for All to ensure meaningful community engagement to comply with the Clean Power Plan. DEQ should use this toolkit as a guide to design its own plan for community engagement during this process. ACEJ recommends the creation of a long-term plan designed to increase participation of EJ communities. DEQ should formalize a process to gather feedback from community members affected by climate change, including creating a sustained dialogue to discuss complementary policies that may be adopted to maximize emission reductions in EJ communities. ACEJ recommends that DEQ host community forums in locations that are experiencing threats from climate change, and explain how this rule is designed to strengthen the state's commitment to fighting climate change.	Policy, DEQ is also taking the following steps as part of its strategic plan and commitment to build community involvement: - Provide opportunities for meaningful community involvement in all agency programs, and consistently look for new ways to enhance public input, and include development of education materials and training opportunities for the public. - Identify and implement steps that enable early public involvement and collaboration in significant environmental decisions. - Seek input reflecting different points of view and carefully consider this input when making decisions. - Work to ensure that decisionmaking activities are open and accessible to all interested individuals and organizations, including those with limited experience participating in environmental decision making. - Develop innovative ways to present information on the agency web site and elsewhere, and ensure that information is useful, understandable and easy to find. DEQ's EJ Coordinator has also been consulted for advice on communicating and working with vulnerable communities. The EJ Coordinator will provide this assistance on an ongoing basis as the rule is implemented. Routine RGGI program reviews will also provide the opportunity for any

Commenter	Comment	Agency response
		affected community to bring attention to any issues that may arise. Linking to RGGI will make Virginia a participant in RGGI's regularly scheduled program reviews. These comprehensive, periodic reviews consider program successes, impacts, and design elements. Stakeholder meetings are held throughout the program review process in order to encourage stakeholder engagement and the submission of comments from interested parties. As part of this process, the department will evaluate how the program is working from a Virginia standpoint as well as in the context of the other RGGI states. Any issues identified with respect to affected communities may be identified and resolved as part of this exercise. In order to clarify that this review process will take place, the proposal has been modified to add a new Article 10, Program Monitoring and Review. This provision specifies that in conjunction with the CO_2 Budget Trading Program program monitoring and review process, the department will evaluate impacts of the program specific to Virginia, including economic, energy and environmental impacts, and impacts on vulnerable and environmental justice and underserved communities. The department will also develop a plan to encourage increased participation by affected

Commenter	Comment	Agency response
		communities.
56. Virginia Advisory Council on Environmental Justice (ACEJ)	DEQ should complete a robust proximity and cumulative impact analysis to determine the environment and health impacts of co-pollutant emissions and pollution from sectors not subject to the carbon cap for EJ communities. Although capping carbon emissions from power facilities is the scope of the rule, we must study all major sources of carbon and other forms of pollution in Virginia when determining the full scope of environmental health effects in EJ communities. For instance, while reducing carbon from the electric sector has been a major focus of numerous advocates, the largest source of carbon pollution in Virginia is from the transportation sector. Other states in the region are launching a series of listening sessions to explore how to cut carbon from transportation while improving the equity and quality of service. Indeed, EPA has identified proximity to vehicle traffic as associated with increased exposure to toxic gases and particulate matter, which is hazardous to human health. A cumulative impact analysis from Kentucky revealed that "strong relationships between exposure related health problems and vulnerable demographics, such as poverty, educational level, and certain age groups." Similar analysis, in coordination with other state agencies and conducted with input of EJ stakeholders would help the state identify existing pollution hotspots and environmentally stressed communities so that the state can design a carbon reduction program to alleviate harms to those communities. DEQ should prioritize the perspectives and feedback of community members over industry. If hotspots are found, DEQ should create a remediation plan to reduce environmental hazards and lower pollution in environmentally stressed communities. DEQ should solicit the input of community members and other interested stakeholders for corrective remediation of past practices.	Fossil fuel-fired units are subject to a host of regulatory and permitting requirements that specifically target and control emissions of criteria pollutants and toxics. Ultimately, the control of CO_2 will reduce global warming impacts and concomitant welfare impacts on disadvantaged communities. As discussed in the response to comment 55, the opportunity to elevate specific concerns about potential problem areas will be available during routine program reviews. Note that the board's ability to address transportation sector emissions is limited by statute. DEQ believes that the monitoring and review components of the RGGI program will enable any leakage of emissions to be identified and corrected. As demonstrated in RGGI's April 2018 market analysis, carbon intensity in RGGI states is decreasing.
57. Virginia Advisory Council on Environmental Justice (ACEJ)	DEQ proposes to allocate 5% of the allowances to DMME to assist the department in abatement and control of air pollution, presumably through investments in energy efficiency and solar. Ninety-five percent of the allowances are proposed to be allocated to the polluters, which is unacceptably high. If only 5% of the allowances are directed to DMME, it must maximize opportunities to assist families and communities who've been disproportionately harmed by existing energy policy. DEQ should specify that the DMME allocation is directed toward low-income communities. In the alternative, conduct an open decisionmaking process where communities have a say in how allowances are allocated. Energy efficiency and solar energy will advance Virginia's goal to combat climate change and reduce carbon pollution. However, the state would benefit by advancing clean energy in communities who	DEQ recognizes value of directing pollution control efforts toward low-income communities; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement the set-aside. DMME may, at the appropriate time and in accordance with its regulations and policies, implement an energy efficiency set-aside for low

Commenter	Comment	Agency response
	need it most. Low-income and families of all races and ethnicities pay more for utilities, which means there may be cost savings to disadvantaged communities while reducing air pollution.	income communities as described by the commenter.
58. Virginia Advisory Council on Environmental Justice (ACEJ)	Wood and other types of biomass plants release more carbon per unit of energy than coal plants, in addition to localized criteria pollutants. These plants should be fully accountable to the carbon cap and should be included in the proximity and cumulative impact pollution analysis. RGGI caps carbon on power facilities 25 MW or greater, allowing power facilities with multiple combustion turbines that individually fall below the threshold but are collectively greater than 25 MW go unchecked. DEQ should regulate these types of units holistically, and consider ways to place limits on facilities below the 25 MW threshold. New York will begin covering sub-25 MW peaker plants, a step other RGGI states can voluntarily take. EJ groups have long opposed carbon offsets on principle to not allow facilities to continue or increase pollution by avoiding localized pollution reduction. Localized pollution reduction in EJ communities is the central concern of EJ advocates with cap-and-trade programs. ACEJ supports the recommendation of several EJ organizations in the RGGI region to eliminate the use of offsets as a compliance option.	See the response to comment 67 for a discussion of biomass. To our knowledge there are no sub-25 MW peaker plants, existing or planned, in Virginia. Regardless, current state regulation (9VAC5-20-70) prohibits circumvention of air quality requirements by constructing multiple facilities in a piecemeal fashion in order to avoid regulation. As discussed in the response to comment 26, DEQ is not, at this time, proposing to implement offsets.
59. Virginia Advisory Council on Environmental Justice (ACEJ)	DEQ should coordinate with other state agencies, localities, and community organizations to study the effects of the regulation in coal-dependent communities to ensure a fair and just transition from fossil fuels to clean energy. The coalfield counties in southwest Virginia have borne disproportionate economic and environmental burdens as coal has been extracted. Virginia coalfields are now left with pollution from mining and an economy struggling to recover. Relevant state agencies should conduct an economic analysis to identify sustainable investment and other job creation opportunities for coal communities.	The commenter's concerns about coal-dependent communities in southwest Virginia are well taken; see the response to comment 55 for further discussion of how communities will be addressed.
60. AdvanSix, Greif, ODEC, Virginia Manufacturers Association (VMA)	It has been the policy of the state to avoid the imposition of regulatory requirements "which are more restrictive than applicable federal requirements" unless a showing of necessity supports a more stringent Virginia rule (VA Code 10.1-1308 A). The Administrative Process Act establishes a procedure whereby the General Assembly reviews regulations that are more restrictive than applicable federal requirements (VA Code 2.2-4014) and has the opportunity to judge whether such regulations are necessary. The board should adhere to this long-standing approach and leave any such regulation to the appropriate time and approach determined for the nation by Congress and EPA.	The board may indeed promulgate regulations in the absence of a specific federal requirement to address a state-specific need. DEQ notified the appropriate legislative committees of this regulatory action in accordance with § 10.1-1308 in November 2017.
61. AdvanSix, Greif, ODEC, Virginia Manufacturers Association	Cost-effectiveness is a fundamental premise for good regulation. When government burdens its citizens by regulation, the benefits should outweigh the burdens. The proposal fails this basic premise. The proposed regulation is not cost-effective and the cost burden far	Flexible, market-based emissions trading programs provide the most cost-effective means of reducing air pollution. The program

Commenter	Comment	Agency response
(VMA)	exceeds any purported benefits. In EO-57 and ED-11, then-Governor McAuliffe revealed the non-environmental motive for mandating a CO_2 cap-and-trade program in Virginia: to "grow the clean energy economy" and "make clean energy a pillar of our future economic growth and a meaningful part of our energy portfolio." ED-11 notes an increase in "the number of solar jobs in Virginia" and the increase in "revenue for energy efficiency businesses in Virginia." While these are laudable goals, it is a misuse of governmental authority to use environmental regulation for non-environmental purposes. There are other, more appropriate authorities and programs to accomplish these economic goals. It appears that the environmental benefit envisioned from the regulation of CO_2 emissions is the mitigation of the risks to Virginians from climate change. The administrative record is devoid of scientific data or other information to support the conclusion that the proposal would have any perceptible effect on the severity of storms or flooding in Virginia. The preamble to the proposed regulation contains a chart of "Health Benefits of Incidental Reductions in SO_2 and NO_X." The rationale is that regulating emissions of CO_2 would have the "incidental" benefit of reducing emissions of SO_2 and NO_X. However, there are numerous other air regulatory authorities and programs addressing emissions of SO_2 and NO_X, including their own cap-and-trade programs. Thus, if additional regulation of SO_2 or NO_X is deemed necessary, there are other, more appropriate regulatory programs to directly address this necessity. Virginia does not have to resort to CO_2 regulation to indirectly address concerns with SO_2 or NO_X emissions. More specifically, the board cannot say the proposed regulation is needed to address emissions of SO_2 or NO_X . Incidental reductions in SO_2 and NO_X provide no rationale for imposing the proposed CO_2 emissions cap-and-trade program in Virginia. DPB's Economic Impact Analysis states: ". . . EPA and other federal agencies use estimates of the social cost of carbon (SC-CO_2) to value the climate impacts of regulatory rulemakings. The SC-CO_2 is a measure, in dollars, of the long-term damage done by a ton of CO_2 emissions in a given year. This dollar figure also represents the value of damages avoided for a reduction of a ton of CO_2 emissions in a given year (i.e. the benefit of a CO_2 reduction). It should be noted that the federal model estimates of the social cost of carbon are for the world overall. Thus it is not possible to quantify the Virginia-specific benefits." There is a reason why the value of damages avoided in Virginia is impossible to quantify. The effect, if any, of reducing CO_2 emissions from Virginia's electric power sector on the severity of	sets an overall cap but otherwise does not dictate which sources must make reductions. Through emissions trading, the program delivers the lowest cost reductions possible. Virginia has years of experience and considerable success with this kind of program. In addition to the inherent flexibility provided by emissions trading, the program also provides for the allocation of allowances to the entities with a compliance obligation. Allowances have value, and that value will be realized in the consignment auction, with revenue returning to compliance entities. The revenue returned to compliance entities from the compliance auction will serve to offset and mitigate the costs of the program for compliance entities and consumers. The analysis in the record is clear on these points. While the program minimizes costs through emissions trading and mitigates costs through allowance value, it also produces real benefits for Virginians. The administrative record demonstrating the impacts of climate change and the benefits of encouraging clean energy in Virginia toward the protection and improvement of Virginia's environment is well-documented. The focus of the EO 57 Work Group was to evaluate options under the Governor's existing authority while

Commenter	Comment	Agency response
	storms or flooding in Virginia would be negligible at best. The regulation would provide no measurable environmental benefit to Virginia. Climate change and reduction of GHG emissions are global issues. Climate change is not a local phenomenon and to the extent man can craft a solution to climate change by reducing CO_2 emissions, that solution cannot be accomplished by disjointed state and local approaches. If any regulation of CO_2 in the U.S. is deemed necessary to address climate change, that regulation must be undertaken and applied uniformly throughout the country, not state by state or locality by locality. The costs of the regulation outweigh any purported benefits. In its Economic Impact Analysis, DPB notes that the proposal likely would increase electricity costs for Virginia's citizens and businesses by no more than 1.1% ($2015) by 2031. However, a recent study by the Cato Institute showed that electricity costs in the RGGI states rose by 4.6% between 2007 (pre-RGGI) and 2015. This increase was 64% higher than the increase in electricity costs in a sampling of 5 non-RGGI states. As the data from the RGGI states show, adoption of the proposed CO_2 emissions cap-and-trade program will add millions of dollars per year to the electric bills of the citizens and business of Virginia. Virginia has a robust manufacturing sector and is ranked as the fourth most competitive state in overall manufacturing competitiveness in the nation. Moreover, Virginia is ranked the most competitive southern state for manufacturing. However, this position would be jeopardized by increasing energy costs. The Cato Institute study found that from 2007-14 the economies of the 5 non-RGGI comparison states grew 2.5 times faster than the RGGI states. During the same period the RGGI states lost 35% of energy intensive businesses, whereas the 5 non-RGGI comparison states only lost 4%. While the non-RGGI comparison states' overall goods production grew by over 15%, the RGGI states lost 13% of overall goods production. This decline is reflected in industrial electricity demand with the RGGI states falling 17% while non-RGGI comparison states only fell 3%. The greater decline in energy demand in the RGGI states cannot be attributed to greater energy efficiency in those states. In fact, the RGGI states improved by 9.6%, while the non-RGGI comparison states improved by 11.5%. Even as the economy was recovering from the 2008 recession, industry was leaving the RGGI states. If the program is enacted in Virginia, electricity costs for manufacturing facilities will undoubtedly increase, by as much as 4-5% by 2031. This increased cost of operation will diminish Virginia's competitive advantage. If Virginia participates in RGGI, we can expect the same fate for our industry that the RGGI states have experienced--	simultaneously creating more clean energy jobs. (The legal authority to develop this program in the first place is well established; see the response to comment 76 for more detail.) The process consisted of monthly meetings with presentations from the public. Numerous presenters described the impacts of climate change to the Working Group, and presenters included Dominion Energy, the American Petroleum Institute, Covanta, WestRock, and other stakeholders involved in manufacturing and energy generation. The Work Group also received over 8,000 written comments during a 3-month public comment period. The basis for EO 11 and this regulatory development action are, therefore well-established. Note that other commenters describing detailed environmental and fiscal impacts to the state were also submitted during this proposed regulatory development stage; they are summarized here and the full comments are part of the public record (see, for example, comments 108, 121 and 139). DPB's analysis was based on the best available information, including an analysis of potential changes in residential, commercial, and industrial customer electricity bills prepared for the department by the Analysis Group, an internationally recognized economic consulting firm. In addition,

Commenter	Comment	Agency response
	industry will go where costs of energy are lower.	the Virginia Joint Legislative Audit and Review Commission (JLARC) in its Fiscal Impact Review of ED 11 (December 2017) found that the fiscal impact of the proposed regulation on state government should be minimal. The impact is estimated to be negative in 2020 when the regulation takes effect and be approximately $1.9 million (in 2017 dollars) in 2031, the last year for which information is available for developing an estimate. Nearly all of the impact is because of the impact to electricity costs for state agencies and public higher education institutions. Based on the results of these studies as well as various modeling exercises, DEQ maintains that impacts on electricity consumers will be minimal. In fact, the latest analysis of customer bills based on updated modeling shows that average bills will slightly decrease as a result of the rule. Non-carbon benefit information provided in the public notice comes from DPB's analysis and quotes EPA COBRA analysis. The latest COBRA analysis again shows significant economic co-benefits resulting from criteria pollutant reductions as a result of this rule. The primary purpose of the regulation is to control CO_2; however, it is accurate to note that there will indeed be other air quality benefits associated with the control of carbon pollution. This discussion is part of the

Commenter	Comment	Agency response
		comprehensive economic analysis required by state law that attempts to identify significant impacts--direct and indirect--of the regulation. No analysis of the costs and benefits of the proposal can accurately say that there will be no impacts on other pollutants. DEQ agrees that climate change is a global problem. However, in the absence of a federal program, the Commonwealth is well within its authority to address air pollution within its borders. Linking to RGGI is not a "go it alone" approach; it will enable Virginia to leverage its pollution reduction efforts with a well-established, proven effective interstate program. As discussed in RGGI's most recent market analysis, carbon intensity is decoupling from energy generation in the RGGI region. In addition to its own analyses DEQ has reviewed the results of the RGGI program and finds that costs have been contained and benefits have been realized. See, for example, the most recent recent report prepared by the Analysis Group, "The Economic Impacts of the Regional Greenhouse Gas Initiative on Nine Northeast and Mid-Atlantic States: Review of RGGI's Third Three-Year Compliance Period (2015-2017)." This analysis found that RGGI continues to to lower CO_2 emissions while benefiting local and regional economies and employment opportunities.

Commenter	Comment	Agency response
		The report estimates that RGGI states will realize $1.4 billion in net economic value from RGGI's implementation during the 2015-2017 period. According to the report, the program also will create more than 14,500 new job-years (the equivalent of one full-time job for the duration of one year) due to the program's implementation during the past three years. In addition, CO_2 emissions from power plants have dropped by more than 50% over the 9 years since RGGI began. DEQ realizes that the electric generation system in RGGI is different, and that Virginia's participation in RGGI will be via consignment rather than direct auction; however, all indications are that linking to RGGI will be beneficial for Virginia. The energy price projections resulting from the updated modeling are lower than the previous modeling exercise in 2017. Thus, the cost of the program will be less for consumers and regulated sources than previously estimated. Ignoring the costs of carbon pollution will endanger Virginia's competitive advantage, and linking to RGGI is a step toward addressing that risk. DEQ is well aware of the need to address air pollution in the fairest, most cost-effective means possible, which is why the program is flexible and allows emissions trading to seek out the lowest cost

Commenter	Comment	Agency response
		reductions possible. DEQ has also taken measures to ensure that the program goals are realistic and can be reasonably achieved; see, for example, the response to comment 37. In short, the program has been designed to minimize impacts on businesses and consumers while achieving DEQ's air pollution control mission to protect public health and welfare.
62. AdvanSix, Greif, ODEC, Virginia Manufacturers Association (VMA)	The regulation imposes a carbon tax and cedes this tax authority to RGGI. The regulation envisions a process whereby conditional allowances are allocated by DEQ to regulated sources. Those regulated sources are compelled to consign the conditional allowances to RGGI for auction. Regulated sources throughout Virginia and the RGGI states can bid on the allowances. RGGI states have taken the auction revenue and used it for a variety of purposes, one of which is not related at all to the goal of reducing CO_2 emissions: 8% of the revenue was used "for state budget reduction," just like any other tax revenue that goes into the state's coffers. The cap-and-trade program in Virginia is supposed to operate differently. Revenue generated by the auction of conditional allowances consigned by a regulated Virginia source is supposed to be returned to that source owner, less RGGI administrative fees. DEQ has indicated the revenue received by owners of regulated electric utilities will "flow to rate payers pursuant to SCC requirements." However, we have no idea that will actually happen or to what purposes the revenue would be put. The provisions governing the allocation and auction of CO_2 emission allowances, whether conducted by DEQ under the board's authority or RGGI, are designed to produce revenue to fund energy efficiency programs, resiliency infrastructure, and other government purposes. The overlay of the additional cost imposed by the auction of CO_2 emission allowances constitutes a tax. The magnitude of that tax will not be set by Virginia; it will be set by RGGI, a non-governmental entity. The General Assembly may delegate the power of taxation to any county, city, town, or regional government (Va. Const. art. VII, § 2). However, the General Assembly cannot delegate its taxing power to an unelected entity, whether the board, DEQ or RGGI. The Constitution and case law are quite clear on these matters. Although the Constitution does not explicitly prohibit the delegation of such decisional authority concerning the imposition of taxes, that delegation is prohibited by necessary implication, and the General	The definition of "tax" is well established in state and federal law. The purpose of the regulation is to control and abate carbon air pollution, not to generate revenue. Rather than impose a tax, the regulation requires the issuance of allowances by the department to CO_2 budget units. An allowance is a limited authorization by the department under the trading program for CO_2 budget units to emit up to one ton of CO_2. Allowances are then traded within the confines of a consignment auction. No money is generated for or sent to the state.

Commenter	Comment	Agency response
	Assembly may not delegate its taxing power to a non-elected body. Thus, the Virginia Constitution prohibits ceding tax power to the board, DEQ or RGGI.	
63. AdvanSix, Greif, ODEC, Virginia Manufacturers Association (VMA)	The program is unnecessary. Virginia's per capita energy use fell from a peak of 346 MBtu per person in 2005 to 292 MBtu in 2013 and 2014. Virginia's 2014 rate is lower than the national average of 309 MBtu and ranked Virginia 21st among U.S. states for energy consumption. The decrease in energy consumption translates into a decrease in CO_2. From 2000-15, Virginia's energy-related CO_2 fell by 16.3%; the RGGI states averaged a 17.1% decrease and the entire U.S. experienced a 10.3% drop. Virginia already generates a relatively low amount of GHGs from electrical power generation, transportation, heating/cooling, and industrial processes. Virginia's CO_2 emissions decreased from 15.9 tons per person in 2005 to 12.5 tons in 2014. This was substantially better than the national average of 17.0 tons per capita and ranked 13th best in the country. Virginia is reducing its carbon footprint at a rate better than the nation and comparable to the RGGI states even without a cap-and-trade program. Virginia's electric utilities are expanding the role of renewable energy in power generation. Dominion has solar facilities capable of producing approximately 744 MW of power either operational or under development. ODEC has approximately 300 MW of renewable energy generation capacity, and plans to add 70 MW of solar generation in the next 5 years. As technology costs decrease, solar electric generation is growing rapidly in Virginia. According to the Solar Energy Industries Association, Virginia's total solar capacity of 619.5 MW at the end of 2017 ranked 17th among the states. SEIA data indicate that Virginia's solar generation fleet grew by 381.3 MW in 2017. Virginia ranked 10th in the nation last year in adding solar capacity. Dominion's 2017 IRP calls for the addition of at least 3,200 MW additional solar capacity by 2032 and at least 5,280 MW additional solar capacity by the end of a 25-year study period concluding in 2042. Dominion is moving forward with a project consisting of two, 6-MW turbines that will become the mid-Atlantic's first offshore wind project in a federal lease area. Larger-scale deployment of turbines in an adjacent site could potentially produce up to 2,000 MW of electricity. SB966 (2018), states that construction or purchase by Virginia electric utilities of solar and wind-powered facilities capable of producing up to 5,000 MW of electricity at maximum output is "in the public interest." It is clear that Virginia's electric utilities are moving rapidly to greatly expand generation from renewable resources. Virginia is already among the nation's leading states in this regard. A costly CO_2 program is unnecessary to	The program is needed. DEQ's modeling analysis suggests that carbon emissions from the electricity sector will increase without the program. The analysis is consistent with similar analyses conducted by the federal Energy Information Agency (EIA) showing emissions generally flat or modestly increasing in the coming years and decades. While emissions have decreased in some recent years, that trend is reversing and emissions are expected to continue to increase without the trading program. The commenter is correct that renewable energy development is expanding in Virginia, and it is expected that this trend will continue. DEQ has also recognized the value of these types of programs by establishing the 5% set-aside. New renewables and energy efficiency will make compliance with the trading program easier, but neither new renewables nor energy efficiency guarantee an emissions reduction from the sector. The program does.

Commenter	Comment	Agency response
	promote the continued rapid growth of renewable energy generation in the state.	
64. AdvanSix, Greif, ODEC, Virginia Manufacturers Association (VMA)	Virginia's electric utilities have billions of dollars invested in assets that serve the public good and generate returns for investors. If the program fails to allocate allowances necessary for those facilities to generate electricity, that failure would deprive those entities of their ability to operate. In essence the government would be taking the value of those electric generating assets from Virginia's utilities without public need and compensation. Similarly, if sufficient allowances for Virginia's utilities to operate are allocated but then forced to be consigned to RGGI for potential purchase by someone else, the board would be taking valuable allowances away from these companies without public need and compensation. Such "takings" are prohibited by the U.S. and Virginia Constitutions. Virginia is a member of numerous interstate and regional compacts. An essential feature of these compacts is authorization by the U.S. Congress and confirmation by the General Assembly. Linking to RGGI by compelling the consignment of allowances to RGGI for general auction would constitute an unauthorized compact with the RGGI states. Attempting to do so would exceed the authority of the board. Emission allowances should be allocated without cost to EGUs that will be constrained by the emissions cap. Direct auction of the allowances with the revenue collected by the state would constitute a tax. A direct auction would greatly increase the cost of the program to Virginia citizens and businesses.	DEQ disagrees with the commenter's assertion that the allocation of allowances constitutes a taking of value. As described in 9VAC5-140-6050 C 9, a CO_2 allowance does not constitute a property right. The allocation of allowances in no way deprives electricity generators of their ability to operate. That would defeat the purpose of the emissions trading program. Allowances are allocated based on actual generation (versus static historical generation), thus providing facilities with greater flexibility. Linking to RGGI does not constitute entering a compact. RGGI is a cooperative venture, governed by consensus among member states to maximize collective emissions reductions capabilities. Linking to RGGI does not exceed any federal or state requirement, nor does it directly impose any legal requirements on Virginia or its regulated community. As discussed in the response to comment 76, the board has the legal authority to control carbon pollution. Linking to RGGI is the most cost effective and efficient means of accomplishing this goal.
65. AdvanSix, Greif Packaging, Virginia Manufacturers Association (VMA)	Fossil fuel-fired units that serve electrical generators smaller than 25 MWe and industrial facilities should not be included in the proposed program. ED 11 speaks in terms of "electric power facilities," and EO 57 speaks in terms of "power plants," "the electric sector," "electric companies," and "electric utilities." It is clear that the mandate from then-Governor McAuliffe was for the board to propose a CO_2 cap-and-trade program tied to RGGI	DEQ agrees with the commenter's characterization of the directive to control carbon emissions from fossil fuel-fired generators. The ED 57 Work Group specifically recommended that the

Commenter	Comment	Agency response
	that would apply to facilities whose primary, if not exclusive, purpose is the generation of electricity for sale to the public. Industrial facilities are not power plants owned by electric companies and operating in the electric sector, and are clearly outside the scope of EO 57 and ED 11. Many industrial facilities in Virginia do not have multiple locations with different energy generating capacities to provide flexibility in meeting a CO_2 emissions cap. They have one facility and cannot shift allocations between facilities and generating technologies. Virginia's electric utilities have multiple units and generating technologies which allow them to find the least expensive way to reduce CO_2 emissions. Utility power producers are in the business of building alternative power generation sources while manufacturers are not. It is easier for utility power producers to shift the mix of generation to renewable power. Electric utilities have economies of scale and may purchase larger and a greater number of alternative generation units. Manufacturers' power needs are generally much smaller. Electric utilities are better able to pass their costs on to their customers, while manufacturers do not have a captive customer base. They compete worldwide for business from customers who are acutely price sensitive. Large capital expenditures for alternative energy generation would increase the price of products and damage their market position. Electric utility revenues are not affected by these global market demands. Emissions from industrial sources comprise only 11.3% of Virginia's CO_2 emissions. Expanding cap-and-trade to the manufacturing sector would impose significant costs with only a small reduction in emissions. The regulation does not define "primary use." The dictionary sense of "primary" would allow a facility to export just under 50% of the electricity and heat generated from fossil fuels on site and still qualify for the exemption. The reality is that no manufacturing facility comes close to exporting 50% of the energy generated on site. However, the regulation should provide manufacturing facilities a margin of flexibility to export energy when it is not all needed on site. "Primary use" should mean that in order to qualify for the exemption, no more than one third of the power generated on site, in the form of electricity and heat, can be exported. This approach is based on the cogeneration exclusion in Virginia's CAIR rule. For example, 9VAC5-140-1040 B 1 a (2) excluded cogeneration units provided they did not supply more than one third of the unit's potential electrical output capacity to any utility power distribution system for sale.	Governor consider taking action via a regulatory process to establish a trading-ready carbon emissions reduction program for fossil fuel-fired electric generating facilities. In the RGGI Model Rule, facilities that provide less than 10% of their power output to the grid are exempted from compliance obligations. DEQ also evaluated dedicated electricity generating units serving industrial facilities in Virginia, and determined that those facilities would not qualify as CO_2 budget sources. These facilities are already subject to a stringent permitting process to control criteria and toxic pollutants, and are closely monitored in order to ensure that they are meeting state requirements for controlling those emissions. Exemption of this level of industrial producers is also consistent with the RGGI model rule. The proposal has been amended to remove the phrase "owned by an individual facility." This change is being made in order to ensure that facilities are not penalized for employing more energy efficient and less polluting generating systems that may be operated by a third party on behalf of the primary facility. The proposal has also been modified to set a threshold for what constitutes "primary use of operation of the facility." These changes are necessary in order that the applicability provisions be consistent with RGGI's

Commenter	Comment	Agency response
		2017 Model Rule. Note that ongoing program reviews will provide the opportunity to adjust the exemption if necessary. There may also be opportunities in separate future rulemakings to directly address the exemption should implementation issues be identified.
66. Virginia Advanced Energy Economy (AEE)	AEE supports a CO_2 budget trading program. The regulation will help to make Virginia's energy more secure, clean, and affordable, bolstering the state's economy while reducing emissions. We support the ability of the regulation to integrate into other carbon markets. Integration with other states and regions will help Virginia achieve greater efficiencies and further reduce emissions. Utilizing the State Tool for Electricity Emission Reductions (STEER), AEE analyzed possible compliance pathways. With a diverse portfolio of advanced energy resources, including renewables and energy efficiency, the state could reduce emissions by over 13.3 million tons between 2020-30 at little to no cost, far surpassing the proposed targets. We recommend a 2020 baseline at or below 33 million tons. Lowering the baseline may encourage system planners and grid operators to accelerate the deployment of advanced energy resources in preparation for the 2030 targets. Such accelerated deployment is beneficial to ratepayers, as it would take advantage of the federal production tax credit for wind and the investment tax credit for solar and other advanced energy technologies. These incentives lower the costs of renewable resources, savings that will be passed along to consumers. Given the cost-effectiveness of energy efficiency, the sooner it is deployed the greater the cumulative savings will be to ratepayers. Our modeling also indicates that with a portfolio of advanced energy technologies in conjunction with coal-to-gas switching, Virginia can beat its 2030 carbon reduction target by approximately 3.4 million tons. These results suggest that actual reductions will exceed targets. When emissions reductions outstrip targets it has the effect of lowering the price of a carbon credit. While keeping the price of credits in check is preferable, significantly depreciating them is not, as it depresses the market and introduces volatility. We support the CCR and the ECR as they ensure that	Support for the proposal is appreciated. DEQ recognizes the value of the renewable energy market and energy efficiency measures as important tools in reducing carbon pollution. The program will promote both renewables and energy efficiency by putting a price on carbon emissions. The program effectively encourages renewables and efficiency because they are carbon-free resources and do not have a compliance obligation, unlike carbon-emitting resources. DEQ also recognizes that CHP units are highly efficient, and do not encourage the development of fossil fuel-fired generation. The program achieves its primary environmental objective through the cap, and not the allocation method. Note, however, that the updating output-based allocation methodology will reward units that produce more electricity with lower carbon emissions. In the past, DEQ has always allocated allowances to compliance entities and not to other entities, with the exception of set-asides to promote energy efficiency. This

Commenter	Comment	Agency response
	carbon prices remain within a predictable range. However, we prefer predictable and robust prices established and maintained through the market, as opposed to out-of-market interventions. Such prices are essential to the effective financing of advanced energy projects. We recommend that the rate at which the cap decreases each year be 4% annually, and that the ECR and CCR be adjusted correspondingly. These changes will help ensure that targeted and achieved reductions move in closer alignment, and that market functions proceed smoothly. Under the proposal, all permits are allocated to generators (less the set-aside) based on a 3-year average of net generation. We approve of basing allocations on generation, as opposed to historic emissions, as well updating allocations over time. To encourage compliance, we recommend that the rule allocate allowances to all generating units equal to or greater than 25 MW regardless of technology. This will ensure that the allowance allocation remains technology neutral and encourage competition among emission reduction measures. CHP units that generate heat and power for an individual facility are exempt. Given the efficiency of such systems, and the corresponding emissions benefits, this exemption is reasonable. We recommend that "owned by an individual facility" be removed. This will ensure that CHP systems that serve an individual facility are exempt regardless of ownership status. In order to ensure that the "primary use" of the CHP system is indeed to serve the individual facility, the regulation should specify that a minimum of 85% of the useful energy output be used at the site. As proposed, a covered CHP system must account for emissions created in the production of electricity and useful thermal energy (UTE). However, absent a CHP system, such thermal energy would be generated through a conventional method that is not subject to the regulation, potentially discouraging the use of CHP while creating new emissions from non-covered sources. The UTE exemptions put forward by other states should be considered. AEE supports the 5% set aside for DMME. According to studies by EPRI, by 2030 energy efficiency programs have the potential to save Virginians over 23,000 GWh of generation, more than 17% of the state's load, each year. On Virginia's current trajectory, the state will achieve just 5% of that potential. This underperformance stems from underinvestment in energy efficiency and a misalignment of incentives. Until this misalignment is reformed we support allowing experienced parties the ability to implement programs in addition to the utilities. We recommend doubling the set-aside to 10% in order to	program takes a similar approach. The structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement that set-aside. DEQ believes the set-aside should be 5% in the early stages of the program, and this percentage is consistent with past DEQ programs. The set-aside may be revised at a later date as the state gains experience with the program and with the program DMME develops. DEQ agrees that the phrase "owned by an individual facility" should be removed. Under the RGGI Model Rule, facilities that provide less than 10% of their power output to the grid are exempt from compliance obligations; the proposal has been revised accordingly.

Commenter	Comment	Agency response
	provide a more robust financing stream. According to our modeling, energy efficiency has the potential to help Virginia meet its carbon mitigation targets while reducing rates, creating jobs, and stimulating new in-state investment. The challenge energy efficiency presents lies in the ability of system planners, regulators, and other stakeholders to effectively track, evaluate, measure, and verify the energy savings produced by an array of energy efficiency programs and measures. The National Energy Efficiency Registry (NEER) helps states track and verify energy efficiency savings and transform those savings into tradable instruments parties may then use for compliance. Regulators and stakeholders should use NEER to facilitate the administration and tracking of energy efficiency programs in Virginia. Employing consistent and well-established methods for evaluation, monitoring, and verification of savings will help Virginia effectively tap into this cost-effective resource. Voluntary purchasers of renewable energy do so in part based on carbon reduction benefits. In many states, the purchase of a REC includes the purchase of environmental attributes associated with the carbon reductions of that power. Unless the voluntary market is taken into account, a statewide carbon reduction requirement could undermine voluntary purchaser commitments because they will no longer represent a regulatory surplus. Several programs have avoided this through a voluntary purchaser set-aside. This can also be done by allocating allowances to resources that reduce emissions rather than only to emitting resources. This will allow advanced energy resources to fulfill any contracted-for obligations to transfer allowances to purchasers under existing power purchase agreements. Those purchasers can then choose to do what they wish with the allowances. This gives purchasers the choice to retain these allowances if they wish to preserve the project's regulatory surplus.	
67. American Forest and Paper Association; American Wood Council; Forest Products Industry National Labor Management Committee; Virginia	The following principle should be incorporated into the regulation: "Emissions from the combustion of any forest-derived biomass shall not be considered a GHG if: 1) timberland carbon stocks, based on U.S. Forest Service Forest Inventory and Analysis data for the U.S. South Region, are stable or increasing relative to the 2005 carbon stocks assessment for this region; or 2) the forest-derived biomass is from forest products manufacturing residuals, harvest residues, or waste-derived feedstocks, including used wood products." Subsection 1 is based on the fact that harvesting wood for energy does not contribute to net carbon emissions in cases where it is offset by wood growth and associated carbon sequestration. U.S. Forest Service data shows	DEQ is well aware of the concerns associated with biomass, and discussed the pros and cons of including or excluding biomass units with the Regulatory Advisory Panel established to advise and assist in the development of the regulation. The group did not reach consensus on an approach for dealing with biomass; given that, and given the numerous, detailed comments

Commenter	Comment	Agency response
Agribusiness Council; WestRock	carbon stocks in trees on timberland across the southern U.S. have increased from 4.9 billion tons in 2005 to 5.6 billion tons in 2016. This shows biogenic CO_2 from biomass removed from the forest is more than offset by removals of CO_2 from the atmosphere by growing forests. Also, 2016 data from the U.S. Forest Service demonstrates that the growth/removal ratios for timberlands in Virginia is 2.29, meaning timberlands are growing more than twice as much wood as is being harvested. This positive net growth/removal ratio shows that Virginia forestry is more than sustainable. Finally, strong markets for wood preserve forests by providing an incentive not to convert the land to other uses. Subsection 2 is based on the fact that emissions from forest products manufacturing residuals, harvest residues, or waste-derived feedstocks would eventually enter the atmosphere even if they are not used for energy production. Simply landfilling these feedstocks can result in methane emissions, which have a much greater impact on global warming than CO_2. The use of biomass residuals each year avoids the emission of approximately 181 million tons of CO_2 indicating there are GHG reduction benefits in using forest products residuals for energy in the pulp, paper, packaging and wood products industry.	received during the public comment period, DEQ recognizes that this is a polarizing subject. However, the ED 57 Work Group specifically recommended that the Governor consider taking action via a regulatory process to establish a trading-ready carbon emissions reduction program for fossil fuel-fired electric generating facilities. The RGGI Model Rule provides that a biomass-fired facility may be a CO_2 budget source if the use of fossil fuel combusted comprises, or is projected to comprise, more than 50% (commence operation pre-2005) or 5% (commence operation post-2005) of the annual heat input on a Btu basis during any year. DEQ evaluated the fuel mix of the 5 potentially affected biomass-fired facilities in Virginia, and determined that those facilities would not qualify as CO_2 budget sources. These biomass-fired facilities are already subject to a stringent permitting process to control criteria and toxic pollutants, and are closely monitored in order to ensure that they are meeting state requirements for controlling those emissions. Additionally, most RGGI states allow CO_2 budget units that co-fire eligible biomass to deduct CO_2 emissions attributable to the burning of eligible biomass from their compliance obligation in accordance with the RGGI

Commenter	Comment	Agency response
		model rule. DEQ has amended the proposal to indicate that a CO_2 allowance is a limited authorization to emit up to one ton of CO_2 that has been generated as a result of combusting fossil fuel. Finally, periodic program reviews at the RGGI and state level will provide opportunities to adjust the exemption should implementation issues be identified. The proposed definition of "fossil fuel-fired" is inconsistent with the RGGI 2017 Model Rule, which sets a threshold of 5% of the annual heat input on a Btu basis during any year, and the regulation has been amended accordingly. This change is necessary in order to ensure that Virginia's regulation is a corresponding CO_2 Budget Trading Program regulation, such that Virginia can be considered a RGGI Participating State; the proposal has been amended accordingly.
68. American Forest and Paper Association; American Wood Council (AF&PA and AWC)	AF&PA and AWC do not support Virginia joining RGGI because it will raise electric power prices and consequently cause Virginia-based businesses to become less competitive. Biogenic CO_2 emissions from forest-derived bioenergy should be counted as making zero contribution to the build-up of GHGs in the atmosphere where timberland carbon stocks are stable or increasing. Through the natural carbon cycle, growing forests sequester carbon as trees are replanted and grow through their lifecycles, even as some trees are harvested. Recent data from the U.S. Forest Service indicate that timberlands in Virginia, the U.S. south, and the entire U.S. have positive net growth/removal ratios. Virginia's timberlands are growing more than twice as much wood as is harvested. The most significant pressure on forests is conversion to non-forest uses, such as development. By contrast, strong markets for wood help to preserve forests by providing	The commenters' concerns are recognized. As discussed in greater detail in the response to comment 61, potential costs and benefits have been rigorously examined, and the program has been designed to provide the maximum benefit at the least possible cost. See the response to comment 67 for further discussion of how biomass will be treated under the program and the response to comment 65 for further discussion of industrial boilers.

Commenter	Comment	Agency response
	an incentive to not to convert land to other uses and to invest in healthy forest management practices. A Journal of Forestry article concluded that "[t]he demand for wood keeps land in forest, provides incentives for expanding forests and improving forest productivity, and supports investments in sustainable forest management that can help offset the forest carbon impacts of increased demand." A U.S. Department of State report shows that strong demand for forest products will increase forest carbon stocks through ongoing landowner investment. Paper and wood products mills rely on residuals from the manufacturing process for steam and power for their operations or to sell electricity to the grid, and there is consensus that the use of residuals and biowastes for energy has significant GHG reduction benefits. A study published in the Journal of Industrial Ecology concluded that "[T]he use of biomass residues from forest products manufacturing, including black liquor, to produce energy in the U.S. forest products industry for 1 year avoids, over a 100-year period, 181 million tons of CO_2-equivalent emissions per year. Even ignoring the displacement of fossil fuels such as coal, the article finds that the avoided disposal of forest products manufacturing residues alone produces a GHG reduction benefit of approximately 5 million t CO_2-eq/yr." This is equivalent to removing one million cars from the road. The article states that ". . . if mill residues were not used for energy, most of these materials would be wastes that would be either incinerated, in which case the atmosphere would see the same biogenic CO_2 emissions as if the material had been burned for energy, or disposed in landfills." Disposal of residues in landfills creates methane, which has about 28 times greater global warming potential than CO_2. The article concludes, "consider[ing] all GHGs and fossil fuel substitution, the overall [GHG reduction] benefits of using manufacturing residuals for energy are large and become evident in short periods." Forest biomass, including manufacturing residuals, should be treated as carbon neutral whether or not it is co-fired with fossil fuel. The carbon profile of biomass is not altered simply because it is co-fired. This distinction is not scientifically supportable given that the biomass portion of the fuel mix has the same characteristics regardless of whether it is co-fired with 9% fossil fuel, 10% fossil fuel, or 90% fossil fuel. It is the biomass portion of the fuel mix alone that should be evaluated for net carbon emissions. The regulation should not cover industrial boilers. ED 11 pertains exclusively to controlling CO_2 emissions from "electric power facilities." Likewise, EO 57 directed the Work Group to recommend methods to reduce CO_2	

Commenter	Comment	Agency response
	emissions from "electric power generation facilities." The Economic Impact Assessment, the charge given to the Regulatory Advisory Panel, the emissions and economic modeling conducted by DEQ and its consultants, and DEQ's information leading up to and supporting the proposal indicated that the regulation applied only to the electric power sector. Indeed, covering only utilities is consistent with the intent and scope of the existing RGGI program, and RGGI allowance prices are based on the marginal cost to reduce GHG emissions from the utility sector and do not reflect the capability of industrial sources to reduce emissions. Unlike the electric power sector, industrial facilities must compete in a highly competitive global marketplace and do not have the comparable ability to pass on increased compliance costs to customers. Accordingly, it would be arbitrary and capricious, a violation of due process, and fundamentally unfair for the final rule to include other emission sources, such as industrial boilers. We also urge that the state retain the issuance of free allowances rather than conduct auctions, which would drive up compliance costs and harm the households and businesses served by the power grid.	
69. Appalachian Power/American Electric Power (APCo/AEP)	It would not be in the best interest of the state to develop incremental carbon policies to intervene in an ongoing transformation of the electric sector. Given that the Virginia regulatory process is robust and that CO_2 emissions have trended significantly downward, additional restrictions on carbon emissions could put Virginia at a competitive disadvantage. Unlike the Clean Power Plan, which included all states, a Virginia-specific carbon strategy would distort economic decisions. Carbon restrictions that are more stringent than national standards could lead to existing generating facilities being closed or new facilities constructed elsewhere, leading to a loss of both employment opportunities and tax revenue. The regulation will also result in higher customer rates, which would place additional stress on the finances of households and business, and influence where businesses choose to locate. DEQ has not provided adequate analysis supporting that benefits of the regulation for Virginia citizens would outweigh the costs. APCo is encouraged by the fact that DEQ has proposed a cap and trade program as the regulatory structure. Cap and trade programs have long been documented as effectuating emission reductions at the lowest cost. APCo supports allowance banking and a CCR allowance should allowances costs exceed projections. This is a fair way to ensure that consumers and businesses are not unduly burdened. APCo does recommend that several aspects of the regulation be modified. First, DEQ has not provided an adequate rationale for use of a	Support for the proposal is appreciated. As discussed in the response to comment 61, Virginia's carbon control strategy is not go-it-alone; the purpose of the regulation is to leverage Virginia's carbon reduction efforts by linking to a well-established and effective multi-state program. DEQ agrees that cap-and-trade programs are effective in controlling emissions. However, as discussed in the response to comment 64, DEQ has designed the program to implement a consignment auction rather than a direct auction. This will ensure that Virginia can link to RGGI while accommodating Virginia's unique utility regulatory regimen, and ensure a stable, transparent and fair program. See comments 108 and 136 for further discussion of the appropriateness of the

Commenter	Comment	Agency response
	consignment auction. Cap and trade programs have been overwhelmingly successful with a direct allocation to affected sources. Second, the allocation mechanism for allowances on the basis of updating net generation output does not acknowledge the inherent differences in carbon emissions between units utilizing different fossil fuels. Units using fuels with a higher carbon content are unfairly disadvantaged by the allocation process, even as they are subject to a declining carbon cap. APCo recommends directly allocating allowances to affected generators on the basis of actual emissions.	consignment auction.
70. Appalachian Power/American Electric Power (APCo/AEP)	APCo does not support allocation of conditional allowances to DMME. There is no adequate rationale for this set-aside. Under a cap and trade program affected sources and other parties have the incentive to utilize the most cost effective way to comply with the program and/or associated costs. The proposed set-aside effectively represents a 5% tax on affected sources and ultimately consumers and there is no justification that the benefits of this "tax" will justify any benefits that may be provided.	The primary purpose of EO 11 is to control carbon emissions from fossil fuel-fired power plants; however, EO 11 has also identified the encouragement of clean energy as a program goal. A 5% set-aide is modest, and will enable the state to determine the effectiveness of this type of program; see the response to comment 51 for further detail. To characterize the set-aside as a tax is inaccurate as discussed in the response to comment 62.
71. Appalachian Power/American Electric Power (APCo/AEP)	Inclusion of new units will be a disincentive to siting new fossil generation within Virginia as these units would be subject to an incremental cost associated with complying with the regulatory program. As such, units could be more cost effectively built in adjoining states not covered by the Virginia program, thus depriving the state of jobs and tax revenue associated with new generation facilities.	Inclusion of new sources is consistent with the RGGI program. In order for carbon reduction efforts in Virginia to succeed over the long term, new fossil fuel sources in the state must be considered. DEQ is confident that leakage will be addressed by a variety of RGGI and Virginia mechanisms; see comments 91, 108, 136 and 144 for more detail.
72. Appalachian Power/American Electric Power (APCo/AEP)	APCo has concerns with the need to maintain a new Virginia-specific database for GHG emission reporting, operating and maintaining a new database and software program for allowance trading, and maintaining records associated with CO_2 emissions and accompanying reports. APCo already maintains systems for emissions reporting and record retention per federal requirements, which differ significantly from those Virginia has proposed. Better aligning the proposed reporting, trading and compliance programs with the federal systems already in place would reduce the administrative burden	Because Virginia is linking to an existing trading program, it is not anticipated that any new Virginia-specific database will be needed. The Commonwealth is expected to use the RGGI COATS system to track allowances and emissions. The COATS system accepts

Commenter	Comment	Agency response
	of the rule.	emissions reporting consistent with federal requirements and is connected to EPA's emissions reporting system.
73. Appalachian Power/American Electric Power (APCo/AEP)	The higher starting cap of 34 million tons of CO_2 would mitigate the economic impact of the regulation. The higher cap would have imperceptible impact on the environmental effectiveness of the program with the benefit of lower resulting compliance costs.	The starting cap will be 28 million tons; see the response to comment 37 for more information.
74. Alliance for Industrial Efficiency	We commend DEQ for developing this regulation. Our members support market-based programs like RGGI because they account for the cost of carbon emissions while promoting economic growth. The regulation provides Virginia the opportunity to capture the economic benefits of transitioning to a low carbon economy. We applaud DEQ for recognizing the most economically efficient means for reducing CO_2 emissions in Virginia: incentives for energy efficiency. Finally, we commend DEQ for exempting certain industrial CHP units, which recognizes the emissions benefits offered by these systems. CHP systems produce heat and electricity from a single fuel source. Instead of generating power and letting the waste heat escape, CHP systems harness the thermal energy for heating, cooling, and other applications. Waste heat to power systems capture waste heat from industrial processes to make electricity, requiring no additional fuel and generating no further emissions. Not only does CHP have higher efficiencies than conventional power generation, it produces energy at the site of the end user, which eliminates line losses. CHP also provides benefits besides energy savings and resiliency and reliability benefits--it can continue to function in the event of a grid disruption. CHP should be a key element of the state's broader efforts to modernize its electric grid and make it more reliable. The General Assembly recognized the benefits of CHP in the 2018 omnibus energy bill which directs utilities to consider CHP as either a demand-side energy efficiency measure or a supply-side generation alternative. The regulation requires that CHP units over 25 MW that do not qualify for the industrial exemption purchase CO_2 emissions allowances for all emissions, including those associated with useful thermal energy (UTE). In the absence of a CHP system, the host would get its thermal energy from conventional methods, such as standalone boilers, which are not subject to the regulation. To avoid this disincentive for CHP, the regulation should exclude CO_2 emissions associated with UTE from a CHP unit. Emissions associated with thermal energy should be	Support for the proposal is appreciated. As discussed in the response to comment 51, DEQ believes the set-aside should be 5% in the early stages of the program; the set-aside may be revised at a later date as the state gains experience with the program and with the program DMME develops. In order to address CHPs with more clarity, the regulation has been amended to specify that the industrial exemption applies to fossil fuel CO_2 budget source located at a manufacturing facility that supplies less than or equal to 10% of its annual gross electrical generation to the electric grid, or supplies less than or equal to 15% of its annual total useful energy to an entity other than a manufacturing facility, provided that source had, prior to January 1, 2019, supplied both non-electric thermal energy to a manufacturing facility and 15% or less of its annual total useful energy to an entity other than a manufacturing facility. The unit's permit must contain a condition with the appropriate restriction of either gross electrical generation or

Commenter	Comment	Agency response
	deducted from a qualifying unit's total emissions allowances, as in Massachusetts' RGGI rule. The hallmark of a CHP system is that it produces heat and electricity from a single fuel source. Without a thermal exemption, the regulation undervalues the output of these systems. We commend DEQ for including an energy efficiency set aside, as such programs help consumers and businesses use less energy, reduce carbon emissions, and save money on energy bills. According to an Alliance for Industrial Efficiency analysis, if Virginia achieves a 1.5% annual energy savings target, the state can reduce annual CO_2 emissions by 2.6 million tons in 2030 and save businesses $4.1 billion in cumulative cost savings from avoided electricity purchases. Increasing the set-aside from 5% to 10% would create additional opportunities for energy efficiency programs and help capture more carbon reduction benefits. For example, EPA's guidance document on Establishing an Energy Efficiency and Renewable Energy Set-Aside in the NO_X Budget Trading Program recommends a set-aside of 5-10%. We recommend that DEQ clarify that energy efficiency includes CHP and would be eligible for set aside funds. Although DEQ has previously categorized CHP as a near-term energy solution to enhance energy efficiency, listing CHP incentives explicitly as eligible for set aside funds would ensure that potential project hosts are aware of the definition.	useful thermal energy.
75. Dwight Alpern	I support the proposed rule. I was the attorney-advisor for EPA's Clean Air Market Division and involved in developing regulations for allowance trading programs, including the Acid Rain Program and NO_X SIP Call. I suggest revisions to facilitate program operation and achievement of CO_2 reductions. 1. The proposal does not explain clearly how a holder of a public contract with DMME would set up and operate a conditional allowance account. The function of such an account would be similar to that of any general account established by other persons, i.e., holding and transfer of CO_2 allowances. Neither account's function would include holding allowances for compliance. The simplest approach would be to revise the rule to clarify in 9VAC5-140-6020 C that accounts for handling conditional allowances are a type of CO_2 Allowance Tracking System account (in revised definitions of "CO_2 Allowance Tracking System" and "CO_2 Allowance Tracking System account") and that those accounts of holders of public contracts with DMME (but not of CO_2 budget sources) are general accounts (in a revised definition of "general account"). This would make applicable to the public contract holders' accounts the general-account	Support for the proposal is appreciated. The commenter correctly notes that the proposed rule does not explain how a holder of a public contract with DMME would set up and operate a conditional allowance account. This process will be determined by DMME in accordance with DMME procedure. Because this process will be governed by DMME, it is more appropriately addressed by DMME and not in this regulation. With respect to allowances usable for compliance, the definition of an allowance has been modified such that it covers any other state participating in the

Commenter	Comment	Agency response
	provisions, e.g., for applying for an account and selecting and changing an authorized account representative, alternate, and electronic submission agent. Conforming revisions should be made to 9VAC5-140-6220 A, 9VAC5-140-6230 A, 9VAC5-140-6240, and 9VAC5-140-6250 A and B. For example, proposed 9VAC5-140-6230 A should be revised to read: Upon receipt of a complete account certificate of representation under 9VAC5-140-6110 or subsection B of this section, the department or its agent will establish a conditional allowance account and a compliance account for each CO_2 budget source or ~~and~~ a conditional allowance ~~compliance~~ account for a holder of a public contract with DMME for which the account certificate of representation was submitted. 2. The proposal requires Virginia CO_2 budget sources to hold "CO_2 allowances" for CO_2 emissions (9VAC5-140-6050 C 1 and 2 and 9VAC5-140-6260 B) but defines the term "allowance" (9VAC5-140-6020 C) by referring only to the Virginia CO_2 Budget Trading Program. That definition should be expanded to include CO_2 allowances issued by any other state participating in the RGGI program. If DEQ also decides to allow Virginia CO_2 budget sources to use for compliance offset allowances issued by any participating state, the same limitations on the use of offset allowances by other RGGI states' sources should apply to Virginia sources, i.e., limited use to cover emissions and no use for excess emission deductions. If offset allowances are to be usable, the following revisions are suggested: 9VAC5-140-6260 1. The CO_2 allowances, other than CO_2 offset allowances, are of allocation years that fall within a prior control period, the same control period, or the same interim control period for which the allowances will be deducted. ***3. For CO_2 offset allowances, the number of CO_2 offset allowances that are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of 9VAC5-140-6050 C for a control period or an interim control period may not exceed 3.3% of the CO_2 budget source's CO_2 emissions for that control period, or of 0.50 times the CO_2 budget source's CO_2 emissions for an interim control period, as determined in accordance with Article 6 (9VAC5-140-6220 et seq.) of this part and Article 8 (9VAC5-140-6330 et seq.) of this part. 4. The CO_2 allowances are not necessary for deductions for excess emissions for a prior control period under subsection D of this section. 9VAC5-140-6260 C 2. The department or its agent will deduct CO_2 allowances for a control period from the CO_2 budget source's compliance account, in the absence of	trading program.

Commenter	Comment	Agency response
	an identification or in the case of a partial identification of available CO_2 allowances by serial number under subdivision 1 of this subsection, as follows: i. First, subject to the relevant compliance deduction limitations under subsections A and D of this section, CO_2 offset allowances. CO_2 offset allowances shall be deducted in chronological order (i.e., CO_2 offset allowances from earlier allocation years shall be deducted before CO_2 offset allowances from later allocation years). In the event that some, but not all, CO_2 offset allowances from a particular allocation year are to be deducted, CO_2 offset allowances shall be deducted by serial number, with lower serial number allowances deducted before higher serial number allowances. ii. Second, any ~~Any~~ CO_2 allowances, other than CO_2 offset allowances, that are available for deduction under subdivision 1 of this subsection. CO_2 allowances shall be deducted in chronological order (i.e., CO_2 allowances from earlier allocation years shall be deducted before CO_2 allowances from later allocation years). In the event that some, but not all, CO_2 allowances from a particular allocation year are to be deducted, CO_2 allowances shall be deducted by serial number, with lower serial number allowances deducted before higher serial number allowances. 9VAC5-140-6260 D 1. After making the deductions for compliance under subsection B of this section, the department or its agent will deduct from the CO_2 budget source's compliance account a number of CO_2 allowances equal to three times the number of the source's excess emissions. In the event that a source has insufficient CO_2 allowances to cover three times the number of the source's excess emissions, the source shall be required to immediately transfer sufficient allowances into its compliance account. No CO_2 offset allowances may be deducted to account for the source's excess emissions.	
76. Americans for Prosperity	The regulation requires electric generators to purchase allowances to emit CO_2 in the RGGI cap-and-trade program. These allowances are equivalent to permit or license fees. In addition, the regulation delegates 5% of the allowance proceeds to DMME for CO_2 reduction projects. The Constitution of Virginia establishes authority to raise and spend money to the General Assembly, not DEQ (Article IV, § 11 and Article X, § 7). The regulation adopts the RGGI Model Rule, model legislation which has been adopted by the legislatures of all participating RGGI states. The General Assembly clearly opposes adoption of a CO_2 cap and trade program without legislative approval. The Senate and House passed HB1270 resolving that no CO_2 cap and trade program be adopted without authorization. In addition, the Senate Agriculture, Conservation and Natural Resources Committee rejected SB696, which	To characterize the issuance of an allowance as a permit or license fee is inaccurate; see the response to comment 62. Facilities have always incurred costs as they have been required to meet legal mandates to control and reduce pollution. Under a cap-and-trade program, facilities have enhanced flexibility to manage these compliance costs based on their specific business needs.

Commenter	Comment	Agency response
	would establish cap-and-trade in Virginia and bring the state's regulations into compliance with the RGGI model rule. The proposed regulation will not withstand a legal challenge.	As discussed in comments 139 and 159, it is necessary and appropriate for the board to promulgate state-specific regulations controlling carbon pollution. The board's legal authority to issue regulations controlling air pollution is found in the Code of Virginia at §§ 10.1-1306 through 10.1-1308; the Office of the Attorney General of Virginia issued an official advisory opinion on May 12, 2017, which concluded that the board is legally authorized to regulate carbon pollution under these sections of the code. While the board has broad authority to control air pollution, it is also responsible for achieving this goal in the most effective and cost-effective means possible, and, in the case of carbon pollution, this goal is most readily achieved through implementation of a cap-and-trade program. Cap-and-trade programs are proven means of reducing air pollution (see, for example, the response to comment 48); they incentivize pollution reduction. Unlike a "command-and-control" approach that would simply impose specific pollution control requirements, the trading approach maximizes the ability of a facility to flexibly make favorable business decisions while meeting the primary goal of reducing air pollution. The board furthermore has the authority to maximize the efficiency and efficacy of a

Commenter	Comment	Agency response
		cap-and-trade program by linking the program with RGGI rather than attempting to establish a new and untried state-only system. There is nothing novel about Virginia's participation in a cap-and-trade program; indeed, the Commonwealth has participated in such programs since EPA established the Acid Rain Trading Program under Title IV of the 1990 amendments to the federal Clean Air Act. Currently, Virginia is operating under the latest iteration of EPA's trading program for the control of NO_X under CSAPR. Nor is there anything novel about the regulation of carbon pollution in Virginia. Virginia's greenhouse gas permitting regulation (9VAC5-85) has been in place since 2011.
77. Americans for Prosperity	The RGGI program has not worked to reduce CO_2 emissions. CO_2 emissions fell just as fast in states with similar energy policies except for RGGI as they did in RGGI states according to "A Review of the Regional Greenhouse Gas Initiative" (Cato Journal 2018). Lower natural gas prices and EPA regulation encouraged fuel switching from coal to natural gas between 2007-15. This resulted in a 16% reduction in coal-fired electric generation, and a corresponding increase in natural gas generation of about 10% in RGGI and non-RGGI states. The same report shows non-RGGI states added generation from wind, and solar power at over twice the rate as RGGI states (5.5% compared to 2.3%). Non-RGGI states also saw a faster rate of improvement in energy intensity, a measure of energy efficiency (11.5% compared to 9.6%). RGGI, Inc. claims allowance revenue was invested in energy efficiency, and wind and solar power, but the actual comparison results show no significant impact of the investments. Compare non-RGGI Virginia to the combined results in neighboring RGGI states of Maryland and Delaware. All three are in the PJM Interconnection Regional Transmission Organization. The extra costs of RGGI	The RGGI program has been very successful at reducing emissions in participating states. Current emissions are approximately 45% lower than where RGGI started. Commenters argue that RGGI did not bring about the reductions but offers no evidence to demonstrate that RGGI did not cause—or at least contribute—to the emissions reductions in the RGGI region. While the electricity system is complex and it is difficult to separate out specific causes, adjustments to the RGGI program over the years have reduced the RGGI cap, preventing emissions from increasing and locking in reductions.

Commenter	Comment	Agency response
	allowances discouraged electric generation in Delaware and Maryland where electricity imports grew 42% since 2005, while Virginia imports decreased 34%. In other words, the RGGI states simply exported electric generation and emissions to other states. Adjusting for those exported emissions, emissions rates per person fell 38.6% in Virginia since 2005 compared to a combined 37.1% for Maryland and Delaware. Importing more power from other states is not the only form of emissions leakage. RGGI allowance costs added to already high regional electric bills. The combined pricing impact resulted in a 12% drop in goods production and a 34% drop in the production of energy intensive goods. Comparison states increased goods production by 20% and only lost 5% of energy intensive manufacturing. The extra costs of RGGI allowances have turned coal-fired plants from base load providers to intermittent suppliers by dramatically lowering operating hours. Expected increases in RGGI emission allowance cost will soon have the same impact on natural gas-fired power plants. Ramping power plants up and down has dropped efficiency 18.5% which results in more emissions, not less, and further raises electricity costs. 61% of Virginia power generation comes from coal and natural gas. A national target of 28% lower emissions from power plants by 2025, and 32% by 2032 from a 2005 base established in the Clean Power Plan will be met without taxes or fees on CO_2 emissions. Over the most recent 12 months power plant emissions have already fallen 27%. The U.S. leads the world in reducing emissions. Since 2005 the U.S. has reduced CO_2 emissions twice as fast as the rest of the developed world combined. Clearly RGGI has not had the expected impact of lowering CO_2 emissions. Benefits calculated in the Economic Impact Analysis assumed the regulation would lower CO_2 emissions along with reducing SO_X and NO_X as a byproduct. A decade of experience with RGGI has shown no added reduction in CO_2 or air pollutant emissions from the RGGI program; therefore there can be no monetized benefits from the proposal. To calculate the costs of the regulation an estimate of tons of annual emissions through 2030 is needed, along with an estimate of how many allowances will be available (each allowance covers one ton of emissions), and an estimate of the future price of allowances. Fortunately, the proposal provides the last two items. The SCC files an annual "Status Report: Implementation of the Virginia Electric Utility Regulation Act." The state's two largest investor owned electric utilities Dominion	This stands in stark contrast to analyses of uncapped areas of the country where emissions are expected to remain flat or slightly increase into the future. In addition to these demonstrable emissions benefits, as discussed in the response to comment 61, the RGGI program has greatly benefited local and regional economies. DEQ continues to believe that the studies and analyses developed on its behalf as well as additional information provided by RGGI and other experts in the field demonstrate that linking to RGGI will benefit the Commonwealth by cost-effectively reducing carbon pollution and stimulating clean energy growth. See comment 136 for more information on how RGGI's market mechanisms work and how they will operate in Virginia. Note that CO_2 intensity is decreasing across the RGGI region in spite of increased generation. With regard to costs incurred as a result of the CCR, the consignment auction approach means that ratepayers only bear the cost of excess allowances needed to comply.

Commenter	Comment	Agency response
	Energy and Appalachian Power file annual Integrated Resource Plans (IRP) which forecast future demand, supply, and pricing. Based on these documents there are planned retirements between 2017-26 of 1731 MW of oil and coal-fired capacity, and 440 MW of natural gas capacity. Between 2017 and 2019 5413 MW of new natural gas-fired capacity has already been approved by the SCC. Natural gas emits about half the CO_2 for each MWh of power generated. The retirements could be considered as offsetting emissions from 4280 MW of new natural gas capacity. That leaves a net increase of 1132 MW of new natural gas capacity. If that new capacity operates 5000 hours a year it will generate about 2.5 million tons of added CO_2. New power plants should yield less expensive power and run more hours than the older replaced plants, meaning higher emissions. Some of the retiring power plants will continue to operate after the new plants start up meaning higher emissions. Appalachian Power and Dominion own out-of-state power plants, and could shift generation out of state, meaning lower Virginia emissions, but global emissions would remain the same. The RGGI states review the program every 3 years and have worked to raise the allowance price each time, so it is likely allowance prices will rise. All of these factors will be ignored in favor of a conservative emission forecast adding 2.5 million tons to the 36.6 million tons emitted in 2016, for a total of 39.1 million tons in 2020. The proposal commits 5% of allowances for sale by DMME with the allowance revenue to be spent on CO_2 reduction projects. The Economic Impact Analysis forecasts an allowance price very close to the proposed ECR trigger price which subtracts allowances offered in an auction if the price goes below the trigger price. Our analysis uses the ECR trigger price as the forecast price. An upper range would use the CCR trigger price which runs about twice the ECR trigger price. If the CCR trigger price is exceeded extra allowances are added to the auction. From 2013-15 the CCR acted as a price signal in the auctions. The forecasted cost assumes power companies chose buy the emission allowances they need to comply to maintain electric grid reliability. The alternative is to write off premature closing of existing plants, while paying premium prices for new zero or low emission generation sources. This is likely as Dominion expects demand to grow 24% by 2030 and will need the capacity. The SCC allows utilities to pass on the cost of meeting environmental requirements and would likely allow the pass through of allowance costs. There is no penalty other than allowance cost if a state misses its RGGI target. The total Net Present Value cost through 2030 of	

Commenter	Comment	Agency response
	the regulation is $674 million with no offsetting benefits. The cost would be twice as high if the CCR trigger price sends the expected price signal to the auctions, so the range of cost is $0.7-1.4 billion. In 2030, the program will add $182 million, or about $20 a year to residential electric bills. Industrial bills could rise by over $100,000 a year.	
78. Business Council for Sustainable Energy (BCSE)	A regulation to reduce and cap CO_2 through a multi-state trading program makes sense for Virginia. Capping carbon from generation facilities will incentivize the use of cleaner energy resources that promote economic development and job creation in the state. Trading within a larger group of states will allow for greater market efficiency and lower compliance costs. The state will need to use the full portfolio of clean energy technologies and services, including energy efficiency programs that reduce energy consumption, cleaner burning natural gas, and renewable energy resources. BCSE supports the updating output-based allocation structure. DEQ should encourage the use of set asides granted to DMME to support of the full suite of clean energy technologies, including both supply-side and demand-side energy efficiency measures. RGGI states have benefitted from investing the multiyear funding from auction proceeds in clean energy, and BCSE encourages DEQ to consider a larger set aside amount.	Support for the proposal is appreciated, particularly support for the updating output-based allocation structure. As discussed in the response to comment 51, DEQ recognizes the value of energy efficiency programs as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement the set-aside. DEQ believes the set-aside should be 5% in the early stages of the program; the set-aside may be revised at a later date as the state gains experience with the program and with the program DMME develops.
79. Biomass Power Association	Biomass accounts for a significant portion of Virginia's renewable fuels makeup. As of 2015, biomass represented the bulk of renewable power available in the state. We commend the board for pursuing the CO_2 trading program. Only through programs like these can we seriously address the threat of climate change. By supporting a rich combination of power sources, a state can advance goals in other areas like forest management, watershed management, economic development, and transportation. The regulation would apply only to fossil fuel fired-facilities, exempting biomass power. We urge Virginia to maintain this position. Aside from supplying the state with a significant portion of its carbon neutral electricity generation, biomass is a critical part of the forestry supply chain. Biomass power facilities purchase the leftovers that remain following the harvest of a forest for higher-value wood fibers, adding value to the entire supply chain. The wood fibers used to generate biomass power are typically unusable for other wood products, and emit methane during decomposition.	Support for the proposal is appreciated. See the response to comment 67 for further discussion of biomass.

Commenter	Comment	Agency response
	The Association commissioned a study to determine the extent of carbon savings that can be achieved by opting for biomass over natural gas. A report is available on our website. The study examined the carbon intensity of a 50 MW capacity biomass power facility with a 43 MW net output on the electric grid, comparing it to that of a typical combined cycle natural gas facility. The study found that the use of organic residues as fuel in a biomass power plant instead of natural gas in a combined cycle facility results in immediate carbon savings of 115%, with 98% carbon savings over 100 years. Like the majority of biomass power facilities in the U.S., the subject of the study uses organic residues to generate power supplied to the grid. The fuels used at this facility are residues left over from harvesting fiber for local lumber and paper mills. These low-value materials are generated whether they are used for power or left to decay. If not used by biomass power plants, the materials typically remain in the forest as slash piles. The avoidance of carbon and methane emissions by removing and using materials that decay results in a significant GHG reduction over time. While the decay of these materials releases small amounts of methane consistently over time, methane has a 21 times higher global warming impact on the climate than CO_2. Further, with federal incentives for carbon capture and sequestration, and rapid technological advances being made in this area, biomass with carbon capture can become one of the only viable techniques that allows for the removal of atmospheric carbon. While the technology is still developing, we are optimistic that our members will soon be able to contribute to reducing the impacts of climate change in an even more meaningful way. Biomass is an essential part of any carbon reduction program.	
80. Blue Ridge Environmental Defense League (BREDL), Food and Water Watch, People Demanding Action, Preserve Floyd, Renewable Energy and Electric Vehicle Association	The excessively high RGGI cap and low allowance clearing prices, combined with other flaws in the program, prevent RGGI from being stringent enough to drive any meaningful reductions in CO_2. RGGI is a weak program that has allowed power plants to emit on a business-as-usual basis. For the first 5 years of the program, the industrywide cap was set over 50% higher than actual emissions. This meant fossil fuel power plants did not need to do anything to meet the overly generous cap. The initial cap allowed power plants to bank a substantial amount of unused allowances, amounting to 140 million tons of CO_2. While the cap was adjusted to address these saved allowances, this allowance surplus could continue to grow significantly due to a cap that continues to be higher than actual emissions, low allowance clearing prices, the purchasing of all available allowances and other factors. This further limits the effectiveness of the program.	The commenter suggests that RGGI allowance prices have been too "low" to drive emissions reductions. As of July 2018, RGGI allowance prices have remained between $2-4 for 70% of the auctions to date, and allowance prices have never reached $8 per ton. At the same time, emissions in RGGI have been steadily declining at a pace that exceeds the rate of decline of the RGGI emissions cap. Given the complexity of the electricity markets, it is difficult to

Commenter	Comment	Agency response
	The CCR further disincentivizes emissions reductions by operating as a cushion by releasing additional pollution allowances on top of the cap if prices get too high. The CCR was triggered in 2014 and 2015, allowing 5 million and 10 million additional allowances to be sold. All of these allowances were purchased, and because they were not borrowed from future years, they essentially increased the cap. RGGI prices, including the reserve price, continue to be too low or too volatile to result in any meaningful carbon reductions. Most, if not all, of the current carbon markets have failed to create "a stable, market-driven price of carbon," and often prices for GHG allowances "have been so low as to create little incentive to invest in GHG reduction," according to researchers at the University of California. Structural flaws in the RGGI program prevent the purported market-based incentives from working. Moreover, polluters prefer a larger supply of low-priced pollution allowances, creating a disincentive to actually embrace a pollution price point that might be effective. No market-based pollution trading scheme will ever result in market prices sufficient to encourage all polluters to reduce their emissions. RGGI has not accounted for increased emissions of methane from the growth of fracking and natural gas infrastructure. The climate proponents and petroleum industry that favor natural gas contend that since gas-fired plants emit less CO_2 than coal-fired plants, replacing coal power plants with gas power plants reduces climate emissions. However, methane emissions throughout the natural gas supply chain can nullify or even reverse any climate benefits from switching from coal-fired. RGGI's climate projections also ignore the reality that natural gas emits more CO_2 than coal. Declining CO_2 emissions from coal-fired power plants and coal-related methane emissions have been exceeded by increases in CO_2 from natural gas-fired power plants and methane leaks related to the gas used to fuel the power plants. RGGI drives demand for new gas-fired power which provide symbiotic profit opportunities for power companies that are capitalizing on low gas prices and fracking companies that hope the new plants will soak up supplies and ultimately raise prices enough to encourage more drilling. The Department of Energy reported that more than 420 new gas-fired power plants were proposed for construction between 2017-21. The demand for gas-fired electricity generation increases the demand for fracking and natural gas infrastructure, which further expands methane emissions.	discern the precise cause of the RGGI emissions decline in a given year or years. One econometric analysis carried out by economists at Duke University concluded that the RGGI price has indeed been a principal reason for the emissions reductions seen in the RGGI region. This suggests that even at prices between $2-4 RGGI is driving emissions reductions contrary to the commenter's suggestion. Apart from the RGGI price signal, it is clear that adjustments to RGGI's cap from time to time have locked in the emissions reductions that have been realized in the RGGI electricity sector. The commenter suggests the RGGI cost-containment reserve (CCR) has a negative impact on emissions reductions. The CCR threshold is currently set at $10, meaning that allowance prices would have to reach $10 a ton in a given auction for the CCR to be triggered. The auction clearing price for the June 2018 RGGI allowance auction was approximately $4—far below the CCR threshold. As mentioned above, RGGI allowance prices have never exceeded $8 per ton. Low allowance prices mean lower overall program costs before taking into account the mitigating impact of allocated allowances to consumer benefit. RGGI has locked in meaningful emissions reductions on the order of 45-50% since 2009, while simultaneously

Commenter	Comment	Agency response
		keeping allowance prices low. In essence, the RGGI program has achieved its program goal: controlling carbon pollution in a cost-effective and efficient manner. As discussed elsewhere, CO_2 is a global and national problem. RGGI stands for the proposition that a group of states can have a positive impact on emissions without driving emissions allowances up over $8 to date. This effectively balances the need to reduce emissions with the need to keep program costs at a reasonable level. Detailed discussion of how the consignment auction and market mechanisms operate, as well as the benefits of this approach, is available at comments 108 and 136. Executive Directive 11 directs DEQ to "1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit carbon dioxide emissions from electric power facilities that: a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of carbon dioxide allowances through a multi-state trading program; and b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on carbon dioxide emissions imposed in other states

Commenter	Comment	Agency response
		with such limits." (Emphasis added.) In other words, the proposed regulation under consideration is designed to meet the Governor's mandate to control CO_2 via participation in an emissions trading program. This emissions trading program is RGGI and, as the commenter states, RGGI does not address methane. DEQ agrees that the control of methane emissions is important; however, this specific regulatory action is not the means by which that will be accomplished. Note that methane is controlled elsewhere in the board's regulations as appropriate, and other measures may be adopted at a different time and in compliance with federal Clean Air Act and state law. As discussed elsewhere, emissions trading programs are authorized under the federal Clean Air Act and are a proven means of reducing air pollution (see, for example, comment 37). Joining RGGI will impose additional controls on each source of pollution beyond technology-based emissions controls imposed by federal and state permitting programs. Note that RGGI specifically addresses CO_2, not methane. More information on benefits realized by RGGI is discussed elsewhere; see, for example, comments 61 and 108.
81. BREDL et al.	Because biomass is typically considered renewable under state renewable standards, RGGI does not count CO_2 emissions from biomass processing and combustion. This underestimates the amount of carbon	As discussed elsewhere, the focus of this regulation is the control of CO_2 from fossil fuel-fired generators;

Commenter	Comment	Agency response
	released from this energy source by a significant amount. There is a growing consensus that biomass cannot be considered carbon neutral. Processing, transporting and burning wood at biomass plants all produce GHG emissions, which can be greater than those from coal. Carbon sequestration from the growth of woody material takes decades to occur and is counteracted by the rapid clearcutting of forests to fuel wood-fired power plants. If biomass CO_2 emissions were counted in RGGI states, total RGGI CO_2 emissions could be on average 31% higher than what is currently projected over the next 10 years. This would also undercount the CO_2 emissions from Virginia's rapidly growing biomass industry. From 2011-16, electricity generation from biomass more than doubled in the state. In 2016, 2.60% of Virginia's power came from biomass, nearly 50 times Virginia's energy generation from wind, solar and geothermal energy combined. By not counting these emissions, RGGI would promote the growth of biomass, increase harmful pollution, and suppress the expansion of genuine renewables like solar.	see the response to comment 67 for additional information.
82. BREDL et al.	RGGI proponents argue that emissions have fallen under RGGI. While CO_2 emissions have declined during the time that RGGI has been in place, there is no indication that RGGI itself has driven these reductions. Those reductions were more likely attributable to the Great Recession than to the program, since RGGI went into effect in 2009 as the economic activity declined steeply. Emissions were already declining before RGGI went into effect; emissions fell faster before RGGI was implemented. Much of the alleged effectiveness of RGGI is attributable to a massive countrywide shift away from coal and oil to natural gas that was already underway when RGGI took effect in 2009. Overall, from 2005-15, coal and oil use decreased from 32% to 9% of electricity production in RGGI states, while natural gas--which has become significantly cheaper because of the risky fracking boom--increased from 25% to 42%. RGGI effectively promotes the expansion of fracking for natural gas at the expense of renewables. From 2009-16, RGGI states have added 4 times more gas-fired electricity generation than wind and solar generation. The percentage of electricity from natural gas-fired power plants rose by 11.2% from 2009-16 but only rose 2.4% from wind and solar. Natural gas-fired power plants have relied on fracking which benefits power companies but imperils communities. Oil and gas operations have become the second greatest global source of the methane. RGGI further encourages the shift to fracked gas because CO_2 is the chief GHG pollutant emitted from coal-burning power plants. If a power company shifted its energy mix from coal to natural gas, it would accumulate RGGI allowances. While shifting to natural gas results in much lower CO_2 emissions at the power plant, the	As noted in the response to comment 80, it is difficult to determine the precise factors that lead to a specific result in complex electricity markets. One study carried out by economists at Duke University concluded the RGGI program was in fact a significant factor on the emissions reductions realized in the RGGI region. Other factors, such as low natural gas prices, also played a role. Without a doubt, the RGGI program has effectively locked in emissions reductions of approximately 45-50% since the program began through cap adjustments. Thus, RGGI has been very effective in realizing emissions reductions from power plants in the RGGI states. RGGI is a flexible, market-based program that imposes an allowance cost on burning fossil fuels, including natural gas. It therefore tends to

Commenter	Comment	Agency response
	increased reliance on natural gas significantly amplifies methane emissions. RGGI's failure to consider or cap methane as a GHG allows RGGI states to overestimate climate benefits. The GHG footprint of natural gas is worse than coal and oil because methane traps more heat in the atmosphere. Utilities that switch from coal to gas reduce CO_2 smokestack emissions but could be increasing CO_2 equivalent GHG emissions from methane leaks.	discourage electricity generation from natural gas relative to lower carbon sources of electricity such as wind and solar that have no allowance cost. It is wrong to suggest that RGGI promotes natural gas use over renewables. Also note that not all of the energy shift under RGGI has been to natural gas; shifts to renewable energy and energy efficiency are occurring and on the increase in RGGI and Virginia. For example, implementation of the Grid Transformation and Security Act of 2018 will encourage renewables. The set-aside will also encourage the development of renewable and efficiency projects. See the response to comment 51 for further discussion.
83. BREDL et al.	Cap-and-trade programs have the potential to form pollution hotspots and harm vulnerable communities. These populations already face higher pollution exposures because of the disproportionate location of toxic facilities in their neighborhoods. Market-based environmental policies can exacerbate hotspots that remain outside the scope of trading schemes, and they worsen pre-existing health and socioeconomic disparities. RGGI supporters point to the program's ability to raise revenue for renewable energy and energy efficiency initiatives, as well as reduce energy bills for low-income households. However, many states have used this pollution payment scheme to balance state budgets. While governments need revenue, funding from pollution means that governments will be less inclined to eliminate carbon from industry as they become dependent on the revenue. RGGI proponents assert that the program will save households millions of dollars in electricity rates. This has not been the case. RGGI states' residential consumers have seen their bills go up $1.1 billion since the program was implemented. At the same time, industrial users have seen a $1.9 billion decrease in their electricity bills.	DEQ is committed to addressing the environmental and health impacts of power plants in all communities, including those communities that have historically borne a disproportionate burden from local air pollution sources. The goal of the program is to reduce carbon emissions from power plants using a tool that has proved effective at reducing air pollution at the lowest possible cost. The emissions cap is designed to ensure that carbon emissions are reduced from a baseline, meaning that overall the environmental situation is improved from the baseline. Based on the modeling carried out for the proposal, not only would the program reduce carbon

Commenter	Comment	Agency response
		emissions, but it will also produce co-benefits in the form of reductions in other harmful pollutants that contribute to low-level ozone and particulate pollution. This is good for the health of Virginians. The commenters are concerned that because the program does not require emissions reductions at specific plants it may not reduce emissions at plants in specific neighborhoods. Individual power plants are subject to facility permits that hold those plants to specific emissions limits designed to protect public health. As discussed in comments 48 and 136, cap-and-trade programs are effective pollution control programs that reduce emissions beyond permitting controls. It is important to note that Virginia is a regulated state in which costs are carefully monitored and managed by the SCC. The program is not raising revenue; the consignment approach ensures that benefits return to the ratepayers, and no funds of any kind will be available for uses other than emissions reductions. The most recent economic analysis found, that from 2015-17, RGGI lowered CO_2 emissions while benefiting local and regional economies.
84. Birchwood Power Partners, L.P.	Birchwood Power operates a 240 MW coal-fired cogeneration facility in King George County. Birchwood is equipped with state-of-the-art pollution controls, including low NO_X burners, over-fired air, and selective catalytic reduction to reduce NO_X; use of high quality, low sulfur bituminous coal and a flue gas desulfurization system with a dry lime scrubber to control SO_2; and a high efficiency fabric filter baghouse to control particulate	The commenter's concerns are appreciated. DEQ is assisting affected sources in managing compliance costs by issuing allowances. The amount of compliance cost covered by the allowances will

Commenter	Comment	Agency response
	matter. Birchwood provides the advantages of fuel diversification, high energy efficiency, and low emissions, and is located in relatively close proximity to load. This combination makes Birchwood an important tool for balancing grid reliability and environmental protection. Birchwood is one of the few remaining coal-fired power plants in Virginia. In 2005, coal-fired power accounted for approximately 34.6 GWh or about 46% of in-state electricity generation. By 2012, coal-fired generation in Virginia was reduced to 13.6 GWh, about 20% of in-state generation. During the same period, generation from natural gas-fired combined cycle plants increased from 7.3 GWh, 10% of in-state generation, to approximately 23 GWh, 35% of in-state power generation. Further retirements of coal plants and construction of new gas plants are underway. The 2014 Virginia Energy Plan lists Birchwood as a coal-fired plant with projected long-term operations, and it is the only such plant that operates as an independent power producer (IPP). Coal-fired generation is important for maintaining fuel diversity and reliability. Birchwood is dispatched during extreme weather events and peak power demand periods. During Polar Vortex events in 2014 and 2015, natural gas that might have been available for power generation was consumed by residential and commercial customers for heating or, if available, became very costly. The Birchwood plant, with an on-site fuel stockpile, was dispatched at a high capacity factor and was 100% available for dispatch. Birchwood is particularly important to maintaining reliability as it is located close to the Washington D.C. and northern Virginia area and can provide fuel diversity in the face of gas shortages or price spikes. Birchwood's sale of energy is currently contracted to a third-party and is unable to pass the costs of the proposed regulation through to the market. Although Birchwood will be able to include these costs in its price of energy after its contract expires, the economics of coal-fired power plants have been severely impacted by the glut of natural gas, which has reduced energy margins and dispatch of the facilities. The regulation will put further pressure on the viability of these critical assets. Birchwood urges DEQ to adopt an approach that preserves a diversified fleet of power plants using different fuels. Diversification of the types of electricity generation sources will help maintain grid reliability during situations where there are natural gas curtailments, periods when renewable energy is limited or not available, and other events impacting individual base load units in Virginia.	depend on business decisions made by any individual facility.

Commenter	Comment	Agency response
	Birchwood's allocation will be based upon the average generation of the years 2016, 2017, and 2018. During this period, Birchwood's dispatch was at a historical low that represents only approximately 25% of its potential generation, due to the low price of natural gas. As an IPP, Birchwood would be severely disadvantaged based upon the proposed allocations of emission allowances. Accordingly, selection of a different period would more accurately represent dispatch of Birchwood.	
85. Blue Ridge Power Agency (BRPA)	The commenting members (Towns of Bedford and Richlands; Cities of Danville, Martinsville, Radford, Salem; Virginia Polytechnic Institute and State University; Central Virginia Electric Cooperative) are concerned that the board may lack statutory authority to participate in RGGI. Legislatures in most RGGI states have passed authorizing legislation. These legislatures have determined that because RGGI is a reflection of state policies and will require citizens to bear a cost to achieve those policies, those elected by the citizens of those states should make the decision as to whether joining RGGI is justified. Virginia, on the other hand, is acting without the benefit of legislative direction. Governor McAuliffe directed the board to implement RGGI. Without any support other than saying that it is "well settled," Attorney General Mark Herring determined that GHGs fall within the definition of air pollution under Virginia law. To avoid the uncertainty of protracted litigation and to ensure support for the program, the board should defer action until the General Assembly approves participation and authorizes DEQ to administer carbon-reduction programs.	As discussed in the response to comment 76, it is necessary and appropriate for the board to promulgate state-specific regulations controlling carbon pollution. See also comments 139 and 159 for further discussion.
86. BRPA	The rule would not require generators to purchase emissions allowances from the state in an auction, thus avoiding a requirement that all revenue-raising measures must be approved by the General Assembly. Instead, generators would be freely allocated allowances, which they consign to the RGGI auction. Allowances purchased at the RGGI auction would no longer be conditional, i.e., generators would surrender these allowances to DEQ in order to cover their actual annual CO_2 emissions. For each conditional allowance consigned to auction, the generator would receive the clearing price of the auction. This process allows generators to consign all of their conditional allowances but only purchase what they actually need. Unneeded allowances would be sold, with the proceeds collected by the generator. The program does not address the treatment of these windfall proceeds and, importantly, contains no provision specifying how such windfalls would be returned to consumers. The impact of the program on monthly customer bills is not reliable, and the impacts are likely to be considerably higher. The regulation preamble suggests that the	To date all emissions trading programs implemented by Virginia have allocated emissions allowances to the compliance entities. This is consistent with the approach recommended repeatedly by EPA in the various federal model rules offered for implementation by states beginning with the NO_X Budget Program in the late 1990s. This program will similarly allocate allowances to compliance entities. The program does two things that address the concerns voiced by the commenter. First, compliance entities will

Commenter	Comment	Agency response
	average monthly bill impact for residential, commercial, and industrial consumers through the year 2031 will be nominal--never more than 1.1%. These estimates are taken from an impact analysis prepared by a consultant that assumes that "95% of revenues that accrue to utilities from the sale of carbon allowances or credits are returned to ratepayers." No factual basis exists upon which to base an assumption that 95% of the revenues accrued would be returned to customers. As DEQ recognizes, the "revenue received by CO_2 Budget Sources owned by regulated electric utilities flow to rate payers pursuant to SCC) requirements." However, there is no legislative or other mandate to require the SCC to impose such a requirement on regulated utilities. The outcome of any proceeding at the SCC contemplating a proposal to direct the regulated utilities to return RGGI windfalls to customers is uncertain. Relying on the presumed outcome of an action that may or may not be taken by a different regulatory agency as the basis for cost estimates is speculative. The cost estimates developed by The Analysis Group fail to take into account that a significant share of the covered generators are not subject to SCC jurisdiction. Approximately one-third of the energy produced in Virginia in 2015 was generated by facilities owned by IPPs., which are not regulated by the SCC and would not be subject to any regulation that may be adopted later by the SCC. These facilities sell power into the regulated wholesale markets, and those sales are subject to the exclusive jurisdiction of FERC. The consultant's study assumes that "revenues from allowances to independent power producers [would be treated] in the same way as those allocated to utilities (i.e., revenues returned to ratepayers)"; however, no state mechanism exists to assure that the benefits of allocations to IPPs actually accrue to ratepayers. The program would allow these facilities to make windfall profits off of their allocated share of RGGI allowances, and permit those profits to lay beyond the jurisdictional reach of the state's rate regulator. Surely this approach is contrary to the program's intent. The board should explain why customer bill impacts should not be adjusted to remove revenues from allowances to unregulated entities, or explain what regulatory mechanisms would assure those revenues are returned to customers. The RGGI model rule leaves how to allocate allowances to states. Under the proposal, allowances will be allocated to units based on the average of the 3 amounts of the unit’s total net-electric output during the 3 most recent years for which data are available prior to the start of the control period. All covered units in Virginia, regardless of whether they are regulated by the SCC, will receive an allocation of allowances based on past	consign their allocated allowances to auction, where the allowances will be sold. Unlike previous programs, this means that the value of the allowances will be transparently known to all observers of the auction. This, in turn, means that the utility commission will have a clear valuation of the allowances to use in carrying out their responsibilities. Second, the allocations are to be made on an updating, output basis. This means that the allocation will tend to reflect the facts in the field: the plants that run more will get more allowances and the plants that run less will get less. This should greatly reduce the chances of an overallocation to individual plants. The commenter notes that independent power producers are not subject to rate regulation by the commission. To the extent the power generated by independent power producers is purchased by regulated utilities, however, the costs of that power are indeed the subject of regulation. This would include any embedded allowance costs. The commission, therefore, may have some influence over whether the costs of allowances are in fact passed on to consumers when the compliance entities have received the allocations at no cost to them. In any event, the program will make such regulatory decisions much easier than previous

Commenter	Comment	Agency response
	operation and the right to potentially convert those allowances into profits. Note that no other state has chosen to allocate 95% of allowances to generators. The allocation of conditional allowances to generators based on historical usage is arbitrary, and likely to overcompensate generators and produce excess allowances because energy production at many of the covered units will continue to decline as zero-carbon resources compete with high-carbon emitters. These excess revenues will be sold at auction or banked by the generators, but those entities that have made investments in energy efficiency and carbon-reducing technologies are provided nothing. Further, the board has stated that the SCC will need to act to require that regulated utilities return auction revenues to customers. But until those rules are finalized there is no guarantee whether or how that will be done and there is a risk that the funds will become windfall profits to the recipients of allowances. It is also unclear as to how Virginia customers will receive any benefit from the profits earned by unregulated IPPs. An alternative to the allocation of allowances to units is to directly allocate allowances to load-serving entities (LSEs) in proportion to their customers' energy consumption. The value could be passed on to those customers by way of offsetting reduction to their bills, or the benefits of programs to invest in local alternative energy projects in their service territories. This approach would not foreclose the statewide set-asides of allowances to support energy efficiency programs. The commenting members therefore strongly urge the board to withdraw the regulation for the purpose of considering whether allocation of consignment allowances should be redirected from generating units to LSEs. The preamble does not explain how the program would impact the cost of wholesale power sold to Virginia entities, which it would assuredly do for BRPA's members. These impacts take effect at the wholesale markets regulated by FERC. With respect to power purchase contracts that include a formulaic type of cost-of-service rates, the cost incurred by the owners of covered generators of procuring RGGI allowances are likely to be passed through in those cost-based rates. However, it is not clear whether revenues from the auction for consigned allowances would be credited through the formula rate process and returned to our members. This is to be decided by FERC, and could leave members and consumers with the obligation to bear the costs of RGGI without any offsetting revenues. Energy prices could increase as the cost of RGGI allowances are incorporated into the energy offers that are submitted into the PJM energy markets. Energy prices in the regional markets are determined by the	emissions trading programs where allowance allocations were made without the benefit of a consignment auction or without updating. See, for example, comment 136. According to the bill impact analysis conducted on DEQ's behalf, costs are expected to be minimal.

Commenter	Comment	Agency response
	offer of last-dispatched and highest-price resource, and because the auction is a single-price auction the generator's cost of RGGI allowances could have region-wide price impacts. Over time, the program would ratchet up the RGGI allowance price and ratchet down available quantity, so the cost of RGGI will become more apparent in wholesale market prices. BRPA members will see a more significant impact of RGGI on wholesale power costs. Participation in RGGI has the potential to affect congestion paid by our members. Wherever power is generated, whether in Virginia or another state, it must be moved financially from that location into the Blue Ridge. Regardless of the contract price, if the price of power at the point of generation in another state is low and the price of power in the Blue Ridge area is high, the purchaser must pay for the difference, and those costs can be substantial. We ask the board to reconsider the allocation of conditional allowances to generators. The Regulatory Advisory Panel was clear: cost to customers should be a primary consideration. In fact, the panel could not come to consensus on whether LSEs or generators should receive the auction credits. Assigning allowances to LSEs is the most direct way to assure that the benefits of RGGI accrue to intended beneficiaries--retail consumers in Virginia.	
87. Calpine	Calpine supports cap-and-trade programs that place a clear price on carbon emissions in a way that allows such a price to be reflected in wholesale power prices and that are designed to minimize market distortions, including broad coverage of new and existing power generation facilities that emit GHGs; effective and equitable methods for distributing emission allowances; minimization of leakage issues that result from differing requirements from one state to the next; and setting allowance budget caps at a level that will result in meaningful carbon reductions by incentivizing environmentally efficient dispatch of power generation facilities. For these reasons, Calpine supports the proposal, including allowing Virginia sources to use allowances that either originated in Virginia or any other RGGI state. Linkage with RGGI will allow for a broader, more flexible emissions market, helping to improve market competitiveness and trading efficiency while lowering carbon abatement costs for affected generators. Because Virginia's linkage with RGGI will significantly expand the size of the RGGI market, it is important to recognize the potential impact of the level of Virginia's base budget on the RGGI program and on allowance prices. A budget that is not based on reasonable assumptions regarding the generation mix in light of a cap-and-trade program in Virginia may result in significantly higher or lower compliance costs for the	Support for the proposal is appreciated, as is the commenter's discussion of the benefits of RGGI and its market mechanisms. As discussed in the response to comment 37, a cap of 28 million tons was selected.

Commenter	Comment	Agency response
	overall program. In RGGI's most recent auction, CO_2 allowances sold at a relatively weak clearing price of $3.79. This suggests that a too-high base budget could further weaken the carbon price signal. At this price, the societal value of the RGGI program is largely limited to income it generates for the participating states; it is too low to impact power system dispatch to any meaningful degree. Thus, Calpine recommends that Virginia set its initial base budget to no more than 34 million tons of CO_2. The proposed budgets account for recent trends in Virginia's electric generation sector, including planned retirements of fossil fuel generators and opportunities for clean energy and energy efficiency. The opportunity to trade with other RGGI states, and the inclusion of the CCR, help ensure that a base budget no higher than Virginia's proposed levels is reasonable and will ensure sufficient overall market liquidity. Recognizing the historically low allowance prices in the RGGI region, Calpine supports the proposal to include the ECR.	
88. Covanta	We fully support efforts to reduce GHG emissions through a market-based mechanism. We are proud to be part of efforts already underway to reduce GHG emissions in Virginia. Covanta operates EfW facilities in Fairfax County and Alexandria. These facilities are recognized internationally as a source of GHG emissions mitigation and low carbon energy generation. EPA has determined that EfW facilities reduce lifecycle GHG emissions by one ton of CO_2 equivalents (CO_2e) for every ton of MSW diverted from a landfill and processed. Based on Virginia data, every ton of MSW diverted to EfWs reduces GHG emissions by roughly 0.7 tons CO_2e. Covanta's Alexandria and Fairfax facilities annually reduce GHG emissions by over 900,000 tons of CO_2e a year relative to landfilling. Capping emissions through a trading-ready approach will incentivize the use of low-carbon energy sources that promote economic development and job creation. To achieve the most cost-effective program, we support a full portfolio of clean energy technologies and services, including wind, solar, energy efficiency, and EfW. We encourage DEQ and DMME to leverage the set-aside mechanism to further support renewable generation, both for existing facilities that face ongoing operating costs as well as new capacity, inclusive of both greenfield development and additional generation achieved at existing facilities. We also support the proposal to allocate allowances on the basis of regularly updated electricity output, as opposed to historical emissions. This approach provides the greatest alignment between the carbon intensity of electrical generation and the market-based policy signal.	Support for the proposal is appreciated. DEQ agrees that EfW facilities play an important role in the reduction of carbon pollution.
89. Center for Resource Solutions	The RGGI Model Rule includes a voluntary renewable energy market set-aside provision. Virginia would be able to draw on the experiences of 8 other RGGI states	As discussed in the response to comment 51, DEQ recognizes the value

Commenter	Comment	Agency response
(CRS)	that have successfully implemented this provision. We strongly recommend that Virginia incorporate this or a similar provision in order to maintain and grow the environmental and economic benefits of voluntary, private investment in renewable energy. Under the rule, GHG reductions at regulated electricity generating facilities due to renewable energy generation will be automatically counted and reported by those facilities toward compliance, and since the rule determines and fixes the level of emissions from the sector, there is no net change to emissions at regulated sources due to renewable generation. In this scenario, voluntary renewable energy can have no impact on statewide or regional GHG emissions beyond what is already required; furthermore, it subsidizes compliance for regulated entities. As voluntary renewable energy reduces emissions counted toward compliance, voluntary purchases help reduce the cost of compliance, making it cheaper and easier for regulated emitting facilities to comply. This presents a different value proposition for voluntary and corporate buyers and investors in comparison to circumstances prior to implementation of the rule. Voluntary renewable energy is not used to meet governmental targets or mandates--it stands apart from and builds on compliance efforts. This separation enables the voluntary market to make an incremental difference or "regulatory surplus." Voluntary purchasers of renewable energy tend to value this incremental impact highly. Renewable energy generation that is counted toward regulatory compliance cannot be considered surplus to regulation. Regulatory surplus with respect to GHG regulation may be important for voluntary renewable energy demand. Since many of the companies and individuals purchasing in the voluntary market do so a commitment to address GHG, an effect on emissions beyond what is required by law may be a non-financial benefit. Where renewable energy sold into the market does not have an effect beyond compliance and only helps regulated entities comply, this changes the effectiveness of voluntary renewable energy as a climate change solution for companies and individuals. As such, voluntary demand for renewable energy may decline if these benefits do not remain intact. Virginia's program can protect voluntary renewable energy benefits and demand by incorporating a provision that sets aside and periodically retires allowances for voluntary renewable energy, effectively lowering the emissions cap on its behalf. This mechanism would counteract the automatic counting of emissions reductions associated with voluntary renewable energy and recognize those emissions reductions as	of a voluntary renewable energy market as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement that set-aside. DMME may, at the appropriate time and in accordance with its regulations and policies select a voluntary renewable energy market set-aside.

Commenter	Comment	Agency response
	incremental to what would otherwise be achieved through GHG regulations. This helps preserve voluntary demand and private investment in renewable energy as drivers of emissions reductions, which can lower the cost of and reduce the need for GHG regulations. The RGGI Model Rule contains provisions for the number of tons that would be allocated to the voluntary renewable energy market set-aside account in a specific control period, including a sample formula with which the state could calculate the quantity of set-aside allowances that would be required. Regulatory surplus is critical to sustaining clear voluntary claims and has been helpful in the RGGI region in sustaining voluntary investment in renewable energy beyond what is required. A voluntary renewable set-aside preserves regulatory surplus for voluntary renewable energy by lowering the emissions cap and recognizing those emissions reductions as incremental to what would otherwise be achieved due to the cap. A set-aside can motivate private capital to produce voluntary renewable energy generation and emissions reductions in excess of state mandates. Alternatively, where voluntary demand for renewable energy is limited, so is the development of renewable energy and associated emissions reductions. By not including a set-aside for voluntary renewable energy in the regulation, Virginia may potentially leave privately-funded emissions reductions on the table, which it will later have to regulate to achieve. Green-e sets the standard for the voluntary market . To maintain the impact of the voluntary market and meet consumer expectations, Green-e requires a set-aside mechanism or allowance procurement and retirement for certified sales in regions covered by cap-and-trade regulation. Due to lack of a set-aside, Green-e would not be able to certify voluntary sales of renewable energy from within RGGI or Virginia to customers in Virginia, unless the customer pays the additional price to independently purchase and retire an allowance. Since customers are unlikely to pay this additional cost, we anticipate that there would be no Green-e market for Virginia renewable energy generation, or for RGGI renewable energy generation that is sold into Virginia. Voluntary buyers in Virginia will have to get their certified renewable energy from outside of the RGGI region. In 2016, Green-e certified over 728,000 MWh in sales to over 30,000 retail customers located in Virginia. This shows strong demand for voluntary renewable energy in the state.	
90. Dominion Energy	We support a program that would allow for emissions trading and be trading-ready. The program should reduce carbon emissions not only in Virginia, but regionally. The program should encourage the growth of	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed

Commenter	Comment	Agency response
	cleaner-emitting generation commensurate with the Grid Transformation and Security Act of 2018, which finds 5,500 MW of new solar and wind in Virginia in the public interest, as opposed to encouraging the increase in the dispatch of higher emitting generation in neighboring states. It must recognize the benefit of reducing purchased power from out of state and its impact on the environment, the Virginia economy and Virginia jobs. The program must establish a representative baseline that accounts for the emissions serving Virginia customer energy needs from which to determine and measure emissions reduction goals. This should account for emissions from in state generation sources as well as emissions from purchased power. The plan should evaluate and set emission goals and realistic implementation timelines that will provide needed time for the ramp-up of new renewables, energy efficiency programs, and infrastructure improvements in order to maintain the state's fuel diversity and goal to become more energy independent. The program should recognize the role of extending the operation of Virginia's existing fleet of carbon-free nuclear generation and the role of natural gas as the lowest cost, cleanest and most reliable form of dispatchable generation to complement the integration of renewables to the grid. It should also account for electrification of other sectors of the economy, such as transportation, and must not hinder the growth of electric vehicles. The program should be flexible, with multi-year emission averaging and other measures so that reductions can be achieved in the most cost-effective manner. The program should address electric system reliability and rate impacts.	in further detail below.
91. Dominion Energy	Any program setting carbon emission targets for electric generating units must accommodate for the dynamics of power generated outside of and imported into Virginia. The baseline and targets must account for the fact that Virginia is a net importer of energy from more carbon-intensive out-of-state resources. The program must also incentivize the expansion of lower-emitting cleaner generation in the state, and reduce imports of electricity. Encouraging the expansion of natural gas-fired combined cycle and renewable energy resources will grow the economy and lower emissions by decreasing reliance on imported carbon-intensive power. Setting a stringent cap on already cleaner generation in Virginia absent a similar level of reductions from neighboring states or a way to address leakage would increase the cost burden to Virginia generators. This would encourage lower cost electricity imports that are more carbon-intensive and not subject to a carbon cost adder, and result in limiting the dispatch natural gas combined cycle facilities in Virginia. In the PJM Interconnect, units are dispatched based on "replacement cost" of the variable components required	In theory, emissions "leakage" occurs when an emissions cap causes generation to shift from the area under an emissions cap to an area outside the cap, and that shift leads to increase in emissions. A number of factors make emissions leakage unlikely in the case of the trading program in Virginia. The electricity markets are in a period of significant change. Retirements of older plants and construction of new plants in new locations means changes in where power is generated. In addition, plants closer to the well heads tend to enjoy lower

Commenter	Comment	Agency response
	to run the unit. The variable components include fuel and emission allowances, such as RGGI allowances. The replacement cost changes based on the market value of the type of fuel used in a unit and the market value of the allowance. Dominion does not choose when to operate its units, units are called upon by PJM. If Dominion units are above the target price for the day, other units, generally less controlled and more carbon intensive, will be called upon to meet load demand. Due to a carbon cost adder to the unit bid price when Virginia units bid into the electric market that other PJM resources would not have to account for, Virginia generators will be less competitive, resulting in increased imports. Coupled with the retirement or curtailment of fossil fuel-fired resources, this raises reliability concerns. These concerns are borne out by modeling analyses. In support of the company's 2018 IRP, ICF provided Dominion with forecasts for cases where Virginia joins/does not join RGGI. Virginia linking to RGGI does not reduce emissions regionally. The modeling results indicate that Virginia entering RGGI in 2020 does not result in overall carbon emission reductions in the EI or PJM regions by 2030. Emissions in the entire EI in 2030 are about 10 million tons higher than emissions in 2020 and about 3 million tons higher in the PJM region during the same period. The analysis shows that emissions reductions achieved in the RGGI region are offset by emissions increases in the non-RGGI portions of the EI region. Cumulatively, over 2020-30, emissions in the portion of the EI subject to RGGI are reduced by about 75 million tons, but increase by almost 90 million tons in the non-RGGI portion of the EI In the RGGI region, emission decreases over the period 2020-30 with Virginia linked to RGGI are driven by emission reductions in Virginia emissions in the non-Virginia portion of RGGI actually increase. The modeling results also show significant increases in net energy imports in Virginia, increasing from about 28% under the case with no carbon regulations in Virginia to 48% for the case with Virginia linked to RGGI. At the same time, the weighted average capacity factor for NGCC facilities in Virginia is projected to decrease by almost 50% between 2020 and 2030 under the RGGI case. DEQ modeling of Virginia linking with RGGI showed similar increases in power imports under both policy scenarios evaluated relative to the case with no carbon regulations in Virginia. DEQ has proposed an updating output-based allowance allocation approach that it believes will incentivize utilization of NGCC resources as a means to counter leakage. However, while an updating output-based allocation approach may be more favorable to NGCC units relative to coal-fired units, it does not address leakage. Natural gas-fired units in Virginia will still be subject to a CO_2 cost adder that	fuel costs—the primary operating cost for natural gas power plants. The cost of transmission, in contrast, favors plants that are closer to the load the plant serves. Thus, while differences in environmental costs have the potential to change the relative costs of plants in Virginia compared to plants outside Virginia, shifts in generation are determined by a whole host of other factors that are more significant than the low RGGI allowance price. Second, the owners of generation in Virginia are unlikely to face any competitive disadvantage relative to plants outside the state because the allowances are to be allocated to compliance entities under the program, and the amount of the allocations are to be determined on an updating output basis. To the extent a generator must use an allowance to generate power and also receives an allowance at no cost, the generator does not have an increased operating cost relative to plants outside Virginia. If there is no competitive disadvantage, there can be no shift in generation caused by the program. Third, vertically integrated utilities have the option of self-scheduling their generation in the competitive wholesale electricity markets. This means that even where generators outside the state have a lower operating cost that is the result of the program’s

Commenter	Comment	Agency response
	units outside of the region will not be subject to. The effect of RGGI-equivalent reduction requirements in Virginia is likely to limit the dispatch of highly efficient and lower emitting NGCC facilities in Virginia and encourage the dispatch of higher emitting resources and increased emissions in neighboring states outside of the RGGI region. Average carbon intensity in 2030 of electricity serving Virginia with the state not joining RGGI is projected to be 742 lb/MWh in 2030; the carbon intensity increases to 784 lb/MWh if Virginia joins RGGI. This is a 5.7% increase in carbon intensity of the electricity used by Virginia customers largely due to increased electricity imports into Virginia, which have a higher carbon intensity than in-state generation.	allowance cost, utilities may choose to run anyway because it makes economic sense to do so. Utilities, therefore, have a tool to prevent the generation shifts that might otherwise constitute leakage. Fourth, updating output-based allocation is expected to encourage generation in the state, rather than discourage it. Because power plants receive allowances only when they operate, the program is set up to discourage generation shifts by rewarding in-state generation. According to an August 2017 study conducted by researchers at the Regional Economic Studies Institute and Resources for the Future, updating, output-based allocation can be an effective tool to counter incentives to shift generation to areas not covered by an emissions cap. Fifth, if a shift in generation does in fact occur there is some question whether the shift is likely to lead to an increase in emissions. Natural gas has become the dominant fuel in PJM and typically fuels the marginal unit. To the extent a shift occurs between a natural gas plant in Virginia to a natural gas plant outside Virginia, there may be no increase in emissions that occurs as a result of the shift, especially to the extent adjustments to the emissions cap are made over time to address any excess allocations

Commenter	Comment	Agency response
		under the trading program. For all of these reasons, DEQ believes that emissions leakage is unlikely to occur under the program (see responses to comments 108, 136 and 144). Also note that the implementation of the DMME set-aside will also encourage the reduction of in-state demand, thereby reducing carbon pollution and further preventing leakage. To the extent the possibility of leakage may theoretically exist, current evidence suggest that it has not happened under RGGI. RGGI issued the "CO_2 Emissions from Electric Generation and Imports in the Regional Greenhouse Gas Initiative: 2015 Monitoring Report." This report, the seventh in a series of annual monitoring reports, summarizes data from 2005-15 for electricity generation, net electricity imports, and related CO_2 emissions for the participating states. These monitoring reports were called for in the 2005 RGGI MOU in response to concerns about the potential for the RGGI trading program to cause emissions leakage. The observed trends in electricity demand, generation, and net imports show there has been a small change in CO_2 emissions from total non-RGGI electric generation serving load in the RGGI region during 2013-15 when compared to the base period, and the CO_2

Commenter	Comment	Agency response
		emissions from this category for 2015 show there has been virtually no change when compared to the base period. In other words, the carbon intensity of additional generation is reduced, and emissions leakage has not actually occurred. Linking to RGGI will make Virginia a participant in RGGI's scheduled program reviews, and those program reviews can address any leakage problems should they arise with the program in the future. RGGI participating states perform comprehensive, periodic program reviews to consider program successes, impacts, and design elements. Stakeholder meetings are held throughout the program review process in order to encourage stakeholder engagement and the submission of comments from interested parties. As part of this process, DEQ will evaluate how the program is working from a Virginia standpoint as well as in the context of the other RGGI states. In addition to regular RGGI program reviews, the regulation will also be subject to state periodic review as required by § 2.2-4017 of the Virginia Administrative Process Act. The periodic review procedure includes a review by the Attorney General to ensure statutory authority for the regulation, and a determination by the Governor whether the regulation is necessary for

Commenter	Comment	Agency response
		the protection of public health, safety and welfare, and is clearly written and easily understandable. Regulations under periodic review are subject to public comment; this would be another venue to identify concerns about program implementation.
92. Dominion Energy	Based on ICF modeling, linking to RGGI is projected to cost Virginia customers about $530 million over 2020-30, significantly less than actually joining RGGI. The modeling indicates that Virginia linking to RGGI will lower allowance prices thereby lowering the cost of carbon compliance in other RGGI states, subsidized, in part, by Virginia electricity customers. Should Virginia link to RGGI, customers in RGGI states outside of Virginia will incur $876 million less in cost related to RGGI allowance purchases from 2020-30 than the RGGI states would incur without Virginia joining RGGI. Additional costs related to carbon reductions isolated to the state and stranded investments for forced closures will be borne by customers. With the majority of the PJM region not subject to carbon regulations, the energy market will favor non-Virginia generating units, making Virginia units less competitive. This will advantage licensed competitive service providers (CSPs) that cover load through power purchases from non-Virginia-based resources. Unless these costs are non-bypassable, larger energy customers that have the ability under retail choice to purchase energy from a licensed CSP may find that CSPs can provide more attractive pricing and can avoid the costs related to carbon reductions. To the extent larger customers migrate to CSPs, remaining customers will bear the cost for compliance with the state carbon program.	The commenter is correct that the modeling showed that linking Virginia's program to RGGI did modestly reduce the modeled allowance prices for the program overall. These lower costs are exactly what one might expect when making an emissions trading market bigger. Bigger markets open up greater opportunities for lower cost reductions and lower overall costs for consumers across the entire footprint, including in Virginia. The commenter provides no evidence to support its assumption that the PJM market will favor non-Virginia units over Virginia units in the presence of the program. In general, generating units place bids to supply power to the wholesale market and those bids depend on the generator's costs to generate power. Fuel cost is the biggest component of a bid to supply power, and fuel cost depends on the fuel market and a plant's efficiency, not on the program. The program will allocate allowances on the basis of output from a generating unit and allocations will be periodically updated. As a result, the program will provide additional value to

Commenter	Comment	Agency response
		a generating unit in Virginia that operates. This will tend to encourage Virginia units to operate, not discourage them compared to units outside the Commonwealth that do not earn this additional value. In addition, to the extent a unit incurs an incremental cost from the program, that cost is expected to be offset in whole or in part by the allowance value received through the allocation and the consignment auction. Essentially, the outcome is an effective program with a modest price tag
93. Dominion Energy	The 33 million ton cap case uses assumptions from Dominion's 2017 IRP; the 34 million ton cap is based on RGGI assumptions. IRPs depict a suggested portfolio expansion and tend to change on an annual basis. While IRPs may provide guidance in setting long-term goals, their purpose is not to establish regulatory requirements. Fundamentals-based models, such as the IPM model, are useful for evaluating the impacts of policy strategies but should not be used to set the program baseline. Rather, an emissions baseline should be established on historic emission levels including allowance for historic variations in emission levels due to year-to-year differences in weather and fuel prices. For example, for the initial RGGI cap determination in 2005, RGGI designers set the 2009 cap about 4% above the average emission levels observed between 2000-02. Historical data have also been used by EPA in establishing baseline levels for various trading programs including CSAPR and the NO_X SIP Call. 2016 emissions for Virginia units that would be covered under the Virginia proposal were about 35.3 million tons. An analysis of statewide emissions from electric generating units in Virginia over the last 20 years shows an average annual emission level of about 35 million tons with ±1 0% CO_2 emission volatility. Average emissions over 2014-16 were about 34.3 million tons. Applying a 10% margin to account for variability would yield a cap of over 37.5 million tons. Applying the same 4% margin used in setting the initial RGGI cap yields a baseline of about 35.7 tons. Accordingly, the 2020 baseline should be between 35.7-37.5 million tons to provide a margin to account for year-to-year fluctuations in weather and fuel price volatility. (This analysis does not include emissions from new generation projects.)	As discussed in the response to comment 37, a base cap of 28 million tons was chosen as the most representative and effective starting point for the program. This number is a reasonable starting point as evidenced by the modeling results, which tend to show reasonable cost impacts from the program using this base cap number. As discussed in numerous comments elsewhere, energy efficiency and renewable energy are increasing in Virginia, and the cap-and-trade program will contribute to this trend.

Commenter	Comment	Agency response
	The modeling performed for DEQ by ICF projects almost 1100 MW of additional coal-fired capacity retirements by 2020 in the Virginia assumptions case and over 1500 MW of coal capacity retirements by 2020 in the RGGI case. Unit retirements should not be used to set the baseline. Efforts to reduce emissions by way of unit retirements implemented in advance of the baseline date should be applicable toward compliance and not penalized by applying them toward a further reduction to the baseline level. The data record must include the emissions from all units covered under the program, including units at which CO_2 emissions are not measured by continuous emissions monitoring systems. Coupled with the ability to credit reductions that occur prior to 2020, this would be a more fair approach. The 2020 baseline and reduction targets thereafter should not be based on a presumption that energy efficiency potential based on policies in neighboring states can be achieved in Virginia. Dominion continually works to achieve operating efficiencies to obtain more output with fewer emissions. In addition, we offer a number of end-use energy savings programs to our customers. As reported in the 2017 IRP, these programs have already achieved a substantial amount of energy savings; however, some of these programs are due to expire. Implementation of future programs is subject to approval by the SCC, which is not within the company's control. Dominion has filed approximately 36 replacement and new programs for approval by the SCC, and to date about two-thirds of them have been approved. While there remains potential for energy savings from consumer-side energy efficiency programs, this expansion is subject to state law and regulation. The success of these programs is affected by the degree to which customers choose to participate. Regardless of the success of energy efficiency programs, utilities must be prepared to serve their native load. Accordingly, the emissions target should be based on reasonable expectations of achievable energy savings and the compliance timelines must provide adequate time for the development of energy efficiency programs deemed necessary to achieve such objectives. The Virginia cap should not be more stringent than levels that would have been imposed under the CPP. Although the intent of the Governor's directive is to regulate carbon in the absence of federal action, it does not compel the state to establish emission targets equivalent to or below levels that would have been imposed under the CPP, which was approximately 27.8 million tons in 2030. The mass-based carbon emissions target EPA established under the CPP underestimated potential	

Commenter	Comment	Agency response
	future growth to meet energy demand and was the most costly compliance alternative identified in the 2017 IRP. The limits required under the CPP envisioned a nationwide emissions trading program. Virginia should not impose more stringent emission reduction requirements to address a global environmental issue while the states we compete with economically have no emission reduction goals or requirements. RGGI re-assesses its program every 4 years based on historical performance. Since 2009, RGGI has conducted program reviews in 2012 and 2016-17. Both reviews resulted in a lowering of going-forward CO_2 emission caps for the RGGI region. The next assessment period is scheduled to occur in 2021, which is only one year after Virginia would begin its participation in RGGI. This means that Virginia cap identified through 2030 may be re-negotiated in 2021 with other member RGGI states and may be different than what is currently proposed. Virginia's entrance into RGGI creates just two years (2020 and 2021) of "certain" CO_2 limitations. Based on RGGI's two prior re-assessments, the CO_2 cap will likely be different than what is currently proposed, which increases uncertainty in electric utility planning.	
94. Dominion Energy	We support limiting compliance applicability only to fossil fuel-fired electric generating units greater than or equal to 25 MW. Small combustion turbines and boilers below this threshold should not be subject. This is consistent with many existing federal and state-level EGU-based emission reduction programs including EPA's Acid Rain Program, CSAPR, and MATS, and the RGGI model rule. Consistent with the CPP, we support exempting units that use biomass as their primary fuel. In 2013, Dominion converted 3, 51 MW coal-fired units to 100% biomass. Close proximity to an ample supply of waste wood biomass as well as EPA's carbon-neutral policy for permitting were key economic drivers for these projects. Given Dominion's investment in renewable biomass, it is important that biomass emissions remain exempt. Any departure from EPA's prior treatment of biomass as carbon neutral or action that eliminates the use of this fuel as a creditable compliance option could raise compliance costs. This compliance exemption should also apply to fossil fuel-fired units that are co-fired with biomass, such as the Virginia City Hybrid Energy Center (VCHEC). Under the proposal, a fossil fuel-fired unit that co-fires with biomass would be obligated to hold allowances for all of its emissions. This is a disincentive for a coal-fired power plant to reduce its carbon emissions. VCHEC burns waste coal and co-fires with biomass. In 2008, the board directed DEQ to incorporate a timetable for biomass utilization in the facility's PSD permit. According to DEQ,	See the response to comment 67 for a discussion of biomass applicability.

Commenter	Comment	Agency response
	the board chose this approach "in order to promote further reductions in sulfur dioxide emissions and show a reduction in carbon emissions. since biomass is considered a biogenic carbon-neutral material." Requiring VCHEC to now hold allowances under a state carbon program for emissions resulting from the burning biomass in compliance with an air permit provision established to address carbon is counterintuitive. Requiring fossil units that co-fire with biomass to hold allowances would also be inconsistent with RGGI which only regulates fossil fuel fired units and provides calculations to subtract CO_2 emissions from biomass from multi-fuel fired units. To regulate biogenic emissions would be a significant departure from the existing RGGI program. It would put Virginia's forest owners and biomass-related renewable energy investments at risk, while creating unnecessary complexity. To the extent that the regulation requires biomass units to hold allowances, the budget must be increased accordingly to assure that the emissions from these facilities are included in the baseline.	
95. Dominion Energy	Dominion supports the consignment auction approach but the proposal does not provide details of the auction process and how revenue will be handled and transferred. The rule mentions that such revenue transfers will be done "in accordance with procedures established by the department." Clarity is needed as to how the Virginia allowances, which are proposed to be allocated annually, will be merged with the RGGI auctions, which are conducted quarterly. Additional legislation is required for the board to designate use of revenue associated with a trading program. Absent such authority, DEQ could not directly conduct an allowance auction or collect revenue from an auction. The consignment auction approach could provide a mechanism for the rule to proceed. Accordingly, to the extent the regulation links to RGGI via auction, we support the consignment approach. Direct auctioning would increase the stringency and cost of the program by forcing generators to purchase allowances they otherwise would have been allocated. EGUs would have to pay twice to reduce emissions: first to reduce emissions from affected EGUs or to develop new low-emitting generation, and second to obtain allowances to cover their remaining emissions. Modeling scenarios performed by ICF with Virginia joining RGGI with the auction proceeds returned to the state projected costs to the customer that are three times higher than costs estimated under the consignment auction approach. We support the proposal to allocate most allowances to affected EGUs using either historic generation (output based) or emissions data. This approach is reasonable,	DEQ agrees with the commenter that at this time the consignment auction is a cost-effective approach for the trading program. Use of the RGGI auction platform provides an already functioning system with detailed procedures that have proven effective. Details as to how the specifics of the auction will operate will be addressed in auction "instructions" which are developed separately from the regulation. DEQ will take the commenter's concerns into account when those instructions are developed. The consignment auction is designed to be cost neutral while enabling participation in the RGGI auction and providing for implementation of the CCR, ECR, and auction reserve price. Generally, the purpose of a regulation is to establish the relationship between DEQ and an affected facility; i.e., the department sets requirements that the

Commenter	Comment	Agency response
	consistent with many of EPA's other emissions trading programs, such as the ARP and the CSAPR, and will help to minimize compliance and customer costs. Allocating allowances directly to affected EGUs who have a clear financial interest in complying with the rule will create a more reliable, predictable, and manageable system. Direct allocations to non-affected entities could increase the stringency of the cap by forcing affected sources to acquire allowances they otherwise would have been allocated, and under the proposed consignment auction approach, would have the opportunity to recover cost through auction revenue returned to the generator. This would increase the cost of compliance for affected EGUs and therefore ratepayers. RGGI's quarterly auctions limit how many allowances a single entity can bid (25% of the initial offering of CO_2 allowances in the auction). If Virginia participates in the RGGI auction program, such a limitation might not make it possible for all the compliance entities in the program to rely strictly on the auction to acquire their necessary allowances and they may be forced to go to the secondary market to get sufficient allowances needed to comply. This bidding limitation has not been an issue to date in RGGI because there has not been a single entity requiring enough allowances to hit the 25% limit. Virginia should advocate that RGGI amend this rule by expanding the size of the bid limitation by anyone entity such that every entity has the possibility of relying on the auction for compliance.	facility must meet, and the facility does so following the provisions of the regulation.
96. Dominion Energy	An updating frequency of less than 3 years (including annually) should not be considered. A unit that retires should not be required to give back allowances it has already been allocated. The allocation approach should provide a reasonable lag time between unit retirements and the discontinued allocation of allowances to those units, an approach EPA has allowed under trading programs such as CSAPR. The updating allocation methodology will effectively transition retired units out of the allocation cycle without requiring units to give back allowances. With respect to the baseline for determining a unit's pro-rata share of the state total budget, we suggest using the average of the 3 highest years over the previous 5-year period. This approach, which is consistent with other successful programs such as CSAPR, would provide additional flexibility to assure a baseline representative of a unit's normal operations and filter out years when a unit experienced atypical utilization. The rule must provide a mechanism for providing allocations to units that meet the definition of an existing unit but do not have 3 years of historical operational data. In cases where a unit does not have a full year of operational data over the 2016-18 time period, the allocation could be based on an estimate of	A 3-year period was chosen as the most realistic compromise between too much and too little flexibility. It is designed to avoid year-to-year variations that result from external factors that may influence operation and have a serious impact on allocations. At the same time, the 3-year period prevents allocations from being coming static.

Commenter	Comment	Agency response
	projected annual operation with a requirement that the source give back any unused allowances for redistribution to existing sources.	
97. Dominion Energy	Under the proposal, 5% of the statewide budget would be set aside and allocated to DMME. These allowances would be consigned for auction by the holder of a public contract with DMME to assist the department in the abatement and control of air pollution. However, the proposal provides no details as to how the revenues obtained from the sale of these allowances in the RGGI auction would be used. The allowances and proceeds allocated to DMME to administer the program are revenues of the state and cannot be paid to DMME but rather would have to go into the State Treasury. DMME would only be allowed to use funds appropriated by the General Assembly to cover administrative and other costs. Although not explicitly stated, DEQ has indicated its intent to at least in part direct the 5% set-aside to encourage energy efficiency projects. To the extent the set aside is directed toward incentivizing energy efficiency, both demand- and supply-side energy efficiency improvement programs, including voltage optimization and other transmission and distribution efficiency improvements, should be eligible. Eligibility should include programs that help reduce carbon emissions such as infrastructure for electric vehicles.	As discussed elsewhere, DMME will determine how the set-aside is implemented, whether through incentivizing energy efficiency, other transmission and distribution efficiency improvements, or something else. DEQ agrees that both demand- and supply-side energy efficiency improvement programs should be eligible.
98. Dominion Energy	DEQ must explain adjusting the Virginia emission cap on the basis of banked allowances amassed over 2018-20 by affected entities in other RGGI states that Virginia affected sources will not be holding since Virginia entities will not become subject to an emissions cap or required to hold allowances until 2020. RGGI states were not subject to such adjustments through the first two 3-year compliance periods. Banking should be unlimited. Provisions to adjust emissions caps or withhold allowances based on volume of banked allowances should be delayed to provide time for the Virginia carbon market to mature. Similarly, there is no justification for applying the ECR mechanism at the inception of the Virginia program. Virginia sources will not be carrying any banked allowances during the initial compliance period. Under the RGGI model rule, states have discretion whether to implement the ECR mechanism; New Hampshire and Maine do not intend to implement this mechanism. Accordingly, DEQ should allow the Virginia market to mature before applying any mechanism that would artificially reduce the emission cap and increase compliance costs by driving up the allowance price. Another concern with adjustment mechanisms is that compliance entities will be compelled to purchase allowances from noncompliance entities to obtain enough allowances to comply with reducing caps. This	DEQ has developed the rule with the intent of linking to RGGI, because linking to a larger, well-functioning, existing program is a reasonable, efficient way to reduce emissions from Virginia units at the lowest cost. In establishing the provisions of the program and analyzing its potential impacts, DEQ has taken into account the provisions in the rule, including the adjustment of the allowance budget over the course of the program, and implementation of the ECR. Both of these features were included in the modeling and analysis conducted for the program and that analysis showed the program can be implemented yielding substantial benefits at a modest cost.

Commenter	Comment	Agency response
	will be further complicated by the ECR that will reduce the bank of allowances. It is likely that the cost of allowances will increase as noncompliant entities seek a return on their investments, which increases compliance costs. The adjustment provisions should not be incorporated into the Virginia program without further evaluation. Applying adjustments and restrictions to the unlimited use of allowance banking would complicate and limit the very emissions trading system that the RGGI states have praised for its success.	The bank adjustment, CCR and ECR are all required elements for participating in the RGGI program. The ECR will only be triggered if the allowance prices are lower than expected and only to the extent the winning bids at a particular auction are lower than the ECR trigger price. The ECR mechanism is designed, therefore, to operate only in those circumstances where allowance prices are below the ECR trigger price.
99. Dominion Energy	The RGGI program has always allowed for a multi-year compliance true-up timeline. For the first 6 years of the program, affected entities were required to demonstrate compliance on a 3-year cycle. Beginning in 2015, the program was modified to a tiered 3-year compliance obligation. This compliance obligation will be maintained under the revised RGGI program and model rule that takes effect beginning in 2021. This allows for a smooth transition for RGGI compliance entities into the next phase of the RGGI program with a new 3-year compliance true-up (2021-23) following the last 3-year compliance true-up (2018-20) under the current phase. DEQ proposes to implement a similar tiered 3-year compliance approach. We generally support a multi-year compliance approach as it affords compliance entities flexibility in meeting compliance obligations. Note that the CPP also allowed for a 3-year compliance true-up. Aligning true-up requirements with compatible 3-year compliance cycles in RGGI makes sense.	Support for the proposal is appreciated.
100. Dominion Energy	With the Virginia program starting in 2020, the regulation would impose a one-year initial compliance timeline (to address 2020 emissions) before converting to a 3-year compliance cycle. DEQ explains that initial 2020 allocations and a one-year compliance true-up obligation is needed to align the Virginia program with RGGI's current 3-year compliance cycle. This single year compliance requirement places a burden on Virginia generators that no other compliance entities in the RGGI program have. In order to address this issue, DEQ should defer the implementation of the Virginia carbon program until 2021. This would fully align the compliance obligations under the Virginia program with RGGI's current 3-year cycle and provide a smoother transition to linking with the RGGI allowance system.	DEQ acknowledges the commenter's concern. The department was faced with a choice: either abbreviate the normal 3-year compliance period to 1 year in order to align the program start with RGGI (2021), or delay implementation and enable sources to obtain a full 3-year compliance period. There are advantages and disadvantages to either approach. DEQ based its final decision on what would best meet the overall program goal of smoothly

Commenter	Comment	Agency response
		linking to RGGI. Starting the program on time and limiting facilities to a 1-year compliance period does impose an immediate burden on sources; however, this will benefit them in the long run by giving them a longer term compliance period as well as a smooth transition to the RGGI program. Adjusting as the commenter recommends would provide relief in the short term but put facilities on a steeper, more rapid compliance period overall.
101. Dominion Energy	We support adoption of the CCR which would provide a pool of additional allowances for sale in the consignment auction if the costs of allowances exceed a certain threshold. Such a mechanism is needed to address unexpected scenarios and to address potential adverse impacts on electric system reliability, and could also offer affected entities protection in terms of not being penalized for fewer emission reductions resulting from the unpredictable performance of renewable generation units.	DEQ agrees with the commenter that the CCR is a needed mechanism; see comment 136 for more detail as to how the CCR works.
102. Dominion Energy	The regulation should include offsets as allowed under the RGGI model rule, expanded to allow offsets that will encourage the reduction of emissions from electrification of other sectors of the economy, such as transportation. EVs and charger installations should be allowed to generate offsets. In 2016, more carbon emissions came from the transportation sector than the power sector. The regulation should allow reductions in emissions from sulfur hexafluoride (SF_6), one of the most potent GHGs. This offset category was eliminated from the RGGI model rule on the basis that, to date, there had been no SF_6 projects finalized in any RGGI state. One of the reasons for this has been may be the overall low RGGI allowance prices coupled with an abundant supply of RGGI allowances rendering administration costs undesirable. However, the more stringent RGGI cap and new mechanisms designed to minimize the allowance bank and drive the allowance price higher may now make these projects more viable.	As discussed in the response to comment 26, offsets are not being included in the regulation at this time. DEQ agrees that control of carbon pollution from the transportation sector is important, and may be addressed in another action.
103. Dominion Energy	Table 140-5A in 9VAC5-140-6210 D 2 and Table 140-5B in 9VAC5-140-6210 E 2 should be corrected to reflect that the annual number of CCR and ECR allowances listed are in million tons.	The proposal has been corrected accordingly.
104. DuPont	DuPont acquired the cogeneration units adjacent to its Spruance Plant as the supply contract expired and the previous owner discontinued operation. DuPont has a long-term agreement with Veolia to operate and maintain	DEQ agrees that the phrase "owned by an individual facility" should be removed; see the response

Commenter	Comment	Agency response
	the cogeneration units that supply the Spruance powerhouse on the manufacturing campus. Veolia plans to upgrade the utilities to be more efficient, and enhance performance and reliability, which will help DuPont reduce its costs and environmental footprint. The unit that Veolia will operate and maintain for DuPont is a combined heat and power (CHP) unit. DEQ exempts certain industrial CHP units under 9VAC5-140-6060 B. However, this exemption requires that the CHP unit be owned by the industrial end user rather than a third party. DuPont has engaged Veolia to utilize their specialized expertise to operate and maintain the industrial utility, while allowing DuPont to focus on manufacturing. Rather than regulating CHP ownership, DuPont suggests that DEQ remove the phrase "owned by an individual facility and" so that 9VAC5-140-6040 B reads: "Exempt from the requirements of this regulation is any fossil fuel power generating unit located at that individual facility that generates electricity and heat from fossil fuel for the primary use of operation of the facility."	to comment 65. Under the RGGI Model Rule, facilities that provide less than 10% of their power output to the grid are exempt from compliance obligations and the proposal has been revised accordingly. The regulation has been further amended in order to address CHPs with more clarity; see the response to comment 74.
105. Environmental Defense Fund (EDF)	EDF strongly supports regulations to limit carbon pollution from Virginia's power sector because Virginia has profound public health and climate benefits at stake. An overwhelming majority of Virginians agree: 87% support Virginia continuing to reduce carbon emissions from power plants. The board has clear existing authority to regulate carbon emission through a statewide cap, trading program, a revenue-neutral consignment auction, and linking with RGGI. EDF supports Virginia linking to RGGI and aligning its proposed rule accordingly. An expanded regional carbon trading market in which Virginia links with the existing RGGI program has a number of benefits, including greater liquidity, streamlined administration, and additional opportunities for cost-effective compliance. The benefits of cost-effective CO_2 emission reductions from a well-designed CO_2 trading program are clear. For example, from 2012-14, RGGI added $1.3 billion in economic value in the region and led to the creation of more than 14,000 jobs. By finalizing a strong CO_2 trading program that links with RGGI, Virginia is poised to garner significant economic, public health, and environmental benefits as well. Virginia has tremendous opportunity to accelerate clean energy deployment and expand the role of renewables and energy efficiency in the state. Virginia has an estimated 89,000 MW of onshore and offshore wind capacity potential that could serve an electric load that outstrips the state's own needs. Virginia can also take advantage of tremendous solar capacity potential. Shifts in Virginia's power sector reflect national trends toward low carbon electricity. In Virginia, power sector CO_2 emissions declined by 24% from 2005-15. These	Support for the proposal is appreciated.

Commenter	Comment	Agency response
	reductions have been driven by falling costs of renewable energy, low natural gas prices, changing consumer preferences, and policies that incentivize clean energy deployment.	
106. EDF	Thirty million tons should constitute the upper bound for the starting budget in 2020, with strong evidence indicating an even lower budget. In addition, the budget should decline annually by a tonnage amount of at least 3% of the 2020 budget--which is in alignment with the existing RGGI program--and consider a more stringent rate of decline. Recognizing that the ability to accurately predict future emissions based on current data has limitations, EDF also recommends DEQ provide for a mechanism to adjust the base budget in 2020 or 2021 if actual emissions are lower than projected. The 2020 budget should be at or below emissions that would have occurred under a BAU scenario. This is crucial in order for the program to drive additional CO_2 reductions beyond BAU, as well as greater near-term emission reductions in the early years of the program, enabling more cost-effective reduction pathways and opening the door to achieving higher levels of mitigation over the long-term. A starting base budget can also be lower than expected emissions under BAU, since covered facilities will have time to plan ahead for compliance with the regulation--and in fact, have already had time to anticipate the general direction of the regulatory framework given the policy direction outlined in ED 11 and the ongoing rulemaking process. Cost-effective abatement opportunities in the power sector are readily available. Modeling suggests that Virginia power sector CO_2 emissions under BAU in 2020 could be as low as 24 million tons. In 2017, DEQ projected Virginia power sector emissions would be 33-34 million tons in 2020, using the Integrated Planning Model (IPM) and assumptions from Annual Energy Outlook (AEO) 2017, Dominion's 2017 IRP, and the RGGI 2016-2017 Program Review. The Natural Resources Defense Council (NRDC) in 2017 projected BAU emissions would be 32.8 million tons in 2020, using assumptions from AEO 2017. However, more recent NRDC modeling conducted in 2018 used updated assumptions to project BAU emissions of 28 million tons in 2020. Meanwhile, The Rhodium Group projected BAU emissions well below DEQ's forecast, as low as 24-25 million tons in 2020, with cumulative emissions of 247-277 tons of CO_2 in 2020-30. These additional modeling efforts suggest DEQ's original projections of 2020 BAU emissions are likely to be overestimates. As new data become available, projections of 2020 BAU emissions could be expected to decline further.	The 2020 budget reflects the reference case used to determine the proposed base budget, and was at or below emissions that would have occurred under a BAU scenario. As discussed in the response to comment 37, a cap of 28 million tons has been selected. Because of the importance of aligning the Virginia program as closely to RGGI's as possible, the cap and rate of decline must align. This will ensure that the program operates as effectively and efficiently as possible.

Commenter	Comment	Agency response
	Recent announcements of fossil fuel deactivations, as well as new developments for renewable energy and energy efficiency, further indicate the power sector is becoming cleaner, and demonstrate a pace toward a lower-carbon electric sector in Virginia that is challenging for modeling efforts to fully capture. Clear trends toward a cleaner power sector in Virginia reflect an ongoing transformation toward a low-carbon future for the U.S. electric power sector. As of April 3, 2018, 1,721 MW of coal and natural gas generating capacity is now slated for deactivation by March 2019, according to PJM. In 2016, these units emitted 3.87 million tons of CO_2. In 2017, the units emitted 1.71 million tons. Meanwhile, recent developments suggest a promising future for zero-emitting solar and wind generation that could reduce Virginia emissions by displacing fossil fuel generation. As of April 2018, a total of 3,621 MW of solar capacity in the PJM interconnection queue is expected to enter into service by the end of 2019. The Virginia Solar Energy Development and Energy Storage Authority reported that as of November 2017, 2,703 MW of solar was under development in Virginia. In March 2018, new energy legislation in Virginia declared 5,000 MW of new solar capacity and 16 MW of offshore wind capacity to be "in the public interest." New energy legislation also paves the way for Virginia to deploy more cost-effective energy efficiency, which, by reducing demand for electricity, can contribute to avoiding CO_2 emissions. These trends combined with recent modeling indicates that 2020 BAU emissions are likely to be lower than initially estimated and could continue to decline between now and the beginning of the program. EDF recommends that DEQ set a base budget that starts no higher than 30 million tons in 2020, but encourages DEQ to consider evidence from recent modeling and power sector trends that supports the setting of a base budget that starts below this upper bound. A lower starting budget can also facilitate additional benefits that can result from a more environmentally protective program. A base budget that starts below 30 million tons would be consistent with a trajectory for Virginia to reach zero carbon emissions from the power sector by mid-century. A lower budget would also help drive additional near-term emission reductions, unlocking the benefits of taking earlier actions to mitigate climate change. With annual average temperatures in the U.S. having increased by approximately 1.0°C in the last 115 years, the impacts of climate change are already apparent. Increased magnitudes of temperature rise are likely to further increase the prevalence of harmful climate changes worldwide, including severe weather events, extreme temperatures, extreme precipitation changes, and impacts to natural ecosystems and human necessities such as food security. Given cost-effective	

Commenter	Comment	Agency response
	opportunities to reduce carbon emissions in the electric sector, and the lower overall emissions that can result from securing power sector decarbonization in advance of other sectors switching to electricity, it makes sense that the electric power sector should do more than its proportional share in reducing emissions, and follow a steeper trajectory earlier in time. In order to assess whether Virginia's emissions budget is consistent with this trajectory, DEQ can evaluate historical emissions data from 2016 and 2017. Using this data as one set of possible benchmarks, a straight-line decline from 2016 or 2017 emissions to zero by 2050 is consistent with 2020 emissions of 29-30 million tons or less, supporting a base budget that starts below 30 million tons in 2020. The Fourth National Climate Assessment finds, "Net cumulative CO_2 emissions in the industrial era will largely determine long-term, global mean temperature change. A robust feature of model climate change simulations is a nearly linear relationship between cumulative CO_2 emissions and global mean temperature increases. … Increasing the probability that any given temperature goal will be reached therefore implies tighter constraints on cumulative CO_2 emissions. Relatedly, for any given cumulative CO_2 budget, higher emissions in the near term imply the need for steeper reductions in the long term." Furthermore, a number of studies find that the timing of efforts to reduce CO_2 emissions can significantly impact the economic and environmental costs of action. Delayed action requires significantly accelerated mitigation efforts in later years to achieve the same cumulative emissions goals. Studies show that delaying mitigation efforts can increase the economic costs of necessarily more ambitious mitigation in the future. Delayed action also increases the risk of overshooting cumulative emission targets. Conversely, prioritizing emission reductions today can enable long-term mitigation to be more cost-effective and increase the likelihood of keeping temperature increases below target limits. By setting a lower 2020 starting budget, Virginia can facilitate long-term economic and environmental benefits of prioritizing early emission reductions and further limit cumulative CO_2 emissions from the power sector. The RGGI states have determined a regional cap for 2021-30 that declines by 2.275 million tons per year after 2021--approximately 3% of the 2021 cap--resulting in a 30% reduction in the cap from 2020-30. Virginia should achieve at least a similar level of reductions as it contemplates linkage with RGGI. Furthermore, ED 11 directs DEQ to create a rule to reduce CO_2 from the power sector that provides for a "corresponding level of stringency" with CO_2 limits in other states. DEQ should also consider a steeper decline, considering the benefits	

Commenter	Comment	Agency response
	of prioritizing near-term reductions and of maintaining consistency with a trajectory to zero emissions by midcentury, as discussed above. For example, a pathway to zero emissions by 2040 could imply a yearly decline equivalent to 5% of the 2020 budget, while a path to zero emissions by 2050 could imply a yearly decline equivalent to 3.3% of the 2020 budget. A steeper rate of decline at the program outset, even while retaining a lower rate of decline in later years, would also facilitate further limits on cumulative emission reductions and additional near-term reductions.	
107. EDF	EDF recommends a mechanism to adjust the emissions budget as new data and analysis emerge. An adjustment could be made to lower the emissions budget in order to achieve additional emission reductions if abatement opportunities are more readily achievable and cost-effective than forecasts show, as well as to optimize market function. DEQ could establish a mechanism to automatically adjust the budget if certain conditions are triggered, or provide for a manual adjustment early in the program. An automatic adjustment mechanism could use a pre-determined formula to tighten the emissions budget under certain conditions. DEQ could establish such a mechanism to adjust the base budget in early years of the program if actual emissions are lower than projected--not unlike how RGGI has adjusted its cap in the past to account for banked allowances. DEQ has a range of options for the timing of any such adjustment, and should consider factors such as the availability of new emissions data, ease of administration, and the timing of RGGI auctions, compliance periods, and the 2021 bank adjustment. Alternatively, DEQ could provide for a manual adjustment of the emissions budget when new data becomes available--for example, 2019 or 2020 actual emissions from the affected power sector units. Virginia has appropriately included the ECR and withholding of allowances in alignment with RGGI's Model Rule. DEQ should harmonize the minimum reserve price for the Virginia program with the minimum reserve price in RGGI. There is a continued need for emission reductions beyond 2030 to achieve climate goals and protect Virginians from the impacts of carbon pollution. DEQ should participate in RGGI program reviews. Periodic program reviews are an important means to assess program success and make changes to strengthen the program. It is important for DEQ to provide as much long-term certainty around carbon regulation as possible--market certainty will contribute to a successful emissions market, and can also help ensure Virginia is at the table as a leader on climate policy in the future.	As part of linking to RGGI, it will be essential for Virginia to participate in RGGI market controls--such as the CCR and ECR--and in periodic reviews to adjust the program as needed. There is no need for Virginia, at this point, to develop its own preemptive mechanisms. DEQ appreciates the need to respond quickly to unpredictable market fluctuations and other unknown issues; however, the best approach to do so is in concert with the other RGGI states. Should a definite state need arise, a Virginia-specific remedy may be implemented.
108. EDF	EDF supports allocating allowances to covered sources with an updating output-based approach, and consignment of allowances to the RGGI auction. This	The commenter's remarks on how the updating output-based approach and

Commenter	Comment	Agency response
	design smooths integration with RGGI, facilitates transparency and market efficiencies, and mitigates leakage. Consignment auctions are a proven method to facilitate transparency and price discovery. Successful examples of consignment auctions include the federal Acid Rain SO_2 Trading Program and California's Cap-and-Trade Program. A consignment auction in Virginia should be able to integrate seamlessly with the RGGI auction and key design elements including the price floor and ECR. Consignment auctions can create further incentives to reduce electric sector carbon emissions through a carbon price signal reflected in electricity rates. Furthermore, measures can be taken to provide benefits to ratepayers alongside a carbon price signal. Analyses conducted by EDF and RFF in the context of the CPP found that an updating output-based approach can be an effective means of mitigating emissions leakage--wherein carbon emissions shift out-of-state or to sources not covered by the program through, e.g., shifting generation. Modeling conducted by RFF found that an updating approach to allocate 100% of allowances to a subset of eligible sources under the CPP (as opposed to a historic approach) could reduce leakage by up to 64% compared to a mechanism that allocated only 5% of allowances with an updating output-based approach. Similarly, EDF analysis found that allocating all or nearly all CO_2 allowances with an updating output-based approach could significantly reduce leakage. EDF encourages Virginia and other RGGI participating states to monitor and evaluate whether and to what extent emissions leakage might be occurring on an ongoing basis, and evaluate additional opportunities to effectively mitigate any leakage that may occur.	consignment of allowances to the RGGI auction will address leakage are acknowledged. DEQ agrees that these mechanisms, along with robust program reviews for which RGGI explicitly monitors leakage, will discourage and limit emissions leakage. See the discussions under the response to comment 91.
109. EDF	Industrial power plants over 25 MW in size are a source of carbon pollution that DEQ proposes to exempt. Much of the literature on carbon market designs suggests that broader inclusion of sources can lead to more cost-effective and efficient outcomes. Industrial power plant sources may be included in future climate policies and Virginia can help provide regulatory certainty to these facilities by bringing them into the program and drive investments to reduce emissions now. In order to meet our climate goals, more emitters will need to reduce emissions. There are extensive, cost-effective opportunities for improving efficiency and increasing renewable energy use across industrial sources and DEQ should include these sources in the program.	See the response to comment 65 for a discussion of how industrial facilities will be handled. DEQ agrees that energy efficiency and renewable energy are important elements in a carbon reduction program, and will likely continue to improve in Virginia for a variety of market- and pollution control-based reasons.
110. EDF	A strong trading program can provide important benefits for communities overburdened by pollution. Without affecting timely finalization of the rule, DEQ should conduct ongoing analysis and monitoring to ensure communities disproportionately impacted by air pollution benefit from efforts to abate carbon pollution. This	As discussed in the response to comment 55, the EO 73 EJAC Council will take the lead on directly addressing environmental justice issues. DEQ will

Commenter	Comment	Agency response
	analysis could include a geospatial EJ screen using demographic and environmental indicators to identify disadvantaged communities. DEQ should continue to work with affected communities and other stakeholders, such as the EJAC, to identify instances of adverse economic or pollution impacts on disadvantaged communities and take appropriate action to mitigate the effects. DEQ should also continue to engage meaningfully with EJ stakeholders and disadvantaged communities as the agency works to finalize this rule and implement the program. EDF commends DEQ for its efforts to date to hold public hearings across Virginia and invite deep engagement from diverse stakeholders, and encourage DEQ to continue this practice.	continue its public outreach efforts in such a way as to maximize public participation from all Virginians.
111. Forest Products Industry National Labor Management Committee (LMC)	LMC opposes joining RGGI due to concerns it would increase electricity and natural gas prices for businesses and consumers. The following language should be included in the regulation: "Forest biomass, including forest products manufacturing residuals, should categorically be treated as carbon-neutral whether or not it is co-fired with fossil fuel." The carbon profile of biomass is not at all altered when co-fired with other fuels. The biomass portion of the fuel mix has the same characteristics no matter what fossil fuel it may be co-fired with. It is the characteristics of the biomass feedstock, not of the power generation process or facility, that support treatment of biomass as carbon neutral. Additionally, LMC strongly urges the regulation not be expanded beyond its focus on utilities to also apply to industrial boilers. ED 11 pertains exclusively to controlling CO_2 emissions from electric power facilities. The Economic Impact Assessment, the direction given to the Regulatory Advisory Panel, the emissions and economic modeling conducted by DEQ and its consultants, and DEQ's written and oral information supporting the proposal indicated that the regulation applied only to the electric power sector.	See the response to comments 65 and 67 for further information on rule applicability.
112. GRID Alternatives Mid-Atlantic	We understand the consignment is designed to be revenue neutral. However, DMME will have a contract with a third-party administrator that would sell allowances allocated to DMME and make the funding available for use in a variety of programs to help reduce CO_2 emissions. Accordingly, one of DMME's strategies is to accelerate the adoption of energy efficiency practices and expand the deployment of renewable energy. This funding could be utilized to create new economic opportunity in the state through solar energy. Solar provides long-term financial relief to families struggling with high and unpredictable energy costs, living wage employment opportunities in an industry adding jobs at a rate of 20% per year, and a source of clean, local energy sited in communities that have been disproportionately impacted by traditional power generation. Virginia solar jobs increased by 10% in 2017, and the state now has over 3500 solar workers. Virginia is poised to experience	DEQ recognizes the value of low-income solar programs as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement that set-aside. DMME may, at the appropriate time and in accordance with its regulations and policies, implement a low-income solar program set-aside. As

Commenter	Comment	Agency response
	1.5% solar jobs growth in 2018. Low-income ratepayers pay a disproportionate amount of their income on utility bills. These customers stand to benefit most from solar energy, and must be prioritized through targeted policies and programs. The proposal assumes that all revenues raised from the auction by utilities are returned to ratepayers. In the case of distribution utilities dependent on other wholesalers for power, such as rural electric cooperatives and municipal electric entities, those wholesale contracts could impose costs on those dependent purchasers with no mechanism--and nothing that DEQ could make a requirement--for the wholesaler's auction revenues to offset those costs or return those revenues to the underlying load that is responsible for paying those costs. There may be solutions to this issue; however, those solutions would be outside DEQ's purview, either involving an order from the SCC, a mandate to run auction revenues through a FERC formulary rate in a certain way, or legislation. Low-income consumers that use electricity should not pay for the costs of carbon regulation without also receiving the benefit of revenue, if any, from allowance auction proceeds. The proposal does not fully address this issue. GRID Mid-Atlantic has seen the benefits of low-income solar programs in markets across the country. We recommend the regulation directly benefit low-income ratepayers with a solar program funded by DMME's allowance funding. A low-income solar program would have the goals of significantly reducing the electrical energy burden of Virginia's low-income ratepayers and training the next generation of solar workers. This type of programming would complement DMME's strategic objective to expand the deployment of renewable energy and overall reduction of CO_2 emissions.	discussed in the response to 55, affected communities will be monitored on an ongoing basis to assure that no disproportionate impacts are experienced. Note that the trading program as well as how the costs of energy in Virginia are arrived at are open and transparent. There will also be numerous opportunities to identify and remedy any identified impacts.
113. International Emissions Trading Association (IETA)	IETA welcomes this opportunity to voice strong support for the proposal. More than 50% of the world's economy is subject to some form of carbon pricing, most of which is under cap and trade systems. This growing coverage includes major international trade partners and the entire RGGI collaborative. Virginia's proposed program allows the use of market-based mechanisms and trading of CO_2 allowances. It provides an important link to RGGI's program, enabling Virginia market participants to have access to a bigger, more efficient market. 9VAC5-140 will allow Virginia to join the other RGGI states as a leader in cutting emissions that lead to climate change and air pollution, while providing opportunities for in-state clean economic growth and business development. The rule would also provide regulatory certainty to Virginia's electric generation sector, including a clear price signal and incentive for electricity generators to invest in innovative lower carbon technologies. IETA sees the	Support for the proposal is appreciated, as is the commenter's discussion of RGGI's attributes.

Commenter	Comment	Agency response
	program having 4 fundamental advantages: flexibility, cost-effectiveness, linkability, and building on the proven success of emissions trading systems globally--and most importantly--in the context of the RGGI cap and trade program. The program accesses regional allowance auctions and gives participants across the RGGI region the opportunity to participate in the Virginia market. This will provide a broad market for program revenue, price discovery, and market liquidity. Issuing allowances to generators based on their current GHG emissions and allowing them to sell excess allowances creates an incentive for generators to be innovative in their carbon investment and compliance strategies. Compliance flexibility afforded by the program will ensure that emission reductions are realized cost effectively. Cost-containment design elements, such as an auction reserve price and price ceiling, will guarantee that the carbon price does not go above or below acceptable ranges. This approach will reduce administrative burdens for government. Virginia will be able to take advantage of economies of scale to reduce compliance costs while meeting GHG reduction goals while maintaining Virginia's autonomy and ability to act in its best interest. Linkability will also allow Virginia to take advantage of systems such as COATS without the need to develop and operate new systems and infrastructure. IETA encourages Virginia to establish an offsets policy and framework that could take advantage of existing methodologies developed by RGGI and the Western Climate Initiative. Over nearly a decade, RGGI has resulted in significant environmental and socio-economic benefits, including emission reductions and more than $2.76 billion in net economic gains. Virginia's cap and trade program can demonstrate that economic growth and carbon reductions can work together. As a global organization, IETA is aware of the broad and powerful role that programs like cap and trade can play in efforts to address the climate challenge. Adoption of 9VAC5-140 is a critical step that Virginia must take in order to reduce emissions and air pollution. At a time when Washington D.C. is regressing on climate action and leadership, Virginia's progress could not occur at a more important time	
114. Institute for Policy Integrity, New York University School of Law	When Virginia joins RGGI, the total emissions regulated by RGGI will rise by over 40%. Thus, the choice of Virginia’s emissions cap will substantially affect the total number of allowances available at each auction and may affect the stringency of the RGGI cap. Changing the stringency of the RGGI cap will, in turn, affect future permit prices, affecting all participants in RGGI auctions. In particular, power plants in other states will be able to purchase permits at a lower price, leading to less	Support for the proposal is appreciated, as is the commenter's discussion of trading programs.

Commenter	Comment	Agency response
	abatement. Therefore, the achievement of environmental goals by RGGI will also be a function of Virginia's cap choice. A new state joining RGGI could either increase or decrease the stringency of the total emission cap. The RGGI price is currently below the socially optimal price for a ton of CO_2, and the price ceiling in RGGI is also below this level, so a less stringent cap would result in lower social welfare when compared to a tighter cap. If Virginia's cap is set relatively tight, leading to a lower total number of allowances than required to maintain RGGI's stringency, then RGGI permit prices will increase, possibly even hitting the price ceiling. This would not constitute an inefficiency from a social point of view. In 2020 the Social Cost of Carbon will be $49. Even if the generators were paying the full CCR trigger price, which in 2020 will be $10.77, the permit price would still be too low to fully internalize the externality caused by carbon emissions. By the same token, depressing the allowance price by decreasing the stringency of the cap would lower social welfare. If Virginia chooses to issue allowances for more emissions than its generators would emit under a business-as-usual scenario (the "counterfactual emission level"), this will loosen the emission cap for all of RGGI. Unless allowance prices are at the price floor, the price will go down, causing the aggregate emissions to increase compared to a scenario where Virginia does not join RGGI. A fall in the permit price will also decrease the revenue that the other states receive from RGGI auctions. The magnitude of those adjustments will depend on the magnitude of the changes in RGGI's cap. For emissions to decrease, the number of permits issued in Virginia must be set below the counterfactual emission level. To achieve that goal, a reliable prediction of the future emissions path is required. However, developments that can significantly affect Virginia's emission levels are uncertain, for example the rate of fossil fuel retirements and additions of renewables. DEQ should discuss their forecast of state CO_2 emissions to help assess whether the allocation will be too high or too low. Virginia proposes to set the base budget at 33 or 34 million allowances (while putting an additional 3.3 to 3.4 million allowances into the CCR). This might be too generous, even when future declines in the budget are considered. For instance, comments submitted to RGGI by Arcadia Center, NRDC and Sierra Club suggest that 2020 baseline should be set in the range of 30-32 million tons. The choice of the initial budget needs a sound justification given its potential impact on total pollution and permit prices. The allowance price will decrease slightly even if Virginia	

Commenter	Comment	Agency response
	sets the cap equal to or just below its counterfactual 2020 emissions. This effect operates through two channels. Cheap pollution abatement possibilities may exist for Virginia's electricity generators that have already been implemented in the other RGGI states. And, if the RGGI cap is more restrictive than the cap chosen by Virginia, the total effective cap will be less stringent than without Virginia joining the system. However, the price decline will not be accompanied by an increase in total emissions compared to the scenario without Virginia. Therefore, a falling permit price, by itself, will not be informative as to whether RGGI's expansion will decrease total CO_2 emissions. As RGGI prices are already close to the reserve price, if Virginia enters RGGI with a loose cap, this will increase the probability of the ECR becoming operative. As Maine and New Hampshire do not intend to implement the ECR and will thus not withhold allowances when the trigger price is reached, this will create redistributional effects between the states. Adding Virginia generators to RGGI will improve market efficiency for current RGGI states and will help Virginia cost-effectively meet its carbon pollution reduction goals. Because of the consignment auction mechanism being used to distribute conditional allowances and RGGI proceeds, the SCC should ensure that all participants in RGGI are on an equal playing field to maintain market efficiency. One concern with the consignment auction is that some power generators in Virginia might be able to keep the revenue disbursed by RGGI, while, ideally, the consignment process should be revenue neutral for all compliance units. Regulated power producers in Virginia will be required by the SCC to pass all revenue from RGGI auctions on to state electricity consumers. The SCC will be in charge of verifying that the consignment auction is indeed revenue neutral for those units. Vertically integrated utilities could potentially gain revenue from the auctions by substituting RGGI-derived revenue for other customer support payments. Only newly conceived customer support programs should be funded using RGGI revenue to ensure that the support is additional to any other support that the generator might have offered. The SCC will need to be proactive in protecting Virginia consumers to prevent behavior by generators that results in windfall revenue. Windfall revenues would place the producer at a long-run competitive advantage relative to electricity generators that participate in RGGI but that do not receive revenue from the auctions. Because conditional permits will be allocated based on electricity generation rather than CO_2 emissions, clean generators could even see their profits increase if they manage to receive revenue from RGGI. This could happen for a generator that receives more conditional allowances than it needs to buy from RGGI to	

Commenter	Comment	Agency response
	cover its own emissions, consequently receiving more revenue from RGGI than it spends at RGGI auctions. If non-regulated, private generators in Virginia subject to the proposed regulation do not have a revenue neutrality requirement, those generators will receive a revenue windfall in the form of proceeds from RGGI auctions. Some of the cleanest private resources might experience a profit windfall. As a consequence, this might create a competitive advantage for private generators over regulated resources. This could send incentives for new private power generation to locate in Virginia rather than RGGI states. Even if these generators receive revenue from the auction, joining RGGI will improve market function relative to the current status quo. Right now, emitting generators in Virginia are receiving an implicit subsidy, as they are not paying for the environmental damage caused by their emissions. Internalizing this externality will eliminate the perverse incentives for high emitting generators to locate themselves in Virginia relative to other RGGI states. The pass-through of the permit price from generators to customers will determine the extent to which generators themselves face the incentive to reduce carbon emissions. If the SCC allows generators to increase electricity rates in response to the costs of purchasing RGGI permits, then consumers will face an incentive to reduce electricity consumption and invest in energy efficiency. At the same time, higher energy prices may slow down the rate of electrification of the automotive and heating sectors. To the extent that the SCC wants the incentive for abatement of CO_2 to fall on the generators, it should limit the pass-through of permit prices to consumer electricity prices, either through limits on the approved rate increases by regulated generators or through rebates of RGGI proceeds to consumers. Similarly, if Virginia aims to increase electrification of other sectors of the economy, it should prevent pass-through of permit prices to consumer electricity prices. Electricity generators in Virginia will be incentivized to reduce CO_2 emissions whether or not the consignment auction is fully revenue neutral. A requirement to hold a permit for each ton of CO_2 emitted provides a marginal incentive to reduce emissions. This marginal incentive to abate will be present regardless of whether generators receive lump-sum revenue from RGGI. The RGGI-derived revenue would affect the long-run profitability of the generators if it is not distributed to consumers, so over time higher or lower emitting generators may be more likely to enter or exit the market. However, the marginal incentives to abate will be realized as long as the requirement to hold a permit to emit is in place. Moreover, were Virginia not to place any price on carbon, it would impede efficient market operation by	

Commenter	Comment	Agency response
	implicitly subsidizing fossil power generators in the state. Therefore, including Virginia in the RGGI trading program will help improve market function and promote a level playing field between generators. The way in which the revenue from the consignment auction is passed to consumers will also have implications for environmental outcomes and energy demand. If consignment auction revenue is passed to consumers on a volumetric basis, consumers will see a lower price for electricity, reducing the incentive to pursue energy efficiency but also preserving the incentive for electrification. The design of the regulation needs to balance those trade-offs. Finally, the consignment auction mechanism also creates different incentives among the generators inside Virginia. Because the permit allocations and updates are based on net electricity output, the cleanest fossil fuel plants will have an incentive to expand their generation compared to higher emitting generators. This incentive should make the Virginia fleet even cleaner, leading to quicker decreases in emissions. In sum, adding Virginia generators to RGGI will increase environmental quality and improve market efficiency.	
115. Lena Lewis	I strongly support implementing carbon cap and trade of power plants. I congratulate DEQ on writing strong carbon cap-and-trade policy that will move Virginia forward in protecting our citizens from the worst impacts of climate change. I support linking with RGGI, which has a proven track record of success in reducing carbon emissions while keeping state economies strong. The purpose of cap-and-trade is to cause people to make different decisions than they otherwise would without the cap. Exempting biomass will create an incentive to cut down more forests, and will create the incentive for more biomass plants to be built, or for plants to be converted from fossil fuel to exclusively biomass. This will increase the incentive to cut down forests in Virginia. In addition to removing CO_2 from the atmosphere, these mature forests provide many other ecosystem services, such as cleaner drinking water, reduced erosion, and oxygen production. Keep in mind that carbon is just one element among many in our ecosystems. Carbon policy that exempts biomass risks increasing the destruction of biodiversity in forest ecosystems and reducing other benefits that they provide. Proponents of biomass say that it is carbon neutral because the energy source will absorb CO_2 as it grows back. A large body of scientific literature explains that the truth is not so straightforward. One essential question is the time frame needed in order for a harvested forest to	Support for the proposal is appreciated. See, for example, comment 67 for further discussion of biomass, and comment 65 for more information on the industrial exemption. A base cap of 28 million tons tons has been selected; see the response to comment 37 for additional information. As discussed elsewhere, the purpose of the regulation is to control carbon pollution emitted by fossil fuel-fired electric generating facilities.

Commenter	Comment	Agency response
	grow back enough to absorb all of the carbon released from burning. This time frame depends on many variables, including age of trees, species, amount of fossil fuels required to harvest trees, temperature, and growth rate of species. We are on the verge of a tipping point with climate change. Harvesting forests for biomass fuel will increase carbon emissions in the near term. In the decades it will take for those forests to reabsorb that carbon, the added CO_2 in the atmosphere will contribute to accelerated release of carbon from melting permafrost in the tundra and reduced albedo in at the poles due to melting ice cover. Some public comments express concern that including biomass in the carbon cap will hurt the paper industry and tree farmers. The point of a market-based solution is to change behavior. If paper factory owners assess that carbon allowances no longer make it profitable to burn residuals, they are not required to burn their wood waste. Nor are they stuck in a situation of profit loss. Paper factory owners are free to innovate to find new ways to use residual wood waste. They may discover a new application that brings in more money than burning waste wood. Market-based solutions such as cap-and-trade promote innovation. Exemptions do not. The climate crisis calls for innovation across all sectors of society, and should not exempt the paper industry or the biomass industry. Though Virginia does not currently have large power plants that incinerate municipal or industrial waste to produce energy, a cap that does not include them will promote their development. Because MSW burned for energy is predominantly plastic that could otherwise be recycled, it is a potential source of carbon emissions and would promote the destruction of otherwise recyclable materials. Rather than wait for these plants to be built before regulating them, the regulation should state that plants burning MSW and industrial waste must retire carbon allowances to do so. The level of the initial cap is important because subsequent reductions are percentages, not set amounts. DEQ's proposed initial cap of 33-34 million tons is based on the electricity utilities' flawed projections of energy demand. The point of the cap is to reduce carbon emissions, not to give utilities a new source of revenue through selling allowances. Such a high number of allowances will flood the market, reducing the clearing price of allowances in the RGGI market and reducing revenue for RGGI states. Furthermore, a cap of 33-34 million will not change Virginia’s carbon emissions. The cap must put downward pressure on carbon emissions from the first year. Virginia’s electricity consumption is growing very slowly. Expected electricity demand growth	

Commenter	Comment	Agency response
	over the next 15 years is less than 1% a year. The DEQ scenario of 33-34 million tons assumes an annual growth rate of 1.9-3%. It does not take into account the amount of utility scale solar projects already in the construction pipeline, nor the increase in rooftop solar. Anticipated energy demand depends on which historical data is considered. When looking at 2012-16, one could conclude that energy demand is increasing. However, 2012 had a mild winter and cool summer. Energy demand from 2005-16 resulted in emissions of just under 32 million tons of CO_2. Therefore, the cap should be lower than 32 million in 2020 to account for increased solar and natural gas, and to put downward pressure on emissions from the first year. Even if a business-as-usual scenario predicts a decrease in carbon emissions, the purpose of a cap is to decrease carbon emissions by a greater amount than under business as usual. Therefore, I recommend a starting cap of 30 million tons.	
116. Malin Moench	My comments go to the relative harm that coal, natural gas, and biomass do to the climate and to human health from the toxins that they generate when they generate electric power. Incentives should double down on energy efficiency and on renewables that are truly clean. The Clean Power Plan provided for gas-shift emission rate credits for utilities that replace coal-fired production with gas turbine production. Virginia's plan should not include such credits. Producing and burning natural gas is as climate forcing as coal largely because the effect of fugitive methane is far bigger. About 3.8% of conventional natural gas production and about 12% of shale gas production is fugitive methane. After properly accounting for fugitive methane, and using a 20-year impact analysis, it may very well be that gas-shift penalties are needed, rather than gas shift credits. Biomass should not be eligible for renewable energy credits. Burning wood scraps for power is not climate neutral. Per Btu, it emits 10-35% more CO_2 than burning coal, depending on the moisture content of the fuel, combustion efficiency of the plant, and processing losses. Regrowth of clear-cut hardwood forests will not offset the higher CO_2 intensify of burning wood scraps until the year 2100. By then, under current CO_2 emission trends, the world will have blown past critical tipping points in the carbon cycle. Burned biomass also exceeds coal in its emissions of toxins. Like coal emissions, wood smoke is an extreme public health hazard, containing over 200 toxic chemicals and particulate matter. The component of burned biomass that harms human health the most is fine particulate matter. Wood-fired power plants and coal-fired power plants are primarily neurotoxin and carcinogen factories from a physician's point of view, but	The commenter's observations about biomass are appreciated. Although toxic and criteria pollutants from biomass are indeed a source of concern, they are not regulated by this particular program, nor is methane. These pollutants are more appropriately addressed in other areas of the board's regulations. See the response to comment 67 for more detail.

Commenter	Comment	Agency response
	on a Btu-equivalent basis, wood-fired is much worse. They should not get a free pass.	
117. National Alliance of Forest Owners (NAFO), Virginia Forestry Association (VFA)	Excluding biomass CO_2 emissions is good environmental policy and supported by scientific studies. There is an extensive record supporting a decision to differentiate biogenic CO_2 emissions from fossil fuel GHG emissions. Importantly, there is scientific consensus that, because it is part of the natural carbon cycle, the potential for impacts on atmospheric GHG levels from biogenic carbon is fundamentally different than fossil carbon. In the forests of Virginia, biogenic CO_2 emissions are more than balanced by carbon sequestered in growing forests. Studies show that combusting biomass for energy offers substantial GHG mitigation benefits when compared to fossil fuel. There is strong evidence that forests are currently being managed sustainably and will be for the foreseeable future. Thus, when forest carbon stocks are evaluated over appropriate time and spatial scales, there is ample support for the proposition that forests are capable of meeting increased demand without reducing overall forest carbon stocks. It is well-established that all wood products, including biomass combusted for energy, are part of the natural forest carbon cycle. CO_2 is sequestered in forests through photosynthesis and emitted through decomposition and combustion. As long as forest carbon stocks remain stable or increase over time, biomass energy and other forest product uses do not increase atmospheric GHG. In contrast, CO_2 emissions from fossil fuel combustion permanently increase atmospheric GHG concentrations because they release carbon that has been geologically stored for millennia. Sustainable management of forested lands provide distinct climate change mitigation benefits which reduce net GHG emissions over time: 1) durable forest products continue to store carbon for decades after harvest, 2) manufacturing forest products is much less carbon-intensive than alternative products such as concrete or steel, and 3) biomass used for energy can directly displace fossil fuel emissions over multiple harvest cycles. Many studies evaluating biomass energy have found significantly lower net GHG emissions when compared to fossil fuel. Recent studies have attempted to quantify in absolute terms the GHG mitigation benefit of substituting biomass energy for fossil fuels. These studies also identify substantial reductions in GHG emissions, but do not directly answer the question whether biomass combustion for energy results in any net CO_2 emissions. However, these studies consistently conclude that active forest management focused on supplying forests products and biomass energy produces the greatest GHG mitigation benefits from forested lands. Stability or growth in forest carbon stocks is essential for establishing that biogenic CO_2 emissions do not increase	See comment 67 for further discussion of biomass.

Commenter	Comment	Agency response
	atmospheric CO_2. If forests are converted to other land uses after harvest, the carbon cycle is broken. Thus, given urban development and other external pressures, it is essential to ensure that forest carbon stocks are not depleted as a result of biomass energy. However, projections by the U.S. Forest Service suggest that forest stability will continue for decades to come. Whether viewed nationally or regionally, studies consistently find that forest carbon stocks have remained stable or increased over the past 60 years despite increases in demand for forest products. Timberland in Virginia has a highly positive net growth/removal ratio, meaning that through sustainable management, our forests are growing more than twice as much wood as is harvested. Despite the stability in U.S. forest carbon stocks over time, some have expressed concern that increased demand for biomass energy will reduce the amount of carbon that would otherwise be stored in forests. However, these concerns are inconsistent with the market factors that influence forest management decisions. Studies have repeatedly found that forest owners will respond to increased demand for biomass energy (or any other forest product) by increasing production, and thereby increasing forest carbon stocks. In the case of biomass energy, such responses can include increased consumption of existing harvest residuals, increased productivity through management practices, and land use changes. Biomass energy relies on low-cost biomass feedstocks to remain competitive with other types of energy. Thus, biomass energy feedstocks are commonly composed of residues and other low-grade feedstocks. In contrast, high-grade trees are reserved for saw timber and similar products that command higher prices and generally result in products that store carbon for decades. Given the price differential between low-grade feedstocks and saw timber, it is unlikely that high-grade, mature trees would ever be harvested exclusively for energy production. While increased demand for biomass energy could increase prices to some degree, even optimistic projections would not raise feedstock prices to the point that landowners would manage forests for energy instead of saw timber. NAFO and VFA support the proposal to exclude 90-100% biomass-fired facilities from the rule. The proposal is supported by scientific consensus that biogenic CO_2 should be regulated as being carbon neutral and is consistent with the RGGI Model Rule. We understand that at least one other commenter has raised the issue of how emissions from biomass are treated under the proposal. NAFO and VFA are sensitive	

Commenter	Comment	Agency response
	to the issue of emissions of all kinds from biomass materials; however, these issues that are beyond the scope of the proposal. The proposal addresses CO_2 emissions from electric power generating units in Virginia, not other pollutants. Pollutants like benzene and formaldehyde are governed by other federal and state regulatory regimes already being administered in Virginia. The board should continue to focus the proposed regulation on CO_2 emissions and let existing laws and regulations govern non-CO_2 emissions from electric power generating units. We encourage the board to allow operators that co-fire biomass with fossil fuels to deduct the biogenic CO_2 emissions from the total CO_2 emissions the unit must cover with allowances. It is consistent with carbon-neutral environmental policy, and would bring Virginia in line with the RGGI Model Rule, as well as other RGGI states like New York. The Department of Forestry recognizes the sustainable development value and economic benefits of promoting use of biomass and biogenic fuel sources in Virginia, stating that the "benefit[s] of expanded utilization of biomass include: [p]rovid[ing] new markets for waste wood, manufacturing residues, and materials from forest management activities; … [r]educ[ing] material going to landfills, being dumped or open burned, such as woody debris and other wood waste; [r]educes site preparation costs for artificial regeneration; [r]educ[ing] pollution compared to using fossil fuels …." Congress also understands the environmental and sustainable development benefits of biomass-based fuel. In a display of bipartisan support, Congress passed the Consolidated Appropriations Act of 2018, where it directed the Department of Energy, the Department of Agriculture, and the Environmental Protection Agency to "establish clear and simple policies for the use of forest biomass as an energy solution, including policies that (A) reflect the carbon-neutrality of forest bioenergy and recognize biomass as a renewable energy source, provided the use of forest biomass for energy production does not cause conversion of forests to non-forest use; (B) encourage private investment throughout the forest biomass supply chain … (C) encourage forest management to improve forest health; and (D) recognize State initiatives to produce and use forest biomass." Encouraging the biomass fuel market to grow in Virginia will continue to help the board achieve the purpose of the regulation: "to control CO_2 emissions in order to protect the public's health and welfare." As reported in The Economic Impact of Virginia's Agriculture and Forest Industries (2017), "Biomass energy production has emerged in recent years as a	

Commenter	Comment	Agency response
	significant new market for surplus wood residues in Virginia. Federal clean and renewable energy programs and Virginia's voluntary Renewable Portfolio Standard offers incentives to the state's power companies to produce electricity from renewable resources. Woody biomass accounted for most of Virginia's renewable power generation in 2015 and approximately 5% of total power generation in the state. Since 2012, Virginia has added over 300 MW in electrical power generation capacity." Also, "Virginia hosts 10 wood pellet plants, most of which have been established in the last decade. Collectively, they processed over 1.4 million tons of wood, mill, and forest residues." NAFO and VFA can vouch that a broad range of robust markets for all Virginia wood and fiber are in the best interests of forest health and sustainability, the economic prosperity of the state, and the welfare of citizens of the state. Markets for low value wood that may not have other outlets are critical to woodland owners and to lumber manufacturers searching for purchasers of sawmill residues. Energy production from woody biomass aids in reducing the threat of wildfire and insect infestation, and can enhance wildlife diversity. It is vital to have markets for wood during the clean up of biomass debris resulting from natural disasters. By exempting biomass-only and near biomass-only facilities, the board has demonstrated that it agrees biogenic emissions are inherently different from fossil fuel carbon emissions. We urge the board to consistently apply these conclusions by allowing operators that co-fire biomass with other fuel sources to deduct their biogenic emissions when calculating compliance. This policy has already been developed in the RGGI Model Rule and in 6 of the 9 RGGI states. Virginia would be an outlier by disallowing biogenic CO_2 deductions. Since RGGI began, it has engaged working groups to develop Model Rules that can be reviewed, adapted, and implemented by states joining the system. Many stakeholders participate in these reviews and many states have chosen to adopt in full substantive provisions of the Model Rule. In every iteration of the Model Rule, RGGI has allowed operators that co-fire biomass with fossil fuels to deduct the emissions attributable to biomass from the total amount of CO_2 emissions for compliance purposes. The RGGI Model Rule is not an abstract framework; most states that participate in RGGI have adopted it almost verbatim and implemented it with great success. The rule should allow operators co-firing biomass with fossil fuels to deduct biogenic emissions from annual CO_2 compliance accounting. It is consistent with the environmental and economic policies built into the regulation. NAFO and VFA encourage the board to add a definition	

Commenter	Comment	Agency response
	of biomass. This will add clarity to the issue of biomass exemptions and allow the board to more easily review the exclusion of biogenic emission from CO_2 co-firing facilities. The legislature has already provided such a definition in VA Code § 10.1-1308.1.	
118. National Council for Air and Stream Improvement, Inc. (NCASI)	The rate at which global CO_2 emissions are increasing and the implications for global temperatures in the near- and long-term has led to calls for steep near-term reductions in emissions. IPCC indicates that, with respect to emissions of CO_2, it is cumulative emissions that will determine peak global temperature. IPCC notes that, "…taking into account the available information from multiple lines of evidence . . . the near linear relationship between cumulative CO_2 emissions and peak global mean temperature is well established in the literature and robust for cumulative total CO_2 emissions up to about 2000 petagrams of carbon. It is consistent with the relationship inferred from past cumulative CO_2 emissions and observed warming, is supported by process understanding of the carbon cycle and global energy balance, and emerges as a robust result from the entire hierarchy of models." IPCC indicates that, "A number of papers have found the global warming response to CO_2 emissions to be determined primarily by total cumulative emissions of CO_2 , irrespective of the timing of those emissions over a broad range of scenarios." One study cited by IPCC states that ". . . the relationship between cumulative emissions and peak warming is remarkably insensitive to the emission pathway (timing of emissions or peak emission rate). Hence policy targets based on limiting cumulative emissions of CO_2 are likely to be more robust to scientific uncertainty than emission-rate or concentration targets." It is only by reducing cumulative CO_2 emissions and thereby peak global temperature that ecological tipping points can be avoided. Near term increases in CO_2 that allow later reductions in cumulative CO_2 emissions are different from those that do not. In this context, it is not uncommon for increased use of forest bioenergy to result in near-term increases in atmospheric CO_2, compared to continued use of fossil fuels. However, as long as land remains in forest, increased use of forest bioenergy to displace fossil fuel accomplishes longer-term reductions in cumulative CO_2 emissions. The time required for increased use of forest bioenergy to transition from net CO_2 emissions to net CO_2 reductions depends on a number of factors. In the case of certain residual materials, the transition is essentially immediate. In other cases, this transition requires more time. Increased use of forest bioenergy to displace fossil fuels is likely to result in net benefits to atmospheric CO_2 within a decade or two. After this transition is completed, the benefits of forest bioenergy continue to accrue.	See comment 67 for further discussion of biomass.

Commenter	Comment	Agency response
	Even critics of forest bioenergy acknowledge the long-term benefits of displacing fossil fuel with forest bioenergy. A report prepared on behalf of the National Wildlife Federation and SELC, for instance, found that "…using southeastern forests for an expansion of electric power generation produced a significant long term atmospheric benefit, but at short term atmospheric cost." In the this study, a 35- to 50-year breakeven period was estimated, but this study did not account for reduced deforestation and increased afforestation associated with increased demand for wood, a well-documented phenomenon. Near-term increases in CO_2 emissions must be judged in the context of whether they are associated with reduced cumulative CO_2 emissions in the longer term. This is because of the insensitivity of global temperature to near-term CO_2 emissions, and the need to reduce cumulative CO_2 emissions to limit peak global temperature. These considerations are directly related to questions about biogenic CO_2 resulting from increased use of forest bioenergy. Increased use of forest bioenergy often results in higher near-term CO_2 emissions compared to continued use of fossil fuel but, as long as land remains in forest, cumulative CO_2 emissions are reduced in the longer term when fossil fuels are displaced by forest bioenergy. This phenomenon needs to be considered when contemplating potential regulation of biogenic CO_2 emissions from biomass energy production. The two cases in which emission profiles argue for differential treatment of biomass are 1) when the material used for fuel would have ended up being emitted to the atmosphere even if not used for energy production, and 2) when sustainable management of the biomass resource ensures that ongoing growth will remove equivalent quantities of CO_2 from the atmosphere. In the first case, the biomass emissions that would have occurred anyway will prevent fossil fuel emissions associated with producing the same amount of energy. In the second case, a sustainably managed resource grows biomass equal to or exceeding the amount of biomass harvested, ensuring that the resource is not a net source of CO_2. In both cases, it is the characteristics of the biomass feedstock, not the characteristics of the power generation process or facility, that support treatment as carbon neutral. By exempting facilities using 90% or more biomass feedstock, the regulation implicitly acknowledges the environmental and atmospheric benefits of biomass compared to fossil fuels. The regulation takes an all or nothing approach: either all of a facility's emissions are exempt (if it uses 90% or more biomass fuel) or none of	

Commenter	Comment	Agency response
	its emissions are exempt. This removes any incentive to use biomass as part of a fuel mixture in fossil-dominant plants. We have evaluated the carbon stock in trees on timberland across the U.S. South. Carbon stocks increased from 4.9 billion to 5.6 billion tons from 2005-16, an increase of 14.5% over a period with an average of 104 million tons of carbon removed annually during harvests. Even if all the biomass harvested from the forest during this time was immediately converted to CO_2 and emitted to the atmosphere (far from the actual situation), the fact that forest carbon stocks continue to increase is proof that biogenic CO_2 from biomass removed from the forest is more than offset by removals of CO_2 from the atmosphere by growing forests. In Virginia alone, tree carbon stocks on timberland rose from 503 million tons in 2005 to 589 million tons in 2016, a net increase of 17% while carbon removals from harvests were 7.4 million tons annually. In summary, when biomass from residuals or from sustainably managed forests replaces fossil fuels, there are climate change mitigation benefits. A large body of scientific evidence supports the environmental benefits of biomass energy, regardless of whether the biomass is combusted alone or as part of a biomass-fossil mix.	
119. Northern Virginia Electric Cooperative (NOVEC)	While NOVEC's power supply portfolio is predominantly natural gas-fired, NOVEC is keenly aware of its responsibility to provide renewable energy; as such, NOVEC's waste wood-fired biomass plant, landfill gas-fueled generation, and solar energy resources provide over 8% of NOVEC's system energy requirements. The definitions of "fossil fuel" and "fossil fuel-fired" are appropriate and should not be modified. Waste wood-fired, biomass-generating facilities should remain excluded. NOVEC owns and operates a 49.9 MW generating facility in Halifax County that is fueled exclusively by waste wood products that come predominantly from logging operations. This facility provides a winning solution to the management of wood waste products and the production and delivery of renewable energy to the power grid. NOVEC's mission includes the provision of a low-cost, reliable, and environmentally sound energy supply. NOVEC built this facility in response to member requests for additional renewable energy in its resource mix. NOVEC located the facility in an area that was already active in logging woodlands to supply the construction, furniture, and paper industries. Doing so minimized the need to transport waste wood over long distances; a side benefit was an economic boost to local communities.	See comment 67 for further discussion of biomass.

Commenter	Comment	Agency response
	NOVEC does not log for the plant's fuel. Instead, purchasers of high quality timber hire loggers to clear land and deliver the high quality round wood for lumber products. The remaining un-marketable wood, known as "slash," remains in the form of branches, limbs and stumps. The region that provides slash to NOVEC's facility produces more than 1 million tons of this waste product annually. Land owners typically want the slash removed, as leaving it in place reduces the amount of land available for growing the next generation of trees. Harvesting slash is superior to sending it to landfills, as the volume would fill up landfill capacity. While slash can be disposed of through uncontrolled burning, there is no control of SO_X, NO_X, particulates, or other emissions. The NOVEC biomass model is the best alternative to open burning or leaving slash in the forest. NOVEC purchases slash already chipped and delivered in truckloads. Small businesses create jobs associated with chipping activities and delivery of wood chips. The facility's air quality permit limits the amount of certain emissions that result from combustion of wood chips. The heat generated during uncontrolled burns is wasted. At the NOVEC facility the heat produced from the combustion is captured and converted to electric energy, reducing the amount of electricity needed from other power plants. Fly ash produced by the plant is used as a soil nutrient by nearby farmers. In summary, NOVEC's biomass power plant is a win for the environment, the local economy, and Virginia. As such, biomass should not be included in the definition of fossil fuels. NOVEC pays a forestry tax to the Department of Forestry that is used to fund the re-planting of trees throughout Virginia. The forestry tax can be viewed as a carbon tax that is already in place and paid by biomass plants. Young trees take in a higher amount of CO_2 compared to older trees for the same acreage. Combusting wood slash does not emit any carbon that is not already in the natural life cycle. Biomass plants in economically challenged areas provide jobs and investments as well as tax revenues for schools and other local government services. Unlike natural gas or coal, biomass fuel is produced close to the plants and the harvesting/chipping/delivery of slash is a significant economic engine for the locality and region.	
120. Northern Virginia Electric Cooperative (NOVEC)	Resolution of the unresolved revenues allocation methodology should be directed to the SCC for development of an equitable distribution formula that includes all electric utility ratepayers across the state. Even though the Regulatory Advisory Panel was unable to reach a consensus on a distribution approach for the revenue, the RAP ranked the following allocation goals as the two most important: 1) protect electricity customers, and 2) promote cost-effectiveness. The rules in this area reference the December 4, 2017,	DEQ appreciates the commenter's concerns, however, this issue is beyond the scope of the regulatory action and the authority to address it rests with the SCC.

Commenter	Comment	Agency response
	presentation before the Joint Committee on Electric Utility Regulation; it stated that the "revenue received by CO_2 Budget Sources owned by regulated electric utilities flow to rate payers pursuant to SCC requirements." This statement failed to recognize that Virginia ratepayers served by utilities that do not own CO_2 Budget Sources but purchase power from the PJM wholesale power market (presumably the CO_2 Budget Source entities market for their power) would see their power prices increase as a result of these rules as currently envisioned but would be unable to mitigate the increases in power prices through an allocation of the auction revenue as would be available to a select group of Virginia ratepayers. Making this potential treatment of utilities and its customers that do not own CO_2 Budget Sources is arbitrary and capricious. Assigning the resolution of this matter to the SCC and tasking the SCC to finish the job of developing an equitable distribution formula that includes all ratepayers across the state can achieve both of the original objectives of the RAP.	
121. Natural Resources Defense Council (NRDC)	Because of immediate and growing health and economic dangers, Virginia law clearly encompasses CO_2 in its definition of air pollution. Limiting and reducing carbon pollution would also achieve the board's charge to prevent harm to public health, safety and welfare. Because of the health and economic dangers that unmitigated carbon pollution poses to Virginia's human health, its economy, and property, we broadly support the proposed rule, using the same means already proven effective in 1 in 5 states in the country: a sensible, achievable limit on electric sector carbon pollution, with subsequent annual reductions. NRDC supports DEQ's proposal to ensure allowances comport with, and are fully tradable on, RGGI's pre-existing platform, due to its low administrative costs, third party market monitor reports, and robust cybersecurity. NRDC recommends that the rule set a 2020 baseline of 28.0 million tons. In order to determine the state's business-as-usual emissions and an appropriate annual reduction trajectory, DEQ should review reputable data and projections to establish a baseline that is not artificially high. To do so, DEQ should rely on up-to-date estimates of what Virginia's business-as-usual emissions will likely be in 2020. Similarly, DEQ should avoid industry-derived emissions projections that appear to be set unrealistically high, such as Dominion's 2017 IRP. DEQ's own proposal of either 33 or 34 million tons in 2020 is similarly flawed. An incorrectly high year-1 baseline budget would undermine the entirety of the program and jeopardize Virginia's ability to access the marked benefits of linking with the larger RGGI market. To set an appropriate baseline, DEQ should consider multiple up-to-date projections. The federal EIA's Annual	Support for the proposal is appreciated. The baseline has been set at 28 million tons, as discussed in the response to comment 37.

Commenter	Comment	Agency response
	Energy Outlook (AEO) from 2018 shows emissions decreasing in the Virginia-Carolina region by 27% between 2017-20. NRDC's IPM modeling, conducted by ICF, predicts similar emissions declines in Virginia between 2017-20. Preliminary results from NRDC's updated IPM modeling for Virginia (utilizing an updated 2018 data set) projects the state's power sector emissions to be 28.0 million tons in 2020. This more up-to-date modelling accurately reflects the reality of today's power sector in Virginia. Not only are additional coal retirements planned, but renewable energy installations are increasing, concurrent with recently lower or declining demand growth across the state in 2017. The factors of lower in-state electricity demand, persistently declining gas prices, and growing low-cost renewable energy resources mean the state's emissions will be well under 33 million tons in 2020. NRDC's IPM modeling supports the adoption of a 28 million ton baseline as a likely-to-occur starting point in 2020. A sufficiently ambitious program will drive significant economic and health benefits, including lower energy bills and rates, as well as improved public health resulting from cuts in co-pollutants like NO_X and SO_X.	
122. NRDC	DEQ must ensure the economic efficiency of the program by directing allowance value toward consumer benefit. Therefore, the proposal is correct to avoid imposing costs on Virginia families and businesses by awarding allowances directly to emitting generators for free. Doing so would allow the ultimate price of those allowances to be borne by Virginia families and businesses in the form of higher wholesale electricity costs, while providing a windfall profit to generators. NRDC therefore supports the consignment auction, as that mechanism provides an opportunity to recapture revenue that would otherwise be a windfall to generators. Indeed, these carbon allowances are inherently a public good, and thus their value must be captured and utilized on behalf of all Virginians. However, DEQ should amend the rule at 9VAC5-140-6215 to allocate allowances directly to distribution companies, based on pro rata share of load served, to ensure that allowance revenue goes directly to customer benefits. In order to ensure market efficiency and a transparent, undistorted allowance price that levels the playing field for all generators, achieve maximum economic efficiency for Virginia citizens through allowance allocation, and align with the Grid Transformation and Security Act of 2018, a standing Emissions Trading Stakeholder Advisory Group should also be established to monitor implementation and performance of the final rule.	The consignment auction is designed to be cost neutral, and RGGI employs various market control mechanisms to ensure a balanced and consistent flow of prices. In addition, Virginia is a regulated state; thus, it is the responsibility of the SCC to maximize economic efficiency for Virginia citizens. As discussed elsewhere, implementation and performance of the program will be continual, with RGGI program reviews and Virginia APA rule reviews providing opportunity for public comment should issues with program implementation be identified.
123. NRDC	Many forms of biomass fuel are used or under consideration in Virginia, including landfill gas recovery, agricultural plant residues and animal wastes, forest harvest residues, energy crops, whole trees, and industrial waste. Many of these feedstocks can generate	See the response to comment 67 for a discussion of biomass.

Commenter	Comment	Agency response
	carbon benefits compared with fossil fuels, while others can have significant negative carbon impacts. We focus on "forest-derived" biomass, specifically, categories of forest-derived feedstocks used to produce electricity: 1) whole trees and other large diameter wood that would otherwise be used in merchantable end uses; 2) harvest residues that would otherwise be discarded or left to decay; and 3) industrial and mill waste produced at a forest products processing facility that would otherwise be burned. We support the proposal to require co-fired facilities to hold allowances for the CO_2 they emit, whether those emissions be from forest-derived biomass or fossil fuels. We urge Virginia to issue a final rule that covers the net carbon emissions from all utility sector biomass power facilities larger than 25 MW. Specifically, Virginia must account for the net emissions from forest-derived biomass combustion from power sector facilities greater than 25 MW, including both dedicated biomass-burning units and those that cofire with forest-derived biomass, and cover these facilities under the cap. We recommend that Virginia regulate net emissions from forest-derived biomass as follows: 1) CO_2 emissions from onsite waste that would otherwise be burned in an industrial setting without energy recovery will require zero allowances for each ton of carbon emitted; 2) CO_2 emissions from forest-derived residues that would otherwise decay will require approximately 0.69 allowances for each ton of carbon emitted; 3) CO_2 emissions from whole trees and large diameter materials that would otherwise have a merchantable end-use, including pulp, paper, fiberboard, engineered wood or lumber will require one allowance for each ton of carbon emitted. Virginia should also require EGUs to furnish to DEQ an estimate of the proportion of their total forest-derived feedstocks annually that fall into these categories. Finally, Virginia must reject sustainable forestry as a proxy for carbon impacts of forest-derived biomass. "Sustainability," however defined, is not a measure of carbon impacts.	
124. NRDC	DEQ should design an economically efficient program with minimal market distortions, maximizing consumer benefits through efficiency investments by allocating allowances to distribution companies, and driving significant levels of in-state renewable energy development. Leakage can be minimized through the cost-effective development of untapped, clean resources like solar and energy efficiency. To ensure the program does not inadvertently lead to increased fossil-based electricity imports, DEQ should establish an annual program review process to assess whether interstate power flows are shifting as a result of the carbon price. A modest price on carbon is but one of many variables that	By linking to RGGI, Virginia will be linked to and involved in basic RGGI processes such as the routine program reviews and monitoring for potential leakage; however, recognizing the potential for any possible leakage to have an impact on disproportionately affected populations, a provision providing for review of

Commenter	Comment	Agency response
	can influence interstate power flows; any such analysis would need to account for those in a comprehensive manner. The RGGI states have already built in such emissions monitoring and reporting that assesses leakage, and we urge Virginia to do so as well.	impacts on such communities has been added. See the responses to comments 55 and 91 for further information.
125. NRDC	Climate change is inherently an environmental justice issue, as coastal communities and low-income communities ultimately bear the worst brunt of its impact. Therefore, the program should make significant cuts to CO_2 and ensure the consumer and energy efficiency benefits flow to the low-income citizens most impacted not just by climate change, but energy costs as well. Additionally, because CO_2 is not harmful in locally-higher concentrations, and there do not appear to be specific Virginia plants in proximity to at-risk communities whose capacity factors will increase under a carbon program, a carbon market in Virginia appears unlikely to create hot spots of pollution in frontline communities. And as the cap for carbon emissions is lowered, it can also create additional benefits of further reducing associated co-pollutants that cause health problems in communities close to their source. To ensure this is the case, the regular program review should also incorporate an annual environmental justice review. As RGGI demonstrates, it is good practice to build in regular program reviews to ensure the framework is working effectively. As Virginia adopts and implements its program, it may need to be adjusted over time, to ensure it is functioning efficiently and is driving significant and additional carbon pollution reductions. Program reviews can ensure that the cap is set and updated at the correct level to drive carbon emissions reductions beyond BAU, while maximizing the development of a clean energy economy. Virginia's program should undergo internal review on a regular basis, including stakeholder and public input as RGGI has done. The first review should occur in 2020, to review 2019 emissions and ensure the 2020 budget reflects the reality of Virginia's power sector emissions. As Virginia pursues linking with RGGI, it should integrate itself directly into that program's review processes.	As discussed in the responses to comments 55 and 91, Virginia will participate in RGGI program reviews, and a Virginia-specific program review will be conducted to ensure that EJ communities are monitored.
126. National Wildlife Federation and the Virginia Conservation Network	We applaud Virginia's plan to confront the growing threat of climate change by creating a carbon market that can link with RGGI. According to the National Climate Assessment, with 3 feet of sea level rise between 162 to 877 miles of roads could be inundated. Further, the gradual subsidence of coastal land in Virginia is magnifying the impacts of sea-level rise in the region. The rising seas threaten the coastal tourism industry in Virginia, a critical component of the state's economy. For examples, tourism contributed $1.4 billion to the economy of Virginia Beach in 2015, which resulted in $256 million in salaries and more than 12,900 jobs. Virginia's beaches and coastal waters also support 5 of	Support for the proposal is appreciated, and the commenter's observations on the threat of climate change are recognized.

Commenter	Comment	Agency response
	the 7 sea turtle species found worldwide. Every year between 5,000-10,000 sea turtles swim into the Chesapeake Bay. Most of these turtles are the threatened species, which depend on the bay for food and safety. The loggerhead sea turtle depends on the bay's sandy beaches and dunes for nesting habitat. As the sea level rises and extreme weather events occur more frequently, these nesting habitats are being washed away. Likewise, the bay is also experiencing the impacts of rising sea levels and warmer water. Warming temperatures and increased runoff from flooding are making the bay and its tributaries susceptible to harmful algal blooms--a threat to people and wildlife. These changes alter the abundance and migration patterns of wildlife in the bay, leading to declines in waterfowl and commercially important shellfish. Virginia is home to the U.S.'s largest clam aquaculture industry, with an average annual economic impact of $60 million; the seafood industry in Maryland and Virginia support almost 34,000 jobs. RGGI is a highly successful cooperative effort to harness market forces to cap, price, and curb harmful carbon emissions that are contributing to the climate change threats facing Virginia. RGGI states account for one-sixth of the U.S. population and one-fifth of the nation's GDP. Since the program began, RGGI states have experienced a net gain in economic growth, increased jobs, long-run electricity cost reductions, and decreased emissions. By establishing a program to trade carbon that will link with RGGI, Virginia can enjoy the benefits of a carbon trading system while adding momentum to the effort to mitigate climate change by ensuring that, with California's carbon pricing system and New Jersey rejoining RGGI, 1 in 3 Americans will live in states with carbon pricing policy designed to drive down carbon pollution. Tackling carbon emissions is important for avoiding dangerous levels of warming that will have high costs for Virginia. Though there has been a downward national trend in emissions from the power sector in recent years, carbon pollution from Virginia's power plants has risen from 23 million tons in 2012 to 34 million tons in 2016 and is expected to rise to 37 million tons in 2019. Linking to RGGI will reverse this trend for Virginia, propelling it to become a world leader in clean energy development, protecting the state's treasured natural resources and wildlife while creating new jobs and boosting the state's economy. While RGGI is considered to be an excellent example of a multistate program that encourages innovation and collaboration, there are still areas in which it can be improved. As an independent state linking with the RGGI carbon market, Virginia would have a unique opportunity to strengthen and advance the	

Commenter	Comment	Agency response
	program. By doing so, Virginia has the potential to cement itself as a gold standard for carbon pricing.	
127. National Wildlife Federation, Virginia Conservation Network	Virginia could provide a model to improve RGGI's approach to biomass. While some biomass practices can reduce carbon emissions compared to other fuels, other practices increase near-term emissions and degrade wildlife habitat. One model for carbon accounting is the Net Emissions Impact, which applies multipliers for each unit of carbon from different biomass feedstocks. We urge Virginia to consider the nuances of biomass and weigh the potential for negative repercussions. The demand for low-value wood for pellets is driving a shift in the southeast from natural forests to pine plantations--a significant downgrade in habitat value. Unrestricted harvests leave high conservation value species and ecosystems vulnerable to biomass harvests, particularly wetland forests like bottomland hardwoods. Research has found that biomass from southeastern forests takes 35-50 years before it performs better than fossil fuels. This is far too long to mitigate the impacts of climate change, and not in line with he governor's executive order to reduce carbon pollution. We encourage measures to protect wildlife and habitat while pursuing measures to address climate. The state can reinforce the RPS limit on non-waste feedstocks by applying it to its carbon market as well. The state should preclude biomass sourced from high conservation value areas, and limit growth in the biomass market to truly sustainable feedstocks. Virginia must establish best practices for biomass production that lead to benefits for both wildlife and climate.	As discussed in the response to comment 67, and discussed in great detail elsewhere, there are pros and cons associated with using biomass as fuel. DEQ agrees that some biomass practices can reduce carbon emissions, and should include measures to protect wildlife and habitat.
128. Old Dominion Electric Cooperative (ODEC), Virginia, Maryland and Delaware Association of Electric Cooperatives	ODEC and the Association have significant concerns regarding the impact of this regulation on the electric bills of its ultimate consumers. Even a modest increase in bills in the territories served by ODEC and member cooperatives will be problematic, and larger increases in costs will turn electricity into a luxury item. The Cooperatives' service territories are predominantly rural and residential. The majority of rural areas in Virginia have seen both a declining population and sluggish to negative economic growth. The Cooperatives' service territories have high numbers of low- and middle-income families, families and seniors on fixed incomes, and families suffering from unemployment and underemployment. The Cooperatives' service territories do not have significant non-residential loads--the service territories are over 80% residential. From 2011-15, many of Virginia's rural counties experienced negative job growth. Current Department of Labor Statistics show that many of the rural counties in Virginia have significantly higher unemployment rates than the urban and suburban areas of the state. Historically, most Cooperatives have per capita annual incomes that fall 22% below the statewide average. For Cooperatives that are more rural,	DEQ agrees with the commenter that costs to consumers are an important consideration, and has worked to develop a rule that minimizes costs while maximizing benefits associated with reducing carbon pollution. Implementing a cost neutral consignment auction is expected to minimize cost impacts to consumers. To the extent that power is purchased from a regulated entity in Virginia, costs will be controlled through the auction and subject to SCC oversight.

Commenter	Comment	Agency response
	that percentage is 260%, and for three of the most rural Cooperatives, the percentage is 30% or more below the statewide average. Historically, 13% of Cooperative member-owners are over 65 years of age, and unemployment in Cooperative territories is generally 1-4.5 percentage points above statewide unemployment rates. Based upon the 2010 Census, median household income in rural areas is less than half that of the suburban counties. Concerns over increased costs to consumers are not simply based on future projections. EIA Power Monthly indicates that there is already price pressure indicated on electric rates in RGGI participating states. Every state that participates in RGGI had average retail rates higher than the national average and 4 out of 5 of the states with the highest average retail rates in the U.S. participate in RGGI. The Cooperatives have only their ratepayers from which to recover costs; there are no separate stockholders. Furthermore, electric distribution cooperatives receive their generated electricity by contract. These contracts directly pass on the costs of any regulatory or environmental compliance to the distribution cooperatives, which then recover that cost from their consumers through a cost recovery mechanism in electric rates. Smaller cooperatives, including those wholly dependent on investor-owned utilities for their electricity, could be hit especially hard, as the costs of the regulation could be passed directly to those cooperatives and their consumers, with no mechanism for those suppliers to pass through proceeds from any sales of allowances back to the distribution cooperatives or their consumers.	
129. ODEC et al.	There is no modeling that can show the projected local benefits based upon the anticipated program reductions. The modeling for economic impact of this type of regulatory effort can be severely compromised based upon a variety of unknowable factors: market assumptions, regional power flows, projected resource mix, and demand considerations. In this case, there has been very little analysis done to support the anticipated and likely impacts on electric rates. The limited modeling that has been done could be significantly understating the impacts of the regulation, and by the time we see the results, it will be too late to make adjustments. We recommend a more holistic analysis be performed encompassing total energy consumption. Potentially higher future electric costs may produce unintended consequences in the form of shifts in energy usage or choice of fuel. An example would be a homeowner having an efficient electric heat pump choosing to produce some of the heat for their home via natural gas, propane, oil, or woodstove. In addition to the potential for additional emissions from these other alternate energy sources, one would also see increased CO_2 emissions	DEQ understands that impacts on electric rates are important, and several cost/benefit analyses were conducted; see response to comment 61 for more information. No significant impacts to consumers are anticipated.

Commenter	Comment	Agency response
	from the delivery/transportation of these sources.	
130. ODEC et al.	Regulating CO_2 at the state level is not as effective as a broader regional or national approach. Putting this additional burden on Virginia generation will encourage imports from other states, potentially requiring the construction of additional transmission infrastructure to maintain reliability. This is already occurring where the RGGI regulation in Maryland has contributed to the construction of new transmission lines to facilitate the import of power from adjoining non-RGGI states. PJM, as a regional transmission organization, allows for cost-effective exchange of electricity throughout its territory, which includes the majority of Virginia. Inconsistent state CO_2 policies within PJM create distortions in generation dispatch that can increase regional emissions. For example, the cost of CO_2 allowances from the RGGI program in one state can discourage a low-emitting in-state natural gas plant from operating, only to make way for imported coal power from a neighboring state because the out-of-state plants do not incur CO_2 cost. We recommend adding a provision for an analysis of trends in imports in Virginia once the program has been implemented. If there is a significant increase in imports, Virginia should be able to adjust the regulatory requirements for in-state generators to deter the import of out of state generation. The board should consider "safety valve" measures--for consumer protection from price increases, for reliability of the electricity system, and for imports from out-of-state. The additional burden of this program could result in premature retirement of coal facilities, such as the Clover Power Station. These plants were designed, built and permitted in compliance with federal and state regulations to meet long-term electricity needs. This regulation may reduce the remaining useful life of these assets which are still being paid for by our consumers. Virginia needs to develop a mechanism to compensate consumer-funded prematurely-retiring coal generation. One possible way would be to carve out allocations for retired consumer-funded generation for a significant number of years after their retirement. This would remove a barrier to the closure of consumer-funded coal generation by providing allocated allowance revenue to offset the stranded costs. Other mechanisms would likely require legislation to implement. Those renewable generation resources owned directly by Cooperatives should continue to be counted as renewable resources and excluded from the proposed regulation. This includes not only solar PV projects, but also the NOVEC wood waste biomass plant in Halifax County.	Virginia's program is not at a purely state level; rather, Virginia is linking to a larger group of states in order to leverage its carbon control abilities to the maximum. As discussed elsewhere, leakage will be monitored for and addressed as needed; see, for example, the response to comment 91. If the cost of allowances become too high the CCR is triggered; see comment 136 for more information. DEQ agrees that existing coal plants were designed, built and permitted in compliance with federal and state regulations to meet long-term electricity needs. Most of Virginia's coal fleet is owned and operated by Dominion Energy, which has the ability to adjust its electric generating portfolio to meet its business needs while protecting its customers' interests. See the response to comment 67 for additional discussion of biomass.
131. ODEC et al.	While it is true that some form of consignment auction has been used for other allowance programs, it is a wholly new concept to "link" Virginia to RGGI. We do not believe that the mechanisms that will have to be put in	The consignment auction is designed to be cost neutral. This approach has been carefully crafted to

Commenter	Comment	Agency response
	place to track allowances, as well as the increased burden on DEQ, have been fully factored into the cost of the program. Additionally, administrative costs have not been fully analyzed. Given that Virginia is not joining RGGI, but "linking" to it, we are unsure how administration of the consignment would be paid for. DEQ has no mechanism to recover its own administrative costs. As a not-for-profit cooperative, ODEC is exempt from federal income taxes as long as it receives no more than 15% of its revenue from non-members. This rule applies to all of the electric distribution cooperatives in Virginia. Cooperatively-organized businesses are designed, from their foundation, to serve their members, who are also their customers. Therefore, ODEC has concerns about the potential accounting and tax impacts of receiving "revenue" in the form of proceeds from the RGGI auctions. This concern would apply to any cooperatively-organized entity receiving auction proceed revenues. To the extent that the regulation maintains the concept of a consignment auction, consideration should be given to this unintended consequence. A solution could be to allow cooperatives to offset any allowance requirement with an equal amount of allocated allowances without the requirement to auction the allowances.	minimize costs. Program design elements such as the unlimited banking of allowances may mitigate this issue further.
132. ODEC et al.	Virginia has seen a downward trend in energy consumption and CO_2 emissions. Virginia's energy resource mix is evolving, with more investments in clean energy resources and renewables, regardless of CO_2 regulation. As reported in January 2018, Virginia has reduced its overall CO_2 emissions from all energy-related sources from 123.1 million tons in 2000 to 103.0 million tons in 2015. That 16.3% reduction ranks Virginia as the 16th highest reduction among all states and significantly higher than the national average reduction of 10.3%. This includes all energy related sources of CO_2 emissions including utility generation, transportation, industrial, commercial and residential sources. Even more impressive is the reduction in average CO_2 emissions per person where Virginia reduced its average emissions per person by 28.9%, ranking it the ninth highest reduction in the nation and significantly better than the national average reduction of 21.1%. The current trends support the initial budget being set at 34 million tons. While the trend has been declining over the years, there has been a great deal of recent investment in new clean combined cycle generation that would be subject to the program. Virginia should be allowed to enter the RGGI program with a budget that is fair to Virginia given the current generation resources. Even with the budget set at 34 million tons, with the new generation assets, the goal will still be challenging. Given that Virginia generators are	The commenter correctly asserts that investments in clean energy resources and renewables are increasing. The 28 million ton cap, as discussed in the response to comment 37, was selected. The RGGI program already contains multiple "safety valves"; the program is continually monitored and adjusted in order to protect reliability and resilience. See also the response to comment 33 for a discussion of modeling and emissions.

Commenter	Comment	Agency response
	just now entering the RGGI-linked program, the banking adjustments that have been calculated by RGGI and are being proposed to be applied to subsequent years, should not be applied to the Virginia budget. These banking adjustments are based on participants outside of Virginia banking more allowances than anticipated, and not the actions of any generators in Virginia. Such an adjustment should only be applied to existing RGGI participants. In addition, there should be a reliability and resiliency safety valve. Such a mechanism would recognize that overreliance on intermittent generation or a single fuel such as natural gas may negatively impact reliability and resilience. Analyses should be performed to assure that resiliency is maintained and that critical generation resources are not retired because of the regulation. In the case where retirement of critical resources is likely, adjustments to the allowance allocations should be contemplated.	
133. ODEC et al.	We generally support the provision establishing that 95% of the budget will be allocated to the generators. Particularly for the Cooperatives, revenues from the allocations will go directly to consumers. This is a critical means to reduce the net cost impact on electric consumers. Setting a price on CO_2 emissions as this program does is enough incentive for all sectors to seek ways to reduce emissions. Even when allocated allowances, utilities will still have an incentive to pursue low or non-emitting resources and energy efficiency measures. Not having allowances granted to such sources and forcing electric ratepayers to foot the bill for CO_2 emissions would be a significant cost impact and can be somewhat mitigated by allocated allowances to generators as proposed. Any utility with a wholesale power contract could be adversely affected by a system where their consumers pay for the costs of CO_2 emissions and receive nothing in return. This could be resolved by flowing auction revenues through applicable FERC ratemaking mechanisms using FERC Form 1 data.	Revenues will only be realized if there are excess allowances. It is beyond the scope of this regulation and the department's authority to direct auction revenues through FERC.
134. ODEC et al.	We recommend allocation based on emissions, not megawatts generated. Incumbent utilities have made significant investments under the existing regulatory compact to provide power economically and reliably to meet retail loads. There should be an appreciation for the value associated with these investments in electric generating plants. The conditional allocations being allocated on an emissions basis will provide a glide path for the existing resources to continue to operate within their remaining useful life, rather than having significant stranded resources. Coal generators would still have an incentive to operate efficiently since the allowance price will set the value of each ton of CO_2 emitted irrespective of who is given the allowances.	See comment 136 for a discussion of allocations.
135.	We analyzed Energy Information Administration (EIA)	See the response to

Commenter	Comment	Agency response
Partnership for Policy Integrity (PFPI), Appalachian Mountain Club, Center for Biological Diversity, Dogwood Alliance, Michelle's Earth Foundation	2016 data on the fuels burned and energy generated from Virginia's power sector and calculated CO_2 emissions using EIA emissions factors for each fuel. To achieve effective carbon reductions, and to administer the program fairly, Virginia should cover all plants greater than 25 MW, including industrial facilities that generate heat and power, standalone bioenergy plants and waste-to-energy plants in the utility sector. This would reduce CO_2 emissions more effectively, remove incentives to re-fire fossil plants with biomass, and reduce air pollution at some of the most polluting plants in Virginia. Industrial power plants are a significant source of CO_2 in Virginia. As a whole, the industrial sector emitted 16% of power sector CO_2 in 2016. The proposal would exclude some of the biggest polluters in Virginia. For instance, the WestRock Covington plant would under the industrial exemption as a plant that generates on-site heat and power. This facility burns natural gas, bituminous coal, distillate fuel oil, residual fuel oil, black liquor, and wood, and was responsible for 7% of Virginia's power sector CO_2 emissions in 2016. The company brought a new 75 MW wood-fueled generator online in 2013, which led to a dramatic increase in wood consumption and emissions. The facility is a large source of conventional pollution, and has recently been penalized by EPA for excessive particulate matter emissions. Similarly, the WestRock West Point mill burns coal, black liquor, distillate fuel oil, natural gas, residual fuel oil, sludge waste, and wood solids. It was responsible for 3.3% of the state's CO_2 emissions but as an industrial burner would be exempt, as would be the International Paper Franklin mill, which emitted about 700,000 tons of CO_2 from black liquor and natural gas in 2016. Failure to cover dedicated biomass-fueled power plants will exempt a significant amount of CO_2 pollution from coverage, and, like the industrial exemption, give a free pass to some of the largest sources of air pollution. The 50 MW Halifax County plant is a standalone facility shown as burning less than 300,000 tons of wood in 2016 although its capacity is upward of 600,000 tons. The plant has recently been subject to consent decrees for air quality violations. Dominion operates the 83 MW Pittsylvania station, and recently converted 3 coal plants to burn biomass at Altavista, Hopewell, and Southampton, for a total of about 153 MW. Their combined permitted emissions annually were 253.2 tpy $PM_{2.5}$, 114.6 tpy SO_2, 1,237 tpy NO_X, 2,748 tpy CO_2e, and 129.4 tpy VOC. Dominion also built the 585 MW Virginia City plant to burn up to 20% wood with 80% fossil fuels; this facility would need to purchase allowances for biomass-derived CO_2 under the plan. The plan also apparently exempts plants that generate electricity by burning municipal waste, a portion of which	comment 65 for a discussion of industrial facilities, and the response to comment 67 for a discussion of biomass. The regulation has been amended in order to address CHPs with more clarity; see the response to comment 74.

Commenter	Comment	Agency response
	is considered biogenic. Combined, biomass burned in Virginia facilities emitted over 8 million tons of CO_2 in 2016; the non-biogenic portion of municipal waste emitted another 1 million tons. However, under the Virginia plan, only about 2.5% of this CO_2 would be regulated under the cap--the approximately 230,000 tons emitted by co-firing biomass at Virginia City. Covering biomass will dramatically increase the plan's effectiveness because it will regulate a large source of CO_2, and remove an incentive for fossil-fired plants to use biomass. Burning biomass undermines efforts to reduce emissions because biomass fuels inherently emit a large amount of CO_2 per unit energy. In 2016, the top 3 highest-emitting categories of solid fuel per unit energy were biomass. When fuels are burned in a power plant, the efficiency of conversion of fuel to energy affects the CO_2 emission rate on an output basis. Wood-burning power plants are inefficient, in part because wood tends to have a high moisture content. This further increases the GHG impact of bioenergy. We also support including emissions from co-fired biomass. The high moisture content of biomass co-fired with fossil fuels can decrease the efficiency of the facility overall, meaning that it emits more CO_2 per unit energy. In comments to DEQ, Dominion claimed the following: "In 2013, Dominion made significant investments to converted three 51 MW units that used coal to 100% biomass, encouraged by EPA's prior determination that biomass was carbon neutral for PSD permitting. Close proximity to an ample supply of waste wood biomass as well as EPA's carbon-neutral policy for permitting under the PSD effective at that time were key economic drivers for these projects. Given Dominion's significant investment in renewable wood waste and forest residuals biomass, it is important for our customers that biomass emissions be considered carbon neutral." This statement highlights how treating bioenergy as having zero emissions is an incentive for more tree-burning power plants. Beyond that, it contains several inaccuracies. Dominion did not convert three "51 MW units that used coal." The units were 63 MW and the boiler de-rating that occurred with the conversion to biomass downgraded the units to 51 MW. It is not true that EPA had made a "prior determination that biomass was carbon neutral" when the Dominion plants were permitted. When EPA began regulating power plant CO_2 under PSD permitting in early 2011, biomass power plants were regulated alongside fossil fueled power plants--all the CO_2 was counted. In July 2011, EPA suspended regulation of CO_2 from bioenergy facilities under PSD for 3 years and convened a panel of its Science Advisory Board to advise the agency on how to regulate biogenic CO_2. EPA had not determined that	

Commenter	Comment	Agency response
	bioenergy was carbon neutral--it admitted the topic required study, while suspending regulation. The suspension was challenged, and in 2013 EPA's regulatory deferral for biogenic CO_2 was vacated . The court identified nothing in the Clean Air Act that would allow EPA to exempt biogenic CO_2 from being counted when determining whether a facility meets the emissions thresholds that trigger PSD permitting. The permit for Dominion's first conversion (Altavista) is dated May 2012--prior to the ruling but concurrent with the court case. Dominion knew that EPA had not concluded that bioenergy was carbon neutral and knew there was a possibility that plants would be regulated in the future. Further confirming that Dominion knew the status of bioenergy GHG permitting was indeterminate, the company submitted comments to the Science Advisory Panel requesting that the panel make an a priori determination that biomass is carbon neutral. The issue was still in play in 2014, when EPA published an NSPS for GHG emissions. The NSPS both acknowledges the importance of feedstocks for net carbon impacts and conclusion of the panel that biomass cannot be considered carbon neutral. A 2013 article by a Dominion employee mentions several reasons for the coal plant conversions, stating "Benefits to the environment would include reductions in nitrogen oxides, sulfur dioxide, particulate matter and mercury"--but nowhere mentions a reduction in CO_2 emissions as a rationale. Perhaps this particular executive was aware of the skepticism that met Dominion's claims about bioenergy at the SCC when the company applied to convert the plants. In its application and 2011 testimony, Dominion made numerous claims regarding biopower. Dominion described that residues would decompose in 10-15 years, or 25 years for large logs, and that burning these residues should be considered carbon neutral. While this argument might be valid if Dominion's converted coal plants operated for a single year and then shut down, for facilities in continuous operation, the net cumulative atmospheric CO_2 loading over this period would be many millions of tons more than if the residues had simply decomposed. Dominion and other bioenergy proponents also argue that as long as forest growth exceeds harvesting, that burning wood should be considered as having zero emissions. When forests are cut and burned for electricity or heat, the forest bank's deposits are smaller than they would have been if the trees had been left standing, and there is more CO_2 in the atmosphere. When the bioenergy industry claims that current forest growth should be considered as offsetting bioenergy emissions, the bioenergy industry is effectively arguing	

Commenter	Comment	Agency response
	that the bank's deposits can be transferred from one customer's account to another to cover up for the fact that some customers have withdrawn their money. This violates the concept that mass must be conserved. As the IPCC states, "If bioenergy production is to generate a net reduction in emissions, it must do so by offsetting those emissions through increased net carbon uptake of biota and soils." The biomass industry argues that the IPCC treats bioenergy as carbon neutral. The IPCC GHG reporting protocols count carbon loss from bioenergy in the land-use sector, when trees are harvested, and thus to avoid double-counting, does not count it in the energy sector--not the same as treating it as having zero emissions. The false representation of this position has become so pervasive that the IPCC has stated, "The IPCC approach of not including bioenergy emissions in the Energy Sector total should not be interpreted as a conclusion about the sustainability or carbon neutrality of bioenergy." DEQ's decision to count biomass emissions from co-firing should be extended to cover emissions from utility sector and industrial sector bioenergy emissions. Adding these plants would require raising the cap but should not entail other difficulties; the plants would simply increase the number of units covered, and should not interfere with the program's ability to interface with RGGI. Policy precedents for counting biomass carbon exist elsewhere. Massachusetts ended renewable energy subsidies for utility-scale wood-burning power plants in 2012, and the District of Columbia enacted a similar law in 2015. Treatment of bioenergy as having zero emissions under the E.U.'s carbon trading program has led to explosive growth of the wood pellet industry in the U.S. southeast, including Virginia. Forests, including areas that represent some of the most carbon-rich and biodiverse ecosystems in the U.S., are being clear-cut for biomass fuel. DEQ has gone part of the way toward regulating bioenergy emissions by proposing that co-fired facilities be required to hold allowances for 100% of the CO_2 they emit, whether it be from biomass or fossil fuels. We appreciate that DEQ has not repeated the mistakes of the RGGI program in allowing "eligible" biomass to be treated as having zero emissions when it is co-fired in electric plants and defining eligible biomass as sustainably harvested wood. "Sustainably harvested" is a largely undefined term and is not meaningful for carbon accounting. However, it is important for DEQ to cover all plants under the cap, including those that primarily or exclusively burn biomass. This might be facilitated by counting bioenergy net emissions under the carbon plan rather than stack emissions. Net emissions are a	

Commenter	Comment	Agency response
	cumulative measure assessed over some time period, and represent the difference between stack emissions and emissions if the biomass underwent some alternative fate. Four categories of wood-derived biomass are defined by the alternative fate if the material is not burned in a power plant: trees that would continue growing or be harvested for another purpose; residues that would remain onsite to decompose or be burned; residues that would be incinerated; and residues that can be used for other purposes like mulch or particle board. This framework matches in part Dominion's argument about forestry residues that "Unless re-purposed for other uses, such as energy production, this material is often left on-site after a harvesting operation is completed and will eventually be burned on-site or nearby, or will decompose, releasing carbon into the atmosphere and turned into organic matter on the forest floor and soil." Emissions from burning residues for energy are significantly greater than those from decomposition over decades, and thus net emissions should be regulated. The NEI at year 10 is 70%, meaning that 70% of the direct stack emissions represent a net increase of CO_2 over that time period. Applying this figure to carbon trading would mean that facilities burning forestry residues would be obligated to purchase 0.7 allowances for every ton of CO_2 they emitted. For facilities burning materials where the alternative fate was incineration, the net difference between direct emissions and alternative fate emissions is zero. Since many industrial facilities burn residues that may be incinerated if not burned for energy, this provides an exemption based on a scientific rationale rather than an arbitrary exemption. We support counting CO_2 emissions at the stack as the best way to account for CO_2 emissions from industrial, waste-to-energy, and biomass facilities. Counting stack emissions is a closer approximation of the net atmospheric impact than the assumption that emissions are zero, which is the outcome of not regulating wood-burning power plants. Stack emissions are an underestimate of the actual net carbon impact of cutting and burning whole trees that would have otherwise continued growing and removing CO_2 from the atmosphere. As a secondary option, we support the NEI methodology because it is relatively simple, science-based, and would ensure that some emissions are counted even if companies claim to use residues and in fact use whole trees. It would also exempt facilities that burn materials where the alternative fate is genuinely incineration. Regulating these facilities is important because they can be large sources of CO_2, and need the same incentives as the rest of the power sector to reduce emissions.	

Commenter	Comment	Agency response
	CHP plants contributed 22% of Virginia's power sector CO_2 in 2016, and electric-only plants emitted 78%. Most CHP plants are in the industrial sector; those not designated as industrial include Hopewell Cogeneration; Spruance Genco, a coal-burner; and Dominion's Southampton biomass power station, which reported a total heat input of 25% greater than its heat input for electricity only. This plant received 4% of its heat input from distillate fuel oil in 2016. DEQ will need to find a way to accommodate cogeneration plants outside the industrial sector even if the industrial exemption is maintained. However, we recognize DEQ not wanting to overregulate CHP if it leads to reductions in fuel burning. To incentivize CHP, DEQ should cover CHP plants, but provide a reduction in allowance obligations based on generation of useful thermal energy. It is not advisable to simply exempt CHP plants. Some plants may claim to operate as CHP plants, but not generate a meaningful amount of useful thermal energy. Many industrial sector CHP plants burn a variety of dirty and inefficient fuels. Subjecting these plants to trading will ensure that they seek to minimize emissions and generate energy from zero-emissions technologies.	
136. Resources for the Future	The regulation will distribute most of its allowances to compliance entities without charge. However, the allowances have conditional value that cannot be realized and the allowances cannot be used for compliance until they have been submitted on consignment to auction for sale. The state proposes to link with RGGI and the consignment to auction would be integrated as part of the RGGI auction. The compliance auction is a good option for Virginia if the state decides that it cannot directly auction allowances. Under the compliance auction, Virginia compliance entities that were the original holders of the conditional allowances will receive the auction value of their consigned allowances, once sold, in proportion to their original allowance shares. Those entities can purchase the allowances they need for compliance in the auction or in the secondary market. Virginia's consignment auction is not unique. Previous experience with consignment in emissions markets include the SO_2 trading program established under the 1990 Clean Air Act. In that program the emissions allowances were initially distributed without charge to compliance entities, but those entities were required to submit a fraction of their allocation under consignment to an auction held by EPA. In retrospect, economists describe that consignment auction as an important element of the overall program's marked success. Currently, the Western Climate Initiative runs an auction that is very similar in its basic design to the RGGI auction. In that auction, allowances that have been	The commenter's observations are appreciated. DEQ agrees that the updating output based allocation approach will effectively control CO_2 emissions while being cost-effective and transparent.

Commenter	Comment	Agency response
	initially distributed to investor-owned utilities in California must be consigned for sale in the auction, with the revenue returned to the utilities on a proportional basis. The California auction also has a price floor and a cost containment reserve, and the program has worked without a problem. The consignment approach should integrate seamlessly with the existing auction in which allowances are submitted for sale by the RGGI states. The auction outcome does not depend on whether the sold allowances are submitted by a state or if they are submitted by a compliance entity through consignment. From the perspective of other buyers and sellers including the other RGGI states, the auction works equally well in either case. Consigned allowances from compliance entities in Virginia will also work seamlessly with other features of the RGGI program. The consignment auction approach is a valuable feature because it enables the price floor, the ECR, and the CCR to function seamlessly with respect to the aggregate supply of allowances, including both the consigned and state-held allowances. The consigned allowances will be indistinguishable from state-held allowances in the auction, and these auction mechanisms will affect all the allowances in the same way. The same price floor and price points for the ECR and the CCR can apply to the consigned and state-held allowances in like fashion. The consignment approach is transparent, in that all observers can witness the original holders of the allowances, as well as the flow of revenues back to the original allowance holders. This transparency has value to Virginia regulators and it enables evaluation of market performance that is regularly conducted by the RGGI market monitor. Moreover, the consignment approach creates a program design that could seamlessly segue to a revenue raising auction if the state were to choose to move in that direction. The regulation describes a CO_2 allocation methodology to distribute allowances among compliance units based on their share of total electrical output across all units that are eligible to receive an allocation. This "updating output based allocation" approach has been used in previous emissions trading programs including by some of the states in the NO_X Budget Program. This approach provides an ongoing incentive to reduce the emissions intensity of electricity generation. In this regard, it is far superior to an approach that would distribute the emissions allowances across compliance entities based on a static, historic measure of emissions or heat input. The proposal aligns incentives associated with the award of allowances with overall program goals and can be	

Commenter	Comment	Agency response
	expected to improve program's cost effectiveness. An important motivation for using updating output based allocation is that it provides a production incentive, because the greater the production at a facility the greater the share of the emissions budget that would be awarded to that facility. Detailed simulation modeling at Resources for the Future has shown that this approach to allocation can mitigate potential leakage of electricity generation from the state. Because updating output based allocation provides an incentive to increase generation, it helps to mitigate leakage. Consequently, this choice of allocation method helps protect economic interests in the state while helping to achieve environmental goals. It also works well with the consignment auction. Under free allocation with a consignment auction, the Virginia compliance entities that were the original holders of the conditional allowances will receive the auction value of their consigned allowances, once sold, in proportion to their original allowance shares. Because most compliance entities are owned by companies regulated by the state, the value of the consigned allowances would contribute to meeting the revenue needs and thereby benefit electricity consumers. To strengthen this relationship between the source of revenues and their use, the state might require that some portion of the allowance value be invested in program-related efforts such as energy efficiency or renewable energy. In Virginia, the value of consigned allowances returns to regulated companies, and because of state regulatory oversight that value is expected to accrue to the benefit of rate payers. This outcome is somewhat similar to the practice in some other RGGI states such as Maryland, where a portion of allowance value has been returned on the electricity bill. In the future, if the program were to become substantially more stringent either as a regional program or as a model for a national program, the return to rate payers would be more substantial. However, if the value reduces the consumer’s monthly electricity bill, then from the perspective on consumers, their cost of electricity would appear to not reflect the carbon price. In turn, this would deny consumers the information they need to make decisions about energy-efficient investments in household appliances and in their regular electricity consumption. As a result, the regulation may have minimal effect on overall electricity demand. An alternative to returning the value of consigned allowances to the rate base and thereby reducing monthly consumer bills would be to return the value to electricity consumers on an equal and periodic (i.e., six	

Commenter	Comment	Agency response
	month) per-customer-account basis. Consumers would see higher prices in most months, reflecting the value of allowances, thereby providing an incentive to conserve energy. Periodically, they would receive a dividend that preserves distributional goals and provides a program feature that is likely to be popular with recipients, which in turn builds constituent support for the program. The consignment auction preserves many of the benefits of a direct auction of allowances; however, a direct auction has further advantages. A revenue-raising auction would provide state agencies with financial resources to make investments in carbon mitigation, to address distributional goals, or to address the consequences of a changing climate. Public finance economists suggest that in the long-run, great value is associated with a tax swap, with revenues from the carbon price used to reduce other taxes in the state and thereby to help attract economic activity to the state. Another option would be to use revenues to provide dividends that directly compensate households as the common property owners of the atmosphere. The state of Virginia should consider an approach that would directly auction allowances to raise revenue to address these pressing needs to address the challenge of climate change. Two important elements of the RGGI program are provisions to contain emissions and costs when changes in electricity markets lead to outcomes that are unanticipated. The ECR constrains the quantity of allowances that would be sold in the auction when the auction price falls below a specific level. At an even lower price level, the price floor provides an absolute minimum price for the sale of allowances. As a complement, the CCR makes allowances available in addition to the intended cap if the auction price rises to a specific level. Together, these features make the supply schedule for emissions allowances responsive to the equilibrium price in the auction, which is a characteristic of commodity markets in general, but rare in environmental markets. Among other effects, this design helps to reduce price volatility in the allowance market. Empirically, the more important of these provisions is the ECR (and the price floor) because experience in emissions markets around the world shows a consistent tendency for prices to fall below expected levels. The ECR automatically restricts the supply of allowances if the cost of emissions reductions falls, and the CCR automatically expands supply if the cost increases. This feature helps boost confidence in the allowance market and reinforces the goals of the trading program in a transparent way by reducing emissions automatically when it is unexpectedly inexpensive to do so.	

Commenter	Comment	Agency response
	The RGGI auction has a bid limitation that limits the share of allowances that any one entity can purchase to 25% of all allowances that are sold. This bid limitation is a feature to guard against potential manipulation of the auction or the allowance market. When Virginia links to the RGGI program, the bid limitation in the auction might not make it possible for all the Virginia compliance entities to rely strictly on the auction to acquire their necessary allowances if they chose to do so. Virginia should work with RGGI to amend this rule by expanding the size of the bid limitation such that every entity has the possibility of relying on the auction for compliance. A change from 25% to 30% should be adequate. That change would be modest, and will not create a meaningful possibility for market manipulation, because still, no single entity would constitute a sufficient share of demand in the auction to exercise strategic behavior. Further, the largest compliance entities in Virginia operate under cost-of-service regulation, unlike many other firms in the RGGI market that are IPPs. A regulated company would not have the same potential incentive for possible manipulation as would competitive companies because advantageous rewards would be expected to flow to rate payers rather than shareholders; this may lessen the incentive for strategic behavior and mollify potential concern. Nonetheless, the RGGI market monitor should remain vigilant about market disruptions due to manipulation or strategic behavior; however, the concentration in the market held by the largest entity after Virginia begins to participate in RGGI is not sufficient to increase that concern and the expanded size of the market overall should reduce concern. Given that Virginia's regulatory design is very complementary to the RGGI program, the only substantial issue is the relative emissions budgets of Virginia and RGGI when Virginia enters the program. Virginia and the RGGI states will want to look for the right balance among costs incurred by all the states. One of the reasons why the states conduct modeling is to anticipate this type of issue and plan for eventualities. Virginia and RGGI's actions model this and address forecasted emissions is the right process to provide analysis that can support decisions that enable the reduction of emissions on a broad regional basis. However, the assumptions in the modeling will directly influence the results and it appears that the scenarios that were modeled took a very cautious approach, meaning that they lead to forecasts for emissions that are greater than are likely to occur. On a national basis, the demand for electricity fell during the Great Recession but it has remained nearly level since then, reflecting a decreasing energy intensity of economic activity. In Virginia, demand has fallen and	

Commenter	Comment	Agency response
	subsequently risen, where most of that rise has been associated with large data storage facilities. That increase is more than adequately represented in even the most modest forecast of demand growth by DEQ. A second factor is the emissions intensity of electricity generation in the state. Over recent years there has been a substantial growth in natural gas generation that has a lower emissions rate than coal. Much of the new natural gas has reduced imported power, but it has also reduced the use of coal for electricity generation in the state and that trend is expected to continue, and to result in the retirement of coal-fired capacity over the next few years. At the same time, a substantial growth in renewable energy resources is anticipated. Indeed, some of the companies associated with the recent growth in electricity demand for data storage are advocates of renewable energy and have pledges to their customers to link their consumption to expanded renewable generation. In summary, these secular changes appear to indicate that the state of Virginia is on a pathway that will see declining emissions soon. At present, Virginia is considering annual base budgets of either 33 or 34 million tons per year. The considerations I discuss point to the 33 million ton value for the base emissions budget; although a compelling case could be made that the budget could be lower still. Use of a consignment auction coupled with updating output based allocation for the initial distribution of emissions allowances is a strong design for the trading program. The value of allowances submitted to the consignment auction is expected to flow to the benefit of ratepayers, but as that value increases the state should consider separating the value from monthly electricity bills and return it to customers on an intermittent basis. There are additional benefits from directly auctioning allowances that could help the state address a variety of climate-related goals, and this should be considered also. An especially important feature of the RGGI program design is the ECR, which Virginia should support. There is a provision in the RGGI auction design that limits the bid quantity by a compliance entity; this provision could be inconvenient for RGGI and should be considered further in collaboration with RGGI. Finally, the lower of the two emissions budgets is more appropriate given current trends in the industry in Virginia, and an even lower budget could be justified.	
137. Regional Greenhouse Gas Initiative (RGGI)	The RGGI states applaud Virginia's progress toward implementing a market-based program to reduce GHG emissions. In considering Virginia's potential participation in our existing RGGI market, the RGGI states recognize many benefits of an expanded trading market, including increased economic efficiency and mitigation of the	Support for the proposal is appreciated. As discussed in the response to comment 37, the initial base cap has

Commenter	Comment	Agency response
	possibility of emissions leakage. Participation in RGGI has helped our states create jobs, save money for consumers, and improve the public health, while reducing power sector emissions and transitioning to a cleaner energy system. If implemented successfully, expanded RGGI participation will serve to amplify these benefits. The RGGI states recognize the importance of ensuring that any new entrant into the RGGI market is fully compatible with our existing program. In studying Virginia's potential compatibility, we considered the alignment of key program elements, consistency in the use of regulatory language, and comparable stringency of the program as a whole. Expanding the RGGI trading market brings many benefits provided that compatible programs can be established. Making the changes outlined above to Virginia's regulation will help to ensure compatibility so that, as a regulatory matter, Virginia can be considered a RGGI Participating State. The RGGI states are excited by the prospect of Virginia's potential participation in the RGGI program, and applaud Virginia's plans for investment in complementary programs such as energy efficiency and clean and renewable energy. We see an opportunity for Virginia to realize a measure of climate leadership by adopting a lower starting allowance budget than the 33-34 million tons currently proposed. The RGGI states' comments have been informed by productive conversations with Virginia state staff and Agency Heads. States hope to continue the discussions in the future as Virginia makes further refinements to this proposed rule. The RGGI states are available to assist Virginia in addressing these comments as the state continues towards the development of a compatible program.	been set at 28 million tons.
137-1. RGGI	The proposed rule states at 6020 C: *"Allowance" means an allowance up to one ton of CO_2 purchased from the consignment auction in accordance with Article 9 (9VAC5-140-6410 et seq.) of this part and may be deposited in the compliance account of a CO2 budget source.* The RGGI states suggest that this definition be replaced by the following, in order to be consistent with the definition of "CO_2 allowance" in the 2017 Model Rule. This change would help ensure the proper functioning of the RGGI allowance market, including for purposes of tracking of allowances to be used for regulatory compliance with the RGGI program: *"CO_2 allowance" means a limited authorization by the* [REGULATORY AGENCY] *or a participating state under the CO_2 Budget Trading Program to emit up to one ton of CO_2, subject to all applicable limitations contained in this Part."*	The proposal has been revised accordingly.
137-2. RGGI	a. The proposal is silent regarding the potential use of CO_2 offset allowances. The RGGI states recommend that the Virginia rule specify that CO_2 offset allowances will be accepted for compliance, up to a maximum 3.3%	a. The proposal has been revised accordingly. b. The proposal has been

Commenter	Comment	Agency response
	of any entity's compliance obligation. The RGGI states intend to amend the 2017 Model Rule to clarify the limit on offset allowance use. The RGGI states recommend inclusion of the following regulatory language on offsets, in order to be consistent with the to-be-amended 2017 Model Rule: *For CO_2 offset allowances, the number of CO_2 offset allowances that are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of* [Section XX] *for a control period, initial control period, or an interim control period may not exceed 3.3 percent of the CO_2 budget source's CO_2 emissions for that control period or initial control period, or may not exceed 3.3 percent of 0.50 times the CO_2 budget source's CO_2 emissions for an interim control period, as determined in accordance with* [Subparts XX]. b. A definition of "CO_2 Offset Allowance" will be necessary to support inclusion of the offset language offered above. The 2017 Model Rule defines "CO_2 offset allowance" as: "*CO_2 offset allowance. A CO_2 allowance that is awarded to the sponsor of a CO_2 emissions offset project pursuant to section XX-10.7 and is subject to the relevant compliance deduction limitations of section XX-6.5(a)(3).* c. Note that these recommendations pertain to the fungibility and acceptance of CO_2 offset allowances for compliance under the RGGI trading program. The RGGI states leave it to Virginia's discretion whether Virginia wishes to establish state-specific offset protocols, and to issue CO_2 offset allowances to qualifying projects within the state. The proposed rule does not provide for the issuance of CO_2 offset allowances.	revised accordingly with some modification. c. As discussed in the response to comment 26, Virginia is exercising its discretion to not implement offsets at this time.
137-3. RGGI	The proposed rule states at 6020 C: *"CO_2 Budget Trading Program" means the Regional Greenhouse Gas Initiative (RGGI), a multi-state CO_2 air pollution control and emissions reduction program as a means of reducing emissions of CO_2 from CO_2 budget sources.* The RGGI states suggest that this definition be replaced by the following, in order to be consistent with the definition of "CO_2 Budget Trading Program" in the 2017 Model Rule. Because this defined term is part of the regulatory definition of "Participating State," this change would help ensure that Virginia is considered a RGGI Participating State and that Virginia-issued allowances are fully fungible across the RGGI program: *"CO_2 Budget Trading Program" means a multi-state CO_2 air pollution control and emissions reduction program established pursuant to this Part and corresponding regulations in other states as a means of reducing emissions of CO_2 from CO_2 budget sources.*	The definition of "CO_2 Budget Trading Program" has been revised accordingly with some modification. No change has been made to the definition of "participating state" because the need for corresponding regulations is addressed in the CO_2 Budget Trading Program definition.
137-4. RGGI	The proposed rule states at 6020 C: "*Beginning in 2020 and each calendar year thereafter, the CCR trigger price shall be 1.025 multiplied by the CCR trigger price from the previous calendar year, rounded to the nearest whole cent. The CCR trigger price in calendar year 2021 shall be $13.00. Each calendar year thereafter, the CCR*	These corrections have been made.

Commenter	Comment	Agency response
	trigger price shall be 1.07 multiplied by the CCR trigger price from the previous calendar year, rounded to the nearest whole cent, as shown in Table 140-1A." The RGGI states note that the 2017 Model Rule modifies the CCR trigger price trajectory after 2020. The 2017 Model Rule states that the RGGI CCR will be $13.00 in 2021 and increase by 7% per year in the years following. To be compatible, RGGI states suggest the following: *"The CCR trigger price in calendar year 2020 shall be $10.77. The CCR trigger price in calendar year 2021 shall be $13.00. Each calendar year thereafter, the CCR trigger price shall be 1.07 multiplied by the CCR trigger price from the previous calendar year, rounded to the nearest whole cent, as shown in Table 140-1A."* Virginia's proposed rule displays a list of CCR trigger prices in Table 140-1A. These prices differ from those shown in the RGGI 2017 Model Rule by one cent, for the prices starting in 2024 and ending in 2030. Likewise, Virginia's proposed rule displays a list of ECR trigger prices in Table 140-1B. These prices differ from those shown in the 2017 Model Rule by one cent, for the years 2026, 2029, and 2030. Revised tables are provided.	
137-5. RGGI	The proposed rule states at 6020 C: *"'Conditional allowance' means an allowance allocated by the department to CO2 budget sources and to DMME. Such conditional allowance shall be consigned by the entity to whom it is allocated to the consignment auction…after which the conditional allowance becomes an allowance to be used for compliance purposes."* The RGGI states suggest a change to the final clause of this section, to clarify the relationship between a conditional allowance and a CO_2 allowance: "*…after which the conditional allowance becomes a CO_2 allowance once it is sold to an auction participant."* A similar issue exists in 6430, p. 959, where the proposed rule states: *"At the completion of the consignment auction, a conditional allowance shall become an allowance used for compliance purposes."* The RGGI states suggest a change to this language, to clarify the relationship between a conditional allowance and a CO_2 allowance: "*At the completion of the consignment auction, a conditional allowance sold at auction shall become a CO_2 allowance."*	The proposal has been revised accordingly.
137-6. RGGI	The proposed rule states at 6020 C: *"'Minimum reserve price' means, in calendar year 2020, $2.00."* The minimum reserve price for RGGI auctions in 2020 will be $2.32. The RGGI states recommend correcting this number in order to be compatible with the 2017 Model Rule.	The proposal has been revised accordingly.
137-7. RGGI	The proposed rule states at 6020 C: *" 'Receive' or 'receipt of' means, with regard to CO_2 allowances, the movement of CO_2 allowances by the department or its agent from one COATS account to another, for purposes of allocation, transfer, or deduction."* This definition should match the updated definition in the 2017 Model	The proposal has been revised accordingly.

Commenter	Comment	Agency response
	Rule: *" 'Receive' or 'receipt of' means, when referring to the* [REGULATORY AGENCY] *or its agent, to come into possession of a document, information, or correspondence (whether sent in writing or by authorized electronic transmission), as indicated in an official correspondence log, or by a notation made on the document, information, or correspondence, by the* [REGULATORY AGENCY] *or its agent in the regular course of business."*	
137-8. RGGI	The proposed rule states at 6020 C: *"'RGGI, Inc.' means the 501(c)(3) non-profit corporation created to support development and implementation of the Regional Greenhouse Gas Initiative (RGGI). Participating RGGI states use RGGI, Inc., as their agent to conduct the consignment auction, and operate and manage COATS."* The RGGI states recommend deleting the definition of RGGI, Inc., while retaining the general concept of an agent designated to conduct auctions and manage allowance tracking.	The proposal has been revised accordingly.
137-9. RGGI	The proposed rule states at 6020 C: *"'State' means the Commonwealth of Virginia. The term 'state' shall have its conventional meaning where such meaning is clear from the context."* In clarifying the "conventional meaning" of the word "State," the rule should also incorporate the broader 2017 Model Rule definition: "*A State, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, and American Samoa and includes the Commonwealth of the Northern Mariana Islands."* Also, the RGGI states recommend that the broader term "State" not be used in the Virginia regulation where the more specific term "Participating State" would be more appropriate. Where the term "Participating State" is used in the 2017 Model Rule, this term should also be used in the Virginia regulation instead of "State." This would help avoid confusion and ensure compatibility.	The proposal has been revised to eliminate the definition of "state" altogether and rely instead on the definition of "participating state." "State" is a commonly understood term, and there is no need to define it in this regulation. "Participating state" is an important term of art, and is properly defined separately.
137-10. RGGI	The proposed rule states in 6200 A & B: "*A. The department may retire undistributed CO_2 allowances at the end of each control period. B. The department may retire unsold CO_2 allowances at the end of each control period."* Conditional allowances should not be allowed to be transferred, except to be sold at auction, retired, or withheld as part of an ECR trigger event. Accordingly, this phrase should reference undistributed and unsold "conditional allowances" instead of "CO_2 allowances": *"Undistributed or unsold conditional allowances shall not be transferred, with the exception of a transfer to consign them to auction, retire them, or withhold them in the event of an ECR trigger event. The department may retire undistributed conditional allowances at the end of each control period. B. The department may retire unsold conditional allowances at the end of each control period."* A similar issue exists in 6210 E, where the proposed rule states: "*The department will convert and transfer any*	The proposal has been revised accordingly.

Commenter	Comment	Agency response
	CO2 allowances that have been withheld from any auction or auctions in the prior year into the Virginia ECR account…The department will withhold CO2 ECR allowances as follows." "Conditional allowances" should replace "CO_2 allowances." Also note that "in the prior year" has been removed from the 2017 Model Rule, and should be removed here: *"The department will convert and transfer any conditional allowances that have been withheld from any auction or auctions into the Virginia ECR withholding account…The department will withhold CO_2 ECR allowances as follows."*	
137-11. RGGI	The proposed rule states in 6210 I: *"Timing requirements for CO_2 allowance allocations shall be as follows. 1. By May 1, 2019, the department will submit to RGGI, Inc., the CO_2 conditional allowance allocations, in a format prescribed by RGGI, Inc., and in accordance with 9VAC5-140-6215 A and B, for the initial control period (2020). 2. By May 1, 2020, and May 1 of every third year thereafter, the department will submit to RGGI, Inc., the CO_2 allowance allocations, in a format prescribed by RGGI, Inc., for the applicable control period, and in accordance with 9VAC5-140-6215 A and B."* The RGGI states suggest removing references to RGGI, Inc. and replacing them with "its agent." This section should also replace "CO_2 conditional allowance" and "CO_2 allowance" with "conditional allowance": "*Timing requirements for CO_2 allowance allocations shall be as follows. 1. By May 1, 2019, the department will submit to its agent the conditional allowance allocations, in a format prescribed, and in accordance with 9VAC5-140-6215 A and B, for the initial control period (2020). 2. By May 1, 2020, and May 1 of every third year thereafter, the department will submit to its agent, the conditional allowance allocations, in a format prescribed, for the applicable control period, and in accordance with 9VAC5-140-6215 A and B."*	The proposal has been revised accordingly with some additional modification to improve clarity.
137-12. RGGI	The proposed rule states in 6020 C: *"'Fossil fuel-fired' means the combustion of fossil fuel, alone or in combination with any other fuel, where the fossil fuel combusted comprises, or is projected to comprise, more than 10% of the annual heat input on a Btu basis during any year."* This definition is inconsistent with and less stringent than the 2017 Model Rule, which sets a threshold of 5% of the annual heat input on a Btu basis during any year. The applicability provisions of the Virginia rule should be consistent and at least as stringent as those of the 2017 Model Rule. This change is necessary in order to ensure that Virginia's regulation is a corresponding CO_2 Budget Trading Program regulation, such that Virginia can be considered a RGGI Participating State.	The proposal has been revised accordingly.
137-13. RGGI	The proposed rule states in 6040 B, p. 938: *"Exempt from the requirements of this regulation is any fossil fuel power generating unit owned by an individual facility and located at that individual facility that generates electricity*	The proposal has been revised accordingly.

Commenter	Comment	Agency response
	and heat from fossil fuel for the primary use of operation of the facility." This provision does not set a threshold for what constitutes "primary use of operation of the facility." In the 2017 Model Rule, facilities that provide less than 10% of their power output to the grid are exempted from compliance obligations. The RGGI states suggest that the Virginia rule consistently adopt this 10% threshold. The applicability provisions should be consistent and at least as stringent as those of the 2017 Model Rule. This is necessary in order to ensure that Virginia's regulation is a corresponding CO_2 Budget Trading Program regulation, such that Virginia can be considered a RGGI Participating State.	
137-14. RGGI	The proposed rule states in 6210 D 1: *"The department will initially allocate…CO_2 CCR allowances for calendar year 2020."* RGGI states suggest that Virginia clarify how the CCR provisions will work.	The proposal has been modified to specify that CCR allowances will be allocated on a pro rata basis to CO_2 budget sources.
137-15. RGGI	The proposed rule states in 6260 A: *"CO_2 allowances that meet the following criteria are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of 9VAC5-140-6050 C for a control period or an interim control period."* This section mentions requirements for both a "control period" and an "interim control period." However, the Virginia proposed rule includes a third type of control period, the "initial control period." This "initial control period" includes only the year 2020, as a means of synchronizing with the RGGI states' compliance schedule. RGGI states suggest that the "initial control period" should also be mentioned here, to specify that compliance requirements apply in 2020: *"CO_2 allowances that meet the following criteria are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of 9VAC5-140-6050 C for an initial control period, a control period, or an interim control period."*	The proposal has been revised accordingly.
137-16. RGGI	The proposed rule states in 6430, p. 959: "*[C]onditional allowances shall be consigned by the CO2 budget source…or DMME to each auction on a quarterly pro rata basis in accordance with procedures specified by the department."* The RGGI states understand the "quarterly pro rata basis" to mean that generators must consign one quarter of their yearly total of conditional allowances at each auction, rather than distributing the consigned amount over the quarterly auctions at their own discretion. RGGI states suggest that this language be made more explicit in the Virginia rule: "*One quarter of the annual conditional allowance allocation shall be consigned by the CO_2 budget source…or the holder(s) of a public contract with DMME to each auction in accordance with procedures specified by the department."*	The proposal has been revised accordingly.
138. Richard Ball	A baseline as high as 33 or 34 MMT of CO_2, as proposed, would be much too high and lead to much less	Support for the proposal and the commenter's

Commenter	Comment	Agency response
	reduction in Virginia CO_2 emissions by 2030 than is feasible and desirable. For example, the ICF/DEQ Policy scenarios show very low reductions in CO_2 emission reductions. Emissions have already been coming down since 2016 and most projections indicate that a trend in that direction is likely to continue in that direction even in the absence of the proposed regulation. I offer several lines of evidence for that, including calculations of actual 2017 emissions in Virginia for overall electric power emissions and emissions specifically from likely EGUs covered by the regulation. If the baseline is set in the range of 30-34 MMT of CO_2, the program might fail to achieve CO_2 reductions that are substantially greater than what would happen even in the absence of the ED 11 program. My conclusion is that it would be feasible to achieve reductions under a base cap of 28 MMT with an aggressive, but feasible solar or wind expansion program and phasing out a substantial amount of higher ED 11 CO_2 carbon sources along with considerable natural gas generation while maintaining a steady level of total Virginia generation. It also implies that it makes little sense to continue expanding natural gas generating sources since they are likely to be constrained in their generation. A steady level of generation would be consistent with an aggressive program of energy efficiency measures, which might be implemented as a result of new legislation enacted in the 2018 session of the General Assembly. RGGI expects Virginia to reduce its baseline cap, although they did not specify a particular value. In my analysis, I have borrowed results on the likely list of ED 11 EGUs that will be covered under ED 11 and the associated estimated generation, and CO_2 emissions from the comments submitted by the Virginia Chapter of the Sierra Club. Another conclusion is that the ICF modeling results published by DEQ in the autumn contained some out-of date assumptions due to subsequent events. I conclude that: the ICF results were furnished in autumn, 2017 before actual 2017 results for Virginia were known and before SB 966 was passed in the 2018 Session of the General Assembly, and before the announcement of retirement plans for a number of EGUs, so those factors could not be reflected in the modeling. In particular, CO_2 emissions by 2020 EGU-covered units in 2017 was overestimated in the ICF modeling as 32 MMT CO_2 , compared with the Sierra Club's estimate of 29 million tons based on actual 2016 data. Those factors also may have led to overestimation of subsequent modeled results for 2020 through 2030. Hence I look at likely emission reductions for other baseline cap values than just 33 MMT under several different policy assumptions.	observations on the base cap are appreciated. As discussed in the response to comment 37, the base cap has been set at 28 million tons.
139. Southern	DEQ has broad legal authority to promulgate regulations	Support for the proposal is

Commenter	Comment	Agency response
Environmental Law Center (SELC)	to reduce CO_2 pollution through an emissions trading program. Specifically, the board is authorized to regulate air emissions, which includes CO_2. The Virginia Code authorizes the Air Board to "develop a comprehensive program for the . . . abatement and control of all sources of air pollution in the Commonwealth." This power includes the ability to "promulgate regulations . . . abating, controlling and prohibiting air pollution[.]" The law defines "air pollution" as "the presence in the outdoor atmosphere of one of more substances which are or may be harmful or injurious to human health, welfare or safety, to animal or plant life, or to property, or which unreasonably interfere with the enjoyment by the people of life or property." CO_2 clearly qualifies as a "pollutant" subject to board regulation. Indeed, it is well settled on a national level that CO_2 is a pollutant needing regulation. The Supreme Court held in Massachusetts v. EPA that GHG, including CO_2, are "without a doubt" pollutants under the Clean Air Act. Subsequently, EPA determined that GHG emissions endanger the public health and welfare. Virginia Code requires the board to “make . . . such investigations and inspection and do such other things as are reasonably necessary to carry out the provisions of this chapter . . . including the achievement and maintenance of such levels of air quality as will protect human health, welfare and safety[.]" At the state level, carbon pollution is a clear threat to Virginian’s health, welfare and safety. Virginia's coast faces the highest level of sea level rise on the Atlantic Coast of the U.S. Sea level rise is also a threat to public and private property, including the Norfolk Naval Base and the Hampton Roads region, which is becoming increasingly vulnerable to flooding. A report issued by the Virginia Institute of Marine Science predicts sea level rise will increase in the Hampton Roads area by more than a foot between 2018-50. Moreover, in Virginia, climate change is exacerbating chronic respiratory diseases. Because of the clear danger carbon emissions pose to human health, welfare and safety, it is well within the board’s broad legal authority to regulate these harmful pollutants. Linking to RGGI preserves Virginia’s autonomy, while addressing the threat carbon emissions pose to the state in a cost-efficient manner.	appreciated. As discussed here and, for example, the response to comment 76, the board clearly has the authority to address demonstrated negative GHG effects in accordance with its mandate to protect public health and welfare.
140. SELC	Covering new and existing fossil fuel-fired units prevents a market perversion where power generators could shift generation away from regulated plants to new, unregulated power plants, which would not produce a reduction in statewide carbon emissions. We are also glad to see that the regulation applies to all CO_2 emitted from co-firing units that include at least one fossil fuel-fired unit. However, the final regulation should include all electric power facilities that emit CO_2, regardless of fuel type. Specifically, the regulation should apply to any 25 MW unit that burns biomass.	See the response to comment 67 for detailed discussion of how biomass will be treated.

Commenter	Comment	Agency response
	The science is clear that burning certain biomass, particularly forest-derived biomass, increases net atmospheric CO_2 for 35-100 years or more, compared to fossil fuels. Numerous studies have shown that burning chips or pellets made from standing trees puts more CO_2 in the atmosphere than continuing to burn coal in existing or new power plants. One report showed the use of whole trees from naturally regenerated forest in the U.S. for power production could result in four times the amount of carbon in the atmosphere versus burning coal over a 100-year timeframe. Thus, it is critical that the regulation cover all net carbon emissions. Straightforward carbon accounting protocols such as those advocated by the Partnership for Policy Integrity (PFPI) demonstrate that even under the best case scenario, emissions from wood-burning plants exceed those from fossil fuel-fired plants for periods of one to two decades and beyond. As a result it is most reasonable to include all biomass stack emissions under the cap. Should DEQ wish to provide some credit to generators who are burning true wastes or residues, PFPI has offered a calculator that can be used to find the net emissions over the regulatory time frame. This framework would appropriately weight emissions from industrial facilities burning black liquor as having nearly zero net emissions, as the framework assumes that black liquor would be burned for disposal even if energy recovery does not occur. It would also reflect the net impact of burning wood residues more accurately than the current effective assumption that emissions are zero, when biomass facilities are not covered under the cap. DEQ should amend the regulation to include "any unit combusting carbon-based fuels that serves an electricity generator with a nameplate capacity equal to or greater than 25 MWe . . . and any sources that includes one or more such units shall be a CO_2 budget sources, subject to the requirements" of the regulation.	
141. SELC	SELC supports a 33 million ton base budget and 3% reductions annually thereafter, but encourages DEQ to consider actual emissions data from 2019 to determine whether the 2020 cap should be revised down. Contrary to concerns raised in comments to the NOIRA, compliance with Version 1 is in fact readily achievable. Dominion's 2017 IRP created a Plan Alternative for Clean Power Plan compliance which readily met the Virginia limit of 27,830,174 tons of CO_2 by 2030. Version 1 of the regulation requires 23.10 million ton cap by 2030. However statewide carbon emissions in 2017 were 31.2 million tons, which are lower than the Version 1 baseline of 33 million tons. Also note that SB966, passed by the General Assembly in 2018, proposes 5,000 MW	As discussed in the response to comment 37, a cap of 28 million tons has been set. The regulation has been amended to specify that the department will review the base budget and recommend appropriate adjustments in the base budget for 2031 and succeeding years, considering the best

Commenter	Comment	Agency response
	of renewable, carbon-free generation and over $1 billion in energy efficiency investment between now and 2028. With this new landscape, we encourage further modeling to predict what 2018 and 2019 emissions are likely to be and recommend a starting baseline that is the lower of Version 1 or DEQ's updated forecast for actual 2019 carbon emissions. This allows DEQ to avoid setting a baseline cap that is higher than actual emissions in the first compliance year. A lower initial base budget and more stringent overall cap by 2030 also better achieves the goal of reducing CO_2 emissions, growing Virginia's clean energy economy, and protecting the public health and welfare. We support the decision to implement a 3.0% per year reduction in carbon emissions over 10 years beginning in 2020. This results in a base budget of 23.10 million tons by 2030. While this is a good initial reduction and sensible 10-year goal, SELC encourages a 10 year review provision. This 10-year review provision would ensure that Virginia continues to reduce its carbon emissions beyond the initial 10-year goal and determine emissions reduction goals beyond 2030.	available science and all relevant information and policies available from any CO_2 multi-state trading program in which Virginia is participating. In the context of the RGGI program as a whole, it is important to remember that the program is subject to routine program review. As discussed elsewhere, the RGGI states routinely review and evaluate how current strategies are working, and look ahead to what changes are needed to the program to insure its ongoing effectiveness. RGGI's comprehensive program reviews will consider program successes, impacts, and design elements. As part of this process, DEQ will evaluate where Virginia needs to go with respect to budgets and allowances. In order to be transparent and effective, this must be effected through the program review process in concert with the other RGGI states.
142. SELC	SELC supports the 5% set aside to assist DMME in efforts to abate and control air pollution, although we encourage DEQ to evaluate whether a 10% set aside would produce more benefits than it would increase costs for covered entities. SB966's commitment to energy efficiency is a notable improvement on the role efficiency will play in Virginia's energy future, but there can always be better and more diverse initiatives to bring this lowest-cost resource to Virginia. Despite being the lowest-cost energy resource, energy efficiency measures are also among the most labor-intensive, which means that the effect of every dollar spent on efficient has greater economic ramifications that dollars spent on more traditional, supply-side energy resources. A recent study by Applied Economic Clinic of Virginia's possible energy efficiency future found that under a "medium efficiency" scenario, total annual electricity sales in Dominion's territory could actually decrease. As Virginia's in-state generation fleet becomes less carbon intensive as a product of SB966, a decrease in total	Support for the proposal is appreciated. As discussed in comments 51 and 83, a relatively small 5% set-aside is appropriate in the early stages of the program, although this amount may be revisited as a result of program review.

Commenter	Comment	Agency response
	energy sales only amplifies the possible reduction in statewide carbon emissions. The study also confirmed that a "medium efficiency" scenario could lower customer bills by up to 0.3% by 2028. The 5% (or possible 10%) set aside can play a key role in helping Virginians achieve lower carbon pollution and lower electricity bills.	
143. SELC	The proposal includes several important cost management mechanisms, similar to those provided for in the RGGI program. SELC supports the inclusion of these provisions as they are designed to provide enhanced market flexibility and stability, and have proven to be important in establishing a successful cap-and-trade program. Consistent with the RGGI program, the regulation allows covered entities to bank unlimited CO_2 allowances. SELC supports this provision, so long as it is clear banking can occur for allowances purchased at auction. Banking provides flexibility and has been shown to encourage sources to reduce their emissions sooner and below required levels. Banking ensures that all CO_2 reductions have a long-term economic value, and not merely short-term value for immediate compliance purposes. By using banking, participants are very adept at smoothing the supply of allowances over time--for example, banking allowances in early compliance periods in anticipation of increased allowance scarcity in later periods. Research on other cap-and-trade programs without banking indicates that such programs typically result in "just-in-time" emission reductions, rather than encouraging cost-effective, long-term emissions reductions. The budget adjustment for banked allowances is necessary due to the high volume of allowances banked during early compliance periods where the volume of RGGI allowances far exceeded actual emissions. Although the RGGI states significantly lowered the regional cap to more closely reflect actual emissions, participants had already banked large numbers of allowances. In 2014, for example, there were an estimated 140 million tons of banked allowances, significantly exceeding that year's emission cap of 91 million tons. Even with the significant cap reduction in 2014, emission reductions were unlikely to occur without further adjustment to account for the volume of banked allowances. These adjustments have been in place for several compliance periods, with the third such adjustment period applying to allocation years 2021-25. Virginia sensibly includes this adjustment, which should further the goal of reducing CO_2 emissions in an economically efficient manner. SELC supports the CCR allocation, although improvements should be considered in the coming years to ensure that such reserves are only triggered during truly unexpected price spikes. In the event the allowance	DEQ agrees that RGGI's cost management mechanisms will ensure that the emissions cap is maintained while managing prices and assuring a stable market.

Commenter	Comment	Agency response
	price exceeds a specified price ("trigger price"), the CCR mechanism introduces a limited quantity of additional allowances into the auction to increase the supply and thereby reduce the cost. After being implemented in 2014, the CCRs have already been triggered twice, which raised concerns that the containment mechanism is not functioning as intended. Instead of being reserved for truly extreme and unexpected market spikes, the CCR trigger prices may have been set too close to anticipated allowance prices, resulting in 15 million reserve allowances being added to the market. Some have argued that these additional allowances were unnecessary, given the large quantities of banked allowances. In 2017, after another design review, RGGI implemented several changes to the CCR mechanism, which should help prevent unnecessary allowances from being released into the market. For example, the trigger price was initially set at $4 in 2014 raising to $10 in 2017, and thereafter escalating by only 2.5% each year. Now the trigger price will be set a $13.00 in 2021 and increase by 7% every year. Additional changes to the CCR mechanism should be considered. Most importantly, the proposal, consistent with the RGGI program, provides that every year, additional allowances--up to 10% of the emissions cap--can be allocated and sold at auction in the event of a trigger. While this mechanism should help to contain cost, it also effectively increases the overall cap. Virginia, along with other participants in the RGGI auction process, should consider whether additional modifications could better balance carbon emission reduction with cost concerns. For example, it may be more effective to generate CCRs by borrowing allowances against future years or from allowances unsold at auction, rather than generating additional allowances. This sort of program-level borrowing would maintain the overall emissions cap across the initial 10 year program, while still protecting against short-term price spikes. SELC also supports the ECR. There is inherent price uncertainty in a market-based cap-and-trade program due to factors such as natural gas price volatility, variable electricity demand, uncertainties associated with nuclear projects, and evolving renewable energy programs. Where prices are significantly higher than anticipated, the CCR is designed to increase supply and reduce cost. Prior to 2017 changes, however, there was not an analogous mechanism if prices were lower than anticipated. Instead, the RGGI program relied only on a reserve price--a minimum acceptable bid. In 2017, the RGGI program changed its model rule to incorporate an ECR, which Virginia has incorporated into the regulation. In the event allowance prices fall below established triggers, Virginia, like other RGGI states, will withhold up to 10% of its allowances from circulation. According to	

Commenter	Comment	Agency response
	the RGGI model rule, the ECR trigger price is set at $6.00 in 2021 and will rise at 7% each year. This cost management mechanism should help further Virginia's overall policy goal of reducing carbon emissions in the event that emission reduction costs are lower than projected. Initial modeling of this mechanism indicates that it should further incentivize carbon emission reductions. In situations of low demand and low prices, i.e., situations where the emissions containment reserve is likely to be triggered, a cap-and-trade program is typically not driving emission reductions. Modeling of the emission containment reserve should better align incentives for individual actors in the region and make the auction price more responsive to supply.	
144. SELC	SELC supports the 3-year review, updating output-based allowance allocation method. This method of allocating allowances based on a rolling average of emissions over the past 3 years ensures that where generators do not use the full amount of allowances received over 3 years, these allowances can be retired or banked, and not hoarded by the generator. To the extent any parties express concern about leakage, we believe DEQ has adequately addressed that issue with its continually-updating output system. In any event, emissions leakage is not likely to become an issue. Some critics have argued leakage would occur in RGGI states, yet studies have found that these concerns have not materialized. Indeed, RGGI's most recent Monitoring Report found no evidence of significant leakage. Moreover, Dominion Energy's 2017 IRP demonstrated Clean Power Plan compliance was possible without significant increases in purchased power. While Plan CT is not an exact match to the proposed trading program, it demonstrates Dominion's ability to comply with a significant carbon emissions reduction program without resulting in emissions leakage. Thus, while leakage is unlikely to become an issue under the proposed system of emissions reduction, the allocation method used in the proposal should address concerns raised by those who fear leakage to be an issue with cap and trade systems.	DEQ agrees that the 3-year review, updating output-based allowance allocation method will best control allowance distribution while avoiding potential leakage.
145. SELC	The regulation should ensure the program is the most economically advantageous for customers and families. While we support banking of allowances, we only support banking of allowances that a unit has purchased in the market, not banking of allowances received at no cost from DEQ and not submitted to the RGGI auction. Article 9 must make clear that all generators are required to sell all allowances back into the consignment auction. Without a full-market participation requirement, a generator could hoard a large share of CO_2 allowances in order to influence prices or prevent competitors from obtaining allowances. To ensure this anti-competitive behavior does not occur, the regulation must ensure 100% of conditional allowances make it to the consignment auction. While the system appears	The commenter's concerns are appreciated. The definition of "conditional allowance" has been amended to specific that a conditional allowance becomes a CO_2 allowance once it has been sold to an auction participant. The RGGI states suggested this change to clarify the relationship between a conditional allowance and a CO_2 allowance. DEQ agrees that collaboration

Commenter	Comment	Agency response
	designed in such a way, additional language could help clarify this important point. Generators initially receive conditional allowances for free, prior to selling into and buying back from the consignment auction. Systems with free allowances have commonly led to windfall profits for generators, to the detriment of customers. However, free allocation systems can be done in a way that prioritizes customers. The final regulation should include a review mechanism to prevent these windfalls for generators and ensure that customers benefit. One means to achieve this is through SCC review of how these windfall profits are used. Indeed there are a number of ways that customers could benefit from allowance profits, whether directly through rate credits, or indirectly through greater emissions reductions, investments in energy efficiency, or other reductions in compliance costs. SELC urges the board to collaborate with the SCC in its review of how generators use windfall profits in order to achieve the greatest level of carbon emissions reduction in the most economically advantageous way for customers. For instance, one possible windfall could occur where a generator sells more allowances in RGGI than it buys back for its own compliance, making it a net seller. In that scenario, the generator is revenue positive as a result of the trading program, but DEQ will have information regarding how many allowances that utility received, how many it surrendered in compliance, and what the various market prices were, which DEQ could make public and also provide to the SCC as it reviews utility earnings and expenses in upcoming triennial rate cases and annual fuel factor dockets. DEQ should also include some failsafe mechanism to ensure that the generator does not profit from the trading program at customer expense as a result of inadequate SCC oversight.	with the SCC is an important element of ensuring that the carbon trading program operates properly in the context of SCC responsibilities
146. Virginia Chapter of the Sierra Club, Appalachian Voices; Virginia Interfaith Power and Light; Environment Virginia; Chesapeake Climate Action Network.	Virginia's proposal to develop a CO_2 trading program that links to the existing RGGI program is an appropriate mechanism to begin reducing CO_2 emissions in Virginia. Although improvements should be made, we support action to limit and reduce CO_2 emissions from power plants and to link to RGGI's larger market. The proposal's goal of reducing CO_2 by 30% from 2020-30, at an annual rate equal to 3% of the base year allowances, is modest and can readily be achieved as demonstrated by planned actions that will reduce emissions and by actual experience in the RGGI states. Importantly, the proposal intends to achieve actual CO_2 reductions, not reductions in carbon intensity which can disguise emissions increases as decreases in the rate of emissions-per-MWH of generation. Dangerous climate change is driven by actual CO_2 emissions and atmospheric CO_2 levels, not the intensity of emissions. While Virginia could potentially implement CO_2 reduction	Support for the proposal is appreciated. DEQ agrees that linking to RGGI will benefit the Commonwealth by protecting public health and welfare in a fiscally responsible way.

Commenter	Comment	Agency response
	requirements without tradable emissions allowances, linking Virginia's proposed plan to RGGI is a good choice. Through 2016, RGGI states had reduced CO_2 emissions from covered power plants by 40% from 2008. RGGI reduced CO_2 emissions at faster rates and with lower costs and greater benefits than predicted. Moreover, those emissions reductions were achieved while customer bills were reduced and while the economies of participating states grew. Reductions in air pollution in RGGI states have improved health outcomes. RGGI's program has been so successful that its member states recently agreed to build upon CO_2 reductions already achieved, so that covered sources reduce CO_2 by an additional 3% per year for 10 years between 2020-30, achieving an overall reduction of more than 65% compared to its initial 2009 cap. Joining this established CO_2 market will help Virginia reduce CO_2 smoothly and cost-effectively, and would avoid the potential pitfalls from implementing a Virginia-only market. The market for allowance trading will enable power plant operators to buy or sell allowances as appropriate to their individual circumstances, while aggregate CO_2 emissions decline. Since RGGI is both very successful and the only functioning CO_2 market in the eastern U.S., it would make no sense to go it alone. Under a consignment auction approach, the value of allowances will go to covered power generators, and utilities will be able to use the funds, subject to regulatory oversight, to reduce electricity rates and to support incremental investments in zero-carbon energy sources and energy efficiency. Such zero-carbon energy investments will further mitigate electric energy costs by reducing fuel purchase requirements. In its 2017 IRP proceeding, Dominion acknowledged that solar costs have fallen dramatically and that solar is now the cheapest form of energy. Both utility and non-utility generators should be required or encouraged to invest such funds in renewable energy and energy efficiency, or, at minimum, to pass consignment revenues through to retail customers. The allocations of conditional allowances can be reconsidered if consignment revenues are not used to advance the rule’s goals. The emission reductions contemplated by ED11 are readily achievable. RGGI's market began full operation in 2009. By 2012-14, the average annual CO_2 emissions from the 2009 baseline had been reduced by 35.7%; and annual emissions in 2016 were 40% below those in 2008. Those reductions occurred in far less than 10 years, and RGGI reduced caps to reflect the more rapid progress. RGGI is now planning to reduce its CO_2 cap by an additional 3%/year from 2021-30, thereby achieving a 65% reduction from its initial 2009 allowance cap. Significantly, AEP recently announced its voluntary	

Commenter	Comment	Agency response
	commitment to reduce its CO_2 emissions from power production by 60% from 2000 levels by 2030 and by 80% by 2050. Its planned CO_2 reductions will be achieved through increased reliance on wind and solar energy, retirements of coal-fired plants, natural gas, greater energy efficiency and grid modernization, and the reductions are to be achieved even as electric demands may increase with greater electrification of the economy. Although AEP's planned reductions fall short of what will ultimately be needed to adequately mitigate global warming, they nevertheless illustrate that willing electric utilities can substantially reduce CO_2 emissions, consistent with customer and shareholder interests. AEP explains that its new clean energy strategy is driven by investors, business risks and the known need to reduce CO_2 in order to limit the global average temperature rise to less than 2°C. In short, the proposal is modest, achievable and reflects the unquestionable need to shift to clean energy as soon as practicable.	
147. Virginia Chapter of the Sierra Club et al.	The mix of generation and emissions is changing rapidly and will change more by 2020. The proposed initial aggregate cap of 33-34 million tons for 2020 is too high and out of date. A too-high initial cap will distort RGGI's markets by artificially inflating the pool of allowances. It would fail to produce real reductions in CO_2 and could lead to higher emissions. The 2020 cap should be set below 30 million tons, subject to updating the 2020 level in a proceeding to be held in early 2019. Updating the 2020 baseline based on the latest available information would be fair to the public and all parties. At the same time, setting a cap below 30 million tons would reflect the most current information and would give better planning notice to owners of budget sources than overstated estimates of 33-34 million tons. However, if the baseline is set at 33-34 million tons, then the annual rate of reductions should be increased to 3.5% per year, which would still be slower than RGGI's average annual reduction over its first 10 years. Changes in the fuel mix are occurring now and more changes are expected. The 2020 baseline should take into account all planned fossil fuel retirements and deactivations between now and 2020. It should also recognize that approved new natural gas facilities will displace emissions from coal plants that remain open. Between 2016-17, natural gas use in Virginia's electric power sector rose, while coal-combustion fell and retail sales fell. From 2016-17, the capacity factors of two of Virginia's largest coal-fired plants dropped by over 40%, and the CO_2 emissions just from those plants dropped by 4,989,186 tons, from 11,783,154 in 2016 to 6,793,968 tons in 2017. Recent additions of natural gas-fired generation have occurred and more are expected; they will continue to push out dirtier coal-fired plants. Traditional coal plants emit roughly 2.75 times as much	A base cap of 28 million tons has been selected; see the response to comment 37 for more information.

Commenter	Comment	Agency response
	CO_2 per MWH than new combined cycle plants, so the trend is toward a much lower CO_2 baseline in 2020. We estimate that the addition of the Greensville plant could displace 7 million tons of CO_2 from coal plants even at a modest 70% capacity factor. Beyond 2017, a number of retirements are expected. In its 2017 IRP, Dominion discussed potential fossil fuel plant retirements. On January 16, 2018, Dominion announced a number of retirements by filing with PJM deactivation requests for 9 fossil fuel units. Collectively, these units have a combined nameplate capacity of over 1,700 MW and emitted around 2.4 million tons of CO_2 in 2016, or 7% of the state's reported power emissions. In addition, Dominion announced the planned retirement of Yorktown 1 & 2. The Spruance and Edgecombe Genco plants have also notified PJM of their intent to retire in 2019 and 2020. Combined, this merchant capacity reflects another 300 MW of capacity and 1 million tons of annual CO_2 emissions. These announced retirements (which would account for 3.4 million tons of CO_2) and any other planned retirements or cold storage of units should be incorporated into calculation of the 2020 baseline. We looked at data for units that operated in 2016-17 and are not scheduled for retirement, and found that 2017 CO_2 emissions from covered fossil-fuel units that will still be operating in 2020 were approximately 29 million tons and the trend was downward, particularly for coal-fired units. The 2020 baseline should incorporate planned renewable energy developments through 2020. Energy from utility scale solar and wind is cheaper than from fossil fuels, and many customers are willing to provide the capital for small-scale solar. The estimates should reflect the improved prospects for renewables, which were boosted by recent legislation as well as by the low cost of solar and wind generation. According to the 2017 Virginia Solar Energy Development and Energy Storage Authority Annual Report, there are presently 219 MW of solar installed and an additional 2,703 MW under development. The PJM queue identifies 8 solar projects with a combined nameplate capacity of 717 MW with projected in-service dates between 2018-20 that would interconnect in Virginia. It is likely that additional solar will be added through 2020 as a result of third-party investments or arrangements with utilities, such as the agreement between Dominion and Amazon to install solar. Recent legislation calls for approximately 5.5 GW of solar generation by 2028. These developments must be accounted for in developing the baseline. Since Dominion serves an integrated system in Virginia and North Carolina, the 2020 cap should also take into account solar connected to Dominion's system in North Carolina which will tend to reduce Dominion's need to	

Commenter	Comment	Agency response
	generate energy in Virginia. Dominion has emphasized the growing electric demand for data centers. However, such loads are specifically asking for renewable energy. Those loads will add more to zero-carbon generation than to fossil fuel generation. A group of data companies submitted a September 2017 letter to the SCC in Dominion's IRP docket. They asked regulators to take energy resource preferences into account when deciding on future energy infrastructure projects to meet energy load growth from data centers. Citing economic, environmental and market needs, they explained why they wanted more renewable energy and why the IRP under-deploys renewable energy. Thus, demands for solar energy will limit future CO_2 increases even if load grows. This should be considered in setting a baseline below 30 million tons. Electric loads have flattened in recent years. Virginia's retail electricity usage declined between 2016-17. To the extent DEQ's analysis of the 2020 cap relies on Dominion's load forecasts, it should step back. Dominion's forecasts of load growth have been consistently overstated. Virginia's baseline should also account for the state's untapped energy efficiency potential and reflect savings that can be achieved by 2020 and beyond. Electricity generators should not get a higher CO_2 cap for 2020 because Virginia's utilities failed to meet the goal for efficiency-driven demand reductions of 10% compared to 2006 demand. Virginia should not reward its utilities with a higher baseline for CO_2 emissions, which would elevate emissions caps for at least a decade, based upon an indifferent approach to efficiency.	
148. Virginia Chapter of the Sierra Club et al.	We strongly support the proposed definition of "fossil fuel-fired" which would cover most co-firing of biomass and fossil fuels. However, the requirement to purchase CO_2 allowances should be extended to cover all biomass generation meeting the otherwise applicable size requirements. The requirement to purchase allowances should extend to new and existing biomass-fueled units, particularly those that burn wood-based biomass, which is the least likely to result in CO_2 recapture within a time frame helpful to avoiding the looming climate crisis. The premise for exempting generators that burn biomass is that the emitted CO_2 will eventually be recaptured by regrowth of the feedstock and that is sufficient to mitigate the climate damages from current CO_2 emissions. Those assumptions are faulty in several respects. Biomass burns less efficiently than coal or natural gas so more biomass must be burned to produce each MWH of electricity, resulting in CO_2 emissions that are substantially higher than from coal and natural gas. Co-pollutants from biomass combustion are large and	The commenters' concerns about biomass are recognized; see the response to comment 67 for more information.

Commenter	Comment	Agency response
	harmful to human health. Gradual deterioration of wood residues occurs over many years, but the net CO_2 emissions impacts from burning even residues remain large. Adverse climate and health impacts from burning biomass will not be offset by resequestration of CO_2 in the future, even assuming that the biomass is replaced with comparable forests. Exempting biomass from carbon prices would undercut beneficial investments in zero-carbon alternatives, which mitigate climate harms in the near- and long-term. There is no support for the assumption that forests will be regrown in a sustainable way or in sufficient quantities to recapture that CO_2. Furthermore, past investments in large biomass facilities do not deserve special treatment any more than past investments in fossil fuel-fired facilities. The public and climate are harmed by CO_2 emissions in both cases. The climate crisis will never be resolved if previously built emitters are granted exemptions. In any event, value of allowance auction revenues can be passed through to customers to mitigate cost impacts.	
149. Virginia Chapter of the Sierra Club et al.	The rule should be amended to require continued annual reductions of the CO_2 cap beyond 2030, at the same annual quantities as from 2021-30, until the rule is modified. This could be achieved by altering 9VAC5-140-6190 C to state: "For 2031 and each succeeding calendar year, the Virginia CO_2 Budget Trading Program base budget will be reduced by the same annual quantity as the reduction between 2029 and 2030." Continuing to reduce CO_2 at the same annual rate would mean a reduction of approximately 1 MM tons/year, which would achieve a 90+% reduction by 2050. The key is to clearly indicate that reductions will continue until climate stabilization is achieved. If a specific post-2030 target is desired then the rule could provide that yearly reductions of the annual cap will continue, for example, either until the emissions cap on covered sources has been reduced by 90% from the 2020 base budget or until the emissions cap on covered sources has been reduced by the same percentage as has been achieved by RGGI member states relative to their pre-auction emissions. Since RGGI's announced 2030 reduction target is more than 65% below its 2009 cap the latter measure would continue reductions until at least that percentage of emissions reduction is achieved in Virginia--or until greater reductions are achieved if RGGI extends its annual reductions beyond 2030. This would assure that Virginia eventually catches up with a level of reductions that RGGI has shown are achievable. At minimum, it is necessary to clarify that the emissions trajectory post-2030 will be at least as stringent as that agreed to by the RGGI states in subsequent program reviews for the post-2030 years. Absent emission reductions that continue to at minimum match the stringent of the RGGI program beyond 2030, Virginia would be unable to continue to link its program with the RGGI states and reap the benefits of	The proposal has been amended to clarify that CO_2 reductions will indeed continue to be required after 2030; see the response to comment 141.

Commenter	Comment	Agency response
	the larger carbon market.	
150. Virginia Chapter of the Sierra Club et al.	Climate change disproportionately harms the poor and other disadvantaged communities. Residents near and downwind of fossil-fuel power plants suffer disproportionate health impacts from co-pollutants such as particulates, SO_2, ozone, and mercury, and are disproportionately low-income or minority. Generating electricity with biomass also produces high levels of harmful air pollution. In contrast, solar, wind and efficiency do not produce any carbon pollution or co-pollutants. Over half a million people in Virginia live within three miles of a power plant that was to be covered by the Clean Power Plan. Of these, 52% are minority and 34% are low-income, while Virginia has a total minority population of 35% and low-income population of 26%. According to the U.S. Office of Minority Health, black people are three times more likely to die from asthma-related causes than white people. Capping and steadily reducing aggregate CO_2 emissions and co-pollutants will generally improve health outcomes in Virginia and benefit all communities, including disadvantaged communities. This positive benefit from reducing CO_2 has been documented in RGGI states, which have experienced improvements in health outcomes since RGGI's carbon limits took effect. RGGI states have also seen dramatic reductions in SO_2. It is possible that trading could allow some fossil fuel plants to use allowances to continue or increase polluting operations. As a result, localized harms may occur even if the rule produces overall progress. It is therefore critical that DEQ commit to conduct EJ and emissions studies; to continuously monitor and report concentrations of CO_2 and non-CO_2-pollutants to ensure that disproportionate concentrations do not harm particular communities or regions; to investigate detected concentrations as well as any complaints of disproportionate local impacts and to pursue appropriate remedial actions. We urge DEQ to consider amending the rule to prohibit plants fired with coal, biomass or heavy oil from acquiring allowances to increase their annual emissions over historic levels without first obtaining a permit.	DEQ agrees that disadvantaged communities must be specifically addressed in the context of wider EJ programs at the state level and has amended the proposal accordingly; see the response to comment 55.
151. Virginia Chapter of the Sierra Club et al.	The proposal to cover existing units serving a generator of 25 MWe or larger is generally consistent with RGGI's existing rule. However, the rule should be amended to state that the 25 MWe threshold only needs to be crossed once to trigger coverage by the rule. This is important so that coverage cannot be avoided through manipulation of a unit's size or configuration. 9VAC5-140-6040 A should be modified to state that the rule covers units serving all generators having a nameplate capacity of 25 MWe or more "at any time on or after" a fixed date. To be consistent with RGGI's model rule, it would be reasonable to adopt January 1, 2005 as the on-	The applicability limit is indeed designed to be consistent with the RGGI Model Rule. Current state regulation (9VAC5-20-70) prohibits circumvention of air quality requirements by constructing multiple facilities in a piecemeal fashion in order to avoid regulation. DEQ believes that the declining emissions

Commenter	Comment	Agency response
	or-after date. Alternatively, the on-or-after date could be shortly prior to the first notice that a plant might be covered by CO_2 regulations. The rule should be modified to require new units serving generators with a nameplate capacity less than 25 MWe to obtain emissions allowances. We suggest the threshold for new generators be set at 15 MWe or less. This is needed in order to send CO_2 regulatory and price signals to a broader pool of new generators and to prevent gaming that would undermine the regulation's CO_2 reduction goals and that would be unfair to existing generators. Within the RGGI region, there are recent proposals for multiple generation fossil fuel-fired units each just below the 25 MWe compliance threshold. Since economic efficiencies and operating efficiencies would ordinarily support larger units, the sizing appears to be driven by a desire to emit CO_2 without limits, thereby undercutting public health and the goals of the regulation. Since it is essential to reduce future emissions, there is no reason to encourage new generation that emits CO_2. With coverage of new units, the rule would better protect the public from CO_2 and co-pollutants, remove an incentive for building less efficient fossil fuel generators, and protect the integrity of allowance markets. Since developers would have notice of the allowance requirement for new generation, no unfairness would result from imposing a lower size threshold for such generation. Units placed in service after January 1, 2019 would fairly be considered new.	cap will encourage the development of renewable energy and energy efficiency, not the construction of multiple smaller facilities which, as the commenter points out, are less efficient.
152. Virginia Chapter of the Sierra Club et al.	Allocations of conditional allowances is a pragmatic choice designed to implement tradable emissions allowances. However, recipients of economically-valuable conditional allowances should be encouraged to use that value to promote the carbon-reduction purposes of the rule, not to produce windfalls. The proposal presumes that utilities will utilize revenues received from the consignment-and-auction process for the benefit of customers, either through incremental investments in energy efficiency or zero-carbon generation or applying the revenues to reduce retail rates. While this seems to be a reasonable assumption in light of SCC regulation of utilities, it is not a guarantee. DEQ should monitor how the auction revenues are utilized and consider adjusting the method for allocating allowances if the revenues are not used to advance the purposes of the rule. Recipients of allowances should be required to report annually how the auction revenue funds were used, including whether they were passed through to retail customers, used to reduce CO_2 emissions, used for other corporate purposes, or retained as earnings. Generators in other RGGI states do not expect funding from the auctions, and Virginia companies should not get auction revenues unless they promote the purposes of the rule.	The commenter correctly asserts that the SCC regulates and monitors utilities in order to assure that customers are protected. It is unclear how additional reporting requirements would ensure that these goals are effected.
153. Virginia	We support consigning a portion of the conditional	As discussed in comments

Commenter	Comment	Agency response
Chapter of the Sierra Club et al.	allowances to holders of public contracts with DMME for the abatement and control of CO_2. RGGI member states use a much larger share of their auction revenues for such purposes by supporting measures to increase energy efficiency or zero-carbon renewable energy within their borders. It is reasonable for Virginia to do so with at least part of the revenues from the consignment auction process. Nevertheless, 5% is a small starting point. Consideration should be given to reallocating conditional allowances from non-utility generators or utilities to public contractors for implementing energy efficiency and renewable energy, particularly if the covered generators do not invest their auction revenues to expand zero-carbon energy solutions in Virginia.	51 and 53, a 5% set-aside is a reasonable figure in the early stages of the program.
154. Virginia Chapter of the Sierra Club et al.	Dominion's Mt. Storm is a large coal-fired electric generating facility located in West Virginia that is included in Virginia retail rates and is dispatched through PJM. DEQ should consider inviting Dominion to include Mt. Storm as a CO_2 budget source subject to the program, provided that the arrangement does not violate any West Virginia CO_2 rule and is acceptable to RGGI. The plant is old and a substantial source of CO_2 and other pollutants. We are not aware of any barrier to Dominion's agreeing to subject this plant to Virginia's CO_2 program, which would affect PJM's economic dispatch of the plant, but not require any plant modifications or state permits. Dominion and its customers could benefit from phasing down Mt. Storm's operations and shifting CO_2 allowances to newer, cleaner facilities located in Virginia.	Unless and until West Virginia links to the RGGI program, it is unlikely that they would expect for Mt. Storm to submit to RGGI requirements.
155. Virginia Chapter of the Sierra Club et al.	The proposal wisely does not provide for creating offset allowances. Offset allowances would require large investments of Virginia's administrative resources to analyze, approve and enforce proposals. Nearly 30% of the RGGI Model Rule text is devoted to standards and procedures for evaluating, approving, and enforcing offset projects. That is not a burden that Virginia should take on, particularly since it may require physical and economic processes beyond those DEQ normally oversees. Further, the value of offsets is dubious. Even if they reduce CO_2 somewhere, offset schemes may not provide ancillary benefits from reducing power plant emissions of CO_2, including benefits from reducing co-pollutants. Indeed, offset projects may increase the danger that local pollution will increase as a result of purported CO_2 reductions at remote locations as has happened under California's program.	DEQ agrees with the commenter that implementing offsets is not desirable at this time; see the response to comment 26.
156. Tenaska Virginia Partners, L.P.	DEQ projects annual CO_2 emissions from covered facilities to be 36.8 million tons in 2019. Under the 34 million ton alternative, a 7.6% reduction would be required in the first year of the program. If the more stringent 33 million base budget were used, a 10.3% reduction would be required. These are 2.5-3.5 times the proposed 3% annual cap decline in subsequent years. Tenaska strongly suggests DEQ consider a higher base	See response to comment 37 for a discussion of how the final base cap was determined. DEQ is assisting affected sources in meeting compliance costs by

Commenter	Comment	Agency response
	budget, such as 35 million tons, in the event the 2019 emission projection is proven accurate. At the very minimum, 34 million tons should be used. Tenaska strongly favors the "generation updating" approach, whereby covered facilities are allocated allowances according to their respective historical annual net generation as compared to the total aggregate generation from covered facilities, averaged over the immediate 3 calendar years, updated annually (i.e., on a rolling 3-year average). Tenaska believes this approach best meets the intent of the regulation, in that it incentivizes more efficient units that emit less CO_2 per unit of power produced. Note that Regulatory Advisory Panel (RAP) participants favored this option. As presented during RAP meetings, Tenaska's Virginia Generating Station in Fluvanna County currently operates under a long-term contract or "tolling agreement" with a third party, whereby the third party procures the fuel and purchases the generated electricity. The term of the agreement is 20 years and expires in May 2024. Under the terms of the agreement, Tenaska believes it has the ability to pass through to its customer costs for things such as emissions allowances, whether they be for the Acid Rain Program, CSAPR, or any future carbon trading scheme. However, Tenaska's customer has taken the position that Tenaska does not have such a pass through right. These costs are projected to be $2.30/MWh in 2020 and $3.78/MWh in 2031, representing an increase of 14.6-18.9% over the projected wholesale power price. To the extent Tenaska is required to purchase allowances and is unable to pass through those costs to its customer, it will be disadvantaged compared to other generators that can either recoup those costs or that have no costs due to their location in another PJM state without a carbon pricing scheme (e.g., Pennsylvania and West Virginia). Several RGGI states and every major proposed federal CO_2 cap and trade legislation has recognized this predicament and provided various forms of relief, such as creating an allowance set-aside for free allocations or offering allowances at a reduced price. Tenaska requests DEQ also recognize this and either create a set-aside sufficient to cover net allowance obligations for LTC holders or simply exempt LTC holders for the life of the applicable contracts. The set-aside would be less disruptive to the program as it would alleviate units entering and exiting.	issuing allowances. The amount of compliance costs covered by the allowances will depend on business decisions made by any individual facility. If a facility stays within the budget, it will not incur costs.
157. Tenaska Virginia Partners, L.P.	We encourage DEQ to expand the scope of the regulation to include additional sources and seek meaningful reductions in other sectors of the economy (via alternative pathways), including mobile sources, if the dire consequences referenced are to be avoided.	As discussed in the response to comment 65, this exemption is appropriate. While DEQ agrees that other pathways

Commenter	Comment	Agency response
	One such way is to remove the exemption in 9VAC5-140-6040 B for units that generate electricity and heat "for the primary use of operation of the facility." CO_2 emissions from such facilities are no less potentially harmful than those from units that generate electricity for off-site use. Neither the RGGI Model Rule nor the environment make such a distinction and neither should DEQ.	to CO_2 reductions are important, the scope of the regulation is limited by executive order and state law. DEQ believes that the 5% DMME set-aside as well as other ongoing programs such as the Grid Transformation and Security Act of 2018 will provide additional incentives for energy efficiency and renewable energy.
158. U.S. Green Building Council (USGBC)	We agree with the proposal to link Virginia with RGGI, creating opportunities for cost and resource reduction. DEQ should reconsider the 2020 emissions baseline to ensure it meets the objective of capping emissions. The 33 million ton baseline is higher than the 2017 carbon emissions of 31.2 million tons, while energy productivity is increasing. These data suggest that a lower baseline will be more successful at driving reductions. Subsequent to DEQ projections, the General Assembly passed SB966, which could affect the baseline generation from fossil fuel power plants and their carbon emissions. We recommend increasing the 5% set aside. Such set-aside funds are critical to expand DMME programs, which for some sectors are the primary potential source of energy efficiency assistance given SCC limitations on efficiency programs. The majority of the set aside should directly benefit low and moderate income persons and areas. It is well established that disadvantaged populations are disproportionately impacted by air pollution. Moreover, programs aimed at increased efficiency in low and moderate households have a co-benefit of reducing their vulnerability to electricity rate increases. The regulation should provide for DMME to actively seek public input on use of the set aside including how the proposed use benefits target populations. DMME and DEQ should study and monitor potential impacts of the regulation on low and moderate income households, and periodically report findings to the public.	See comment 37 for a discussion of how the final base cap was determined. As discussed in the responses to comments 51 and 53, a 5% set-aside is appropriate in the early stages of the program. The specifics of how this set-aside will be managed will be determined by DMME. DEQ agrees that vulnerable communities must be addressed, and the program contains multiple opportunities to do so; see the response to comment 55 for more information.
159. Environmental and Regulatory Law Clinic, University of Virginia	Given the climate change-related threats facing our state--and considering the sources of pollution in Virginia that contribute directly to those threats--it is entirely appropriate and necessary for the board to initiate a regulatory program linking Virginia to RGGI. The Office of the Attorney General issued an official advisory opinion that analyzed the relevant statutory and administrative authority and concluded "that the State Air Pollution Control Board is legally authorized to regulate GHG emissions." Specifically, the Attorney General	Support for the proposal is appreciated. DEQ agrees that the board and department have the legal authority to develop the proposed regulation; see the response to comment 76 and, for example, comment 139.

Commenter	Comment	Agency response
	noted that the board is authorized to regulate "air pollution" in the state, and observed that GHGs unquestionably fall within the definition of "air pollution." The Attorney General further concluded that because of its "broad statutory authority" under Va. Code § 10.1-1307(A), the board can exercise its regulatory authority through imposition of a "statewide cap on GHG emissions." The board also has the authority to maximize the efficiency and efficacy of a statewide cap by linking the program with RGGI. A state-led program is not preempted by the federal Clean Air Act, and is, in fact, specifically authorized by the Clean Air Act's state law savings clause (42 USC § 7416).	
160. Virginia Loggers Association (VLA)	Virginia's land cover is approximately 62% forested; in total, 15.8 million acres of forest with about 12.2 million acres are owned by private individuals, corporate and non-profit organizations. The majority of Virginia's forests are owned by individuals. Timber production is an important part of Virginia's economy and environment. The most recent study released by Governor McAuliffe shows that our forest products industry is the third largest contributor to Virginia's economy. The study revealed that almost $9.3 billion were added directly due to forests. Most of these forests are managed through the most current science enabling our forests to be productive for timber products and environmental benefits. Our forests are healthy and have increased in volume since inventory studies in 1940s. Virginia's forests are growing at a faster rate than harvest removal and mortality. The latest inventory shows that softwood annual growth to annual harvest is at a ratio of 2.2:1 and hardwood annual growth to annual harvest is 2.4:1. Our forests clean the air, sequester carbon, and improve water quality, wildlife habitat and recreational opportunities while producing products for many. Biomass is an important component of Virginia's energy policy. Many of our members invested millions of dollars in equipment to provide biomass to utilities across Virginia. We ask that any regulation recognize the investments made by our mills and logging businesses as well as the renewable natural qualities of forests. Some areas of the proposal would require our mills to invest further for monitoring biomass sources currently not required. We ask that you remove any additional requirements on biomass based sources. Continue to treat biomass as carbon neutral. Finally, we ask that DEQ maintain the current exemption of industrial boilers.	The commenter's concerns are appreciated. See the responses to comments 65 and 67 for further detail.
161. Virginia Energy Efficiency Council (VAEEC)	Energy efficiency is one of the most cost-effective tools to reduce energy consumption and dependence on fossil fuels, which in turn helps reduce carbon emissions. We applaud the inclusion of the 5% set aside for energy efficiency programs. Expanding energy efficiency provides Virginia residents with affordable energy bills and healthier, more comfortable homes. Last year, the American Council for an Energy-Efficient Economy	Support for the proposal is appreciated. DEQ agrees that energy efficiency is an essential component of reducing carbon emissions.

Commenter	Comment	Agency response
	(ACEEE) listed Virginia as one of the most improved states in their 2017 State Energy Efficiency Scorecard. Moving from 33rd to 29th place underscores the work VAEEC, our members and our partners have done to advance energy efficiency policies and initiatives. But there is more that can be done to help Virginia break into the top 25. The passage of the Grid Transformation and Security Act paves the way for greater opportunities as well. These programs, in addition to the energy efficiency carve out will propel Virginia into the spotlight as a leader on energy efficiency.	
162. Virginia Coal and Energy Alliance (VCEA)	The benefits provided by the coal and coal-related industries should only be placed at risk if the justification for doing so is clear--that is, if the benefits from the burden placed on those industries are greater than the benefits they provide. Unfortunately, the justification provided for the CO_2 Trading Rule is anything but clear, as it unfairly compares an underestimated assessment of real-world local costs and economic impacts to a theoretical and now-rejected overestimate of global benefits. The justification proffered for the proposal contains a logical disconnect. The justification, which is based on the Report of the EO 57 Work Group, proceeds as follows: 1) climate change causes certain harms in Virginia (e.g., heavy storms, water shortages, and warmer temperatures); 2) therefore, reducing the GHG emissions in Virginia will reduce those harms and benefit Virginia. However, that assumes that reducing CO_2 emissions will address harms here. Contrary to that assumption, reducing emissions in Virginia will not have any impact on the earth's climate. Emissions from Virginia--indeed, the entire U.S.--are such a small portion of total global emissions that any reductions are almost certain to have no meaningful effect. The benefits alleged in support of the rule are based almost entirely on the "social cost of carbon," a metric crafted by a disbanded interagency working group under the Obama Administration. The Trump Administration has rejected that metric and directed that it no longer be used to justify federal regulations. The social cost of carbon analysis admits a critical point: "[e]ven if the United States were to reduce its greenhouse gas emissions to zero, that step would be far from enough to avoid substantial climate change." That confirms that even those in favor of climate change policies must recognize that the reductions from any one country, much less any one region or state, will not change anything. The social cost of carbon itself is flawed because it relies on a highly speculative evaluation of global benefits, followed by an unfair comparison of those worldwide benefits to domestic costs incurred within the U.S. alone. Not only is that comparison unreasonable, since	The board is within its legal authority to address carbon pollution, which poses serious threats to the Commonwealth, through a cap-and-trade program; see the responses to comments 61 and 76.

Commenter	Comment	Agency response
	worldwide benefits will always dwarf the costs incurred by a single nation, it also represents a break from the manner in which the impact of regulations has always been evaluated. U.S. costs have always been compared to U.S. benefits in order to provide a fair basis for the comparison, even for regulations that may benefit other countries. With the withdrawal of the social cost of carbon from federal policy, federal agencies must now return to that more reasonable and well-understood approach, and DEQ should do the same. The other justification relies on co-benefits associated with reductions in other pollutants, such as NO_X, SO_2, and particulate matter, which can directly impact human health (unlike CO_2). Co-benefits are not a reasonable basis upon which to justify the rule because the other pollutants are already well controlled by other Clean Air Act programs. Only a small portion of the state is nonattainment for ozone, due to its proximity to the D.C. metropolitan area, not emission sources located in Virginia, and sufficient rules are in place to address those air quality concerns. The rest of the state complies with EPA standards set to protect public health, and no further reductions are needed to maintain compliance with those standards. Claiming that reductions in other pollutants as a justification amounts to double-counting of air quality benefits already achieved and paid for. Although the rule would adopt a seemingly small 3% per year reduction, those compounding reductions will be more significant than the analysis suggests because it ignores and essentially prohibits growth in emissions that would otherwise occur. Whereas the supporting analysis claims a reduction of 30% (from 33-34 million tons in 2020 to 23-24 million tons in 2031), in effect it will actually require reductions of nearly 50% when compared to what would otherwise occur without the program (40-50 million tons). The result will be an increase in the cost of electricity of over 7% and present a significant burden on the coal and coal-related industries. The assertion that emission reductions of a similar magnitude under the proposed rule will have only a minimal impact on the economy of the state is difficult to believe. To combat concerns about the impacts to the economy and the cost of electricity, an analysis was prepared to focus on individual utility bills. The conclusion of that study suggests that the impact to ratepayers will be minimal. However, if that is in fact the case, it must mean the analysis assumes the regulation will not significantly affect the market; that is, the study must have assumed that the market itself would likely encourage nearly the same emission-reducing behavior based solely on the demand for and supply of energy. But if that is true, then	

Commenter	Comment	Agency response
	the regulation would not be responsible for any of the emission reduction benefits claimed. The supporters of the proposal cannot have it both ways--either the program will require reductions that would not otherwise occur under existing market forces, in which case significant costs will be incurred in working against the market, or else the market would already encourage the reductions now sought via regulation, in which case the regulation is unnecessary. The General Assembly has already decided that the CO_2 Trading Rule is not in the best interest of Virginia and passed HB1270 to prohibit the very type of program contemplated by the proposal. The Governor vetoed the law and is charging ahead via executive fiat to establish such a program. This scenario is similar to what has transpired at the federal level. Despite the fact that Congress rejected efforts over more than a decade to enact a climate trading program, the Obama Administration decided to establish one through executive authority by issuing the Clean Power Plan, which was based on a few ambiguous and general sentences of the Clean Air Act. So too here, given that the authority claimed by the Attorney General as the basis of the regulation is merely the general authority "to promulgate regulations, including emergency regulations, abating, controlling and prohibiting air pollution." Legislatures grant bold powers in clear terms, and executive agencies should not try to invent bold powers out of ambiguous language. This principle should have equal effect at the federal and state levels, since both governments are based on the same fundamental principle: the legislative branch makes the laws, and the executive branch wields only the authority granted to it by the legislature. Nothing in the Clean Air Act clearly authorized EPA to issue the Clean Power Plan, and that is likely why the Supreme Court stayed it. Those same concerns appear relevant to the proposal, but perhaps to an even greater extent. Unlike Congress, which has been unable to pass a climate change bill, the Virginia legislature did pass one, but one that prohibits what the executive branch is now trying to do on its own. That executive action is only legal if the legislature has already authorized such a program in a previous statute, but it did no such thing. Rather, the statute claimed to be the underlying authority for the regulation is the same type of highly general authority found in the Clean Air Act. Such general grants of authority to issue regulations to address air pollution provide no clear authority for the policy shift the Governor seeks to implement, which represents a decision of economic and political significance. The Governor should not invent that authority, particularly in light of the statement to the	

Commenter	Comment	Agency response
	contrary recently made by the legislature.	
163. Virginia Conservation Network (VCN); Virginia League of Conservation Voters (VaLCV)	VCN and VaLCV encourage DEQ to select an emissions baseline that best achieves the goals of reducing statewide carbon pollution. This baseline should be the most stringent, lowest possible science-based figure supported by modeling. For additional details on the stringency of the carbon program, as well as modeling results, please see the technical comments from our partners at NRDC, Sierra Club, and SELC. We are thankful that the regulation covers both current and future fossil fuel-fired units. We were glad to see the inclusion of co-firing units that include at least one fossil fuel-fired unit; however, it should include all electric power facilitates that emit carbon, regardless of fuel type. Specifically, the regulation should apply to any unit at or above 25 MW that burns biomass. For additional details on biomass, please refer to the comments submitted by the National Wildlife Federation. We appreciate and support the 5% set aside of allowances to assist DMME in efforts to address carbon emissions. We encourage DEQ to consider increasing this to 10%, with the understanding the benefits of increasing this figure should be greater than the costs associated for covered sources.	Support for the proposal is appreciated. The commenters' specific issues are discussed elsewhere. See the response to comment 37 for a discussion of the baseline emissions cap, comment 67 for a discussion of biomass, and comment 51 for set-asides.
164. Veolia North America	We commend DEQ for exempting certain industrial combined heat and power (CHP) units from the regulation. CHP plays an important role in the state's clean energy and resilience goals and merits additional support. CHP units deserve special treatment as they have been designed to optimize the efficient production of heat and power for industrial facilities. While the exemption sets a positive policy direction, it needs to be modified to ensure that it rightfully applies to all relevant industrial CHP units. The exemption only contemplates the CHP unit being owned by the industrial end user rather than by a third party. This is counter to the trend of more industrial end users moving to outsource ownership, operation and maintenance of their central utilities. In this model, the industrial company can focus on executing its core business while relying on a specialized third party whose core business is owning, operating and maintaining industrial utilities on a safe, cost effective and reliable basis. As such, the ownership status of the CHP unit is not relevant to the key issue: does the CHP exist to primarily provide service to the industrial end user? Relying on "primary use" intent, rather than regulating CHP ownership, would better focus the regulation on GHG reduction while also allowing the industrial and manufacturing sector in Virginia greater flexibility to achieve this regulatory purpose. We suggest that DEQ remove the phrase "owned by an individual facility and" from the industrial exemption.	DEQ agrees that the phrase "owned by an individual facility" should be removed. Under the RGGI Model Rule, facilities that provide less than 10% of their power output to the grid are exempted from compliance obligations; the proposal has been revised accordingly. The regulation has also been amended in order to address CHPs with more clarity; see the response to comment 74.

Commenter	Comment	Agency response
	To qualify for the exemption the useful energy output (thermal and electric) of a CHP needs to be "for the primary use of operation of the facility"; however, "primary use" is not defined. We urge DEQ to clarify the meaning of primary use by considering the magnitude of a CHP's generation of useful thermal energy (UTE) relative to useful electrical energy and by the application of an appropriate CHP efficiency standard. One of CHP's benefits is that it can produce both UTE and electricity from a single fuel source. It is not uncommon for a host to have a high need for thermal energy and a low need for electricity. In order to efficiently service an industrial facility's steam load, a CHP unit may need to be designed in a way that exports a substantial portion of its electric power to the grid. The need to export to the grid is important in circumstances where utility franchise rights prevent third party CHP facilities from delivering power to industrial sites. The integrity of the industrial exemption will be maintained if the focus is on UTE. The industrial exemption can be strengthened by adding an efficiency requirement. This will provide CHP units incentive to maximize requirements of its host rather than exports to the electrical grid. The Virginia legislature recognized the need to encourage CHP systems in the Grid Transformation and Security Act, which requires that the total efficiency, including the use of thermal energy, for eligible CHP facilities meet or exceed 65% (Lower Heating Value) annually. A similar requirement for the industrial exemption would ensure consistency. Veolia recognizes the concept of tying the industrial exemption to a unit "voluntarily restricting its electrical output to the grid (through permit condition) to less than or equal to 10% of the units annual gross generation of the unit." This approach too narrowly restricts what industrial facilities can do with electric generation and conflicts with the broader intent of primary use. Recognizing that not all CHP units will qualify for the exemption, but acknowledging that these units still deliver valuable GHG reductions, we recommend a UTE exemption. CHP units over 25 MW that do not qualify for the industrial exemption, must procure CO_2 allowances for all emissions, including those associated with UTE (i.e., microgrid, district energy, process steam, hot water). Absent production at a CHP unit, the UTE would be produced by conventional methods, such as standalone boilers. These conventional methods of generating UTE are not subject to the regulation, and thermal generation-only unit owners are not required to procure CO_2 emissions allowances. If CHP units over 25 MW are required to procure CO_2 allowances for all emissions, including those associated with UTE, it will create a counterincentive and potentially increase GHG emissions. To avoid this, the regulation should exclude	

Commenter	Comment	Agency response
	CO_2 emissions associated with UTE from a CHP unit. When determining the RGGI emissions allowance compliance obligation for a CHP unit, emissions associated with UTE of that unit should be deducted from the unit's total emissions. There is precedent for adopting a UTE exemption based on existing UTEs in federal and state agency carbon trading programs. EPA's Clean Power Plan included a UTE exemption for CHPs. Several RGGI states have adopted a UTE exemption in different forms. For example, Massachusetts has an exemption for any CHP CO_2 budget source that allows the CHP unit to subtract from its total CO_2 emissions the amount of CO_2 emissions attributable to the production of useful net thermal energy. The Massachusetts regulation acknowledges that, absent production in a cogeneration unit, UTE would be produced in a standalone boiler. These boilers do not have a compliance obligation under any RGGI program, and have no mandated efficiency targets. With this UTE exemption structure, a generation unit has an incentive to maximize useful outlets for its waste heat. The Massachusetts UTE exemption is the most effective and straightforward approach, and we encourage DEQ to adopt a similar exemption. Under this approach, emissions associated with UTE are calculated on a formulaic basis and are subtracted from a CHP's compliance obligation. Note that the exemption is only for emissions associated with UTE. CHP units that fall under RGGI will still be required to procure allowances for any emissions not associated with UTE. However, with the UTE exemption, CHP will be on equal footing with conventional generators whose only output is electricity. By reducing a unit's environmental compliance costs, the UTE exemption removes a potential barrier for investment in CHP. The ability for a CHP unit to exclude emissions from UTE from its compliance obligation will become even more important in the future. With the RGGI emissions cap declining each year, it is likely that RGGI allowance prices will continue to increase. As RGGI allowance prices increase, they will drive up compliance costs and increase the economic disincentive faced by CHP units. Without a UTE exemption, there will be a similar adverse effect on existing facilities that have the option of using CHP to generate UTE or using stand-alone boilers. As the costs of CHP rise due to higher RGGI compliance costs, the dispatch of equipment may change resulting in more standalone generation of UTE and higher regional carbon emissions.	
165. Virginia Forest Products Association	VFPA does not support joining RGGI because it would raise electric power and natural gas rates. This is a grave concern to our small businesses, as even small sawmills without kilns have electric bills that average	The commenter's concerns are recognized. See the response to comment 67 for a discussion of

Commenter	Comment	Agency response
(VFPA)	$6,000/ month. Kiln dryers add substantially to that monthly bill, and larger mills with kilns have monthly electric bills in excess of $20,000. Our primary competition is in North Carolina, not the RGGI states, and an increase in our utility rates will put us at a competitive disadvantage. A more critical concern is the potential impact if emissions from the combustion of biomass are treated as GHG. Lumber production produces manufacturing residuals in the form of mulch, sawdust and chips. Even a small mill can produce 25 tons per day of dust and chips each. There is a ready supply of wood residuals from sawmills in the state that require a variety of markets. Having ready outlets to dispose of residuals is critical; we can't saw lumber if we can't move residuals off the yard. We are extremely concerned that disincentivizing the burning of biomass for power could negatively impact sawmills, loggers, and landowners by reducing or eliminating that market. The boiler fuel outlet for residuals is key to our survival; if it is treated the same as any other fossil fuel but costs more for the utility to procure, they will no doubt select the less expensive option since the benefit is removed. The science on the carbon neutrality of woody biomass is solid, and VFPA supports the comments and supporting data submitted by AF&PA and AWC. Harvesting wood for energy does not contribute to net carbon emissions in cases where the harvesting, measured over a broad region, is offset by wood growth and associated carbon sequestration. The most recent data from the U.S. Forest Service indicate that timberlands in Virginia, the U.S. south, and the entire country have highly positive net growth/removal ratios. The Virginia Department of Forestry's Reforestation of Timberlands Program has reforested 1.8 million acres since the program's inception. This program provides cost-share assistance to landowners in planting, replanting, and managing forest acreage. Since 1970, landowners and industry have reforested 4 million total acres in Virginia. U.S. Forest Service data from 2016 shows growth/removal ratios for timberlands in Virginia, the U.S. South, and the nation as a whole are 2.29, 1.76, and 1.94, respectively. In other words, Virginia's timberlands are growing more than twice as much wood as harvested, while timberlands in the south grow 76% more than is harvested. When environmental organizations cite the cutting of trees by the forest product industry as inherently negative, they ignore the cyclical nature of managed timberlands. The most significant pressure on forests is permanent conversion to non-forest uses, such as development. However, strong markets for wood are the	biomass. The industrial exemption will be maintained; see the response to comment 65.

Commenter	Comment	Agency response
	most powerful incentive to keep forests in production. From the sawmills' perspective, markets for the finished product and residuals on the back end are as important as the supply of trees on the front end. A balance in supply and demand will keep businesses and forests healthy. A 2014 article in the Journal of Forestry noted that if mill residues were not used for energy, most of these materials would be wastes that would either be incinerated, in which case the atmosphere would see the same CO_2 emissions as if the material had been burned for energy, or disposed of in landfills. The article further states that the net impact of burning for energy on biogenic emissions in terms of warming can be less than zero because of the warming potency of methane generated in landfills. In the past, many sawmills burned wastes on site in large incinerators as there were not enough markets for the materials. Residuals build up quickly in the process of sawing lumber. If today's mills lose too many markets for residuals, the financial burdens of incinerating on site or the costs of landfill tipping fees for disposal of thousands of tons of residuals would force many sawmills to cease operation. From economic and environmental perspectives, treating biomass as carbon neutral in energy production makes dollars and sense. VFPA respectfully requests that Virginia not join RGGI. However, if the state does join RGGI, we ask that biogenic carbon emissions be recognized as carbon neutral regardless of whether other fuels also are co-fired; and that the exemption for industrial boilers be retained. This regulation is designed to address utility electrical generation only; the exemption for on-site industrial generation should remain in the final rule. This is also important because of potential market impacts to saw mills if large industrial users lose this incentive for firing with biomass.	
166. Virginia Chamber of Commerce	The Virginia Chamber recently released Blueprint Virginia 2025, a plan that outlines the business community's priorities and recommendations for making Virginia the best state for business. Throughout our stakeholder engagement process, which included over 6,000 members of the business community, we heard from business leaders on how important affordable, reliable energy is to Virginia's economic competitiveness. Energy affordability was identified by 55% of Blueprint survey respondents as their top energy concern. Unfortunately, RGGI is not consistent with the Chamber and Governor's goal to make Virginia the best state for business, as it will increase electricity rates and make Virginia less competitive. The Chamber supports policies that promote energy independence and the development of a robust supply of energy. We advocate an energy portfolio that promotes	The regulation is designed to impose regulatory requirements only as strictly necessary in order to participate in the highly successful RGGI program without affecting economic competitiveness. As discussed elsewhere, the regulation retains exemptions for certain industrial and biomass facilities, and provides for free allowances. Note that RGGI's "CO_2 Emissions from Electric Generation and Imports in the Regional Greenhouse Gas Initiative:

Commenter	Comment	Agency response
	economic development and job growth through traditional and alternative energy investments, and believe that environmental protection and energy independence are compatible goals. It is expected that energy consumption in Virginia will continue to rise, reflecting the increase in population, economic growth, and electrification of the transportation system . To ensure a growing economy, we must develop strategies for an ample supply of affordable and reliable energy. Part of achieving our goal of being the best state for business is to protect our competitive rates for electricity. Business climate rankings factor energy and utility costs into their "cost of doing business index," which can influence our overall position. Favorable energy costs are important in order to remain economically competitive. By joining RGGI or initiating a cap-and-trade program, energy costs for employers and residents will rise. According to a recent Cato Institute study, the RGGI program creates higher electric bills and shifts jobs to non-RGGI states. According to the U.S. Chamber of Commerce's Global Energy Institute, the average electricity rate of the RGGI states is 39% higher than the national average. By contrast, Virginia has the nation's 19th lowest average electricity rates, 12% cheaper than the national average. Virginia's affordable rate provides the state a competitive advantage when it comes to attracting manufacturing and other energy intensive industries, such as high-tech data centers. Any program that would increase electricity rates--such as RGGI--would reduce this competitive advantage. Further exacerbating the negative effects to our economic competitiveness is the problem of carbon leakage. The state's own modeling illustrates the potential impacts of leakage that could result from partnering with RGGI. Participating in RGGI is likely to increase electricity imports into the state. Because many of the neighboring states in the PJM electricity region do not participate in RGGI but are powered by resources with a higher carbon intensity, shifting generation from Virginia into these states may result in an increase in emissions. Under this scenario, Virginia suffers the economic consequences of joining RGGI while achieving no progress toward its environmental goals. While RGGI backers cite the program as a successful cap and trade model, there is little evidence to suggest that the program has been effective at reducing emissions. The Agency Background Document states that a primary advantage to the public of joining RGGI would be "health and welfare benefits associated with controlling carbon pollution." In the Economic Impact Analysis, DPB estimates that the benefits of the state's effort to reduce CO_2 would be between $42-50 million	2015 Monitoring Report" demonstrates that carbon emissions in the RGGI are decreasing in intensity; essentially, carbon intensity is being decoupled from electricity generation. See, for example, the response to comment 61. The regulation has been carefully designed to be least restrictive to Virginia business, does not hurt the state's economic competitiveness, retains an industrial exemption, exempts certain forms of biomass, and provides for free allowances.

Commenter	Comment	Agency response
	annually between 2021-30. Note that the social costs of carbon are controversial and uncertain, based on long-term assumptions about the damages that may result from increased carbon emissions. As DPB notes, the $42-50 million of CO_2 reduction benefits are global, not Virginia-specific. DPB states that it is "not possible to quantify the Virginia-specific benefits," but this is not accurate; a number of analysts employ the use of "equity weighting" as a means to compare impacts to different regions. EPA and other federal agencies now use this method to develop domestic-only estimates of the social cost of carbon (SC-CO_2). We can estimate the benefits to Virginia similarly. When applied to calculate a Virginia-specific benefit, the mid-range of OPB's estimate of $46 million in SC-$CO_2$ benefits is reduced to a mere $250,000. This is because, at the mid-range of the program (2025), U.S. GDP is projected to be 20.5% of global GDP, and Virginia GDP is 2.7% of U.S. GDP ($46 million X .205 X .027 = $250,000). Divided by Virginia's estimated reductions of 1 million tons per year, this equates to a benefit to Virginia of 25 cents per ton of CO_2 reduction. Viewed in this Virginia-specific manner, it is difficult to see how the program's costs justify its projected benefits. If Virginia does move forward with this proposal, we ask that the regulation be least restrictive to Virginia businesses, does not hurt the state's economic competitiveness, retains an industrial exemption, treats biomass as carbon neutral, and provides for free allowances as opposed to an auction.	
167. Virginia Housing Alliance	We recommend that the 5% allocation be used for energy efficiency services for renters in multifamily housing. Energy efficiency in multifamily housing can help Virginia meet the state's voluntary goal to reduce electricity consumption for commercial and residential buildings by an amount equal to 10% of 2006 consumption by 2020 in addition to reducing carbon pollution for compliance with ED 11. If used for energy efficiency, the allocation will reduce energy use and carbon emissions, reduce the need for added electric generation, improve public health and environmental quality, boost job creation, and preserve affordable housing. We support Virginia's entrance into RGGI and hope that energy efficiency will be regarded as a necessary and cost effective tool for Virginia's transition to a clean energy future.	DEQ recognizes the value of energy efficiency in multifamily housing as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement renewable energy and energy efficiency programs. DMME may, at the appropriate time and in accordance with its regulations and policies, implement a set-aside for energy efficiency in multifamily housing. See the response to comment 51 for more information.
168.	While WestRock generates a considerable portion of its	The commenters' concerns

Commenter	Comment	Agency response
WestRock; Covington, Hopewell and West Point mills	own energy at our largest manufacturing facilities, having access to sufficient quantities of utility-provided electricity at reasonable prices is critical for reliability and economic reasons. Some of our mills are entirely energy independent, but others must purchase a significant portion of their electricity from the grid. Our converting operations in Virginia rely heavily on purchased electricity. West Rock spends over $100 million annually on energy in Virginia. As a large electricity consumer in the state that also uses considerable amounts of biomass for energy generation, WestRock will be substantially affected by the proposed rule. We are a member of AF&PA and NCASI, and support the comments submitted by these organizations.	are acknowledged. See the responses to comments 65 and 67.
169. WestRock; Covington, Hopewell and West Point mills	The proposed rule states that if biomass comprises 90% or more of the total heat input to an electric generating unit, the unit and its biogenic CO_2 emissions are not regulated. However, if biomass comprises less than 90% of the heat input to an electric generating unit, biogenic CO_2 emissions are regulated and allowances must be remitted for CO_2 emissions from that unit. This treatment of biogenic CO_2 emissions is arbitrary and capricious. Biomass carbon neutrality does not change based on the amount of biomass fired, nor does it change when biomass is co-fired with other fuels. The treatment of CO_2 emissions from the combustion of biomass represents a significant departure from current U.S. federal law, internationally-accepted carbon accounting protocols, and the RGGI model rule. The carbon benefits of biomass are best understood in the context of the entire carbon cycle. As forests grow, CO_2 is removed from the atmosphere through photosynthesis. This CO_2 is converted into organic carbon and stored in woody biomass. Trees release the stored carbon when they die and decay or are combusted. As the biomass releases carbon in the form of CO_2, the carbon cycle is completed. The carbon in biomass will return to the atmosphere regardless of whether it is burned to produce energy, allowed to biodegrade, or lost in a forest fire. Overall, the flow of forest CO_2 is carbon positive when forests are sustainably managed and the forest system remains a net sink of CO_2 from the atmosphere. Carbon stock accounting shows that carbon storage in U.S. forests is positive and currently offsets about 12% of total U.S. CO_2 emissions annually. In Virginia, the growth of the state's forests offsets about 14% of the total annual CO_2 emissions. In 2014, the ratio of the forest's annual growth compared to harvest volume was more than 2.1:1 for softwood and 2.2:1 for hardwood. This amounts to an annual surplus of 8.4 million tons of softwood and 14 million tons of hardwood. Biomass residuals from the manufacturing process are used as the primary fuel to power paper mills. If these residuals are landfilled	The commenters' discussion of biomass and forest lands is appreciated. As discussed in the response to comment 67, certain biomass facilities will not be subject to the program. RGGI states allow CO_2 budget units that co-fire eligible biomass to deduct CO_2 emissions attributable to the burning of eligible biomass from their compliance obligation in accordance with the RGGI model rule. DEQ has amended the proposal to indicate that a CO_2 allowance is a limited authorization to emit up to one ton of CO_2 that has been generated as a result of combusting fossil fuel. The regulation has also been amended in order to address CHPs with more clarity; see the response to comment 74.

Commenter	Comment	Agency response
	instead of being used as fuel, they would release GHG to the atmosphere, increasing emissions of methane, which has a global warming potential 25 times higher than CO_2. In addition to utilizing residuals, more than 97% of electricity produced by pulp and paper mills is generated through the use of highly efficient CHP. CHP provides energy efficiencies in the range of 50% to 80% at forest products mills. In the 2018 Consolidated Appropriations Act, Congress directs EPA, DOE, and USDA to ensure that federal policy relating to forest bioenergy is consistent across all federal agencies and recognizes the benefits of forest biomass for energy, conservation, and responsible forest management. Several states also have laws recognizing the carbon neutrality of biomass, including Washington and California, and RGGI itself states: "CO_2 emissions from eligible biomass reduce the total CO_2 allowance compliance obligation of the emitting unit. Emissions from eligible biomass should be deducted from the regional total of CO_2 emissions for purposes of calculating emissions from CO_2 budget sources subject to RGGI CO_2 allowance compliance obligations." Biomass CO_2 emissions are either not reported or reported separately or for information purposes in many domestic and international GHG regulations and protocols, including the World Resources Institute/World Business Council for Sustainable Development, and the U.N. Intergovernmental Panel on Climate Change. The board seeks comment on the potential impacts of the rule on forest land preservation. Studies show that recognizing the carbon neutrality of biomass will not negatively impact forest inventories due to the availability of lower cost renewable fuel options. In one such study, the Energy Information Administration (EIA) modeled the potential impact of the Clean Power Plan on the use of biomass for energy generation. In all EIA scenarios, co-firing biomass was projected to decrease under the CPP. In the long term, biomass is not a strategic, large scale, cost-effective alternative to fossil fuel. EIA modeling shows that standalone biomass energy plants are not considered cost competitive. In a recent article, EIA discusses the costs of various electricity generation technologies. The article shows that by 2022, onshore wind will have a lower levelized cost than biomass in all U.S. regions, and solar photovoltaic will be less costly than biomass in some regions. Subsidies will tend to make solar and wind even more competitive. Studies also show that demand for biomass helps prevent forest land from being converted to other uses. A Department of State report shows that demand for forest products will increase forest carbon stocks through landowner investment. Markets for biomass and other	

Commenter	Comment	Agency response
	forest products stimulate forestland ownership and encourage investment in healthy forest management practices. Farmers and forest owners, as with all business owners, respond to markets and produce more when demand increases. The most significant deforestation threat in the U.S. is forest conversion. Current forest inventories and the net sink are subject to the protections of a state law that caps the amount of biomass that Virginia utilities may use for energy under the Renewable Portfolio Standards program. Virginia Code 23 VAC 56-585.2 states: "Utilities participating in such program shall collectively, either through the installation of new generating facilities, through retrofit of existing facilities or through purchases of electricity from new facilities located in Virginia, use or cause to be used no more than a total of 1.5 million tons per year of green wood chips, bark, sawdust, a tree or any portion of a tree which is used or can be used for lumber and pulp manufacturing by facilities located in Virginia, towards meeting RPS goals, excluding such fuel used at electric generating facilities using wood as fuel prior to January 1, 2007." To the extent the regulation requires the monitoring and reporting of GHG emissions, WestRock urges the board to allow covered facilities to separately calculate and report biogenic and fossil fuel CO_2 emissions as is currently allowed under various established GHG reporting protocols.	
170. WestRock; Covington, Hopewell and West Point mills	The proposal excludes industrial sources from coverage, and WestRock supports this. EO 57 and ED 11, the authorities upon which the proposal is based, limit the scope of the rulemaking to the electric power generation sector. ED 11 states that the DEQ Director shall, in coordination with the Secretary of Natural Resources, "develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit CO_2 from electric power facilities." EO 57 is similar. These directives manifest a clear intention to exclude industrial sources. Neither the Economic Impact Assessment, the proposed emissions cap, nor the allowance allocation and price modeling conducted by DEQ and its consultants included emissions from industrial sources. Similarly, the charge given to the Regulatory Advisory Panel did not include industrial sources. Inclusion of industrial sources is unnecessary and cannot be justified on a cost/benefit basis. According to EIA, industrial sources in Virginia emit 11.6 million tons of CO_2 and comprise 11 % of emissions in the state compared to 30% by the electric utility sector, and 43% by the transportation sector. EPA data indicates that GHG emissions from Virginia's industrial sector have decreased 31% since 2000. On the other hand, including	The industrial exemption is discussed in the response to comment 65. Consistent with the RGGI model rule, the proposal has been amended to remove the phrase "owned by an individual facility" in order to ensure that facilities are not be penalized for employing more energy efficient and less polluting generating systems that may be operated by a third party on behalf of the primary facility. The regulation has been amended in order to address CHPs with more clarity; see the response to comment 74.

Commenter	Comment	Agency response
	industrial sources would cost Virginia businesses $18.9 to $41 million. The exemption is consistent with the intent and scope of the existing RGGI program, which does not regulate emissions from industrial sources. In fact, except for the purposes of reporting, there do not appear to be any industrial sources listed in the RGGI CO_2 Allowance Tracking System's list of regulated sources. Including industrial sources would not only put the state at odds with other RGGI participating states, it would put Virginia industry at a competitive disadvantage. RGGI allowance prices are based on the marginal cost to reduce GHG emissions from the utility sector and do not reflect the ability for industrial sources to reduce emissions. Subjecting industrial facilities to allowance markets that are not reflective of their own marginal costs would be unfair and poor public policy. The exemption should be clarified by adding the definition of electric generating unit found in VA Code 10.1-1328 to distinguish between industrial and electric power facilities as it relates to the term "primary use." Steam and electricity generation at an industrial facility is almost without exception for the primary use of the facility. However, actual flows of electricity may reflect buy-sell contractual arrangements or engineering constraints. It is not uncommon for an industrial CHP facility generating electricity to meet the primary needs of its operation, to export all that it generates and purchase 100% of its electricity needs. For the purposes of determining "primary use of the operation," it is imperative that net electricity flows be considered to ensure that industrial generation is not unintentionally included simply by virtue of contractual arrangements or the nature of its physical connection to the grid. Although WestRock owns its onsite CHP operations, in some cases CHP operations may not be owned by the facility where they are located due to financing arrangements. To promote the use of CHP, DEQ should remove the requirement that fossil fuel power generating unit located at an industrial facility also be owned by the facility.	
171. WestRock; Covington, Hopewell and West Point mills	If the rule is promulgated, electricity costs in Virginia will rise. DEQ's economic analysis suggests that the impact of this cost increase will be no more 1.1% by 2031. However, other studies suggest that the increase in electricity prices may be far more significant. According to a report cited by VMA in its comments, electricity costs in the RGGI states rose by 4.6% between 2007-15, which was 64% higher than the increase in electricity costs in a sampling of 5 non-RGGI states. Increases in the cost of electricity for large consumers like WestRock may make Virginia a less attractive place for investment than neighboring states without carbon reduction mandates. Increases in electricity costs may lead to the	As discussed in the response to comment 91 and elsewhere, while generation shifts are common in a regional electricity market, there are many reasons to believe that the trading program is unlikely to cause generation shifts and, if it does cause some shifting, reasons to doubt those shifts will lead to emissions

Commenter	Comment	Agency response
	use of more imported electricity from areas without CO_2 reduction mandates, which may undermine any environmental improvements from the proposal. We encourage the retention of free allowances and a cap of 34 million tons (or higher), both of which may help moderate the cost of the program. WestRock, the industrial sector, and the utility sector have significantly reduced their GHG emissions through capital investment in more energy efficient energy generation, production processes and the use of lower carbon fuels. This trend is expected to continue both through ongoing capital investment and as part of the commitments made by WestRock and others to meet voluntary GHG reduction goals.	leakage. The RGGI states have not found leakage to be a problem for the program in 10 years the program has operated. The program is quite modest relative to other cost factors in the regional electricity markets and any shifting is likely to substitute one gas plant for another, meaning the emissions consequences are not significant. The Virginia program includes an allowance allocation approach that will directly counteract any leakage pressure, because in-state generators will be rewarded with valuable allowances when they operate, while generators outside Virginia will not be so rewarded. In addition, vertically integrated utilities can self-schedule their generators to run knowing that they will receive allowances at no cost under the program, offsetting any compliance cost the generators might otherwise incur. For all of these reasons, leakage is not expected to present a problem. DEQ expects to monitor this issue as RGGI has done and will address the issue should it be necessary in a future program review. The cap will be 28 million tons (see comment 37), and the allowances will be provided at no cost.
172. Wild Virginia	Article 1 states that the trading program is "designed to reduce anthropogenic emissions of CO_2." However, if the rule applies only to fossil fuels and not other carbon emitting generation, it cannot achieve its goal. According to EPA, total CO_2 emissions from the burning of woody biomass in the electric power sector was 22,900,000 tons in 2016. The proposal applies only to fossil fuels, not biomass or municipal waste. This would allow Virginia's wood burners to continue polluting without regulation and reward coal-fired power plants that switch	See the response to comment 67 for further discussion of biomass.

Commenter	Comment	Agency response
	to burning wood from forests. Burning wood to produce electricity increases CO_2 and particulate emissions compared with fossil fuels. Besides undermining efforts to expand clean energy sources, burning forests for energy destroys forest ecosystems which are a defense against climate change. The regulation could encourage more biomass generators to be implemented. Westrock operates the world's largest solid bleached sulfate board paper mill in Covington. It is powered by a biomass boiler and a 75 MW steam turbine generator. In 2016, this facility emitted 2,020,927 tons of CO_2. NOVEC's Halifax plant generates 50 MW of energy, sourcing wood and whole trees from a 75-mile radius while claiming that its energy is carbon neutral. The 585 MW Virginia City Hybrid Energy Center co-fires coal with 20% wood. It emitted 3,101,460 tons of CO_2 in 2016. Dominion's 83 MW Pittsylvania station unloads an estimated 3,300 tons of wood daily. Dominion's Altavista plant turns pellets, chips, slash, or whole trees into 51 MW of energy, and in 2015 released 393,183 tons of CO_2. Dominion received regional renewable energy and federal incentives by converting 3 coal-fired plants to burn wood. In 2016, Dominion's conversion from coal to wood in Hopewell and Southampton has more than doubled carbon emissions from those facilities. In 2016, these facilities together emitted 885,063 tons of CO_2. Wood-burning power plants pump about 50% more carbon pollution per megawatt-hour into the atmosphere than coal plants. Combined, Virginia's wood-pellet manufacturing and wood-burning power plants send more than 5 million tons of CO_2 mostly from forest wood into the atmosphere each year. Power plant carbon pollution warms the climate just as effectively whether it comes from burning trees or fossil fuels, which highlights the critical fallacy of treating biomass power plants as "carbon-neutral." Virginia's plan isn't unique in ignoring emissions from wood-burning plants. The problem also exists with California's cap-and-trade plan, RGGI, and the E.U. trading program. Much of the emissions reductions claimed by the E.U. come from converting coal plants to burn wood pellets imported from the U.S. and Canada, then assuming the emissions will be offset by future tree growth. As a result, millions of tons of trees are harvested, pelletized and shipped overseas as fuel. The pellet industry is responsible for logging tens of thousands of forest acres each year. Burning municipal waste is also a large emitter of carbon. For example, the Hampton/NASA Steam Plant released 24,653 tons of carbon in 2016. We request that the regulation include carbon accounting	

Commenter	Comment	Agency response
	for all large scale industrial emitters of atmospheric carbon, including biomass and solid waste burning energy producing facilities.	
173. World Wildlife Fund on behalf of Eastern Mennonite University Creation Care Council, Emory and Henry College, Hollins University, Lynchburg College, Randolph College, Washington and Lee University	As academic institutions, we understand the importance of reducing carbon pollution and the opportunities provided by clean energy. Colleges and universities are committing to reduce their carbon footprint and increase the use of clean energy, because it is the right thing to do and because it makes business sense. Eleven Virginia colleges and universities have committed to becoming fully carbon neutral no later than 2050. Clean energy allows us to save money, hedge against volatile fossil fuel prices, and lock in predictable energy prices. Market-based carbon-reduction initiatives have been highly effective in reducing electric-sector GHG emissions while fostering economic growth and spurring innovation in clean energy technology. We recognize the importance of strong, stable policies that aim to account for the cost of carbon emissions and provide market certainty, allowing colleges and universities to plan and invest for the future. In Virginia, the proposed carbon reduction program would incentivize investments in renewable energy and energy efficiency--creating good-paying jobs for our graduates and others across the state, attracting world-class students, faculty, and staff to our institutions, improving the well-being of our communities, and making Virginia an even more attractive place to live and work. The regulation will be beneficial for Virginia's economy as a whole. This smart initiative will grow Virginia's nascent clean energy industry, help the state stay competitive, reduce energy costs, and improve the resiliency of our electrical grid. It will help utilities transition to a cleaner electric grid while offering more options for higher education institutions, businesses, and residents to access cost-competitive renewable energy. Our institutions value an affordable, reliable, and clean electricity supply, and we commend the Northam Administration for its commitment to lead Virginia in the transition to a low-carbon economy. We appreciate the many months of compiled research and feedback the previous administration gathered from energy stakeholders to develop forward-thinking carbon reduction measures. Steady carbon reduction policies will signal that Virginia is committed to embracing clean energy innovation, allowing institutions like ours to thrive for years to come.	Support for the proposal is appreciated. DEQ agrees that the program will benefit the state's economy while reducing carbon pollution and its negative impacts on health and welfare.

Public Participation

Please include a statement that in addition to any other comments on the regulatory change, the agency is seeking comments on the costs and benefits of the regulatory change and the impacts of the regulated community. Also, indicate whether a public hearing will be held to receive comments.

In addition to any other comments on the regulatory proposal, the board is seeking comment on the costs and benefits of the revisions to the proposal, the potential impacts of the revisions to the proposal and any impacts of the revisions on farm and forest land preservation. Also, the board is seeking information on impacts of the revisions on small businesses as defined in § 2.2-4007.1 of the Code of Virginia. Information may include 1) projected reporting, recordkeeping and other administrative costs, 2) probable effect of the regulation on affected small businesses, and 3) description of less intrusive or costly alternative methods of achieving the purpose of the regulation.

The department is seeking comment on whether 9VAC5-140-6050 C 1 should be amended to specify that the total CO_2 emissions related to CO_2 allowances only includes emissions resulting from the combustion of fossil fuel. Specifically, the department seeks input as to whether such an amendment to the standard requirements would provide clarity and consistency with the fossil fuel-focus of EO 11, or if such an amendment would be redundant because "fossil fuel-fired" is already defined in 9VAC5-140-6020 C and referenced in 9VAC5-140-6040 A, and is not needed to assure limitation of the rule to fossil fuel-fired facilities.

The Governor encourage comments is how to treat CO_2 emissions from CO_2 budget units that do not combust fossil fuels exclusively.

Anyone wishing to submit written comments for the public comment file may do so by mail, email or fax to the agency contact: Karen G. Sabasteanski, Policy Analyst, Office of Regulatory Affairs, Department of Environmental Quality, P.O. Box 1105, Richmond, Virginia, 23218 (email karen.sabasteanski@deq.virginia.gov, fax 804-698-4510). Comments may also be submitted through the Public Forum feature of the Virginia Regulatory Town Hall web site at: http://www.townhall.virginia.gov. Written comments must include the name and address of the commenter. In order to be considered, comments must be received by 11:59 pm on the last day of the public comment period.

A public hearing will not be held following the publication of this stage of this regulatory action.

Detail of Changes

Please list all regulatory changes and the consequences of the changes. Explain the new requirements and what they mean rather than merely quoting the text of the regulation.

If the regulatory change will be a new chapter, describe the intent of the language and the expected impact. Please describe the difference between existing regulation(s) and/or agency practice(s) and what is being proposed in this regulatory change. Delete inapplicable tables.

If the regulatory change is intended to replace an emergency regulation, please follow the instructions in the text following the three chart templates below. Please include citations to the specific section(s) of the regulation that are changing.

Detail of changes made since the previous (original proposal) stage:

Current chapter-section number	New chapter-section number, if applicable	New requirement from previous stage	Updated new requirement since previous stage	Change, intent, rationale, and likely impact of updated requirements

None	Article 1	CO_2 Budget Trading Program General Provisions	--	--
None	9VAC5-140-6010	Purpose	Amended to state that the rule is to be effected in a manner protective of health and the environment.	Needed for clarity.
None	9VAC5-140-6020 C	Definition of "allocate"	Amended to reflect relocation and renumbering of DMME provisions (see 9VAC5-140-6211).	Needed for clarity.
None	9VAC5-140-6020 C	Definition of "allowance"	Deleted.	Replaced with the new term "CO_2 allowance." Needed to ensure the proper functioning of the RGGI allowance market.
None	9VAC5-140-6020 C	Definition of "alternate CO_2 authorized account representative"	Deleted.	Needed in order to be consistent with new RGGI terminology.
None	9VAC5-140-6020 C	Definition of "CO_2 allowance"	Added.	Replacing "allowance." Needed to ensure the proper functioning of the RGGI allowance market
None	9VAC5-140-6020 C	Definition of "CO_2 authorized alternate account representative"	Added.	Needed in order to be consistent with new RGGI terminology.
None	9VAC5-140-6020 C	Definition of "CO_2 Budget Trading Program"	Amended.	Needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.
None	9VAC5-140-6020 C	Definition of "CCR allowance"	Amended to indicate that the CCR allowance is conditional.	Needed for clarity.
None	9VAC5-140-6020 C	Definition of "CO_2 CCR trigger price"	Amended to include the correct prices.	Needed in order for the program to operate properly.
None	9VAC5-140-6020 C	Definition of "CO_2 ECR trigger price"	Amended to include the correct prices.	Needed in order for the program to operate properly.
None	9VAC5-140-6020 C	Definition of "CO_2 offset allowance"	Added.	Needed in order for offsets from other states to be recognized.
None	9VAC5-140-6020 C	Definition of "conditional allowance"	Amended to clarify the relationship between a conditional allowance and a CO_2 allowance.	Needed in order for the program to operate properly.
None	9VAC5-140-	Definition of	Added.	Needed for clarity and in

	6020 C	"conditional CCR allowance"		order for the program to operate properly.
None	9VAC5-140-6020 C	Definition of "consignment auction"	Amended to refer to the correct auction entity.	Needed for clarity.
None	9VAC5-140-6020 C	Definition of "fossil fuel-fired"	Amended to change the amount of fuel comprised of fossil fuel from 10% to 5%.	Needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.
None	9VAC5-140-6020 C	Definition of "maximum design heat input"	Deleted.	This term is not used in the proposal and must be removed.
None	9VAC5-140-6020 C	Definition of "minimum reserve price"	Amended to change the price from $2.00 to $2.32.	Needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.
None	9VAC5-140-6020 C	Definition of "receive"	Amended to be more specific.	Needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.
None	9VAC5-140-6020 C	Definition of "RGGI, Inc."	Deleted.	Needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.
None	9VAC5-140-6020 C	Definition of "state"	Deleted.	Needed in order for clarity. "Participating state" replaces this more general term.
None	9VAC5-140-6020 C	Definition of "total useful energy"	Added.	Needed in order for the industrial exemption (9VAC5-140-6040 B) to operate properly.
None	9VAC5-140-6020 C	Definition of "useful net thermal energy"	Added.	Needed in order for the industrial exemption (9VAC5-140-6040 B) to operate properly.
None	9VAC5-140-6030	Measurements, abbreviations and acronyms.	Unused terms removed.	Needed for clarity.
None	9VAC5-140-6040 B	Applicability.	Amended to clarify industrial facilities exempt from the rule.	Needed to address third-party industrial suppliers while maintaining consistency with the RGGI Model Rule.
None	9VAC5-140-6050 C 1	CO_2 requirements, holding allowances for compliance		The department is seeking comment on whether an amendment is needed to 9VAC5-140-6050 C 1 to specify that the total CO_2 emissions related to CO_2 allowances only includes

				emissions resulting from the combustion of fossil fuel.
None	Article 2	CO_2 Authorized Account Representative for CO_2 Budget Sources.	--	--
None	9VAC5-140-6090	Alternate CO_2 authorized account representative.	The term "alternate CO_2 authorized account representative" is amended to "CO_2 authorized alternate account representative."	Needed in order to be consistent with new RGGI terminology.
None	9VAC5-140-6100	Changing the CO_2 authorized account representatives and the alternate CO_2 authorized account representative; changes in the owners and operators.	The term "alternate CO_2 authorized account representative" is amended to "CO_2 authorized alternate account representative."	Needed in order to be consistent with new RGGI terminology.
None	9VAC5-140-6110	Account certificate of representation.	The term "alternate CO_2 authorized account representative" is amended to "CO_2 authorized alternate account representative."	Needed in order to be consistent with new RGGI terminology.
None	9VAC5-140-6130	Delegation by CO_2 authorized account representative and alternate CO_2 authorized account representative.	The term "alternate CO_2 authorized account representative" is amended to "CO_2 authorized alternate account representative." In subsection H, "must" has been changed to "shall."	Needed in order to be consistent with new RGGI terminology, and to reflect correct regulatory style.
None	Article 5	CO_2 Allowance Allocations	--	--
None	9VAC5-140-6190 A	Base budgets.	The initial CO_2 base budget has been set at 28 million tons, declining by 3% per year through 2030.	Needed in order to realize the program goal of reducing carbon pollution at a certain rate of a specified time period.
None	9VAC5-140-6190 C	Base budgets.	Amended to establish specific post-2030 adjustments.	Needed to ensure continuing compliance into the future.
None	9VAC5-140-	Undistributed and	Amended to correct	Needed for clarity and in

	6200	unsold CO_2 allowances.	the term "conditional allowance" and to replace "may" with "will."	order for the program to operate properly.
None	9VAC5-140-6210 A	CO_2 allowance allocations.	Amended to clarify the allocation of allowances.	Needed for clarity.
None	9VAC5-140-6210 B	CO_2 allowance allocations.	DMME provisions have been moved to a separate new section (9VAC5-140-6211); succeeding sections renumbered accordingly.	Needed for clarity.
None	9VAC5-140-6210 ~~D~~ C	CO_2 allowance allocations.	Amended to more clearly explain how the CCR allowances will be allocated, including a new equation for calculating the pro rata distribution of CCR allowances.	Needed for clarity and in order for the program to operate properly.
None	9VAC5-140-6210 ~~E~~ D	CO_2 allowance allocations.	Amended to more clearly explain how the ECR allowances will be allocated.	Needed for clarity and in order for the program to operate properly.
None	9VAC5-140-6210 ~~F~~ E	CO_2 allowance allocations.	Minor corrections.	Needed for clarity.
None	9VAC5-140-6210 ~~I~~ H	CO_2 allowance allocations.	Timing requirements amended in order to provide more detail as to how and when conditional allowances will be allocated.	Needed for clarity.
None	9VAC5-140-6210 I	None.	New subsection added to clarify that implementation of the CCR, ECR and banking adjustment will depend on the extent of the CO_2 trading program.	Needed for clarity.
None	9VAC5-140-6211	None.	Section added for DMME provisions moved from 9VAC5-140-6040 A 2.	Needed for clarity.
None	Article 6	CO_2 Allowance Tracking System	--	--
None	9VAC5-140-6230	Establishment of accounts.	The term "alternate CO_2 authorized account representative" is amended to "CO_2	Needed in order to be consistent with new RGGI terminology.

			authorized alternate account representative."	
None	9VAC5-140-6260 A 3	Compliance.	Amended in order for Virginia to recognize offsets generated by other RGGI states.	Needed in order to participate in the RGGI program.
None	Article 8	Monitoring, Reporting and Recordkeeping	--	--
None	9VAC5-140-6330 A	General requirements.	Minor correction.	Needed for clarity.
None	Article 9	Auction of CO_2 CCR and ECR allowances	--	--
None	9VAC5-140-6430	Consignment auction.	Amended to indicate that one quarter of the annual conditional allowance allocation will be consigned by the CO_2 budget source or the holder of a public contract with DMME to each auction. At the completion of the consignment auction, a conditional allowance sold at auction becomes a CO_2 allowance.	Needed for clarity and in order for the program to operate properly.
None	9VAC5-140-6435	None.	New section added to enable the use of a direct auction without consignment in accordance with requirements established by the Virginia General Assembly.	Needed in order for the program to operate properly in the event of a legislative requirement.
None	Article 10	Program Monitoring and Review	--	--
None	9VAC5-140-6440	None.	Article added.	Specifies that in conjunction with program monitoring and review, impacts specific to Virginia will be evaluated, including economic, energy and environmental impacts, and impacts on vulnerable and environmental justice communities. Needed in order to clarify that these specific impacts will be monitored and evaluated.

Compendium of all new provisions:

New chapter-section number	New requirements	Other regulations and law that apply	Intent and likely impact of proposed requirements
Article 1	CO_2 Budget Trading Program General Provisions	--	--
9VAC5-140-6010	Purpose	None.	Establishment of the Virginia component of the CO_2 Budget Trading Program. Needed to provide clarity.
9VAC5-140-6020	Definitions	None.	Terms defined. Needed to assure that the regulation is understood and will operate properly.
9VAC5-140-6030	Measurements, abbreviations and acronyms.	None.	Needed to assure that the regulation is understood and will operate properly.
9VAC5-140-6040	Applicability		Defines sources to which the regulation applies. Needed in order that the regulation apply to certain affected sources. Implementation of this regulation will have an impact on those sources that are directly subject to the requirements of the rule.
9VAC5-140-6050	Standard requirements	None.	General requirements for permits, monitoring, holding and management of CO_2 allowances, excess emissions, recordkeeping and reporting, and liability. Needed in order for the program to operate properly.
9VAC5-140-6060	Computation of time	None.	How to define the beginning and ending of an activity. Needed in order for the program to operate properly.
9VAC5-140-6070	Severability	None.	Clarifies that the remainder of rule is not rendered invalid by the invalidity of another part of the rule. Needed in order for the program to operate properly.
Article 2	CO_2 Authorized Account Representative for CO_2 Budget Sources	--	--
9VAC5-140-6080	Authorization and responsibilities of the CO_2 authorized account representative	None.	Details how this individual is selected and authorized, and their key roles. Needed in order for the program to operate properly.
9VAC5-140-6090	Alternate CO_2 authorized account representative	None.	Details how this individual is selected and authorized, and their key roles. Needed in order for the program to operate properly.

9VAC5-140-6100	Changing the CO_2 authorized account representatives and the alternate CO_2 authorized account representative; changes in the owners and operators	None.	How changes are made to account representatives, and owners and operators. Needed in order for the program to operate properly.
9VAC5-140-6110	Account certificate of representation	None.	How account representatives are to be certified. Needed in order for the program to operate properly.
9VAC5-140-6120	Objections concerning the CO_2 authorized account representative	None.	How to deal with any disputes relevant to the account representative. Needed in order for the program to operate properly.
9VAC5-140-6130	Delegation by CO_2 authorized account representative and alternate CO_2 authorized account representative	None.	Enables the account representatives to delegate their authority to other persons. Needed in order for the program to operate properly.
Article 3	Permits		
9VAC5-140-6140	General CO_2 budget permit requirements	None.	References pertinent permitting regulations. Needed to assure that existing permitting requirements are met.
9VAC5-140-6150	Submission of CO_2 budget permit applications	None.	Requires a budget permit application by a certain date. Needed in order for the program to operate properly.
9VAC5-140-6160	Information requirements for CO_2 budget permit applications	None.	Lists elements concerning the CO_2 budget source for which the application is submitted. Needed in order for the program to operate properly.
Article 4	Compliance Certification		
9VAC5-140-6170	Compliance certification report	None.	Requires the source to certify whether each CO_2 budget unit was operated in compliance with the requirements of the CO_2 Budget Trading Program. Needed in order for the program to operate properly.
9VAC5-140-6180	Action on compliance certifications	None.	Explains how the compliance certification is reviewed. Needed in order for the program to operate properly.
Article 5	CO_2 Allowance Allocations		
9VAC5-140-6190	Base budgets	None.	Base budgets are established from 2020 onward. In the original proposal, the board sought comment on whether the initial Virginia CO_2 Budget Trading Program base budget for 2020 should be 33 million tons or 34

			million tons, and declining accordingly by 3% per year. Needed to effect the carbon pollution reduction that ED 11 require of this regulation.
9VAC5-140-6200	Undistributed and unsold CO_2 allowances	None.	Explains how the department may retire undistributed and unsold allowances. Needed for the program to operate properly.
9VAC5-140-6210	CO_2 allowance allocations	None.	Describes how the department will allocate allowances. CCR and ECR allowances as described in Tables 140-5A and B are tied to the 2020 base budget and as such the board is seeking comment as to whether these numbers should be tied to a base budget of 33 million tons or 34 million tons. Needed to effect the carbon pollution reduction that ED 11 requires of this regulation.
9VAC5-140-6211	CO_2 allowance allocations, DMME allowances	None.	Requires that 5% of the base or adjusted budget allowances be allocated to DMME. Needed in order to assure the development of programs that lower electricity demand and reduce the cost of the program.
9VAC5-140-6215	CO_2 allocation methodology		Describes the methodology for allocating allowances using net electric output. Needed for the program to operate properly.
Article 6	CO_2 Allowance Tracking System	--	--
9VAC5-140-6220	CO_2 Allowance Tracking System accounts	None.	Establishes a system in order for tracking compliance accounts. Needed in order for the program to operate properly.
9VAC5-140-6230	Establishment of accounts	None.	Explains how compliance accounts are established and managed. Needed in order for the program to operate properly.
9VAC5-140-6240	CO_2 Allowance Tracking System responsibilities of CO_2 authorized account representative.	None.	Requires that all submissions pertaining to the account are made only by the authorized account representative. Needed in order for the program to operate properly.
9VAC5-140-6250	Recordation of CO_2 allowance allocations	None.	Describes how the department records allowances. Needed in order for the program to operate properly.
9VAC5-140-6260	Compliance	None.	CO_2 allowances that meet certain criteria are available to be

			deducted in order for a source to comply with the CO_2 requirements for a control period. Needed in order for the program to operate properly.
9VAC5-140-6270	Banking	None.	Requires that CO_2 allowances remain in account until deducted or transferred. Needed in order for the program to operate properly.
9VAC5-140-6280	Account error	None.	Allows corrections to be made. Needed in order for the program to operate properly.
9VAC5-140-6290	Closing of general accounts	None.	Describes how to close an account. Needed in order for the program to operate properly.
Article 7	CO_2 Allowance Transfers	--	--
9VAC5-140-6300	Submission of CO_2 allowance transfers	None.	Specifies how to submit transfers. Needed in order for the program to operate properly.
9VAC5-140-6310	Recordation	None.	Describes the recordation of transfers. Needed in order for the program to operate properly.
9VAC5-140-6320	Notification	None.	Explains notification of transfers to each party. Needed in order for the program to operate properly.
Article 8	Monitoring and Reporting	--	--
9VAC5-140-6330	General requirements	None.	Generally requires a source to comply with monitoring, recordkeeping and reporting requirements as provided in this regulation and 40 CFR Part 75. Needed to assure that all pertinent state and federal requirements are met.
9VAC5-140-6340	Initial certification and recertification procedures	None.	Facilities may be exempt under certain circumstances. Needed in order for the program to operate properly.
9VAC5-140-6350	Out-of-control periods	None.	What to do when a monitoring system fails to meet QA/QC or other requirements. Needed to assure compliance.
9VAC5-140-6360	Notifications	None.	Notification requirement. Needed in order for the program to operate properly.
9VAC5-140-6370	Recordkeeping and reporting	None.	Monitoring plan recordkeeping and reporting requirements. Needed to assure compliance.
9VAC5-140-6380	Petitions	None.	How to request approval for an alternative to any requirement of 40 CFR Part 75. Needed to assure compliance.
9VAC5-140-6390	Reserved	None.	

9VAC5-140-6400	Additional requirements to provide output data	None.	Additional steps to be taken when determining output. Needed in order for the program to operate properly.
Article 9	Auction of CO_2 CCR and ECR allowances	--	--
9VAC5-140-6410	Purpose	None.	General purpose of the article. Needed to provide clarity.
9VAC5-140-6420	General requirements	None.	Describes information required in the auction notice, rules for sale of allowances, information on the reserve price, and withholding ECR allowances from an auction. Needed in order for the auction to operate.
9VAC5-140-6430	Consignment auction	None.	How conditional allowances are auctioned at consignment and converted to allowances used for compliance. Needed in order for the auction to operate.
9VAC5-140-6435	Other auction	None.	Allows participation in a direct auction if permitted by the General Assembly. Needed in the event a direct auction is required.
Article 10	Program Monitoring and Review	--	--
9VAC5-140-6440	Program monitoring and review	None.	Requires evaluation of program impacts specific to Virginia, including impacts on environmental justice communities. Needed to monitor impacts on Virginia and certain communities.

Attachment 11

townhall.virginia.gov

Final Regulation
Agency Background Document

Agency name	State Air Pollution Control Board
Virginia Administrative Code (VAC) citation(s)	Part VII, 9VAC5-140
Regulation title(s)	Regulation for Emissions Trading
Action title	Establish a new regulation to reduce and cap carbon dioxide (CO_2) from fossil fuel-fired electric power generating facilities by means of an interstate trading program (Revision C17)

This information is required for executive branch review and the Virginia Registrar of Regulations, pursuant to the Virginia Administrative Process Act (APA), Executive Order 14 (as amended, July 16, 2018), the Regulations for Filing and Publishing Agency Regulations (1 VAC7-10), and the *Virginia Register Form, Style, and Procedure Manual for Publication of Virginia Regulations.*

Brief Summary

Please provide a brief summary (preferably no more than 2 or 3 paragraphs) of this regulatory change (i.e., new regulation, amendments to an existing regulation, or repeal of an existing regulation). Alert the reader to all substantive matters. If applicable, generally describe the existing regulation.

The State Air Pollution Control Board adopted a proposed regulation to establish the Virginia CO_2 Budget Trading Program. The regulation, as originally proposed, included provisions to (i) implement a declining cap on carbon emissions and establish an allowance that will be issued for each ton of carbon emitted by an electricity generating facility, which can then decide whether to reduce carbon emissions and sell the resulting additional allowances or not reduce carbon emissions and make up the difference with purchased allowances; (ii) establish a consignment auction as the mechanism for determining the cost of allowances; (iii) provide that a cost containment reserve allowance will be offered for sale at an auction for the purpose of containing the cost of CO_2 allowances in the event of higher than anticipated emission reduction costs and that an emission containment reserve allowance will be withheld from sale at an auction for the purpose of additional emission reduction in the event of lower than anticipated emission reduction costs; (iv) implement monitoring, recording, and recordkeeping requirements; and (v) allocate conditional allowances to the Department of Mines, Minerals and Energy.

Since publication of the proposed regulation in 34:10 VA.R. 924-959 January 8, 2018, the board revised the original proposal, which included two options on the base budget of 33 and 34 million tons. The board approved a new base budget of 28 million tons based on new modeling and other information. The new

base budget of 28 million tons will determine, based on a 3.0% annual reduction, the annual budgets and allocations for future years. These requirements apply to fossil fuel-fired electric generating facilities.

Other substantive changes in the re-proposed action include (i) the recognition of offsets from other participating states, (ii) clarification of the exemption of fossil fuel units from CO_2 accounting, (iii) a more detailed description of exempt industrial sources, (iv) a more detailed description of how the cost containment reserve will be managed, (v) a new section allowing for participation in a non-consignment auction, and (vi) a new section requiring program monitoring and review.

Acronyms and Definitions

Please define all acronyms used in the Agency Background Document. Also, please define any technical terms that are used in the document that are not also defined in the "Definition" section of the regulations.

ACE - Affordable Clean Energy Rule
CCR - Cost Containment Reserve
CFB - circulating fluidized bed technology
CHP - combined heat and power
CO_2 - carbon dioxide
CPP - Clean Power Plan
CSAPR - Cross-State Air Pollution Rule
CSP - competitive service provider
DEQ - Department of Environmental Quality
DMME - Department of Mines, Minerals and Energy
ECR - Emissions Containment Reserve
EGU - electric generating unit
ED 11 - Executive Directive 11
EJ - environmental justice
EO 57 - Executive Order 57
EPA - U.S. Environmental Protection Agency
GHG - greenhouse gas
GTSA - Grid Transformation and Security Act
GW - gigawatt
IOU - investor owned utility
IPM - Integrated Planning Model
IRP - Integrated Resource Plan
MW - megawatt
MWh - megawatt hour
NAAQS - National Ambient Air Quality Standards
NGCC - natural gas-fired combined cycle
NO_X - nitrogen oxides
PJM - PJM Interconnection
PM - particulate matter
PSD - Prevention of Significant Deterioration
RGGI - Regional Greenhouse Gas Initiative
SCC - State Corporation Commission
SO2 - sulfur dioxide
VRE - voluntary renewable set-aside
WCI - Western Climate Initiative
WHP - waste heat to power

Statement of Final Agency Action

Please provide a statement of the final action taken by the agency including: 1) the date the action was taken; 2) the name of the agency taking the action; and 3) the title of the regulation.

On April 19, 2019, the State Air Pollution Control Board took final action to amend the Regulation for Emissions Trading by adopting a new regulation, "CO_2 Budget Trading Program" (Part 7 of 9VAC5-140). The regulatory action is to be effective as provided in the Administrative Process Act.

Mandate and Impetus

Please list all changes to the information reported on the Agency Background Document submitted for the previous stage regarding the mandate for this regulatory change, and any other impetus that specifically prompted its initiation. If there are no changes to previously-reported information, include a specific statement to that effect.

There are no changes to previously reported information known to the agency.

Legal Basis

Please identify (1) the agency or other promulgating entity, and (2) the state and/or federal legal authority for the regulatory change, including the most relevant citations to the Code of Virginia or Acts of Assembly chapter number(s), if applicable. Your citation must include a specific provision, if any, authorizing the promulgating entity to regulate this specific subject or program, as well as a reference to the agency or promulgating entity's overall regulatory authority.

Section 10.1-1308 of the Virginia Air Pollution Control Law (Title 10.1, Chapter 13 of the Code of Virginia) authorizes the State Air Pollution Control Board to promulgate regulations abating, controlling and prohibiting air pollution in order to protect public health and welfare. Written assurance from the Office of the Attorney General that the State Air Pollution Control Board possesses the statutory authority to promulgate the proposed regulation amendments is available upon request.

Promulgating Entity

The promulgating entity for this regulation is the State Air Pollution Control Board.

State Requirements

Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from the Electric Power Sector and Growing Virginia's Clean Energy Economy," directs the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural Resources, to take the following actions in accordance with the provisions and requirements of Virginia Code § 10.1-1300 et seq., and Virginia Code § 2.2-4000, et seq.:

1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit CO_2 from electric power facilities that:

a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of CO_2 allowances through a multi-state trading program; and

b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on CO_2 emissions imposed in other states with such limits.

2. By no later than December 31, 2017, present the proposed regulation to the State Air Pollution Control Board for consideration for approval for public comment in accordance with the Board's authority pursuant to Virginia Code § 10.1-1308.

Purpose

Please explain the need for the regulatory change, including a description of: (1) the rationale or justification, (2) the specific reasons the regulatory change is essential to protect the health, safety or welfare of citizens, and (3) the goals of the regulatory change and the problems it's intended to solve.

The regulation is needed to control CO_2 emissions in order to protect the public's health and welfare. The proposed regulation is being developed in order to meet the direction of Governor McAuliffe's Executive Directive 11 (2017), "Reducing Carbon Dioxide Emissions from the Electric Power Sector and Growing Virginia's Clean Energy Economy," which states:

There is no denying the science and the real-world evidence that climate change threatens the Commonwealth of Virginia, from our homes and businesses to our critical military installations and ports. Rising storm surges and flooding could impact as many as 420,000 properties along Virginia's coast that would require $92 billion of reconstruction costs.

The challenges and costs of bolstering resilience and minimizing risk are too great for any locality to bear alone. While the impacts are significant, there are technologies in the clean energy sector that could help mitigate these impacts while simultaneously creating jobs in twenty-first century industries. The number of solar jobs in Virginia has grown by 65 percent in the last year alone, and Virginia is now the ninth fastest growing solar jobs market in the country. Revenue for clean energy businesses in Virginia has increased from $300 million in 2014 to $1.5 billion in 2016. Through state leadership, Virginia can face the threats of climate change head on and do so in a way that makes clean energy a pillar of our future economic growth and a meaningful part of our energy portfolio.

With these considerations in mind, I issued Executive Order 57 (EO 57) on June 28, 2016. Under EO 57, I directed the Secretary of Natural Resources to convene a work group to study and recommend methods to reduce carbon dioxide emissions from electric power facilities and grow the clean energy economy within existing state authority. The group consisted of the Secretary of Natural Resources, the Secretary of Commerce and Trade, the Director of the Virginia Department of Environmental Quality, the Director of the Virginia Department of Mines, Minerals and Energy, and the Deputy Attorney General for Commerce, Environment, and Technology. This group facilitated extensive stakeholder engagement over the last year, including six in-person meetings and a ninety-day public comment period, before compiling its recommendations and submitting a final report to me on May 12, 2017.

Among the most significant recommendations from the group is the need to develop regulations limiting the total amount of carbon dioxide emitted from electric power facilities. Given the nature of the climate change threat and the promise of clean energy solutions, I agree with this recommendation.

Accordingly, pursuant to the authority vested in me as the Chief Executive Officer of the Commonwealth, and pursuant to Article V of the Constitution and the laws of Virginia, I hereby direct the Director of the Department of Environmental Quality, in coordination with the Secretary of Natural Resources, to take the following actions in accordance with the provisions and requirements of Virginia Code § 10. 1-1300, et seq. and Virginia Code § 2.2-4000, et seq.:

1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit carbon dioxide emissions from electric power facilities that:

a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of carbon dioxide allowances through a multi-state trading program; and

b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on carbon dioxide emissions imposed in other states with such limits.

2. By no later than December 31, 2017, present the proposed regulation to the State Air Pollution Control Board for consideration for approval for public comment in accordance with the Board's authority pursuant to Virginia Code § 10. 1-1308.

Additionally, Executive Order 57 Work Group's "Report and Final Recommendations to the Governor" states that:

> The Work Group received a number of presentations and written comments from stakeholders advocating for a regulation to limit carbon dioxide from power plants. These comments included recommendations that the Commonwealth join or participate in the Regional Greenhouse Gas Initiative (RGGI) or another regional trading program, that a price be put on carbon, and that Virginia strive to reduce its greenhouse gases by 30 to 40 percent by the year 2030. . . . Although many stakeholders provided feedback focused on specific in-state targets (such as 30x30), the Work Group believes that it is important and necessary that Virginia work through a regional model, like the established and successful RGGI, in order to achieve lower compliance costs and address the interstate nature of the electric grid.

The Work Group recommends that the Governor consider taking action via a regulatory process to establish a "trading-ready" carbon emissions reduction program for fossil fuel fired electric generating facilities that will enable participation in a broader, multi-state carbon market. DEQ has addressed the issue of how to participate in a regional trading program by working with RGGI because as of this writing, RGGI is the only practicable regional trading program with which Virginia can participate. Given the need to establish a mechanism for an emissions trading program, consideration of the RGGI program is appropriate; however, the draft proposal does not limit Virginia's participation to RGGI.

Substance

Please briefly identify and explain the new substantive provisions, the substantive changes to existing sections, or both. A more detailed discussion is provided in the "Detail of Changes" section below.

1. The primary purpose of the regulation is to implement a declining cap on carbon emissions. The administrative means of accomplishing this will be effected by linking Virginia to RGGI, which is an established emissions trading program. An allowance will be issued for each ton of carbon emitted by an electricity generating facility. The company must then decide if it will reduce carbon emissions and sell the resulting additional allowances, or if it will not reduce carbon emissions and make up the difference with purchased allowances. The original proposal included two options on the base budgets, 33 million tons and 34 million tons. The board selected 28 million tons, which will determine, based on a 3% annual reduction, the annual budgets and allocations for future years.

2. The mechanism for determining the cost of allowances will be a consignment auction.

3. A cost containment reserve allowance will be offered for sale at an auction for the purpose of containing the cost of CO_2 allowances in the event of higher than anticipated emission reduction costs. An emission containment reserve allowance will be withheld from sale at an auction for the purpose of additional emission reduction in the event of lower than anticipated emission reduction costs.

4. Monitoring, recording, and recordkeeping requirements will be implemented to track compliance.

5. Conditional allowances will be allocated to the Department of Mines, Minerals and Energy (DMME) in order to assist the department for the abatement and control of air pollution, specifically, CO_2.

6. In conjunction with program monitoring and review, impacts specific to Virginia will be evaluated, including economic, energy and environmental impacts, and impacts on vulnerable and environmental justice communities.

Issues

Please identify the issues associated with the regulatory change, including: 1) the primary advantages and disadvantages to the public, such as individual private citizens or businesses, of implementing the new or amended provisions; 2) the primary advantages and disadvantages to the agency or the

Commonwealth; and 3) other pertinent matters of interest to the regulated community, government officials, and the public. If there are no disadvantages to the public or the Commonwealth, include a specific statement to that effect.

1. Public: The primary advantage to the public would be health and welfare benefits associated with controlling carbon pollution. The program is designed to avoid any significant economic impacts.

2. Department: No significant advantages or disadvantages to the department have been identified. There may be a minor impact in terms of administering a new program.

Requirements More Restrictive than Federal

Please list all changes to the information reported on the Agency Background Document submitted for the previous stage regarding any requirement of the regulatory change which is more restrictive than applicable federal requirements. If there are no changes to previously-reported information, include a specific statement to that effect.

There are no applicable federal requirements. DEQ notified the Senate Agriculture, Conservation and Natural Resources Committee, the Senate Commerce and Labor Committee, the House of Delegates Agriculture, Chesapeake and Natural Resources Committee, and House of Delegates Commerce and Labor Committee of this regulatory action in November 2017.

Agencies, Localities, and Other Entities Particularly Affected

Please list all changes to the information reported on the Agency Background Document submitted for the previous stage regarding any other state agencies, localities, or other entities that are particularly affected by the regulatory change. If there are no changes to previously-reported information, include a specific statement to that effect.

There are no changes to previously reported information known to the agency.

Public Comment

Please summarize all comments received during the public comment period following the publication of the previous stage, and provide the agency response. Ensure to include all comments submitted: including those received on Town Hall, in a public hearing, or submitted directly to the agency or board. If no comment was received, enter a specific statement to that effect.

Comments received during the initial public comment period (January 8 through April 9, 2018):

Commenter	Comment	Agency response
1. About 155 individual commenters	General support for the proposal was expressed.	Support for the proposal is appreciated.
2. About 415 emails, cards and petition sponsored by Faith Alliance	Climate disruption poses increasing threats to Virginians' public health, national security, environment and economy. Virginia has joined states, cities and counties across the country that understand all levels of government must act on climate if we are to protect our	Support for the proposal is appreciated. Specific issues identified by the commenters are discussed in further detail below.

for Climate Solutions and Interfaith Power and Light; petition sponsored by Virginia Chapter of the Sierra Club, 2717 signatures	communities in light of the Trump administration's continued attacks on environmental protections. I support setting the strongest possible standard to cut Virginia emissions from power plants through participation in a carbon market. This is a critically important step toward carbon pollution reductions. I request that DEQ use its authority to adopt and implement a final standard that caps and reduces carbon pollution as rapidly as possible, beginning as soon as possible. The 2020 base year should be less than 33 million tons. Cover carbon pollution from biomass, which can be worse than energy generated by fossil fuels. Set the expectation of continued carbon reductions after 2030. Monitor implementation in order to respond to disproportionate environmental burden experienced by front-line, low-income and vulnerable communities.	
3. About 550 sponsored emails and Town Hall comments	I am thrilled to see that the board has approved draft regulations to cap carbon emissions. Without immediate and bold action, climate change will present unprecedented challenges to our coastal communities and would harm communities of color at a much higher rate than others. I support a final carbon rule that has the strongest possible cap on carbon emissions from Virginia's power plants through a carbon market. I also support supplemental legislation that would allow Virginia to invest a portion of the carbon market revenue in coastal resilience. The 2020 base year emissions cap should be between 30 and 32 million tons. The cap should cover biomass facilities, which can be worse for the climate than fossil fuel power plants. Carbon emission reductions past 2030 should be addressed. The plan should address the needs of low-income and frontline communities by establishing implementation monitoring and rapid response guidelines that can detect any instances of disproportionate environmental burdens.	Support for the proposal is appreciated. Specific issues identified by the commenters are discussed in further detail below.
4. About 45 sponsored emails and Town Hall comments	I'm writing to voice my support of a regulation that cuts carbon pollution from power plants and allows us to trade carbon allowances with other states. With no help coming from the federal level in addressing climate change, it's up to Virginia to act. By cutting carbon emissions in Virginia, we have the opportunity to protect public health and safety while creating jobs in the carbon-neutral renewable energy and energy efficiency sectors. And because we're joining a coalition of other states with carbon caps, action we take in Virginia is greater than the sum of its parts. Carbon trading also creates the opportunity to bring revenue back to the state to aid in clean energy deployment and resiliency, money we shouldn't leave on the table or gift to our utilities. I urge you to proceed with a strong regulation that shows Virginia is a leader in addressing climate change and takes its responsibility seriously.	Support for the proposal is appreciated.
5. 4 emails	I support Governor Northam's Clean Energy Virginia Initiative. To address the threat of climate change to our	Support for the proposal is appreciated.

	coast and public health, the state must reduce pollution from fossil fuel-fired power plants and expand renewable energy. The initiative calls for a 30% reduction in carbon emissions by 2030 and will enable Virginia to trade carbon allowances with 9 other states, a market-based mechanism that will bring revenue back to Virginia while also cutting harmful air pollution. That is why I urge the board to adopt the plan to fight climate change, protect health, and create economic growth.	
6. 5 emails	I am profoundly proud Virginia is preparing an initiative to reduce carbon and other toxic pollutants from utility power plants. Yet, how Virginia implements this program is critical to its success. And I expect success. A successful plan will: improve public health, expand clean energy development, save all electric customers money and improve our state's competitiveness, protect living creatures and reduce climate change burdens on future generations of Virginians, ensure Virginia is "carbon trading ready," and require that baseline measures of carbon emissions be real and annual reductions be real and ambitious.	Support for the proposal is appreciated.
7. Petition sponsored by Natural Resources Defense Council (NRDC), 884 signatures	I urge DEQ to put a strong limit on carbon pollution and to reduce that pollution as rapidly as possible, in a way that grows the state's renewable energy economy and reduces energy bills through energy efficiency. Virginians are ready for strong action and we--along with future generations--applaud you for stepping up on climate and support your work to finalize a strong statewide carbon rule.	Support for the proposal is appreciated.
8. Petition sponsored by Virginia League of Conservation Voters (LCV), 1551 signatures	To address the climate change that threatens our coast and public health, Virginia must reduce pollution from fossil fuel-fired power plants and expand renewable energy. Governor Northam's Clean Energy Virginia Initiative is the solution for addressing climate change while growing Virginia's economy, reducing greenhouse gas (GHG) emissions, and protecting Virginias' air. The initiative calls for a 30% reduction in carbon emissions by 2030 and will enable Virginia to trade carbon allowances with 9 other states, a market-based mechanism that will bring revenue to Virginia while cutting harmful air pollution.	Support for the proposal is appreciated.
9. Petition sponsored by Environment Virginia, 207 signatures	From dozens of smog-ridden days to rising sea levels, Virginians are feeling the impacts of climate change. Virginia needs to move forward with plans to protect our communities from climate change and follow the steps that other states have taken to cut pollution while the federal government stalls. I request that DEQ adopt the strongest possible standard to cut carbon emissions by ensuring that Virginia cuts carbon pollution as quickly and as soon as possible. The 2020 emissions cap should be between 30 and 32 million tons. This cap should mirror the cap that states in RGGI, the nation's most successful regional climate program, are taking to reduce emissions 30% by 2030. The rule should set the expectation that carbon pollution will continue to be	Support for the proposal is appreciated. Specific issues identified by the commenters are discussed in further detail below.

	reduced after 2030. This standard should take into account Virginia's untapped energy efficiency potential and all planned renewable energy developments in Virginia.	
10. Gianluigi Ciovati	I encourage a base budget of 33 million tons, and applicability to all fossil fuel power generating units. I request DEQ to include biomass into the fossil fuel category as recent expansion of such power generating units highlighted the issues of the long timeframe required to capture the emitted CO_2 by re-forestation and that, in order to meet increasing demand, not all the material used to make the fuel comes from waste but from an increasing fraction is coming from tree logging. The regulation should result in a greater economic benefit than cost: energy efficiency is the lowest cost resource to reduce CO_2 pollution while meeting energy demand. Dominion ranks 50th in efficiency efforts among the 51 largest electric utilities in the nation. Strong energy efficiency policies would result in close to 40,000 new jobs by 2030. More jobs are predicted to be created by further increase in true renewable energy sources such as wind and solar. As the disruptive effects of climate change are becoming more evident, the risk and the cost of inaction on reducing CO_2 emission is too high and the regulation is a positive step in the right direction.	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.
11. Virginia Clean Cities (VCC)	Regulation of carbon emissions is critically important for Virginia, a coastal state with a wide distribution of energy sources. VCC is an alternative fuel vehicle coalition, working with governments at state, regional, local, and federal level with businesses and vehicle operators in an effort to reduce GHG emissions in transportation. While Virginia's largest source of CO_2 and GHGs is the transportation sector, we recognize the value of reviewing our existing electricity portfolio and working toward cleaner sources of domestic fuels. VCC strongly supports involvement in RGGI. Many RGGI states have advanced transportation projects to mitigate the significant GHGs from transportation. VCC include electric vehicles in our portfolio, as well as hydrogen, ethanol and natural gas vehicles all utilizing electricity from the grid in some manner. Further, by using cleaner domestic fuels such as biomass, natural gas, or renewable energy for Virginia's electricity, we can benefit our economy and move Virginia forward.	Support for the proposal is appreciated. Although the transportation sector is not directly addressed in this proposal, DEQ agrees that it is an important consideration in controlling carbon emissions.
12. B. Eli Fishpaw	It is a breath of fresh air that Virginia is embarking on an effort to reduce GHG from power production. Recognizing the measure of what causes climate change is essential to learning to live within the Carbon Cycle. Without active recognition that the license to emit carbon into the atmosphere must be limited, it is difficult to imagine meeting the challenge. We focus our efforts to address human caused climate change with an acceptance that excess carbon emissions (primarily CO_2) is the problem. Therefore, all solutions must have a goal of limiting carbon emissions to less than the amount	The information provided by the commenter is appreciated. The primary purpose of the regulation is to address carbon pollution via linking to RGGI in accordance with ED 11; therefore, no fee-and-dividend approach is being considered under this regulatory action.

	that can be sequestered out of the atmosphere. Most human carbon emissions are sequestered by nature. These emissions are in the Carbon Cycle. Under a Net Zero Carbon Emissions Economy, human emissions would equal the amount that can be sequestered. At this level, we stop adding CO_2 concentration to the atmosphere. However, we are not reducing the CO_2 concentration either. When our emissions are higher than what nature can sequester, the over emissions are added to past years over emissions. We need to limit our emissions to less than what can be sequestered to live in the carbon cycle. This must be understood before the policies that can meet the challenge are combined with a determined effort by the public to meet this challenge. The license to emit CO_2 into the atmosphere should be shared fairly. Using the data from 2007 IPCC on natural and human emissions, to achieve net zero (balanced budget) average per person emissions need to be limited to 2.6 tons CO_2/year. This would be a "Fair Share." At this level, all emissions are sequestered to achieve a Net Zero Carbon Emissions Economy. Cap and Trade allows emissions in exchange for supporting some activity that reduces CO_2 emissions, not from net zero, but from our historically high rate of emissions. In the proposal it provides financial support for high emissions electric production to reduce their emissions through technology. The cap and trade model for pricing carbon has the advantage of functioning in the background without asking sacrifice or understanding of the individual. Getting the public to understand that there is a demand by nature to limit to the amount of carbon emissions is essential to achieving it. Existing high emissions electric generation should not be rewarded by the entitlement license to emit that they can sell by reducing. I promote a continually escalating carbon tax with a rebate for the fair share of emissions and paying people to carbon capture and permanently store in the ground. A carbon tax can be similar to that proposed by Citizens Climate Lobby that charges a fee/ton CO_2 at the source and returns that fee equally to all citizens. By creating a modest fee, financial incentives are created for reducing energy and reward the development of renewable energy. As households and businesses evaluate future investments, their spreadsheets will show that investing in improvements offers the highest rate of return. This creates economic growth in the conservation, regeneration and renewable energy sectors. However, because all fees are redistributed equally, there is no money for sequestering carbon through technology. With a tax similarly structured, with a rebate for the tax on the Fair Share, creates funding for paying people to sequester carbon and preserving	

	existing inventories of terrestrial carbon such as mature forest. Biochar is a way of permanently capturing carbon through pyrolysis. Adding the resulting charcoal to the ground increases retention of moisture, micronutrients and microorganisms. I propose that we pay people to create biochar at half the current rate of the carbon tax. This will insure a net reduction in CO_2 for the whole process. As promising as this is, biochar is not substitute for reducing emissions.	
13. L. David Roper	Deploying wind energy and solar energy in the U.S. can supply the demand. Using time-of-day availability of solar, on-shore wind and off-shore wind power in the four U.S. time zones and reasonable values of availability, wind and solar power can closely supply the time-of-day demand for electricity. Modest battery storage can fill in the small differences between solar/wind electricity production and demand. John Randolph of Virginia Tech has provided the following data about the economic favorability of renewable energy: Nuclear: $148/MWh; Coal: $102/MWh; Natural-gas-combined cycle: $60/MWh; Utility solar: <$50/MWh; Wind: <$45/MWH; Efficiency: <$25/MWh; Lithium-ion batteries: $209/kWh in 2017 and expected to be $100/kWh by 2025. Virginia has moderate experience with solar farms and no experience with wind farms compared to its neighboring states. Virginia would do well to study and emulate renewable energy development in North Carolina, which has similar topology to Virginia. Virginia's coal counties could lead in this. The major fossil-fuels state of Texas is way ahead of Virginia in solar energy and wind energy. It is not wise to depend on natural gas for electricity production over the long-term. Methane leaks from drilling sites and pipelines, over a 100-year period, is 34 times more potent that CO_2 at trapping heat. Extracting and burning methane may be as potent for global warming as mining and burning coal to produce electricity depending on the amount of fugitive methane. Increase the percent of electricity generation that AEP and Dominion allow for rooftop net metering. Do not charge for transmission for net metering because local solar generation greatly reduces the need for transmission lines. In fact, the price paid for rooftop solar should be greater than the cost of grid electricity. Allow communities to create solar farms or purchase from commercial solar farms that produce a given fraction of electricity for the community. Require power companies to build or buy more solar/wind energy, build community microgrids for grid resiliency, build battery backup in microgrids for renewable-energy smoothing and grid	The commenter's remarks on renewable energy are appreciated. The specific suggestions for developing renewable technologies is not directly within the purview of the board or this regulatory action, although DEQ agrees that they are important tools for carbon control. The commenter's concerns about methane are acknowledged; however, as the specific purpose of this regulation is to enable linking to RGGI, methane is not addressed in this regulation.

	resiliency. Virginia needs to develop offshore wind farms.	
14. Rees Shearer, Energizing Renewable Growth in Holston Valley and Emory Climate Collaborative; Hannah Ingram	I am pleased and proud that Virginia is preparing an initiative to reduce carbon and other toxic pollutants from utility power plants over time. How Virginia implements this program is critical to its success. Success means improving public health, expanding clean energy employment, saving electric customers money, improving competitiveness, protecting the creatures which share this land with us, and beginning to reduce climate burdens that we have been placing on the backs of future generations. In order to achieve success, DEQ must ensure that Virginia's carbon reduction regulation is trading ready by adopting a market-based approach. Joining RGGI is the best way to make this happen. DEQ will also need to prepare to auction carbon credits, if the General Assembly refuses to join RGGI. The baseline must not be inflated, and must include large industrial boilers. The 2020 base year emissions cap should be no more than 32 million tons and initiate meaningful and deliberate carbon pollution reductions of 3% per year. To protect our forests, the program should include biomass burning facilities. Virginia is ripe for improvements in energy efficiency and solar energy. A 2015 study determined that if Virginia reduced carbon pollution by embracing energy efficiency and clean energy, households could save a yearly average of $415. Adoption of strong customer energy efficiency improvement standards benefits all customers, but especially those with low or moderate incomes. According to the Solar Foundation's 2017 Solar Job Census, Virginia could create over 50,000 new solar energy jobs. But that's if we adopt solar-friendly policies, sufficient to meet just 10% of residential electric load over the next five years. In 2017, Virginia already boasted 3565 jobs in the solar industry - already triple that of coal mining. In southwest Virginia we desperately need clean energy jobs to replace lost coal employment. But Virginia's utilities quietly thwart pro-clean energy policies and job growth. A current example is legislation that would allow power purchase agreements to finance and install solar facilities, but the bill excludes all residential, commercial and industrial customers. Only non-profit organizations would benefit. We have the resources to make clean energy bloom in southwest Virginia--a ready workforce of trained solar technicians graduating from our community colleges and a healthy number of experienced building contractors; developable unreclaimed mine lands and rural electric infrastructure orphaned by the coal industry; and communities accustomed to living alongside the energy industry. These resources offer prime opportunity for both dispersed and utility-scale solar development and employment right here.	Support for the proposal is appreciated. DEQ agrees that energy efficiency and renewable energy are important tools for controlling carbon pollution, and the 5% set-aside is intended for this purpose. Specific issues identified by the commenter are discussed in further detail below.

	Systematically cutting carbon pollution cuts toxic pollutants from electric generating stations as well, offering a dividend in public health improvements. Enhanced public health makes the case for a program of utility carbon reductions by itself. A healthy carbon-cutting program also keeps physically vulnerable Virginians healthy. A strong carbon reduction program for Virginia, shows that we are doing our part to slow the ravages of sea level rise, storm volume and intensity, drought, heat wave, habitat loss, and disease spread, all of which are the marks of a changing climate.	
15. Pam Clough, Environment Virginia	I am concerned about climate change because it threatens our environment and health. My family and friends have experienced extreme weather events that were likely made worse by climate change. Though this is a national and global problem, change starts at home. I support setting the strongest possible standard to cut Virginia emissions from power plants and join RGGI, the most successful regional climate and clean energy program in the country. We can work across party lines to cut pollution and protect our climate while the federal government stalls on climate action. RGGI states have seen pollution decrease by half since 2005 and consumers have saved over $773 million on their energy bills. I request that DEQ adopt and implement a final standard that cuts carbon pollution as quickly and as soon as possible. The 2020 base year cap should be 30-32 million tons with a baseline at the lower end of that range. The cap trajectory should parallel the model that other states in RGGI have implemented to reduce emissions 30% by 2030. The cap should incorporate all planned renewable energy developments in Virginia. The program should set the expectation of continued annual carbon pollution reductions after 2030. Virginia's baseline should also account for the state's untapped energy efficiency potential and incorporate savings that can reasonably be achieved between now and 2020. The American Council for an Energy Efficient Economy ranked Virginia 29th in its most recent State Energy Efficiency Scorecard, placing Virginia well behind all of the RGGI states. Global warming is exacerbating pollution and harming our health. In 2015 Roanoke residents breathed elevated levels of smog pollution 31 days out the year. Residents in the RGGI states are living longer and healthier lives thanks to cleaner air. The program is estimated to have saved 600 lives and prevented 9,000 asthma attacks in 6 years. An Abt Associates report shows that Virginia has already secured $380 million worth of health benefits because pollution across the region has gone down. Virginia's participation would significantly reduce	Support for the proposal is appreciated. The commenter's concerns about climate change and discussion of the health benefits of RGGI are well taken. Specific issues identified by the commenter are discussed in further detail below.

	pollution even further, accelerating the health benefits we have already seen.	
16. Drema Khraibani, Hannah Funk, Lindsey Mendelson; Environment Virginia	Climate change poses increasing threats to Virginians' environment and health. In 2015 residents of northern Virginia breathed elevated levels of smog pollution 99 days out the year. Smoggy skies are expected to grow worse as temperatures rise. This means that we can anticipate more code red days and asthma attacks. The blacklegged tick that can transmit Lyme disease is expanding its presence in Virginia and reported cases of Lyme disease are on the rise. As noted in the Executive Directive, rising storm surges and flooding could impact as many as 420,000 properties along Virginia's coast that would require $92 billion of reconstruction costs. These health concerns can be prevented if we join RGGI. Residents in the 9 member states are living longer and healthier lives thanks to less pollution and cleaner air. The program has been estimated to have saved 600 lives and prevented 9,000 asthma attacks in just 6 years. Because of the health benefits and the many climate impacts this program can provide our state, the strongest possible standard should be set to cut Virginia emissions from power plants and join the region's market of capping and reducing emissions. I implore you to set the 2020 base year emissions cap to be 30-32 million tons with a baseline at the lower end of that range. This cap should mirror the cap that states in RGGI are taking to reduce emissions 30% by 2030. The rule should set the expectation that carbon pollution will continue to be reduced after 2030, and take into account Virginia's untapped energy efficiency potential and all planned renewable energy developments in Virginia. If Virginia links with RGGI, it would be tied to the most successful regional climate and clean energy program in the country. As we have seen across northeast and mid-Atlantic states, we can work together across party lines to cut pollution, clean our air, and protect our climate while the federal government stalls on climate action. RGGI states have seen their pollution decrease in half since 2005, generated $2.7 billion in revenue, and saved consumers $773 million on the energy bills by directly auctioning their emissions. If Virginia follows a similar model it would generate $2 billion that it could use for clean energy, energy efficiency, and coastal resilience programs.	Support for the proposal is appreciated. The commenter's concerns about health issues are well taken. Specific issues identified by the commenter are discussed in further detail below.
17. Dr. Kathleen Price and Dr. Samantha Ahdoot, Virginia Clinicians for	Patients with Lyme disease suffer from pain and inflammation in their joints, facial nerve palsies, heart arrhythmias, and chronic fatigue. Sometimes even with antibiotics, they do not recover completely. Warmer winters and earlier springs create favorable environments for tick and mosquito survival, reproduction and disease transmission. As a result, tick-borne	Support for the proposal is appreciated. The commenter's observations about health issues are well taken. Specific issues identified by the commenter are discussed in further

Climate Action	infections across the country are soaring, including in Virginia. Between 2006-16, cases of Lyme disease increased in Virginia over 3 fold. Other tick-borne illnesses have increased, including Rocky Mountain Spotted Fever. Mosquito-borne illnesses such as West Nile Virus, and possibly Zika in the future are a threat as well. February 2017 was the warmest February on record for our state. In 2018 we had dramatic temperature anomalies, with numerous days reaching 60-80 degrees. Early onset of spring warmth causes many trees and flowers to start blooming earlier and brings earlier onset to the allergy and asthma season. According to pollen count data, the tree pollen season in Richmond is now peaking one week earlier than it did in the 1980s and the peak tree pollen count is now over 50% higher. CO_2 acts as a fertilizer that makes many plants produce more pollen. Higher tree pollen increases ER and urgent care visits for allergies. As a result of decreasing air pollution, RGGI states have prevented up to 800 premature deaths and 390 non-fatal heart attacks. Policy that protects our air protects our health, and saves the public and the government money that otherwise goes to healthcare. RGGI states have avoided between $3-8 Billion in health effects costs. By participating in RGGI, Virginia can reduce the carbon pollution that is causing these changes in our climate, natural world and health. RGGI would also enable Virginia to reduce other air pollutants that threaten public health. As a result of decreased particulate matter, RGGI states have prevented 8000-9000 asthma attacks, over 200 asthma ER visits and 400-500 cases of acute bronchitis. I support the strongest possible standard to cut carbon emissions through participation in a carbon market. I ask DEQ to use its authority to adopt and implement a standard that caps and reduces carbon pollution as fast as possible. The 2020 cap should be between 30-32 million tons. The cap should include carbon pollution from biomass facilities which can be more climate-polluting than fossil fuel power. DEQ should monitor implementation so that it can rectify instances of communities being disproportionally affected by pollution.	detail below.
18. Dr. Douglas Hendren, Physicians for Social Responsibility	RGGI makes good medical sense as well as business sense for Virginians. Sourcing our energy from dirty sources carries very high costs. Abt Associates has analyzed the public health impacts of RGGI over a 5-year period, finding hundreds of avoided premature adult deaths, hundreds of avoided heart attacks, thousands of avoided asthmatic episodes, hundreds of emergency room visits and hospital admissions, tens of thousands of	Support for the proposal is appreciated. The commenter's observations about health issues are well taken. The commenter's concerns about methane are acknowledged; however,

	lost work days, and savings of $3-8.3 billion. Fossil-fuel energy imposes many hidden costs on Virginians. It shortens our lives and sickens our children. It fouls our air, congests our emergency rooms and raises our medical bills. Changes in the atmosphere have brought higher oceans and violent storms threatening coastal cities. The cost to the U.S. of extreme weather events in 2017 came to $306 billion. Virginians cannot afford to be held hostage by the fossil-fuel sector and their political operatives. It is time to make policy decisions based on scientific assessment and common sense. I support setting the strongest possible standards for cutting Virginia emissions, including an initial cap of 30 million tons, with periodic downward adjustment; continuation of the program after 2030, unless superseded by a carbon tax; no exclusion for biomass plants; and no exclusion for methane. Natural gas is worse for our health and for global warming than burning coal. Nearly all of our natural gas is obtained by fracking, which virtually all independent studies have found is associated with a greater than 5% rate of fugitive methane emissions. This makes gas worse than coal with regard to GHG emissions.	as the specific purpose of this regulation is to enable linking to RGGI, methane is not addressed in this regulation. Specific issues identified by the commenter are discussed in further detail below.
19. Roy Hoagland	Referencing Virginia Clinicians for Climate Action information: Clinicians across the state support linking with RGGI. ED 11 will help protect the health of Virginias while also saving money for the state and taxpayers. Summary of cumulative RGGI health benefits, 2009-2014, avoided health effects: 300-830 premature adult deaths, 35-390 non-fatal heart attacks, 420-510 cases of acute bronchitis, 8200-9900 asthma exacerbations, 13,000-16,000 respiratory symptoms, 180-220 hospital admissions, 200-230 asthma ER visits, 39,000-47,000 lost work days, 240,000-280,000 days of minor restricted activity. Value of avoided health effects between $3-$8.3 billion.	The information provided by the commenter is acknowledged.
20. Deborah Kushner	I'm proud to celebrate Virginia's position as the first southern state to consider joining the RGGI. Not only would overall pollution levels decline, but new clean energy jobs would help the labor sector and we would have a new funding source for energy improvements and assistance for low-income customers. Joining RGGI means the road map for Virginia is already in place. RGGI has proven successful in cutting emissions without costing too much. Emissions from power plants in RGGI states fell 5% from 2015 to 2016, and have fallen 40% from 2008, when the initiative began. I urge DEQ to adopt a much lower cap than the 33-34 million that's proposed. We need to clean air quickly, and Virginia's emissions are already very close to the 33-34 figure. All sources of carbon emissions should be included in calculations. Biomass should be included, since 3 coal powered power plants have already been converted to burn wood, and we cannot afford to have others follow suit. Our forests are being harvested at an alarming rate	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.

	to produce wood pellets and shipped overseas. The Partnership for Policy Integrity calls biomass "the new coal." Wood burning power plants are estimated to put 50% more carbon into the atmosphere than coal burning plants, per megawatt hour. Wood is not carbon neutral, since regrowing forests is anything but quick. Additionally, the plan should continue past 2030.	
21. Michael Keegan	The plan should cap and reduce carbon pollution as rapidly as possible, beginning as soon as possible. We are already way behind where we need to be. Based on starting as quickly as possible, the base year should be 2019 and the base year emissions cap should be 20 million tons. The plan should cover carbon pollution from all power plants including from biomass facilities, which can be more climate polluting than fossil fuel power plants. The plan should continue annual carbon pollution reductions in Virginia after 2030. The plan should allow for closely monitoring the implementation in order to respond to instances of disproportionate environmental burdens experienced by any communities, especially low-income and vulnerable communities that have traditionally borne the brunt of pollution.	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.
22. Kiquanda Baker	I ask that the regulations be set at a realistic yet aggressive limit in order for these regulations to have the desired impact on GHG emissions. It is a proven fact that climate change exists and that humans are the main perpetrators. The practices that have led us to this point should be discontinued. Obviously we can't shut every fossil fuel dependent industry down, but we can cut back. The regulation is essential in pioneering the clean energy transition in Virginia. The cap should be set at least between 30-32 million tons. Biomass emissions should be included because it is a fuel source more unclean than fossil fuels. Decreasing our contribution to global warming and thermal expansion would help alleviate sea level rise in Hampton Roads while we continue to create solutions for resiliency. By embracing clean and renewable energy, Virginia can mitigate the negative impacts of burning fossil fuels while boosting the economy. With low income families and communities of color being the most vulnerable to fossil fuel pollutants and the effects of climate change, we need clean energy sources that benefit all people.	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.
23. Garry Harris, Center for Sustainable Communities	We demand healthy communities and a healthy economy, where workers receive the good-paying, family sustaining clean energy jobs, and their livelihoods are protected in the meantime. There is no reason those jobs can't grow right here, and this legislation offers a path to do so. We have worked for years to help lower income communities reduce energy burdens caused by disproportionate impacts of electricity costs and its effects on the quality of life, creating choices between food, energy, and housing adequacy. ED-11 protects the health of families and communities by curbing carbon pollution that has shown to have a direct link with	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.

	enhancing climate change and is exacerbating extreme weather events. On a personal note, I have to take asthma medication on a daily basis. Implementing ED 11 will reduce harmful pollutants that contribute to dangerous smog and soot, causing heart attacks, respiratory illnesses, and even premature deaths. Virginia is the first southern state to take initiative on limiting and capping carbon pollution from fossil fuel power plants. We can take pride pushing to have energy companies take responsibility for toxic emissions that are damaging the health and environment of our communities at a time when the federal government is dismantling regulations that protect us from corporate polluters. Burning coal releases harmful toxins into the air and water, causing respiratory illnesses like asthma. RGGI states, by reducing toxic emissions and switching to cleaner energy, have successfully prevents 8,200 asthma attacks and saved 300 to 830 lives, in a five year period. The starting cap should be between 30 and 32 million tons of emissions by 2020 and continued reduction of the cap beyond 2030. Another significant polluter is biomass; biomass GHG emissions are higher than those from burning fossil fuels. ED 11 contains a woody biomass loophole, which exempts woody biomass plants from the regulation. Such giveaways to industrial polluters render Virginia's program less efficient and give Dominion an unfair economic advantage. Carbon reduction plans have vast potential to reduce climate changing, harmful emissions and expand the economy. Between 2009-14, RGGI states have successfully reduced CO_2 emissions by 35% (compared to 12% in non-RGGI states) by switching from dirty fossil fuels to clean energy. Additionally, the region saw a 21.1% economic growth (compared to 18.2% in non-RGGI states). Virginia's decision to cap carbon emissions through a market-based approach offers a great opportunity to improve the livelihood and health of low-income families and communities of color who are most vulnerable to climate change and dirty fossil fuel pollutants. ED 11 should ensure that there are emission reductions in environmental justice communities and that there is a mechanism that ensures reductions of GHG co-pollutant emissions by facilities located in or near environmental justice neighborhoods.	
24. Kiquanda Baker, Garry Harris	In 2016, the number of solar jobs in Virginia increased by 65%. If the state received 10% of its power from the sun by 2023, Virginia would see over 50,400 more jobs. Virginia's coasts can support offshore wind turbines. Renewable offshore wind energy would produce clean	The commenters' views on renewable energy are appreciated.

	energy and protect the coast from catastrophic oil and gas spills that threaten fish, tourism, and recreation. The wind industry could provide 1.5 times more jobs that offshore oil and gas, creating almost 14,000 offshore wind jobs and 5,000 manufacturing jobs by 2030.	
25. Joy Loving and Anne Nielsen, Climate Action Alliance of the Valley	Overall, this is a good regulation. It will lower Virginia's carbon emissions below what we would emit without this rule, and do it in a way that is efficient and cost effective. Virginia can reduce carbon emissions while also reducing energy costs. Linking Virginia with RGGI allows Virginia to join other RGGI states in a program with a proven track record of success in reducing carbon emissions while allowing our economy to grow. The member states of RGGI are serious about lowering their carbon emissions and would not allow Virginia to link with them if they didn't believe it would be good for them and also lower overall emissions. By linking to these RGGI states, Virginia will need to coordinate with them to not only lower our own carbon emissions, but also to ensure that member RGGI states continue to lower their carbon emissions and maintain funding for their renewable energy and energy efficiency initiatives. Unless prohibited under Virginia law, DEQ should directly auction carbon allowances, in addition to the proposed consignment format. This approach should allow market forces to operate more effectively. Distribute allowances based on energy output, not historic carbon emissions. The initial cap should be 30-32 million tons. Allowing emissions to increase makes no sense. If allowances are given to power plants based on historic carbon emissions, it will still achieve the goal of carbon emission reductions. But it will not provide a new source of income to zero-carbon energy generators. Instead, allowances should be distributed based on updated energy output. This method gives some allowances to zero-carbon energy sources, who can sell the allowances as a new source of revenue. Do not exempt any fossil fuel power generating unit owned by and located at an individual facility that generates electricity and heat from fossil fuel for the primary use of operation of the facility. Do not exempt power plants that use biofuels. The climate responds to all CO_2 molecules, regardless of their origin. Excluding biofuels would give the power industry an incentive to cut down trees to burn in power plants to avoid buying carbon allowances. Even though RGGI states exempt biofuels, Virginia has many wood-based biofuel generators. DEQ should not read the language of ED 11 too narrowly when it is clear that the impetus behind its issuance is to reduce GHG emissions. Methane, a powerful GHG about 25 times more potent	Support for the proposal is appreciated. Note that it is not possible to conduct both a consignment auction and a direct auction at the same time, and the rule will continue to implement the consignment approach while allowing for future potential participation in a conventional auction. The commenters' concerns about methane are acknowledged; however, as the specific purpose of this regulation is to enable linking to RGGI, methane is not addressed in this regulation. Additional specific issues identified by the commenter are discussed in further detail below.

	than CO_2, accounts for 9% of all U.S. GHG emissions, and almost one-third of that is estimated to come from oil and gas operations. DEQ should interpret ED 11 broadly so as to bring about as much reduction in GHG pollution as possible. The fact that the other RGGI states do not include methane does not prevent Virginia from doing so. Even if exact numbers beyond 2030 are not now known, the regulation needs language that the cap will not increase going forward. Virginia's citizens, agencies and businesses need to know what to expect for their planning purposes. If the regulation leaves open the possibility that the cap will go away or be relaxed, different long-term plans would surely result. The regulation should require close monitoring of implementation to respond to instances of disproportionate environmental burdens experienced by any communities, particularly low-income and vulnerable communities that have traditionally borne the brunt of pollution.	
26. April Moore	The regulations will be extremely important in reining in climate-damaging emissions from fossil fuel-burning power plants. With more than 99% of climate scientists around the world warning that we must get our CO_2 emissions down. Linking Virginia to RGGI is a smart, effective way to significantly reduce GHG emissions. The cap-and-trade approach relies on the free market to do what it does well, with a minimum of government involvement. We know that a cap-and-trade approach works. The RGGI states that are using it have already reduced their power plant carbon emissions by 30% since they adopted cap-and-trade in 2008. And during that time, the economies of these states have increased faster than those of the rest of the country. RGGI states have also lowered their average electricity rates by 3.4%, while the rest of the country's rates have increased by an average of 7.2%. The regulation should include a strong incentive for forest carbon offsets. Because trees take in CO_2 during photosynthesis, they sequester carbon in wood, roots, and soil. Trees are the best technology yet discovered for carbon capture and storage. In fact, scientists rank forests as the single best climate change solution. Some cap and trade programs include forest carbon offsets as a mechanism for transferring money from fossil fuel-burning utilities to forest owners as an incentive to manage their forests for increased carbon sequestration instead of timbering. Given that 62% of Virginia is forested, Virginia should follow the example of cap-and-trade programs that include forest carbon offset credits.	Support for the proposal is appreciated. Although the RGGI model rule does offer states the option to award offset allowances for projects outside of the electric power generation sector, only a single offset project has been implemented in the entire RGGI region since the program's inception. Given the uncertainty of any benefits associated with a complex offset program, DEQ will not, at this time, implement the offset option. However, DEQ does intend to recognize offset allowances generated in other RGGI states in accordance with the RGGI Model Rule, and the proposal has been amended accordingly. The issue of whether or not to implement offsets in Virginia may be addressed in ongoing program reviews.
27. Kim Hafner	We are grateful to DEQ for taking measures to save our lives by enforcing strict regulations on carbon emissions, and by creating a cap and trade initiative which will	The commenter's concerns about methane are acknowledged; however,

	protect the environment and public health. Legislation that will lead us toward 100% renewable, sustainable energy is our best hope. The initial base budget should be 33 million tons or less and decline 3% per year. Methane should be capped. Nothing that is being proposed is actually stringent enough based on the dangers incurred by daily carbon emissions. No fossil fuel power generating unit owned by an individual facility and located at that individual facility that generates electricity and heat from fossil fuel for the primary use of operation of the facility should be exempt. DEQ should be allowed to directly auction carbon allowances in addition to the proposed consignment auction format. On our small family farm, we are working to sequester carbon by planting trees, and by perennially keeping our pasture in grass. Soil that has higher amounts of carbon as a result of such sequestration holds moisture better and lessens the ground's susceptibility to drought. Soil that has sequestered carbon also has green growth that helps the earth maintain lower temperatures. How might we reward farmers for farming practices which lower carbon emissions by sequestering the carbon in similar ways? It is imperative that you establish an aggressive carbon reduction program. Ideally, this would mean bypassing natural gas and all fracking extraction and transitioning directly to renewable energy. While cap and trade initiatives are positive in that they move us away from coal, they are dangerous compromises. None of us knows if the strictest regulations on carbon will be enough to mitigate the damage that we've done in time to make a significant difference, but we do know that compromises like the RGGI cap and trade, which encourages and rewards fracking, will only guarantee more suffering. In a burning building, there is no time to agree we can try buckets when all that can save us is a fire hose.	as the specific purpose of this regulation is to enable linking to RGGI, methane and natural gas are not addressed in this regulation. As discussed in comment 28, for example, cap-and-trade programs in general, and RGGI in particular, are proven effective emissions reduction programs.
28. Jennie Moody	For 30 years I was engaged in research tracing anthropogenic chemical signatures in the atmosphere, using observations of precipitation, aerosols, and atmospheric gases like ozone to study how pollutants are transported. Working at the University of Virginia, I evaluated the origins of sulfur and nitrogen in Charlottesville precipitation, using meteorological data and atmospheric transport models and was able to establish that higher concentrations of sulfate were associated with atmospheric transport. I am proud to think that this work, along with work I did on my Ph.D. may have contributed in some small but tangible way to the successful cap and trade program instituted by the Clean Air Act that reduced precipitation acidity by reducing atmospheric sulfates. Research published with colleagues at the University of Virginia illustrates that	Support for the proposal is appreciated. DEQ agrees that emissions trading programs are a demonstrated, effective means of controlling air pollution.

	sulfate concentrations dropped substantially, as much as 85% from 1980 to 2009 measuring sulfate concentrations in precipitation and aerosols downwind of North America. This is simply to say, cap and trade works, we can lower emissions and their environmental impact. I support DEQ in the position of being the first southern state to formulate a program to encourage the reduction of CO_2 emissions. Since 1978 we have seen a 70 ppm concentration increase from 335 to 405 ppm. The proposal to cap carbon emissions in Virginia is a positive step toward reducing the atmospheric concentration of CO_2. Because the concentration of atmospheric methane has also been increasing, and methane contributes significantly to the aggregate GHG index, transitioning to energy sources that result in higher fugitive methane emissions are less desirable than transitioning to zero-carbon energy sources. Despite concerns regarding methane, I support a statewide declining cap from 2020-30. Capping CO_2 from Virginia fossil-fuel fired electric generating facilities should allow for the pursuit of multiple pathways to attain lower emissions. A carbon trading market force that creates incentives for energy efficiency and development of zero-emission renewable energy sources would be a positive step forward. However, setting the baseline emission cap below 33 MT should be explored. It is important that models reflect the impact of proposed fossil fuel retirements and account for proposed renewable projects or energy efficiency gains that will be realized on or before 2020. Virginia's participation in RGGI, along with the reentry of New Jersey, means that 20% of the 50 states are creating incentives to lower CO_2 emissions. The implementation of this program should have enhanced benefits, including air quality improvements beyond CO_2 particularly to the extent that present fossil fuel generation is replaced by zero-carbon renewable sources like wind and solar.	
29. Randall Freed, Citizens Climate Lobby (CCL)	Virginia's GHG profile is like most other states, in that by far the biggest source is burning fossil fuels. The best way in the long run to reduce emissions is to introduce a carbon fee-and-dividend approach where we put a fee on carbon in fuels, and refund the money directly to households as a dividend. CCL advocates for this approach. In the short run, the most cost-effective and straightforward way to reduce our emissions is to focus on power plants. The RGGI system works--it reduces millions of tons of emissions per year without harming states' economies. Joining RGGI will provide a clear path for utilities to invest in a way that protects ratepayers and the environment. Most of the RGGI states use these	Support for the proposal is appreciated. Virginia's utilities are regulated by the SCC, which ensures that ratepayers are protected. The primary purpose of the regulation is to address carbon pollution via linking to RGGI in accordance with ED 11; therefore, no fee-and-dividend approach is being considered under this regulatory action.

	revenues for energy efficiency programs or technology upgrades. The Grid Transformation and Security Act will create a structure for Dominion and Appalachian Power to invest $1 billion in efficiency programs over the next decade. It commits those utilities to make 5,000 MW in solar, wind, and grid technology upgrades, and provides a financial mechanism to recoup costs. Instead of plowing allowance money back to the utilities, let's demonstrate how a fee-and-dividend approach works, where environmental fees from sales of allowances get distributed evenly to all households. This approach, which CCL advocates for an economy-wide carbon fee and dividend, offers the best long-term solution.	
30. Ivy Main, Virginia Chapter of the Sierra Club	Putting Virginia on a carbon diet opens up opportunities for the growth of Virginia businesses that develop carbon-free renewable energy or that reduce energy use. The more we displace fossil fuels that emit carbon, like coal and fracked gas, the more room we make for wind and solar, and the more we reward energy efficiency. The timing is ideal. Solar is now the cheapest form of energy in Virginia, and offshore wind is maturing into a powerhouse industry. DEQ proposes to begin our carbon diet in 2020 from a baseline of 33-34 million tons of CO_2. That makes 3% annual reductions less difficult than if we start from a lower baseline. However, modeling suggests a more realistic baseline would be 30-32 million tons. We should use this lower baseline to send the right signal to our market participants. We don't want our utilities to bulk up on carbon between now and 2020, when our carbon diet begins. We want them to start putting healthier practices in place now, so by 2020 they have already begun shedding carbon by employing renewable energy and energy efficiency. Another way to cheat on a diet is to kid yourself about what you're consuming. Burning biomass is the empty calories of the renewable energy sector. Unlike wind and solar, biomass emits carbon pollution, more than coal. Dominion went down a blind alley with biomass, thinking it could meet renewable energy goals while burning stuff. That's bad for Virginia forests, the health of residents, the wind and solar industries and the climate. When you put CO_2 into the atmosphere by burning trees, it doesn't do the planet any good to pretend it's carbon neutral. DEQ also proposes to exclude sources of carbon pollution under 25 MW. That's consistent with RGGI, but the exclusion should minimize the incentive for generators to structure operations in a way that will use this exemption. In conclusion, I commend DEQ for developing this carbon diet, and encourage you to make it rigorous.	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.
31. Earle Mitchell	It is commendable that the board is addressing the problem of burning of dirty fossil fuels to generate electricity. RGGI auctions generate proceeds, which	Support for the proposal and the commenter's discussion of RGGI are

	participating states are able to invest in energy and consumer benefit programs. Programs funded have included energy efficiency, clean and renewable energy, GHG abatement, and direct bill assistance. Virginia could allocate some of these proceeds directly to the southwestern part of our state to provide economic development, education and workforce training to those who have been affected by the decline of coal production. Since RGGI started those participating have realized $ 2.3 Billon in lifetime energy bill savings, 9 million MWh of electricity use avoided and 5.3 million tons of CO_2 emissions avoided. Through 2015, $40.4 million has been returned to consumers through rebates. Rather than suppressing economic growth the participating states have outpaced the remainder of the U.S. during the time that RGGI has been operating. RGGI provides technical and administrative services to all participating states; it is a non-profit organization. There is no glory in re-inventing the wheel when other states have already done much research and have come up with a workable, cost effective system that will clean the air and add good paying jobs at the same time. We in Virginia have already embraced a cooperative structure in that we belong to the PJM system. The function of PJM is to coordinate the movement of wholesale electricity in 13 states. Note the similarity of PJM and RGGI: two organizations working for the common good of the participants. From a humanitarian standpoint we need to confront a truth that has not been adequately addressed. The Journal of the American Medical Association published a report which states that miners working in the Appalachian coal country are now experiencing the highest levels of black lung disease that have ever been reported. We need to phase out coal as soon as possible.	appreciated. Specific disproportionately affected community issues are discussed in the response to comment 55.
32. 301 emails sponsored by the National Wildlife Federation	Thank you for taking steps to create a new carbon market in our state with the potential to link to RGGI and make Virginia a national leader in confronting the threat of a changing climate. Virginia communities and wildlife are already on the frontlines of a changing climate, and impacts like extreme weather and sea level rise are only expected to get worse, unless we act now. Wildlife like the Carolina northern flying squirrel need your help. This endangered species is now living on "sky-islands" on nine isolated mountain peaks in the southern Appalachians. The impacts of a changing climate threaten this special species' last remaining strongholds in the state. CO_2 pollution is the leading cause of climate change, which is already fueling phenomena like massive storms, floods, and megafires. It is critical that we reduce this pollution as quickly as possible. By creating a carbon market and linking to RGGI, we can use a proven, effective market-based solution to reduce	Support for the proposal is appreciated. The commenters' concerns are well taken.

	carbon pollution from the power sector while generating revenue at the same time. This revenue can then be invested in additional climate solutions such as energy efficiency measures and renewable energy. My family, our wildlife, and our environment desperately need effective solutions from the growing threat of climate change. It is your duty to protect us, so please do everything you can to make our state a leader in climate action and carbon markets.	
33. Tyler Privott	I am in favor of passing this regulation. However, I wanted to point out some information that the DEQ failed to utilize in their models when coming up with a cap of 33-34 million tons. This information, if implemented, would further reduce the proposed cap below 33 million tons. To start, the models did not accurately depict the amount of current solar power and amount of future solar power used in Virginia. The state already has more than 360 MW of solar power, even though the model used a current estimate of 274 MW. In addition, the model used to calculate a reasonable cap had an extremely slow growth rate for solar energy in Virginia; however, the amount of solar energy in queue for the next few years will increase the total output by at least 1000 MW, including a 500 MW plant that is being built in Spotsylvania. In addition, DEQ assumes a growth rate in electricity demand of 1.9-3%, but the expected demand growth over the next 15 years is only roughly 1%. Also, DEQ is using information that power plant CO_2 emissions have been overall increasing since 2012. 2012 was an anomaly in terms of weather, with a relatively warm winter and cool summer, which means the overall energy consumption would be low compared to other years; therefore, the total power plant CO_2 emissions would be lower relative to neighboring years. Virginia has also reduced the amount of electricity imports from other states by creating more power plants in the state; because of this, Virginia is now responsible for these emissions since the electricity was made in-state versus out-of-state, which would result in skewed data and growth. Either new models should be created or the regulation should include a lower cap than 33 million tons.	Modeling is a decisionmaking tool that captures a set of information at a certain point in time. Assumptions and inputs that are used to develop a model can vary infinitely; therefore, it is important that every effort be made to make them as reasonable and accurate as possible for the time period under consideration. In order to accomplish this goal, DEQ availed itself of modeling expertise provided by the Georgetown Climate Center. The assumptions provided by DEQ were based on reference cases obtained directly from RGGI, coupled with adjustments made for specific Virginia circumstances. The load growth and renewable energy projections provided were the best available information at the time the models were developed. Since the regulatory action was initiated, other modeling and forecasting exercises have been undertaken by a variety of parties, including DEQ, using updated data. It is important to note that the implementation of the 2018 Grid Transformation and Security Act (see response to comment 51) was one of several factors pointing to the need for additional

		modeling based on new circumstances. 28 million tons has been chosen for the base year cap based on new modeling data performed for DEQ by the Georgetown Climate Center as well as public input; see response to 37 for additional detail. Given the fluid nature of modeling, it is important to note that additional modeling will be performed by RGGI in concert with Virginia as the program progresses in order to assure that the program is operating properly and meeting its goals. Virginia also has the capability to conduct modeling at any time if needed.
34. Mike Sandler, Carbon Share	It is society's responsibility to pass along a livable planet to the next generation. Climate change is a dangerous threat to health, the environment, agriculture, the economy, and national security. Auctioning is important because we have seen in other carbon trading programs the tendency to overallocate permits, leaving the price at the minimum. In RGGI's case, power plants switched from coal to natural gas, leaving the program overallocated and the permit price at $2/ton. In the next 10 years, solar and battery storage will undercut the business as usual case, and make current baselines obsolete. This can be partially remedied with an escalating price floor on the permit price (what California did), but auctioning 100% of permits is better because it lets the market determine the impact of innovation on the permit price. DEQ should study how a "consigned auction" differs from a non-consigned auction. Is the purpose of the consignment to protect the companies from the price signal? A climate dividend is important. Some environmental groups would prefer revenues to be used to invest in solar and wind technologies. But this is the people's money. If companies are going to have to buy permits to pollute, that money belongs to all of us. An equal per capita dividend addresses the regressive impacts of the carbon price on low-income households, and encourages support for the program. In an age of	Support for the proposal is appreciated. The primary purpose of the regulation is to address carbon pollution via linking to RGGI in accordance with ED 11; therefore, no fee-and-dividend approach is being considered under this regulatory action. See the response to comment 65 for a discussion of the industrial exemption. As discussed in the response to comment 26, DEQ will not implement the offset option although offset allowances from other RGGI states will be recognized. See the response to comment 37 for a discussion of the cap.

	economic inequality, a climate dividend could unify the public to fight climate change. A climate dividend could become part of a basic income, addressing unemployment and social justice aspects. In addition to a price floor on permits, DEQ should consider limiting or banning offsets. There should be no exemption for onsite fossil fuel plants. Virginia should adopt its own cap and rules before joining RGGI. Once in RGGI, it may be difficult to change. I have heard that many RGGI states would prefer a tighter cap but are unable to get consensus. Virginia's cap should be less than 33 million tons. Virginia should look at an economy-wide cap, not just on the electricity sector. A good first step would be joining the Transportation and Climate Initiative (TCI). Finally, the Department of Mines, Minerals and Energy should change its name to the Department of Sustainable Energy.	
35. Mark Belleville	I am a professor at the Appalachian School of Law, and I teach energy related courses. I strongly support efforts to create an trading-ready GHG emission reduction program for new and existing power plants, with the goal of joining RGGI. It has been 30 years since James Hansen testified before the Senate on the risks of climate change, 26 years since the UN Framework Convention on Climate Change, 11 years the Supreme Court handed down Massachusetts v. EPA, and 5 years since President Obama's Climate Action Plan and we still have no federal law or rule addressing the emission of GHGs like CO_2 and methane. Into that void, states must step. There are many ways to internalize the externalities associated with emitting GHGs; while the RGGI program may not be my first choice, it has grown to work fairly well. One of the benefits Virginia enjoys in entering RGGI at this stage is that it has some empirical data on which to judge the program's efficacy and its fit with Virginia's goals and policies. I'd like to point out some features of the RGGI program that should help inform Virginia's decision, most of which weigh in favor of joining. The serious design flaw of the RGGI program was an initial overallocation of allowances. The spread between allowances and actual emissions was exacerbated by a decrease in energy consumption caused by the economic downturn, the displacement of coal by newly available cheap natural gas, and increased renewable energy deployments. This overallocation led to floor-level prices for allowances, and the absence of a robust trading program. The allowance auctions operated as a small carbon tax, an expense that utilities and their customers barely noticed. This problem has been addressed. By retiring a number of allowances and setting new reduced cap levels, the program is in a	Support for the proposal is appreciated, as is the commenter's discussion of RGGI and Virginia issues. The commenter's concerns about the SCC's role in managing rates is well taken. SCC proceedings and audits are all public; this vertically integrated system is complemented by the RGGI program's open and transparent processes. All auction information is tracked and publically available. At the end of a compliance period, it will be possible to determine how many allowances were bought and sold, by whom, and at what price; based on this information one could then determine to what degree program costs are recoverable. DEQ is therefore confident that SCC's oversight role as well as the transparency of the complete process will ultimately protect Virginia's consumers.

	position to effectuate behavioral changes to the tune of a 3% reduction from current levels each year going forward. While the price of allowances has risen, as it was designed to do, it is still fairly low compared to other cap-and-trade programs around the globe, and mechanisms exist to prevent it from rising too much. Even as the overallocation caused depressed allowance prices, the program has always been successful at raising revenue for the participating states. More than 90% of the allowances have been auctioned off, raising nearly $3 billion for participating states. While it is for member states to decide on how to allocate allowances and spend proceeds, all states have auctioned the bulk of their allowances and utilize the bulk of the proceeds on energy efficiency, clean and renewable energy, and direct bill assistance. Thus, even if the allowance prices were not enough to change utility behavior, these expenditures have helped contribute to not-insignificant emission reductions in member states. With 39 auctions behind it, the quarterly regional auctions are mature and seem to function today with little difficulty. The RGGI program applies only to fossil-fuel fired power plants >25 MW. While I would prefer to see greater coverage for broader industry, the limited scope should provide some comfort for policy-makers worried about a broadly negative economic impact. It is possible that the cap-and-trade program could be expanded beyond fossil-fuel power plants, as this has occurred in both California and Europe. The RGGI program has built in enough safeguards to avoid the demise of affordable electricity. It allows only a limited use of offsets. But it allows increasing use of offsets if the prices for allowances reach certain levels. The program allows unlimited banking of allowances, and has a 3-year, both of which help utilities accommodate fluctuating annual electricity demands. And it has a reserve price that will now rise 2.5% per year; this helps assure that the allowances are utilities hold continue to have value. One of the most serious challenges Virginia and RGGI will face is that most of the currently participating states have deregulated their electric utilities far more than Virginia has. I would focus my attention on how much the SCC will allow Dominion and APCo to pass on increased costs to its customers in the SCC-approved tariffs. I urge the rulemakers to be transparent with the public on this issue. As a rate payer, I am comfortable with a small rise in my electric rates associated with joining RGGI. But I also am aware that recent tax cuts have benefited the bottom line of both major Virginia electric utilities, and there is likely enough excess profit there to absorb the	

	additional costs. I appreciate the Attorney General's opinion that this program is achievable under existing law. There will be serious and plausible litigation over Virginia's attempt to effectuate this change without the General Assembly's involvement. The General Assembly will need to pass legislation to determine how allowances are allocated and revenue spent. For this reason, I would urge DEQ and other involved agencies, as well as our delegates and senators, to work to provide explicit approval for this proposal. State leaders must be clear-eyed as to the sea-level and storm-surge threats facing Norfolk/Hampton Roads, including the naval base and export facilities. Hurricanes affecting mid-Atlantic states will continue to grow in frequency and intensity. Studies suggest degradation and loss of economic value to the Chesapeake Bay, and loss of fish stock and forest productivity. While climate change is a global problem, self-interest and self-preservation should also motivate the state to reduce its emissions. This is a very good proposal, and I strongly support it.	
36. Coleman Dickerson	This regulation needs to be put in place, but not without some changes to the modeling process and general process of assumptions. The proposal grossly overestimates the projected growth in Virginia's future electricity consumption. This overestimation results from neglecting the strides the state has been making in increasing solar power, and neglecting the reduction of increasing electricity demand given a weakening stream of electricity imports. I insist that the projections for Virginia's future electricity demand be re-modeled and realistic expectations for this growth replace the 1.5% - 3% estimation given in the current report. Updating the models with more relevant and accurate information would support the 33 million ton cap versus the 34 million ton cap. Setting the cap at 33 million tons would provide a more accurate goal for the front end of this regulation's time allotment. Reaching the estimations for our 2030 cap is more feasible when the range between starting goal and ending goal is decreased.	See the response to comment 33 for a discussion of DEQ's modeling efforts and the response to comment 37 for further discussion of how the final cap was established.
37. Victoria Glasgow	While it is a step toward responsible GHG management, the proposed cap is higher than what we can meet under current projections. I urge DEQ to update its baseline scenario to reflect more realistic estimates. The current cap of 33 or 34 million tons CO_2 is based on the assumption that energy demand is going to increase at a rate of 1.9% and 3% for residential/industrial and commercial development. When including solar capacity, residential/industrial demand growth is under 1% for the next 15 years. Moreover, commercial demand is growing only because of the prevalence of server farms. The energy demand of these solar farms is covered by	As can be seen from this and many other comments, a wide range of caps has been advocated. Recommendations ranged from a low of 20 million tons per year to a high of 37.5 million. Many recommendations fell within a range of 30-32 or 33-34. It has been determined that 28 million

	newly-installed solar. For example, a 500 MW plant has been proposed in Spotsylvania, and Microsoft has purchased more than half of the energy it will produce. Spotsylvania's 500 MW solar farm is projected to cut 1 million tons of CO_2 per year, so why is this already-planned projection not accounted for in the cap? Additionally, Dominion has 3 new natural gas plants that will displace coal plants and result in reduced emissions: another reason to lower the cap, since the plants will be able to provide the same amount of energy with lower emissions compared to coal. If DEQ keeps its baseline emissions too high, it inflates the cost of reaching the cap. DEQ should consider including ECR as part of the cap (9VAC5-140-6210) plus output-based allocation (9VAC5-140-6215). The cap should also start in 2019 to effectuate the Executive Order as soon as possible.	tons is the appropriate level for a starting base budget. This initial budget will enable the reduction of CO_2 while enabling Virginia's participation in RGGI to operate smoothly and effectively. Since the regulatory action was initiated, modeling and forecasting exercises beyond the department's original modeling have been undertaken by a variety of parties using updated data. Notably, modeling by NRDC using updated assumptions projects business-as-usual emissions of 28 million tons in 2020 (see comment 121), and NRDC recommended that the cap be set accordingly. As discussed elsewhere, implementation of the 2018 Grid Transformation and Security Act, which calls for significant utility energy efficiency and renewable energy initiatives from Virginia investment owned utilities, will further lower emissions beyond what was originally proposed. Additionally, new modeling was conducted with updated information on a business-as-usual basis for Virginia and the 9 RGGI states that indicated a cap of 28 million tons was achievable and reasonable; see the response to comment 33. Ultimately, the program needs a starting point, and, having reviewed the new information and considerable public input, DEQ believes that 28 million tons is a reasonable

		program starting point. More detail on how DEQ's modeling was performed is discussed in the response to comment 33. While DEQ expects to achieve steady emission reductions whatever the starting cap, the state also needs to balance that goal with the reality that there will always be a degree of uncertainty as to the composition and amount of emissions in the future that no model can accurately predict with certainty. Imposing a cap that is too stringent or too lenient will not help Virginia reach its goals, and DEQ believes the final cap strikes the proper balance. As discussed in greater detail elsewhere, RGGI routinely undergoes comprehensive, periodic reviews to consider program successes, impacts, and design elements. Caps can be modified as needed to ensure long-term program success, not only for RGGI but in the specific interests of the Commonwealth.
38. Chris Bolgiano	I support DEQ's cap and trade proposal as at least a first step to addressing climate change. However, it is so limited in scope that Governor Northam should issue a new Executive Order and expand state authority to address certain shortcomings. The irony of facilitating gas pipelines while promoting a cap and trade program for CO_2 is not lost on us. To avoid subverting addressing climate change, CO_2 equivalents should be calculated for net emissions impact of methane by fracked gas production and transport. These methane-CO_2 equivalents must be included in the CO_2 budgets and allowances, because utilities burning coal or oil will move to gas to claim lower CO_2 emissions. A program based only on CO_2 will stimulate fracking, gas transport, and pipelines. Methane is a greater climate danger than CO_2. The Attorney General has ruled that "The Board has the authority to establish a statewide cap on GHG emissions." GHGs include methane. As Bill	The commenter's concerns about methane are acknowledged; however, as the specific purpose of this regulation is to enable linking to RGGI, methane and natural gas are not addressed in this regulation. As discussed in the response to comment 26, offsets will not be implemented at this time. Biomass is further discussed in the response to comment 67. For a detailed explanation of how the consignment auction will operate, see comment 136.

	McKibben says, moving from coal and oil to gas is like kicking OxyContin by taking up heroin. Fossil fuel utilities should pay for the privilege of damaging our environment and Virginia should apply those revenues toward climate solutions, as RGGI does. According to DEQ staff, "Unlike a conventional auction, such as the one RGGI manages, a consignment auction is revenue neutral, and will enable Virginia to link to RGGI while staying within the bounds of Virginia law." In addition, if Virginia law prohibits the return of auction revenues to the state, or if the General Assembly must approve revenue-positive auctions, then DEQ should outline the appropriate steps to overcome these obstacles, because RGGI states gain billions of dollars from auctions which are then used for climate solutions. The single most powerful natural climate solution is forest conservation. Because trees take in CO_2 for as long as they live, which for most of the hardwoods that constitute the majority of Virginia's forests is at least four centuries, trees are the best technology for carbon capture and storage. Yet the proposal does not include forest carbon offset credits, which RGGI allows up to 3% of CO_2 emissions, and the California market allows up to 6%. Given that 62% of Virginia's land base is in forest, and most of that acreage is owned by more than 400,000 private individuals and families, this incentive would benefit all Virginians not only with climate change mitigation but also by long-term protection of water and air quality. To omit forest carbon offsets, and miss the opportunity to encourage retaining forests for the carbon they have already locked up and the amounts they would continue to sequester, would be a strategic mistake. Counting biomass as carbon neutral is another mistake. In a letter to Governor Cooper of North Carolina concerning the increase of biomass burning, more than 100 scientists stated: "Biomass plants emit more CO_2 emissions per unit of electricity than coal or gas plants. In addition, it releases harmful particulate matter and smog precursors.… Removing the CO_2 emitted from burning trees for electricity requires waiting decades to a century for trees to regrow. Forests in the U.S. South are logged at a rate four times that of South American rainforests. A 2016 study showed that logging reduced the potential of the U.S. forest carbon sink by approximately 35%. Increasing carbon sinks by way of forest conservation and restoration plays a significant role in emissions reduction." While logging residues give off CO_2 during decay, removing them for burning depletes soil by removing nutrients, degrading forest productivity including the regrowth of the trees supposed to balance emissions from burning. Whole trees are being harvested for pellets, an industry that has	

	degraded forests in the southeast and is moving into Virginia. There is no mechanism to verify that trees regrow on site, and cutover forests are ripe for development. Even if trees do regrow on site, decades are required for such forests to capture and store as much CO_2 as was emitted by burning, and during that time CO_2 emissions will increase because trees can't grow fast enough to offset them. This proposal covers only one facility that co-fires coal and biomass but should also include the others that burn only biomass, and ideally not allow burning biomass at all.	
39. John Reeves	DEQ and the board deserve wide support for this key initiative. The evidence and science is overwhelming that anthropogenic climate change is very real. Threats to our health, economy, infrastructure, coastline and national security plus carbon pollution from burning fossil fuel is significantly contributing to ramping-up climate change and sea-level rise. Practical, market-based strategies should be optimized to improve Virginia's poor rankings on energy efficiency plus on renewable energy, especially on solar energy capacity and initiatives. Virginia should expedite steps to partner with RGGI. The legislature may also need to concur, so preparations and good findings must be available to ensure this concurrence. Many benefits await good measurement, especially lowering of wasted energy, swinging demands on power grids and peaking facilities, and cost of power bills. The regulation should include practical, market-based ways to continue CO_2 reductions after 2030. There are few justified exemptions for fossil-fueled heat and electricity generators at a factory. There may be a reasonable compromise on some exemption of blended in biomass/forestry byproducts. It seems that Virginia forestry and pulp and paper facilities can justify levels above 10% blend with fossil fuels--maybe up to 30 or 50%?	Support for the proposal is appreciated. See the response to comment 65 for additional discussion about the industrial exemption, and response to comment 67 for further discussion of treatment of biomass.
40. Adam Brookman	We have been given a tremendous opportunity to protect our future with this carbon emissions cap. While this program is best we can hope for right now, the choice we have been presented for how many annual millions of tons of CO_2 to be released is simply appalling. I understand that in any negotiation there is a give and take for all parties involved, but why must we give away what has been taken from us for so long. To choose between 33 and 34 million tons of CO_2 is insulting and reeks of nothing but greed. The reason we have these two choices is obviously the representatives from the major power companies of Virginia. Thank you for giving your customers options. I propose a different amount. I propose that there be an annual allotment of no more than 25 million tons of CO_2 with the amount reducing by 8% each year. This goal may be aggressive but easy goals is something we do not have time for. The text of the proposal consistently refers to "fossil fuels" when discussing CO_2 reduction. While fossil fuels are one of	See comment 37 for further discussion of the cap and comment 67 for further discussion of the treatment of biomass.

	the worst contributors of CO_2, they are not exclusive. The burning of wood or biomass produces equal if not more CO_2, so why should it be treated any different? There should be no exemption for any power producing facility on any of their units that produce CO_2 in any way shape or form. Biomass burning power generation must be held accountable for their CO_2 emissions.	
41. Maria Papadakis	I am writing to indicate my strong support for a cap-and-trade allowance system and participation in RGGI. The regulation should include opportunities for CO_2 emission offset allowances in agriculture (forest offsets and avoided methane from agricultural manure management operations). This would enable the farm sector to benefit financially from efforts to protect forests and to afforest, and from efforts to mitigate methane, a highly potent GHG. The regulation must make a provision for the voluntary renewable energy market set-aside allocation mechanism, as allowed for by RGGI. The set aside enables the voluntary renewable energy market to contribute to the state's overall CO_2 mitigation goals and compliance opportunities, and are critical for the process of reducing emissions. It is also needed to avoid weakening the in-state economy for renewables. The absence of a set aside could cause Green-E to quit certifying in state green power. The Center for Resource Solutions explains that "If a cap-and-trade program is adopted and implemented without a voluntary renewable energy set-aside mechanism, Green-e may be unable to continue to certify voluntary sales of renewable energy from the state, or the additional cost of allowance retirement to the voluntary purchaser may preclude certified sales from generation in the state. This would mean that voluntary buyers in these states will get their certified renewable energy from outside of the state in the future. A voluntary renewable energy set-aside will allow for this demand to be met by resources in the state--allowing your state the opportunity to maintain the private investment dollars that may otherwise go elsewhere."	Support for the proposal is appreciated. DEQ recognizes the value of voluntary renewable energy market; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME. Given the uncertainty of any benefits associated with a complex offset program, DEQ is not, at this time, proposing to implement offsets; see the response to comment 26. See comment 51 for further discussion of the set-aside.
42. William M. Shobe, University of Virginia	Output-based updating of allocations is appropriate and prevents emission leakage. Model runs show that output-based updating of allowance allocations helps reduce leakage while retaining incentives to shift generation away from high-emitting sources. Free allocation of allowances acts as an implicit subsidy for the generation of electricity by granting to ratepayers the market value of the stream of allowances. Generators take this grant into account when calculating their marginal cost of generation and so can maintain relative competitiveness with the generators in the rest of the PJM region. This prevents generation from migrating out of Virginia and into the uncapped portions of PJM. Output-based allocation seems the appropriate choice given the potential for leakage of emissions into the rest of PJM.	See the response to comment 33 for a discussion of modeling, and the response to comment 37 for discussion of the cap. The commenter correctly notes that carbon intensity is decreasing.

	The consignment auction improves efficiency and fairness. By enhancing liquidity in the auction, requiring consignment probably improves price discovery in the RGGI market. The act of consignment and the resulting requirement that Virginia utilities purchase back what they need may make allowance prices more salient to market players and the generators. Consignment auctions monetize the value of the grant of allowances to the generators--they establish a clear market value of the grant. This allows the SCC to establish whether allowance value is being transferred to ratepayers rather than being retained by generators. Given the value of the free grant of allowances, it is critical that ratepayers be protected from generators pocketing the value of allowances. The consignment auction helps make this possible. The ECR helps correct over-allocation. In every emission market established to date, allowances have been over-allocated at first. In the case of RGGI, the cap has been reduced dramatically due to the initial over-allocation. Even after the initial allocation, costs often fall faster than the cap leading to lower than expected allowance prices. The proposed rule continues this pattern of over-allocation, since DEQ has set the initial cap too high. This makes the ECR an important backup mechanism for ensuring that emission reductions will be greater, if the costs of achieving those reductions fall below expectations. The initial cap should be 30 to 31 million tons. DEQ has overestimated business-as-usual emissions over the next 15 years. This makes achieving the reductions for a given cap level appear more expensive than they really are. DEQ's analysis is not off by just a little, it is grossly in error. The agency has provided an analysis that is inconsistent with facts that were readily available to the agency at the time it did its analysis. What is more, the bias is clearly in one direction, overstating the emissions that would occur in the absence of this rule. This, in turn, overstates the cost of achieving a given reduction. "Reference Case 1" (RC1) assumes that Virginia will generate zero electricity with solar PV for the entire forecast horizon. This assumption is false. At the time DEQ did its analysis, Virginia had more than 100 MW of solar PV in operation with more than 250 MW under construction. By the end of 2017, Virginia had just more than 360 MW of solar PV capacity in operation. This capacity can be expected to generate approximately 720 GWh of electricity per year. In addition to the solar already in operation, the PJM interconnect queue has several gigawatts of solar PV slated for Virginia. Two years ago, Dominion had agreed to have 400 MW in place by 2020, but in April 2017 the company announced	

	in its IRP its intention to build around 240 MW per year for the next 15 years. This estimated solar build was for Dominion's "no carbon regulation" case. APCO and ODEC had both announced that they were adding solar capacity as well. There are currently over 700 MW of Virginia solar PV capacity in the engineering and procurement stage. The PJM interconnection queue has close to 6 GW of capacity planned for Virginia in the next few years. Much of this was already on the queue when DEQ assumed zero solar build for Virginia over the next 15 years. At the time of its analysis, DEQ had reason to know that Virginia would probably have at least one GW of solar PV capacity by 2020. Yet the agency assumed in RC1 that there would be zero solar PV built in Virginia before 2031. This inflates the appropriate level of the cap. Reference Case 2 (RC2) is only marginally better; again, understating likely solar PV capacity and generation that would occur in the absence of the rule. The agency assumed that, by 2020, Virginia will have a capacity of 344 MW and will generate only 819 GWh of solar PV electricity. This is less than half of what would reasonably have been expected even before ED11 was announced. Taking the current 360 MW and adding 240 MW per year, this implies solar PV generation of about 1300-1500 GWh more per year than estimated in RC2. If the solar PV displaces half coal and half natural gas, then DEQ has overestimated CO_2 emissions by nearly 1.5 million tons per year due to underestimating solar capacity. The mistake is much greater for RC1, where solar PV is incorrectly assumed to be zero. By underestimating the amount of solar PV generation that would have occurred without the rule, DEQ has overestimated business-as-usual emissions by around 1.5 million tons/year. Both scenarios ignore already contracted capacity increases in the short run. Both of DEQ's Reference Case scenarios err by assuming unrealistic rates of growth in electricity generation. This, in turn, results in unrealistically high capacity factors for coal plants in Virginia and unrealistic growth in fossil fuel generation capacity, mostly natural gas. This further inflates expected business-as-usual emissions and is used to justify a higher cap than is necessary. In its April 2017 IRP, Dominion estimates future generation growth to be 1.3% per year. Accepting Dominion's estimate for demand growth, DEQ made a serious error in its modeling of reference case emissions by assuming unrealistically high growth rates in generation. DEQ's generation scenario for RC 1 has generation growing at an average rate of 1.9% per year and RC2 has it growing at 3.4% per year. Dominion represents 70% of generation in Virginia. The	

	APCO region, which is the second largest in Virginia, has flat or declining demand. The remainder of the state is too small to make up the difference, but does not have growth rates higher than Dominion's. DEQ assumed a higher growth rate for generation than the electric utilities are using in their own capacity planning. This inflates the estimated need for fossil fuel combustion in future years. Dominion has over-forecast demand every year since at least 2012. Its forecasts of future generation have fallen dramatically over this same period but are still too high and will continue to fall in the next few years because of a flaw in its forecasting methodology. Generation has grown faster than demand since 2015 because of a Virginia state policy to repatriate generation and reduce imports of electricity. The process of repatriating imports is now essentially complete. Dominion is anticipating small amounts of exports over the next few years, given that it is nearing completion of 3 new natural gas generators. Now that the process of repatriating generation is complete, generation and demand will tend to grow at the same rate. Recent growth in electricity demand in Virginia has been less than 1% per year even as the state economy has grown following the last recession. Recent trends in both residential and industrial demand have been negative, that is negative growth in demand. In the industrial sector, this is due to a shift to less energy intensive industries. In the residential sector, this is due to the penetration of energy efficient technologies and improvements in the energy performance of the building shell. The one source of increase in electricity demand in Virginia in recent years has been server farms. This is a small fraction of overall electricity demand in Virginia and is already accounted for in Dominion's forecast. DEQ has no basis for its grossly overstated estimates of future demand growth in Virginia. Many firms building server farms want to cover their energy demand with renewable generation and the firms are increasingly insisting that the generation be local. Server farm demand cannot account for the growth in fossil fuel emissions assumed in DEQ's faulty analysis. DEQ’s two reference cases make different assumptions about 2017 total generation: 96,786 for RC1 and 93,305 for RC2. At the time DEQ did this analysis, there was zero chance that demand would be as high as assumed in RC1, but this is consistent with the general pattern of unsupported and erroneous assumptions in its analysis. Actual generation for 2017 was 93,500 GWh. To be conservative, take the higher of the two 2017 generation estimates from DEQ’s reference cases, 96,786 GWh	

	(even though it didn't actually happen) and increase it at 1% per year. The resulting generation profile shows that DEQ's assumed generation is in excess of any reasonable expectation by 3,600 GWh per year by 2020 and 10,500 GWh by 2031. If you assume that each GWh displaces half coal and half natural gas, then each 1,000 GWh is associated with on the order of 1 million short tons of CO_2. In light of this, it is clear that DEQ's analysis has grossly overestimated BAU emissions. Combined with the solar PV analysis, the 2020 emission overestimate is on the order of 4 million tons of CO_2 per year. The assumption of half displacement of gas and half coal is somewhat conservative. Chances are that more coal dispatch will be displaced. Dominion's IRP had a BAU scenario and a scenario for operating under a cap under the Clean Power Plan. One of the major differences between these two scenarios is the retirement of significant coal capacity in 2020, when the CPP was to come into force. These coal plants were not retired under the BAU scenario. This implies that substantial reductions in coal dispatch can be anticipated under this cap, which will ultimately be tighter than what would have been true under the CPP. And coal dispatch is already falling sharply due to the addition of the new natural gas capacity. Net electricity generation from coal in Virginia fell from 15,600 GWh in 2016 to 10,110 GWh in 2017. This downward trend will continue as Dominion brings its Greensville natural gas power plant online in 2019. DEQ has failed to make a case for a cap greater than 30 million tons per year. In recent years, any increases in generation due to load growth (including repatriating imports) has been offset by reduced emission intensity of generation. Since nearly all increments to generation in Dominion's IRP are solar PV, through to the end of the 15-year planning horizon, emission intensity is bound to fall further. In its reference cases, DEQ assumes a natural gas price of $2.83 in 2017 rising to $3.95 in 2020. In April 2018, the spot price of natural gas hovered around $2.75/MMBtu. To match DEQ's assumption, natural gas prices must rise more than 30% in the next two years. And yet, the futures price for natural gas, as of April 3, 2018, is $2.70. DEQ assumed a high rate of growth in natural gas prices and plugged that assumption into its model even though it was known at the time that there was a substantial probability that the price would be lower. This adds more upward bias in the estimated business-as-usual emissions.	
43. Jonathan Miles, James Madison	The proposal will not provide any avenues for voluntary market customers to ensure that their renewable energy purchase contributes to emissions reductions beyond the	DEQ recognizes the value of voluntary renewable energy market; however,

University	cap set by the program. All RGGI states with the exception of Delaware and California have implemented voluntary renewable energy set-aside mechanisms. Without the set-aside, Virginia generation would be ineligible for participation in the Green-e Energy market, meaning that regional voluntary market customers would have to invest in renewable energy in nearby states in order to have the renewable energy certified. This would benefit neighboring states and discourage increased investment in renewable energy in Virginia. The set-aside mechanism is important to continue to stimulate private investment in renewable energy in Virginia, which in turn will promote local jobs and businesses, and further reduce GHG emissions generated in the state. I strongly encourage the inclusion of the voluntary renewable energy market set-aside allocation mechanism from Section XX-5.3(l) of the RGGI Model Rule.	the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME. See comment 51 for further discussion.
44. Christina Luman-Bailey, City Council of Hopewell, Virginia and Chair, GoGreen Virginia	I am concerned that the industry exemption barely passed; although I agree that all major carbon emitters should be held accountable, it is typically the coal-burning utilities sector which is the biggest offender and has a monopoly on the customer market, whereas industry must face more competition and may need more flexibility re cost of production in order to compete in the private sector. The threshold of 90% biomass in order to claim carbon-neutral seems unreasonable. Basing the credit for carbon neutral on the percentage of biomass makes for a more reasonable, scientifically-based formula and is fair. I am glad to see the DEQ moving forward with air pollution controls, but I think that a more reasonable, scientifically-based proposal will be more accepted by all and therefore more successful.	See comment 67 for further discussion of how biomass will be addressed.
45. Mayor Tom Sibold, City of Covington; James H. Hudson, III, Mayor, Town of West Point; William Hodges, Chairman, King William County Board of Supervisors	The WestRock Paper mill in Covington is a significant economic driver for our community providing over 1000 jobs and supporting over $200,000,000 in local investment through supplier purchases, payroll, and taxes every year. If care is not taken, the proposed regulation could have a serious and negative impact on the mill. The West Point Paper Mill has been an important economic driver for the Town of West Point and the broader region for over 100 years. Today, the Mill employs roughly 500 people in good paying jobs. The Mill is the largest taxpayer in the Town of West Point (and one of the largest in King William County), and contributes over $100,000,000 to the regional economy every year. Papermaking is an energy intensive and trade exposed industry, and the mill operates in an intensely competitive business environment. The West Point Paper Mill is of critical importance to King William County. The mill is one of the largest employers, one of the largest taxpayers, and one of the	The commenters' concerns are well taken. The cap-and-trade program has been designed to meet the goal of reducing carbon pollution--which will be beneficial to the manufacturing sector--while protecting the economy. Industrial generation and biomass are discussed in greater detail in responses to comments 65 and 67. DEQ agrees that free allocation of allowances is integral in ensuring the smooth function of the consignment auction.

	most significant corporate members of the community. The hundreds of jobs that the mill provides, the hundreds more that it supports, and the millions of dollars that it injects into the local economy are irreplaceable. Simply put, the mill is the lifeblood of King William County. DEQ should take great care in crafting the final regulation to ensure the mills are not placed at a competitive disadvantage. Specifically, the regulation should: 1) Maintain the existing exemption for industrial generation. 2) Fully recognize the carbon neutrality of biomass by amending the regulation to allow for the subtraction of biogenic emissions from any covered source. This is an approach that is consistent with established science and the existing RGGI program. 3) Preserve the free allocation of carbon allowances currently in the regulation, as a full auction of allowances could significantly increase the financial impact to energy-intensive industries.	
46. Virginia Solar Energy Development and Energy Storage Authority	The Authority was established to 1) facilitate, coordinate, and support the development of the solar energy and energy storage industries and storage projects through programs that increase the availability of financing for solar energy and energy storage projects; 2) facilitate the increase of solar energy generation systems and energy storage projects on public and private sector facilities; 3) promote the growth of the Virginia solar and energy storage industries; 4) provide a hub for collaboration between entities, public and private, to partner on solar energy and energy storage projects; and 5) position the state as a leader in research, development, commercialization, manufacture, and deployment of energy storage technology. If carbon emitting generation is reduced, cleaner forms of power generation will become more widespread. The addition of energy storage will allow intermittent renewables to continue providing power at times when conventional generation would typically be required, leading to further carbon reductions. The Authority recommends that a portion of any proceeds resulting from the auctioning of the 5% of allowances set aside for DMME be used to advance renewable energy coupled with energy storage technologies. Legislators and the Governor, through their creation of this Authority, recognized that accelerated deployment of renewable energy and energy storage technologies will support a more robust and secure electric power grid. It will also lead to decreased carbon emissions, help grow the energy storage industry and create economic benefits for Virginia and its citizens.	DEQ recognizes the value of renewable energy coupled with energy storage technologies; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME. See comment 51 for further discussion of the set-aside.
47. About 25 individual commenters.	General opposition to the proposal was expressed.	The commenters' concerns are recognized.
48. 272 emails sponsored by	I urge you to drop plans to join RGGI, a short-sighted cap and trade program. It seeks to limit CO_2 emissions, but it incentivizes switching from coal to fracked gas,	Executive Directive 11 directs DEQ to "1. Develop a proposed regulation for

Food and Water Watch	exchanging methane for CO_2. That's not progress. Implementing RGGI would ultimately mean more fracked gas and pipelines in Virginia. We don't need schemes like RGGI. For over 40 years, the Clean Air Act has succeeded by requiring each source of pollution to meet individual, technology-based emissions controls that minimize emissions without the lack of accountability that purchasing credits and offsets brings. Effectively, cap and trade programs like RGGI just set up a pay-to-pollute scheme that big polluters can take advantage of year after year.	the State Air Pollution Control Board's consideration to abate, control, or limit carbon dioxide emissions from electric power facilities that: a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of market-based mechanisms and the trading of carbon dioxide allowances through a multi-state trading program; and b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on carbon dioxide emissions imposed in other states with such limits." (Emphasis added.) In other words, the proposed regulation is designed to meet the Governor's mandate to control CO_2 via participation in an emissions trading program. In the absence of federal action to address climate change, Virginia is therefore taking active steps to address this pollutant--but not starting from scratch. The effectiveness of Virginia's carbon control program will be maximized by linking with the only realistically available program for controlling carbon. The control of methane emissions is indeed important; however, this specific regulatory action is not the means by which that can be accomplished. Methane is controlled elsewhere in the Regulations for the Control and Abatement of Air Pollution as appropriate, and other measures

		addressing methane may be addressed at a different time in accordance with the federal Clean Air Act and state law. Because the primary purpose of this regulatory action is to enable Virginia to link to the RGGI program, the regulation was drafted to adhere to the RGGI Model Rule as closely as possible within the framework of Virginia-specific administrative requirements. The commenters are correct that the federal Clean Air Act has been extremely effective in reducing air pollution. Emissions trading programs, which are authorized under §§ 108, 109, 110, and 302 of the Act and implemented under 40 CFR Part 51, are part of the Clean Air Act success story. Emissions trading is a proven means of reducing air pollution; see, for example, comments 28, 113, and 136. Cap-and-trade sets a specific goal and a schedule on which the goal must be met. Clearly, linking to RGGI will ensure additional reductions in carbon pollution not only in Virginia but in the region. Joining RGGI will impose additional controls on each source of pollution beyond other individual, technology-based emissions controls. Note that RGGI specifically addresses CO_2, not methane. RGGI issued the "CO_2 Emissions from Electric Generation and Imports in the Regional Greenhouse Gas Initiative:

		2015 Monitoring Report" on April 27, 2018. This market analysis summarizes data from 2005-15 for electricity generation, net electricity imports, and related CO_2 emissions for the participating states. It demonstrates that carbon emissions in the RGGI are decreasing in intensity; essentially, carbon intensity is being decoupled from electricity generation.
49. Elizabeth Struthers Malbon	It appears that the decision to participate in a CO_2 cap and trade program has already been made by the board, the so-called DEQ, Governor Northam, former Governor McAuliffe, or Dominion. The sad thing is that distinctions between these individuals and agencies may be distinctions without a difference. No one can expect the citizens of Virginia to trust these individuals and agencies given their support for pipelines. The evidence for the decision having been made is in the public notice: "In addition to any other comments, the board seeks comment on whether the initial Virginia CO_2 Budget Trading Program base budget for 2020 should be 33 million tons or 34 million tons, and declining accordingly by 3% per year. After considering public comment, the board will make a final selection of either 33 million tons or 34 million tons." So, the public is being asked to comment on whether we want our air polluted by a huge amount or by somewhat more than a huge amount. I would like the board to think about who is pushing for this program in the first place and who will benefit from it. It is disingenuous of McAuliffe and Northam to act as if they are being responsible in thinking about the dangers of the CO_2 that Virginia's power plants are pumping into the atmosphere, hastening global warming with its sea-level rise and extreme weather events. Participating in such a systematic and continued polluting of the atmosphere might give the impression that something is being done to clean up the air or slow down global warming, but this is not the case. What is needed is regulation that would require energy companies to take real steps toward cleaner air and mitigating global warming by moving away from fossil fuels altogether and utilizing the fast-growing and less expensive technologies for solar and wind power. Such a short-sighted cap and trade program has not worked elsewhere. This program creates incentives for switching from coal to fracked gas. Methane from fracked gas is a more powerful driver of global warming than coal. Fracked gas benefits the companies that extract, transport and sell it, and a cap and trade	See response to comment 48. As discussed in comments 28, 113, 136 and elsewhere, cap and trade programs are proven, effective means of controlling pollution.

	program would pass that advantage along to power companies that burn it--and to any politicians they support. The cap is excessively high, and the price of permits is too low, allowing energy companies to buy or trade their way out of reducing emissions. Such a company could also hold their cheaply-bought allowances to offset future failures to reduce emissions. This program only addresses CO_2 emissions and ignores the impact of methane on climate change and air quality. It would allow switching from coal to fracked gas, effectively worsening climate impact while still complying with the cap and trade agreement. It hardly seems coincidental that two Virginia Governors who were supportive of or tolerant of the building of two interstate pipelines for fracked gas and one state-wide energy monopoly that supported them would now be encouraging a cap and trade program that lets burning this other fossil fuel instead of coal count as environmentally responsible. Money to encourage favorable legislation and regulation has never been a problem for Dominion Energy, and clean air has never been a priority for them. However, the law requires clean air to be the board's priority. You are hardly in a position to pat yourself on the back if you allow only 33 tons of CO_2 pollution instead of 34 tons while turning a blind eye to methane pollution. For over 40 years the Clean Air Act has succeeded by requiring each source of pollution to meet individual, technology-based emissions controls. The citizens of Virginia need and want bold climate solutions that continue to do that and do not compromise the wellbeing of our communities--in terms of air quality, water quality, and overall quality of life in a world feeling the effects of global warming hastened by the use of all fossil fuels. We are not fooled by this pay-to-pollute scheme, and neither should you be.	
50. David Kuebrich	The cap-and-trade polices of RGGI, the E.U., and California have done little to reduce carbon emissions. It's important Virginia learn from the errors of these plans and do better. For example, it would likely be better to impose a flat fee on the use of fossil fuels. This approach would not be nullified by external factors such as an economic decline that kept emissions under a cap. In addition, an imposed fee provides both fossil-fuel users and consumers with predictable price increases. A cap and trade policy can easily lead to disputes, and well-lawyered and politically muscular companies such as Dominion are very savvy at winning disputes. In the past, the benefits of cap and trade have been hyped. Years later, supporters learn the promised reductions in emissions didn't pan out. But for the years between the initial glowing headlines and the later realization of meager results, many citizens and public officials feel a	See response to comment 48. As discussed in comments 28, 113, 136 and elsewhere, cap and trade programs are proven, effective means of controlling pollution. In addition, RGGI has a proven track record in reducing carbon pollution. We recognize the commenter's concern about methane from pipelines; however, that is not the subject of this regulatory action.

	reduced sense of urgency to develop other policies for limiting emissions. Governor Northam may feel if he proves his green creds by creating a cap and trade program, it will then be politically feasible to approve the Atlantic Coast and Mountain Valley pipelines. If so, he's wrong. I ask that DEQ convince our Governor to create a smart plan for reducing carbon emissions and to cancel the pipelines.	
51. 3Degrees Inc.	3Degrees applauds Virginia's decision to implement a CO_2 Budget Trading Program and join RGGI. This will secure the state as a national climate leader, and greatly expand the scope of the regional carbon market, improving market efficiency and lowering costs of compliance across the region. The proposal does not provide an avenue for voluntary market customers to ensure that their renewable energy purchase contributes to emissions reductions beyond regulation. The Voluntary Renewable Energy Market Set-aside allows allowances to be paired with renewable energy at no added cost to the voluntary market. In order to support private investments in renewable energy, 7 RGGI states and California have implemented a renewable energy set-aside. This mechanism sets aside about 2% of the allowances and makes them available for free to be paired with voluntary renewable energy purchases. The renewable energy set-aside will lead to continued demand for Virginia generation in the voluntary market and allow the generation to be eligible for Green-e Energy certification. In addition to the avoided emissions benefit being important in private investment decisions, it is also a requirement of Green-e certification. Green-e certifies tens of millions of megawatt hours of renewable energy every year, including renewable energy generated in Virginia, and, as the only certification for the voluntary renewable energy market in the U.S., is the standard for private purchasing of renewable energy. Where states have introduced cap-and-trade regulation without a renewable energy set-aside, Green-e has required that Green-e certified renewable energy from these states be matched with purchased allowances equal to the generation's emissions reduction benefit on the grid. This adds a significant cost to renewable energy from these states, such that they generally exit the voluntary market. Where private purchase of allowances is not possible, generation from that state is ineligible for Green-e certification. Without Green-e certification, Virginia generation will be less desirable for voluntary purchasing and will lose financial support from the voluntary market. Since Virginia currently only has a RPS goal, the primary markets for Virginia renewable energy generation are	DEQ recognizes the value of the voluntary renewable energy market as an important tool in reducing carbon pollution but has decided not to implement a separate voluntary renewable energy set-aside. The structure of the general 5% set-aside will be under the purview of DMME, which is the appropriate state agency to implement renewable energy and energy efficiency programs. DMME may, at the appropriate time and in accordance with its regulations and policies, seek to implement a voluntary renewable energy market set-aside or its equivalent. However DMME structures the set-aside, it is important to bear in mind that energy efficiency will be an important tool in the control of carbon pollution. Energy efficiency programs reduce in-state demand, which results in the reduction of carbon pollution and the control of potential leakage. Note that renewable energy projects in Virginia should be considered in the context of the Grid Transformation and Security Act of 2018 (SB966), that: - Requires utilities to make $1.145 billion in investments in energy efficiency projects and low-income energy assistance

	adjacent state RPS or the voluntary market. The voluntary market is currently the primary way that high quality renewable energy remains in the state. Local projects risk losing voluntary market support if the renewable energy set-aside is not included. 3Degrees has worked with small-scale and residential solar and wind projects in Virginia, supporting the projects by facilitating the sale of the premium RECs for use by voluntary customers. The voluntary market is generally providing funding for projects that would not receive funding from compliance REC markets, and often providing more funding per MWh. In some cases, the projects would be not financially viable without this revenue stream. If the voluntary renewable energy set-aside is not included, there would no longer be an opportunity for 3Degrees to support projects of this kind in Virginia. We urge DEQ to encourage private capital investing in renewable energy by including the renewable energy set-aside.	over the next 10 years. - Authorizes the SCC to deem 5,000 MW of solar and wind energy projects to be in the public interest, paving the way for approval of new clean energy projects. - Commits Appalachian Power to make a separate investment in 200 MW of new solar capacity. - Promotes energy technology including battery storage and pumped storage in southwest Virginia. - Requires review of state regulations that hinder clean energy development. - Creates a transparent stakeholder process to expand energy efficiency program offerings. - Creates a transparent stakeholder process to make recommendations for solar program expansion, including net metering, community solar, and siting. DEQ expects that opportunities for voluntary renewable energy projects will be encouraged as a result of this initiative.
52. 3Degrees Inc.	3Degrees encourages DEQ to allow the issuance of CO_2 emissions offsets. High-quality carbon offsets can be an important tool for a successful and economic cap-and-trade program. While offsets have not been used to date for compliance in RGGI, as the cap lowers we believe offsets will be an important tool for achieving emissions reductions cost while encouraging innovative climate solutions. Offset projects can address emissions reductions in uncapped sectors and provide other co-benefits.	Although the RGGI model rule does offer offsets, only a single offset project has been implemented in the RGGI region thus far. Given the uncertainty of any benefits associated with a complex offset program, DEQ is not, at this time, proposing to implement offsets; see response to comment 26.
53. American Council for an Energy-Efficient Economy (ACEEE)	Energy efficiency reduces emissions quickly and at a lower cost than any other CO_2 compliance option by reducing the need for power generation. State energy efficiency policies and projects can be the quickest and cheapest means to reduce generation from fossil fuel-fired power plants. Energy efficiency improves air quality	DEQ recognizes the value of energy efficiency as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what

	and saves consumers money. It boosts local economies by creating diverse, high-quality jobs across the construction, engineering, financial, environmental, manufacturing, and industrial supply chains. In 2015, RGGI states invested 64% of allowance revenues on energy efficiency, amounting to 60% of cumulative investments. Programs funded by these investments are expected to return more than $1.3 billion in lifetime energy bill savings. Energy efficiency investments through RGGI contributed to reducing the number of premature deaths and illness in the northeast since 2009. DEQ proposes a set-aside of 5% for the control of CO_2. Given the benefits and low-cost CO_2 reductions energy efficiency provides, we recommend that all set-aside revenues be allocated to energy efficiency projects. However, current market and regulatory barriers to investment in energy efficiency can hinder its use as a compliance strategy. DEQ should consider methods for allowance distribution to address these barriers. Typically, a set-aside is a small portion of a total cap of allowances, which means that energy efficiency is treated as a resource on the margin. This is not consistent with Virginia's energy efficiency potential, nor does it make economic sense. The incentive in a market-based regulation should drive emission reductions by the lowest cost means, which in this case is energy efficiency. Instead of a set-aside, an allowance approach could preferentially award allowances to energy efficiency programs. Allowances could be allocated on an updating output basis according to kWh generated or saved. Ideally, such an approach would award allowances to zero-emission savings and generation first. The remaining allowances could go to fossil-fueled electric generators. An updating output-based allocation provides a transparent and predictable price signal, and rewards measures that deliver lasting CO_2 reductions. There is untapped potential for non-utility energy efficiency programs in Virginia over the next 10 years. The 5% set-aside does not reflect the level of potential investment in energy efficiency that the state could achieve. We recommend a set-aside of 10% in order to provide a more robust financing stream for energy efficiency projects. Increasing the set-aside would lead more cost-effective emissions reductions. Modeling indicates that increasing the set-aside would not impact rates. Energy efficiency measures also reduce overall customer bills, helping to alleviate any potential rate increases. DMME should use the set-aside to invest in energy efficiency projects that save energy and reduce utility costs for public and private sectors. While ratepayer-	programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement the set-aside. DMME may, at the appropriate time and in accordance with its regulations and policies, implement an energy efficiency set-aside as described by the commenter. The set-aside will be 5% in the early stages of the program; the set-aside may be revised at a later date as the state gains experience with the program and with the program DMME develops.

	funded programs for residential and commercial customers in Virginia will ramp up over the next 10 years, large industrial customers will not be served by these programs. DMME can fill this gap. Technical assistance programs targeted at industrial customers can identify potential projects and guide the implementation process. We encourage DEQ to clarify that combined heat and power (CHP) and waste heat-to-power (WHP) projects are eligible for set-aside funds. Other RGGI states have used their auction revenue to support CHP deployment. DMME can leverage its experience operating the Commonwealth Energy Fund, using revenues to make loans to high growth potential early stage Virginia companies focused on energy efficiency and pollution prevention or establishing a revolving loan fund to finance energy efficiency investments at low interest rates for other markets, including public entities, residents or businesses. Financing products could be paired with utility rebates in order to further spur investment. Revolving loan funds have several benefits. These programs are sustainable and can have considerable market impact. Virginia currently has a goal to reduce energy consumption in public buildings 15% by 2017. Through the Virginia Energy Management Program (VEMP), DMME helps state agencies, institutions of higher education, and public bodies reduce utility consumption by working with energy savings performance contractors. In parallel with VEMP, Virginia recently launched the Clean Energy Development and Services (CEDS) program to provide grants and loans for energy efficiency, renewable energy, and alternative fuel projects in state and local agencies. In spite of these efforts, the state has only met about one-third of this energy savings target. We recommend that DMME use the set-aside to expand energy efficiency offerings for public buildings, through VEMP or deeper incentives as part of CEDS.	
54. Virginia Advisory Council on Environmental Justice (ACEJ)	Many members of the environmental justice (EJ) community have been skeptical or opposed to market-based solutions to carbon reduction. Many community members believe their voices have not been heard during program implementation in other states. Concerns with carbon trading include the lack of regulation of co-pollutants, hotspots, equity of allowance allocation, and lack of public engagement. Perhaps the most central concern from an EJ perspective is that many EJ organizations prefer guaranteed emissions reductions at the source of polluting facilities in EJ communities, an outcome that market-based solutions can't guarantee directly. DEQ can structure a program with complementary policies that produce outcomes that EJ	The commenter's concerns are acknowledged. In addition to controlling carbon pollution via this regulatory action, DEQ implements a robust permitting and compliance program to ensure that federal and state standards for controlling air pollution are met.

	groups prefer. We urge DEQ to keep this concern at the forefront, and explore ways to carbon reduction that would achieve guaranteed emissions reductions at the source.	
55. Virginia Advisory Council on Environmental Justice (ACEJ)	DEQ should formalize rules for meaningful engagement of EJ communities. The Clean Power Plan required states to demonstrate how they were meaningfully engaging low-income communities, tribal communities, and communities of color. DEQ should likewise set concrete criteria on how the state plans to engage EJ communities throughout the design and implementation of the regulation. DEQ should participate in a dialogue on allowance allocation and the identification of potential hotspots. DEQ should create a plan for sharing the results of the proximity and cumulative impact analysis to the public, including an education and outreach plan to communities that are convenient and understandable. These methods should be targeted to "meet people where they are" in order to maximize community involvement for specific communities. A toolkit was created by community advocates in coordination with Green for All to ensure meaningful community engagement to comply with the Clean Power Plan. DEQ should use this toolkit as a guide to design its own plan for community engagement during this process. ACEJ recommends the creation of a long-term plan designed to increase participation of EJ communities. DEQ should formalize a process to gather feedback from community members affected by climate change, including creating a sustained dialogue to discuss complementary policies that may be adopted to maximize emission reductions in EJ communities. ACEJ recommends that DEQ host community forums in locations that are experiencing threats from climate change, and explain how this rule is designed to strengthen the state's commitment to fighting climate change.	Community involvement is important to all DEQ programs, and DEQ has a robust community involvement program. Effective community involvement strengthens public confidence in DEQ, and encourages those who are most concerned with agency decisions to inform and help implement them. In addition to a formal Community Development Policy, DEQ is also taking the following steps as part of its strategic plan and commitment to build community involvement: - Provide opportunities for meaningful community involvement in all agency programs, and consistently look for new ways to enhance public input, and include development of education materials and training opportunities for the public. - Identify and implement steps that enable early public involvement and collaboration in significant environmental decisions. - Seek input reflecting different points of view and carefully consider this input when making decisions. - Work to ensure that decisionmaking activities are open and accessible to all interested individuals and organizations, including those with limited experience participating in environmental decision making. - Develop innovative ways to present information on the agency web site and

		elsewhere, and ensure that information is useful, understandable and easy to find. DEQ's EJ Coordinator has also been consulted for advice on communicating and working with vulnerable communities. The EJ Coordinator will provide this assistance on an ongoing basis as the rule is implemented. Routine RGGI program reviews will also provide the opportunity for any affected community to bring attention to any issues that may arise. Linking to RGGI will make Virginia a participant in RGGI's regularly scheduled program reviews. These comprehensive, periodic reviews consider program successes, impacts, and design elements. Stakeholder meetings are held throughout the program review process in order to encourage stakeholder engagement and the submission of comments from interested parties. As part of this process, the department will evaluate how the program is working from a Virginia standpoint as well as in the context of the other RGGI states. Any issues identified with respect to affected communities may be identified and resolved as part of this exercise. In order to clarify that this review process will take place, the proposal has been modified to add a new Article 10, Program Monitoring and Review.

		This provision specifies that in conjunction with the CO_2 Budget Trading Program program monitoring and review process, the department will evaluate impacts of the program specific to Virginia, including economic, energy and environmental impacts, and impacts on vulnerable and environmental justice and underserved communities. The department will also develop a plan to encourage increased participation by affected communities.
56. Virginia Advisory Council on Environmental Justice (ACEJ)	DEQ should complete a robust proximity and cumulative impact analysis to determine the environment and health impacts of co-pollutant emissions and pollution from sectors not subject to the carbon cap for EJ communities. Although capping carbon emissions from power facilities is the scope of the rule, we must study all major sources of carbon and other forms of pollution in Virginia when determining the full scope of environmental health effects in EJ communities. For instance, while reducing carbon from the electric sector has been a major focus of numerous advocates, the largest source of carbon pollution in Virginia is from the transportation sector. Other states in the region are launching a series of listening sessions to explore how to cut carbon from transportation while improving the equity and quality of service. Indeed, EPA has identified proximity to vehicle traffic as associated with increased exposure to toxic gases and particulate matter, which is hazardous to human health. A cumulative impact analysis from Kentucky revealed that "strong relationships between exposure related health problems and vulnerable demographics, such as poverty, educational level, and certain age groups." Similar analysis, in coordination with other state agencies and conducted with input of EJ stakeholders would help the state identify existing pollution hotspots and environmentally stressed communities so that the state can design a carbon reduction program to alleviate harms to those communities. DEQ should prioritize the perspectives and feedback of community members over industry. If hotspots are found, DEQ should create a remediation plan to reduce environmental hazards and lower pollution in environmentally stressed communities. DEQ should solicit the input of community members and other interested stakeholders for corrective remediation	Fossil fuel-fired units are subject to a host of regulatory and permitting requirements that specifically target and control emissions of criteria pollutants and toxics. Ultimately, the control of CO_2 will reduce global warming impacts and concomitant welfare impacts on disadvantaged communities. As discussed in the response to comment 55, the opportunity to elevate specific concerns about potential problem areas will be available during routine program reviews. Note that the board's ability to address transportation sector emissions is limited by statute. DEQ believes that the monitoring and review components of the RGGI program will enable any leakage of emissions to be identified and corrected. As demonstrated in RGGI's April 2018 market analysis, carbon intensity in RGGI states is decreasing.

	of past practices.	
57. Virginia Advisory Council on Environmental Justice (ACEJ)	DEQ proposes to allocate 5% of the allowances to DMME to assist the department in abatement and control of air pollution, presumably through investments in energy efficiency and solar. Ninety-five percent of the allowances are proposed to be allocated to the polluters, which is unacceptably high. If only 5% of the allowances are directed to DMME, it must maximize opportunities to assist families and communities who've been disproportionately harmed by existing energy policy. DEQ should specify that the DMME allocation is directed toward low-income communities. In the alternative, conduct an open decisionmaking process where communities have a say in how allowances are allocated. Energy efficiency and solar energy will advance Virginia's goal to combat climate change and reduce carbon pollution. However, the state would benefit by advancing clean energy in communities who need it most. Low-income and families of all races and ethnicities pay more for utilities, which means there may be cost savings to disadvantaged communities while reducing air pollution.	DEQ recognizes value of directing pollution control efforts toward low-income communities; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement the set-aside. DMME may, at the appropriate time and in accordance with its regulations and policies, implement an energy efficiency set-aside for low income communities as described by the commenter.
58. Virginia Advisory Council on Environmental Justice (ACEJ)	Wood and other types of biomass plants release more carbon per unit of energy than coal plants, in addition to localized criteria pollutants. These plants should be fully accountable to the carbon cap and should be included in the proximity and cumulative impact pollution analysis. RGGI caps carbon on power facilities 25 MW or greater, allowing power facilities with multiple combustion turbines that individually fall below the threshold but are collectively greater than 25 MW go unchecked. DEQ should regulate these types of units holistically, and consider ways to place limits on facilities below the 25 MW threshold. New York will begin covering sub-25 MW peaker plants, a step other RGGI states can voluntarily take. EJ groups have long opposed carbon offsets on principle to not allow facilities to continue or increase pollution by avoiding localized pollution reduction. Localized pollution reduction in EJ communities is the central concern of EJ advocates with cap-and-trade programs. ACEJ supports the recommendation of several EJ organizations in the RGGI region to eliminate the use of offsets as a compliance option.	See the response to comment 67 for a discussion of biomass. To our knowledge there are no sub-25 MW peaker plants, existing or planned, in Virginia. Regardless, current state regulation (9VAC5-20-70) prohibits circumvention of air quality requirements by constructing multiple facilities in a piecemeal fashion in order to avoid regulation. As discussed in the response to comment 26, DEQ is not, at this time, proposing to implement offsets.
59. Virginia Advisory Council on Environmental Justice (ACEJ)	DEQ should coordinate with other state agencies, localities, and community organizations to study the effects of the regulation in coal-dependent communities to ensure a fair and just transition from fossil fuels to clean energy. The coalfield counties in southwest Virginia have borne disproportionate economic and environmental burdens as coal has been extracted. Virginia coalfields are now left with pollution from mining and an economy struggling to recover. Relevant state agencies should conduct an economic analysis to identify sustainable investment and other job creation opportunities for coal communities.	The commenter's concerns about coal-dependent communities in southwest Virginia are well taken; see the response to comment 55 for further discussion of how communities will be addressed.

60. AdvanSix, Greif, ODEC, Virginia Manufacturers Association (VMA)	It has been the policy of the state to avoid the imposition of regulatory requirements "which are more restrictive than applicable federal requirements" unless a showing of necessity supports a more stringent Virginia rule (VA Code 10.1-1308 A). The Administrative Process Act establishes a procedure whereby the General Assembly reviews regulations that are more restrictive than applicable federal requirements (VA Code 2.2-4014) and has the opportunity to judge whether such regulations are necessary. The board should adhere to this long-standing approach and leave any such regulation to the appropriate time and approach determined for the nation by Congress and EPA.	The board may indeed promulgate regulations in the absence of a specific federal requirement to address a state-specific need. DEQ notified the appropriate legislative committees of this regulatory action in accordance with § 10.1-1308 in November 2017.
61. AdvanSix, Greif, ODEC, Virginia Manufacturers Association (VMA)	Cost-effectiveness is a fundamental premise for good regulation. When government burdens its citizens by regulation, the benefits should outweigh the burdens. The proposal fails this basic premise. The proposed regulation is not cost-effective and the cost burden far exceeds any purported benefits. In EO-57 and ED-11, then-Governor McAuliffe revealed the non-environmental motive for mandating a CO_2 cap-and-trade program in Virginia: to "grow the clean energy economy" and "make clean energy a pillar of our future economic growth and a meaningful part of our energy portfolio." ED-11 notes an increase in "the number of solar jobs in Virginia" and the increase in "revenue for energy efficiency businesses in Virginia." While these are laudable goals, it is a misuse of governmental authority to use environmental regulation for non-environmental purposes. There are other, more appropriate authorities and programs to accomplish these economic goals. It appears that the environmental benefit envisioned from the regulation of CO_2 emissions is the mitigation of the risks to Virginians from climate change. The administrative record is devoid of scientific data or other information to support the conclusion that the proposal would have any perceptible effect on the severity of storms or flooding in Virginia. The preamble to the proposed regulation contains a chart of "Health Benefits of Incidental Reductions in SO_2 and NO_X." The rationale is that regulating emissions of CO_2 would have the "incidental" benefit of reducing emissions of SO_2 and NO_X. However, there are numerous other air regulatory authorities and programs addressing emissions of SO_2 and NO_X, including their own cap-and-trade programs. Thus, if additional regulation of SO_2 or NO_X is deemed necessary, there are other, more appropriate regulatory programs to directly address this necessity. Virginia does not have to resort to CO_2 regulation to indirectly address concerns with SO_2 or NO_X emissions. More specifically, the board cannot say the proposed regulation is needed to address emissions of SO_2 or NO_X . Incidental reductions in SO_2	Flexible, market-based emissions trading programs provide the most cost-effective means of reducing air pollution. The program sets an overall cap but otherwise does not dictate which sources must make reductions. Through emissions trading, the program delivers the lowest cost reductions possible. Virginia has years of experience and considerable success with this kind of program. In addition to the inherent flexibility provided by emissions trading, the program also provides for the allocation of allowances to the entities with a compliance obligation. Allowances have value, and that value will be realized in the consignment auction, with revenue returning to compliance entities. The revenue returned to compliance entities from the compliance auction will serve to offset and mitigate the costs of the program for compliance entities and consumers. The analysis in the record is clear on these points. While the program minimizes costs through

	and NO_X provide no rationale for imposing the proposed CO_2 emissions cap-and-trade program in Virginia. DPB's Economic Impact Analysis states: ". . . EPA and other federal agencies use estimates of the social cost of carbon (SC-CO_2) to value the climate impacts of regulatory rulemakings. The SC-CO_2 is a measure, in dollars, of the long-term damage done by a ton of CO_2 emissions in a given year. This dollar figure also represents the value of damages avoided for a reduction of a ton of CO_2 emissions in a given year (i.e. the benefit of a CO_2 reduction). It should be noted that the federal model estimates of the social cost of carbon are for the world overall. Thus it is not possible to quantify the Virginia-specific benefits." There is a reason why the value of damages avoided in Virginia is impossible to quantify. The effect, if any, of reducing CO_2 emissions from Virginia's electric power sector on the severity of storms or flooding in Virginia would be negligible at best. The regulation would provide no measurable environmental benefit to Virginia. Climate change and reduction of GHG emissions are global issues. Climate change is not a local phenomenon and to the extent man can craft a solution to climate change by reducing CO_2 emissions, that solution cannot be accomplished by disjointed state and local approaches. If any regulation of CO_2 in the U.S. is deemed necessary to address climate change, that regulation must be undertaken and applied uniformly throughout the country, not state by state or locality by locality. The costs of the regulation outweigh any purported benefits. In its Economic Impact Analysis, DPB notes that the proposal likely would increase electricity costs for Virginia's citizens and businesses by no more than 1.1% ($2015) by 2031. However, a recent study by the Cato Institute showed that electricity costs in the RGGI states rose by 4.6% between 2007 (pre-RGGI) and 2015. This increase was 64% higher than the increase in electricity costs in a sampling of 5 non-RGGI states. As the data from the RGGI states show, adoption of the proposed CO_2 emissions cap-and-trade program will add millions of dollars per year to the electric bills of the citizens and business of Virginia. Virginia has a robust manufacturing sector and is ranked as the fourth most competitive state in overall manufacturing competitiveness in the nation. Moreover, Virginia is ranked the most competitive southern state for manufacturing. However, this position would be jeopardized by increasing energy costs. The Cato Institute study found that from 2007-14 the economies of the 5 non-RGGI comparison states grew 2.5 times faster than the RGGI states. During the same period the RGGI states lost 35% of energy intensive businesses, whereas	emissions trading and mitigates costs through allowance value, it also produces real benefits for Virginians. The administrative record demonstrating the impacts of climate change and the benefits of encouraging clean energy in Virginia toward the protection and improvement of Virginia's environment is well-documented. The focus of the EO 57 Work Group was to evaluate options under the Governor's existing authority while simultaneously creating more clean energy jobs. (The legal authority to develop this program in the first place is well established; see the response to comment 76 for more detail.) The process consisted of monthly meetings with presentations from the public. Numerous presenters described the impacts of climate change to the Working Group, and presenters included Dominion Energy, the American Petroleum Institute, Covanta, WestRock, and other stakeholders involved in manufacturing and energy generation. The Work Group also received over 8,000 written comments during a 3-month public comment period. The basis for EO 11 and this regulatory development action are, therefore well-established. Note that other commenters describing detailed environmental and fiscal impacts to the state were also submitted during this proposed regulatory development stage; they

	the 5 non-RGGI comparison states only lost 4%. While the non-RGGI comparison states' overall goods production grew by over 15%, the RGGI states lost 13% of overall goods production. This decline is reflected in industrial electricity demand with the RGGI states falling 17% while non-RGGI comparison states only fell 3%. The greater decline in energy demand in the RGGI states cannot be attributed to greater energy efficiency in those states. In fact, the RGGI states improved by 9.6%, while the non-RGGI comparison states improved by 11.5%. Even as the economy was recovering from the 2008 recession, industry was leaving the RGGI states. If the program is enacted in Virginia, electricity costs for manufacturing facilities will undoubtedly increase, by as much as 4-5% by 2031. This increased cost of operation will diminish Virginia's competitive advantage. If Virginia participates in RGGI, we can expect the same fate for our industry that the RGGI states have experienced--industry will go where costs of energy are lower.	are summarized here and the full comments are part of the public record (see, for example, comments 108, 121 and 139). DPB's analysis was based on the best available information, including an analysis of potential changes in residential, commercial, and industrial customer electricity bills prepared for the department by the Analysis Group, an internationally recognized economic consulting firm. In addition, the Virginia Joint Legislative Audit and Review Commission (JLARC) in its Fiscal Impact Review of ED 11 (December 2017) found that the fiscal impact of the proposed regulation on state government should be minimal. The impact is estimated to be negative in 2020 when the regulation takes effect and be approximately $1.9 million (in 2017 dollars) in 2031, the last year for which information is available for developing an estimate. Nearly all of the impact is because of the impact to electricity costs for state agencies and public higher education institutions. Based on the results of these studies as well as various modeling exercises, DEQ maintains that impacts on electricity consumers will be minimal. In fact, the latest analysis of customer bills based on updated modeling shows that average bills will slightly decrease as a result of the rule. Non-carbon benefit

		information provided in the public notice comes from DPB's analysis and quotes EPA COBRA analysis. The latest COBRA analysis again shows significant economic co-benefits resulting from criteria pollutant reductions as a result of this rule. The primary purpose of the regulation is to control CO_2; however, it is accurate to note that there will indeed be other air quality benefits associated with the control of carbon pollution. This discussion is part of the comprehensive economic analysis required by state law that attempts to identify significant impacts--direct and indirect--of the regulation. No analysis of the costs and benefits of the proposal can accurately say that there will be no impacts on other pollutants. DEQ agrees that climate change is a global problem. However, in the absence of a federal program, the Commonwealth is well within its authority to address air pollution within its borders. Linking to RGGI is not a "go it alone" approach; it will enable Virginia to leverage its pollution reduction efforts with a well-established, proven effective interstate program. As discussed in RGGI's most recent market analysis, carbon intensity is decoupling from energy generation in the RGGI region. In addition to its own analyses DEQ has reviewed the results of the RGGI program and finds that costs have been

		contained and benefits have been realized. See, for example, the most recent recent report prepared by the Analysis Group, "The Economic Impacts of the Regional Greenhouse Gas Initiative on Nine Northeast and Mid-Atlantic States: Review of RGGI's Third Three-Year Compliance Period (2015-2017)." This analysis found that RGGI continues to to lower CO_2 emissions while benefiting local and regional economies and employment opportunities. The report estimates that RGGI states will realize $1.4 billion in net economic value from RGGI's implementation during the 2015-2017 period. According to the report, the program also will create more than 14,500 new job-years (the equivalent of one full-time job for the duration of one year) due to the program's implementation during the past three years. In addition, CO_2 emissions from power plants have dropped by more than 50% over the 9 years since RGGI began. DEQ realizes that the electric generation system in RGGI is different, and that Virginia's participation in RGGI will be via consignment rather than direct auction; however, all indications are that linking to RGGI will be beneficial for Virginia. The energy price projections resulting from the updated modeling are lower than the previous modeling exercise in 2017. Thus, the cost of the program will be less for

		consumers and regulated sources than previously estimated. Ignoring the costs of carbon pollution will endanger Virginia's competitive advantage, and linking to RGGI is a step toward addressing that risk. DEQ is well aware of the need to address air pollution in the fairest, most cost-effective means possible, which is why the program is flexible and allows emissions trading to seek out the lowest cost reductions possible. DEQ has also taken measures to ensure that the program goals are realistic and can be reasonably achieved; see, for example, the response to comment 37. In short, the program has been designed to minimize impacts on businesses and consumers while achieving DEQ's air pollution control mission to protect public health and welfare.
62. AdvanSix, Greif, ODEC, Virginia Manufacturers Association (VMA)	The regulation imposes a carbon tax and cedes this tax authority to RGGI. The regulation envisions a process whereby conditional allowances are allocated by DEQ to regulated sources. Those regulated sources are compelled to consign the conditional allowances to RGGI for auction. Regulated sources throughout Virginia and the RGGI states can bid on the allowances. RGGI states have taken the auction revenue and used it for a variety of purposes, one of which is not related at all to the goal of reducing CO_2 emissions: 8% of the revenue was used "for state budget reduction," just like any other tax revenue that goes into the state's coffers. The cap-and-trade program in Virginia is supposed to operate differently. Revenue generated by the auction of conditional allowances consigned by a regulated Virginia source is supposed to be returned to that source owner, less RGGI administrative fees. DEQ has indicated the revenue received by owners of regulated electric utilities will "flow to rate payers pursuant to SCC requirements." However, we have no idea that will actually happen or to what purposes the revenue would be put. The provisions governing the allocation and auction of CO_2 emission allowances, whether conducted by DEQ under the	The definition of "tax" is well established in state and federal law. The purpose of the regulation is to control and abate carbon air pollution, not to generate revenue. Rather than impose a tax, the regulation requires the issuance of allowances by the department to CO_2 budget units. An allowance is a limited authorization by the department under the trading program for CO_2 budget units to emit up to one ton of CO_2. Allowances are then traded within the confines of a consignment auction. No money is generated for or sent to the state.

	board's authority or RGGI, are designed to produce revenue to fund energy efficiency programs, resiliency infrastructure, and other government purposes. The overlay of the additional cost imposed by the auction of CO_2 emission allowances constitutes a tax. The magnitude of that tax will not be set by Virginia; it will be set by RGGI, a non-governmental entity. The General Assembly may delegate the power of taxation to any county, city, town, or regional government (Va. Const. art. VII, § 2). However, the General Assembly cannot delegate its taxing power to an unelected entity, whether the board, DEQ or RGGI. The Constitution and case law are quite clear on these matters. Although the Constitution does not explicitly prohibit the delegation of such decisional authority concerning the imposition of taxes, that delegation is prohibited by necessary implication, and the General Assembly may not delegate its taxing power to a non-elected body. Thus, the Virginia Constitution prohibits ceding tax power to the board, DEQ or RGGI.	
63. AdvanSix, Greif, ODEC, Virginia Manufacturers Association (VMA)	The program is unnecessary. Virginia's per capita energy use fell from a peak of 346 MBtu per person in 2005 to 292 MBtu in 2013 and 2014. Virginia's 2014 rate is lower than the national average of 309 MBtu and ranked Virginia 21st among U.S. states for energy consumption. The decrease in energy consumption translates into a decrease in CO_2. From 2000-15, Virginia's energy-related CO_2 fell by 16.3%; the RGGI states averaged a 17.1% decrease and the entire U.S. experienced a 10.3% drop. Virginia already generates a relatively low amount of GHGs from electrical power generation, transportation, heating/cooling, and industrial processes. Virginia's CO_2 emissions decreased from 15.9 tons per person in 2005 to 12.5 tons in 2014. This was substantially better than the national average of 17.0 tons per capita and ranked 13th best in the country. Virginia is reducing its carbon footprint at a rate better than the nation and comparable to the RGGI states even without a cap-and-trade program. Virginia's electric utilities are expanding the role of renewable energy in power generation. Dominion has solar facilities capable of producing approximately 744 MW of power either operational or under development. ODEC has approximately 300 MW of renewable energy generation capacity, and plans to add 70 MW of solar generation in the next 5 years. As technology costs decrease, solar electric generation is growing rapidly in Virginia. According to the Solar Energy Industries Association, Virginia's total solar capacity of 619.5 MW at the end of 2017 ranked 17th among the states. SEIA data indicate that Virginia's solar generation fleet grew by 381.3 MW in 2017. Virginia ranked 10th in the nation last year in adding solar capacity. Dominion's 2017 IRP calls	The program is needed. DEQ's modeling analysis suggests that carbon emissions from the electricity sector will increase without the program. The analysis is consistent with similar analyses conducted by the federal Energy Information Agency (EIA) showing emissions generally flat or modestly increasing in the coming years and decades. While emissions have decreased in some recent years, that trend is reversing and emissions are expected to continue to increase without the trading program. The commenter is correct that renewable energy development is expanding in Virginia, and it is expected that this trend will continue. DEQ has also recognized the value of these types of programs by establishing the 5% set-aside. New renewables and energy efficiency will make compliance with the trading

	for the addition of at least 3,200 MW additional solar capacity by 2032 and at least 5,280 MW additional solar capacity by the end of a 25-year study period concluding in 2042. Dominion is moving forward with a project consisting of two, 6-MW turbines that will become the mid-Atlantic's first offshore wind project in a federal lease area. Larger-scale deployment of turbines in an adjacent site could potentially produce up to 2,000 MW of electricity. SB966 (2018), states that construction or purchase by Virginia electric utilities of solar and wind-powered facilities capable of producing up to 5,000 MW of electricity at maximum output is "in the public interest." It is clear that Virginia's electric utilities are moving rapidly to greatly expand generation from renewable resources. Virginia is already among the nation's leading states in this regard. A costly CO_2 program is unnecessary to promote the continued rapid growth of renewable energy generation in the state.	program easier, but neither new renewables nor energy efficiency guarantee an emissions reduction from the sector. The program does.
64. AdvanSix, Greif, ODEC, Virginia Manufacturers Association (VMA)	Virginia's electric utilities have billions of dollars invested in assets that serve the public good and generate returns for investors. If the program fails to allocate allowances necessary for those facilities to generate electricity, that failure would deprive those entities of their ability to operate. In essence the government would be taking the value of those electric generating assets from Virginia's utilities without public need and compensation. Similarly, if sufficient allowances for Virginia's utilities to operate are allocated but then forced to be consigned to RGGI for potential purchase by someone else, the board would be taking valuable allowances away from these companies without public need and compensation. Such "takings" are prohibited by the U.S. and Virginia Constitutions. Virginia is a member of numerous interstate and regional compacts. An essential feature of these compacts is authorization by the U.S. Congress and confirmation by the General Assembly. Linking to RGGI by compelling the consignment of allowances to RGGI for general auction would constitute an unauthorized compact with the RGGI states. Attempting to do so would exceed the authority of the board. Emission allowances should be allocated without cost to EGUs that will be constrained by the emissions cap. Direct auction of the allowances with the revenue collected by the state would constitute a tax. A direct auction would greatly increase the cost of the program to Virginia citizens and businesses.	DEQ disagrees with the commenter's assertion that the allocation of allowances constitutes a taking of value. As described in 9VAC5-140-6050 C 9, a CO_2 allowance does not constitute a property right. The allocation of allowances in no way deprives electricity generators of their ability to operate. That would defeat the purpose of the emissions trading program. Allowances are allocated based on actual generation (versus static historical generation), thus providing facilities with greater flexibility. Linking to RGGI does not constitute entering a compact. RGGI is a cooperative venture, governed by consensus among member states to maximize collective emissions reductions capabilities. Linking to RGGI does not exceed any federal or state requirement, nor does it directly impose any legal

		requirements on Virginia or its regulated community. As discussed in the response to comment 76, the board has the legal authority to control carbon pollution. Linking to RGGI is the most cost effective and efficient means of accomplishing this goal.
65. AdvanSix, Greif Packaging, Virginia Manufacturers Association (VMA)	Fossil fuel-fired units that serve electrical generators smaller than 25 MWe and industrial facilities should not be included in the proposed program. ED 11 speaks in terms of "electric power facilities," and EO 57 speaks in terms of "power plants," "the electric sector," "electric companies," and "electric utilities." It is clear that the mandate from then-Governor McAuliffe was for the board to propose a CO_2 cap-and-trade program tied to RGGI that would apply to facilities whose primary, if not exclusive, purpose is the generation of electricity for sale to the public. Industrial facilities are not power plants owned by electric companies and operating in the electric sector, and are clearly outside the scope of EO 57 and ED 11. Many industrial facilities in Virginia do not have multiple locations with different energy generating capacities to provide flexibility in meeting a CO_2 emissions cap. They have one facility and cannot shift allocations between facilities and generating technologies. Virginia's electric utilities have multiple units and generating technologies which allow them to find the least expensive way to reduce CO_2 emissions. Utility power producers are in the business of building alternative power generation sources while manufacturers are not. It is easier for utility power producers to shift the mix of generation to renewable power. Electric utilities have economies of scale and may purchase larger and a greater number of alternative generation units. Manufacturers' power needs are generally much smaller. Electric utilities are better able to pass their costs on to their customers, while manufacturers do not have a captive customer base. They compete worldwide for business from customers who are acutely price sensitive. Large capital expenditures for alternative energy generation would increase the price of products and damage their market position. Electric utility revenues are not affected by these global market demands. Emissions from industrial sources comprise only 11.3% of Virginia's CO_2 emissions. Expanding cap-and-trade to the manufacturing sector would impose significant costs with only a small reduction in emissions. The regulation does not define "primary use." The dictionary sense of "primary" would allow a facility to	DEQ agrees with the commenter's characterization of the directive to control carbon emissions from fossil fuel-fired generators. The ED 57 Work Group specifically recommended that the Governor consider taking action via a regulatory process to establish a trading-ready carbon emissions reduction program for fossil fuel-fired electric generating facilities. In the RGGI Model Rule, facilities that provide less than 10% of their power output to the grid are exempted from compliance obligations. DEQ also evaluated dedicated electricity generating units serving industrial facilities in Virginia, and determined that those facilities would not qualify as CO_2 budget sources. These facilities are already subject to a stringent permitting process to control criteria and toxic pollutants, and are closely monitored in order to ensure that they are meeting state requirements for controlling those emissions. Exemption of this level of industrial producers is also consistent with the RGGI model rule. The proposal has been amended to remove the phrase "owned by an

	export just under 50% of the electricity and heat generated from fossil fuels on site and still qualify for the exemption. The reality is that no manufacturing facility comes close to exporting 50% of the energy generated on site. However, the regulation should provide manufacturing facilities a margin of flexibility to export energy when it is not all needed on site. "Primary use" should mean that in order to qualify for the exemption, no more than one third of the power generated on site, in the form of electricity and heat, can be exported. This approach is based on the cogeneration exclusion in Virginia's CAIR rule. For example, 9VAC5-140-1040 B 1 a (2) excluded cogeneration units provided they did not supply more than one third of the unit's potential electrical output capacity to any utility power distribution system for sale.	individual facility." This change is being made in order to ensure that facilities are not penalized for employing more energy efficient and less polluting generating systems that may be operated by a third party on behalf of the primary facility. The proposal has also been modified to set a threshold for what constitutes "primary use of operation of the facility." These changes are necessary in order that the applicability provisions be consistent with RGGI's 2017 Model Rule. Note that ongoing program reviews will provide the opportunity to adjust the exemption if necessary. There may also be opportunities in separate future rulemakings to directly address the exemption should implementation issues be identified.
66. Virginia Advanced Energy Economy (AEE)	AEE supports a CO_2 budget trading program. The regulation will help to make Virginia's energy more secure, clean, and affordable, bolstering the state's economy while reducing emissions. We support the ability of the regulation to integrate into other carbon markets. Integration with other states and regions will help Virginia achieve greater efficiencies and further reduce emissions. Utilizing the State Tool for Electricity Emission Reductions (STEER), AEE analyzed possible compliance pathways. With a diverse portfolio of advanced energy resources, including renewables and energy efficiency, the state could reduce emissions by over 13.3 million tons between 2020-30 at little to no cost, far surpassing the proposed targets. We recommend a 2020 baseline at or below 33 million tons. Lowering the baseline may encourage system planners and grid operators to accelerate the deployment of advanced energy resources in preparation for the 2030 targets. Such accelerated deployment is beneficial to ratepayers, as it would take advantage of the federal production tax credit for wind and the investment tax credit for solar and other advanced energy technologies.	Support for the proposal is appreciated. DEQ recognizes the value of the renewable energy market and energy efficiency measures as important tools in reducing carbon pollution. The program will promote both renewables and energy efficiency by putting a price on carbon emissions. The program effectively encourages renewables and efficiency because they are carbon-free resources and do not have a compliance obligation, unlike carbon-emitting resources. DEQ also recognizes that CHP units are highly efficient, and do not encourage the development of fossil fuel-fired generation.

	These incentives lower the costs of renewable resources, savings that will be passed along to consumers. Given the cost-effectiveness of energy efficiency, the sooner it is deployed the greater the cumulative savings will be to ratepayers. Our modeling also indicates that with a portfolio of advanced energy technologies in conjunction with coal-to-gas switching, Virginia can beat its 2030 carbon reduction target by approximately 3.4 million tons. These results suggest that actual reductions will exceed targets. When emissions reductions outstrip targets it has the effect of lowering the price of a carbon credit. While keeping the price of credits in check is preferable, significantly depreciating them is not, as it depresses the market and introduces volatility. We support the CCR and the ECR as they ensure that carbon prices remain within a predictable range. However, we prefer predictable and robust prices established and maintained through the market, as opposed to out-of-market interventions. Such prices are essential to the effective financing of advanced energy projects. We recommend that the rate at which the cap decreases each year be 4% annually, and that the ECR and CCR be adjusted correspondingly. These changes will help ensure that targeted and achieved reductions move in closer alignment, and that market functions proceed smoothly. Under the proposal, all permits are allocated to generators (less the set-aside) based on a 3-year average of net generation. We approve of basing allocations on generation, as opposed to historic emissions, as well updating allocations over time. To encourage compliance, we recommend that the rule allocate allowances to all generating units equal to or greater than 25 MW regardless of technology. This will ensure that the allowance allocation remains technology neutral and encourage competition among emission reduction measures. CHP units that generate heat and power for an individual facility are exempt. Given the efficiency of such systems, and the corresponding emissions benefits, this exemption is reasonable. We recommend that "owned by an individual facility" be removed. This will ensure that CHP systems that serve an individual facility are exempt regardless of ownership status. In order to ensure that the "primary use" of the CHP system is indeed to serve the individual facility, the regulation should specify that a minimum of 85% of the useful energy output be used at the site. As proposed, a covered CHP system must account for emissions created in the production of electricity and useful thermal energy (UTE). However,	The program achieves its primary environmental objective through the cap, and not the allocation method. Note, however, that the updating output-based allocation methodology will reward units that produce more electricity with lower carbon emissions. In the past, DEQ has always allocated allowances to compliance entities and not to other entities, with the exception of set-asides to promote energy efficiency. This program takes a similar approach. The structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement that set-aside. DEQ believes the set-aside should be 5% in the early stages of the program, and this percentage is consistent with past DEQ programs. The set-aside may be revised at a later date as the state gains experience with the program and with the program DMME develops. DEQ agrees that the phrase "owned by an individual facility" should be removed. Under the RGGI Model Rule, facilities that provide less than 10% of their power output to the grid are exempt from compliance obligations; the proposal has been revised accordingly.

	absent a CHP system, such thermal energy would be generated through a conventional method that is not subject to the regulation, potentially discouraging the use of CHP while creating new emissions from non-covered sources. The UTE exemptions put forward by other states should be considered. AEE supports the 5% set aside for DMME. According to studies by EPRI, by 2030 energy efficiency programs have the potential to save Virginians over 23,000 GWh of generation, more than 17% of the state's load, each year. On Virginia's current trajectory, the state will achieve just 5% of that potential. This underperformance stems from underinvestment in energy efficiency and a misalignment of incentives. Until this misalignment is reformed we support allowing experienced parties the ability to implement programs in addition to the utilities. We recommend doubling the set-aside to 10% in order to provide a more robust financing stream. According to our modeling, energy efficiency has the potential to help Virginia meet its carbon mitigation targets while reducing rates, creating jobs, and stimulating new in-state investment. The challenge energy efficiency presents lies in the ability of system planners, regulators, and other stakeholders to effectively track, evaluate, measure, and verify the energy savings produced by an array of energy efficiency programs and measures. The National Energy Efficiency Registry (NEER) helps states track and verify energy efficiency savings and transform those savings into tradable instruments parties may then use for compliance. Regulators and stakeholders should use NEER to facilitate the administration and tracking of energy efficiency programs in Virginia. Employing consistent and well-established methods for evaluation, monitoring, and verification of savings will help Virginia effectively tap into this cost-effective resource. Voluntary purchasers of renewable energy do so in part based on carbon reduction benefits. In many states, the purchase of a REC includes the purchase of environmental attributes associated with the carbon reductions of that power. Unless the voluntary market is taken into account, a statewide carbon reduction requirement could undermine voluntary purchaser commitments because they will no longer represent a regulatory surplus. Several programs have avoided this through a voluntary purchaser set-aside. This can also be done by allocating allowances to resources that reduce emissions rather than only to emitting resources. This will allow advanced energy resources to fulfill any contracted-for obligations to transfer allowances to purchasers under existing power purchase agreements. Those purchasers can then choose to do what they wish	

	with the allowances. This gives purchasers the choice to retain these allowances if they wish to preserve the project's regulatory surplus.	
67. American Forest and Paper Association; American Wood Council; Forest Products Industry National Labor Management Committee; Virginia Agribusiness Council; WestRock	The following principle should be incorporated into the regulation: "Emissions from the combustion of any forest-derived biomass shall not be considered a GHG if: 1) timberland carbon stocks, based on U.S. Forest Service Forest Inventory and Analysis data for the U.S. South Region, are stable or increasing relative to the 2005 carbon stocks assessment for this region; or 2) the forest-derived biomass is from forest products manufacturing residuals, harvest residues, or waste-derived feedstocks, including used wood products." Subsection 1 is based on the fact that harvesting wood for energy does not contribute to net carbon emissions in cases where it is offset by wood growth and associated carbon sequestration. U.S. Forest Service data shows carbon stocks in trees on timberland across the southern U.S. have increased from 4.9 billion tons in 2005 to 5.6 billion tons in 2016. This shows biogenic CO_2 from biomass removed from the forest is more than offset by removals of CO_2 from the atmosphere by growing forests. Also, 2016 data from the U.S. Forest Service demonstrates that the growth/removal ratios for timberlands in Virginia is 2.29, meaning timberlands are growing more than twice as much wood as is being harvested. This positive net growth/removal ratio shows that Virginia forestry is more than sustainable. Finally, strong markets for wood preserve forests by providing an incentive not to convert the land to other uses. Subsection 2 is based on the fact that emissions from forest products manufacturing residuals, harvest residues, or waste-derived feedstocks would eventually enter the atmosphere even if they are not used for energy production. Simply landfilling these feedstocks can result in methane emissions, which have a much greater impact on global warming than CO_2. The use of biomass residuals each year avoids the emission of approximately 181 million tons of CO_2 indicating there are GHG reduction benefits in using forest products residuals for energy in the pulp, paper, packaging and wood products industry.	DEQ is well aware of the concerns associated with biomass, and discussed the pros and cons of including or excluding biomass units with the Regulatory Advisory Panel established to advise and assist in the development of the regulation. The group did not reach consensus on an approach for dealing with biomass; given that, and given the numerous, detailed comments received during the public comment period, DEQ recognizes that this is a polarizing subject. However, the ED 57 Work Group specifically recommended that the Governor consider taking action via a regulatory process to establish a trading-ready carbon emissions reduction program for fossil fuel-fired electric generating facilities. The RGGI Model Rule provides that a biomass-fired facility may be a CO_2 budget source if the use of fossil fuel combusted comprises, or is projected to comprise, more than 50% (commence operation pre-2005) or 5% (commence operation post-2005) of the annual heat input on a Btu basis during any year. DEQ evaluated the fuel mix of the 5 potentially affected biomass-fired facilities in Virginia, and determined that those facilities would not qualify as CO_2 budget sources. These biomass-fired facilities are already subject to a stringent

		permitting process to control criteria and toxic pollutants, and are closely monitored in order to ensure that they are meeting state requirements for controlling those emissions. Additionally, most RGGI states allow CO_2 budget units that co-fire eligible biomass to deduct CO_2 emissions attributable to the burning of eligible biomass from their compliance obligation in accordance with the RGGI model rule. Finally, periodic program reviews at the RGGI and state level will provide opportunities to adjust the exemption should implementation issues be identified. The proposed definition of "fossil fuel-fired" is inconsistent with the RGGI 2017 Model Rule, which sets a threshold of 5% of the annual heat input on a Btu basis during any year, and the regulation has been amended accordingly. This change is necessary in order to ensure that Virginia's regulation is a corresponding CO_2 Budget Trading Program regulation, such that Virginia can be considered a RGGI Participating State; the proposal has been amended accordingly.
68. American Forest and Paper Association; American Wood Council (AF&PA and AWC)	AF&PA and AWC do not support Virginia joining RGGI because it will raise electric power prices and consequently cause Virginia-based businesses to become less competitive. Biogenic CO_2 emissions from forest-derived bioenergy should be counted as making zero contribution to the build-up of GHGs in the atmosphere where timberland	The commenters' concerns are recognized. As discussed in greater detail in the response to comment 61, potential costs and benefits have been rigorously examined, and the program has been

	carbon stocks are stable or increasing. Through the natural carbon cycle, growing forests sequester carbon as trees are replanted and grow through their lifecycles, even as some trees are harvested. Recent data from the U.S. Forest Service indicate that timberlands in Virginia, the U.S. south, and the entire U.S. have positive net growth/removal ratios. Virginia's timberlands are growing more than twice as much wood as is harvested. The most significant pressure on forests is conversion to non-forest uses, such as development. By contrast, strong markets for wood help to preserve forests by providing an incentive to not to convert land to other uses and to invest in healthy forest management practices. A Journal of Forestry article concluded that "[t]he demand for wood keeps land in forest, provides incentives for expanding forests and improving forest productivity, and supports investments in sustainable forest management that can help offset the forest carbon impacts of increased demand." A U.S. Department of State report shows that strong demand for forest products will increase forest carbon stocks through ongoing landowner investment. Paper and wood products mills rely on residuals from the manufacturing process for steam and power for their operations or to sell electricity to the grid, and there is consensus that the use of residuals and biowastes for energy has significant GHG reduction benefits. A study published in the Journal of Industrial Ecology concluded that "[T]he use of biomass residues from forest products manufacturing, including black liquor, to produce energy in the U.S. forest products industry for 1 year avoids, over a 100-year period, 181 million tons of CO_2-equivalent emissions per year. Even ignoring the displacement of fossil fuels such as coal, the article finds that the avoided disposal of forest products manufacturing residues alone produces a GHG reduction benefit of approximately 5 million t CO_2-eq/yr." This is equivalent to removing one million cars from the road. The article states that ". . . if mill residues were not used for energy, most of these materials would be wastes that would be either incinerated, in which case the atmosphere would see the same biogenic CO_2 emissions as if the material had been burned for energy, or disposed in landfills." Disposal of residues in landfills creates methane, which has about 28 times greater global warming potential than CO_2. The article concludes, "consider[ing] all GHGs and fossil fuel substitution, the overall [GHG reduction] benefits of using manufacturing residuals for energy are large and become evident in short periods." Forest biomass, including manufacturing residuals, should be treated as carbon neutral whether or not it is co-fired with fossil fuel. The carbon profile of biomass is not altered simply because it is co-fired. This distinction	designed to provide the maximum benefit at the least possible cost. See the response to comment 67 for further discussion of how biomass will be treated under the program and the response to comment 65 for further discussion of industrial boilers.

	is not scientifically supportable given that the biomass portion of the fuel mix has the same characteristics regardless of whether it is co-fired with 9% fossil fuel, 10% fossil fuel, or 90% fossil fuel. It is the biomass portion of the fuel mix alone that should be evaluated for net carbon emissions. The regulation should not cover industrial boilers. ED 11 pertains exclusively to controlling CO_2 emissions from "electric power facilities." Likewise, EO 57 directed the Work Group to recommend methods to reduce CO_2 emissions from "electric power generation facilities." The Economic Impact Assessment, the charge given to the Regulatory Advisory Panel, the emissions and economic modeling conducted by DEQ and its consultants, and DEQ's information leading up to and supporting the proposal indicated that the regulation applied only to the electric power sector. Indeed, covering only utilities is consistent with the intent and scope of the existing RGGI program, and RGGI allowance prices are based on the marginal cost to reduce GHG emissions from the utility sector and do not reflect the capability of industrial sources to reduce emissions. Unlike the electric power sector, industrial facilities must compete in a highly competitive global marketplace and do not have the comparable ability to pass on increased compliance costs to customers. Accordingly, it would be arbitrary and capricious, a violation of due process, and fundamentally unfair for the final rule to include other emission sources, such as industrial boilers. We also urge that the state retain the issuance of free allowances rather than conduct auctions, which would drive up compliance costs and harm the households and businesses served by the power grid.	
69. Appalachian Power/American Electric Power (APCo/AEP)	It would not be in the best interest of the state to develop incremental carbon policies to intervene in an ongoing transformation of the electric sector. Given that the Virginia regulatory process is robust and that CO_2 emissions have trended significantly downward, additional restrictions on carbon emissions could put Virginia at a competitive disadvantage. Unlike the Clean Power Plan, which included all states, a Virginia-specific carbon strategy would distort economic decisions. Carbon restrictions that are more stringent than national standards could lead to existing generating facilities being closed or new facilities constructed elsewhere, leading to a loss of both employment opportunities and tax revenue. The regulation will also result in higher customer rates, which would place additional stress on the finances of households and business, and influence where businesses choose to locate. DEQ has not provided adequate analysis supporting that benefits of the regulation for Virginia citizens would outweigh the costs.	Support for the proposal is appreciated. As discussed in the response to comment 61, Virginia's carbon control strategy is not go-it-alone; the purpose of the regulation is to leverage Virginia's carbon reduction efforts by linking to a well-established and effective multi-state program. DEQ agrees that cap-and-trade programs are effective in controlling emissions. However, as discussed in the response to comment 64, DEQ has designed the program to implement a consignment auction rather than a direct

	APCo is encouraged by the fact that DEQ has proposed a cap and trade program as the regulatory structure. Cap and trade programs have long been documented as effectuating emission reductions at the lowest cost. APCo supports allowance banking and a CCR allowance should allowances costs exceed projections. This is a fair way to ensure that consumers and businesses are not unduly burdened. APCo does recommend that several aspects of the regulation be modified. First, DEQ has not provided an adequate rationale for use of a consignment auction. Cap and trade programs have been overwhelmingly successful with a direct allocation to affected sources. Second, the allocation mechanism for allowances on the basis of updating net generation output does not acknowledge the inherent differences in carbon emissions between units utilizing different fossil fuels. Units using fuels with a higher carbon content are unfairly disadvantaged by the allocation process, even as they are subject to a declining carbon cap. APCo recommends directly allocating allowances to affected generators on the basis of actual emissions.	auction. This will ensure that Virginia can link to RGGI while accommodating Virginia's unique utility regulatory regimen, and ensure a stable, transparent and fair program. See comments 108 and 136 for further discussion of the appropriateness of the consignment auction.
70. Appalachian Power/American Electric Power (APCo/AEP)	APCo does not support allocation of conditional allowances to DMME. There is no adequate rationale for this set-aside. Under a cap and trade program affected sources and other parties have the incentive to utilize the most cost effective way to comply with the program and/or associated costs. The proposed set-aside effectively represents a 5% tax on affected sources and ultimately consumers and there is no justification that the benefits of this "tax" will justify any benefits that may be provided.	The primary purpose of EO 11 is to control carbon emissions from fossil fuel-fired power plants; however, EO 11 has also identified the encouragement of clean energy as a program goal. A 5% set-aide is modest, and will enable the state to determine the effectiveness of this type of program; see the response to comment 51 for further detail. To characterize the set-aside as a tax is inaccurate as discussed in the response to comment 62.
71. Appalachian Power/American Electric Power (APCo/AEP)	Inclusion of new units will be a disincentive to siting new fossil generation within Virginia as these units would be subject to an incremental cost associated with complying with the regulatory program. As such, units could be more cost effectively built in adjoining states not covered by the Virginia program, thus depriving the state of jobs and tax revenue associated with new generation facilities.	Inclusion of new sources is consistent with the RGGI program. In order for carbon reduction efforts in Virginia to succeed over the long term, new fossil fuel sources in the state must be considered. DEQ is confident that leakage will be addressed by a variety of RGGI and Virginia mechanisms; see comments 91, 108, 136 and 144 for more detail.

72. Appalachian Power/American Electric Power (APCo/AEP)	APCo has concerns with the need to maintain a new Virginia-specific database for GHG emission reporting, operating and maintaining a new database and software program for allowance trading, and maintaining records associated with CO_2 emissions and accompanying reports. APCo already maintains systems for emissions reporting and record retention per federal requirements, which differ significantly from those Virginia has proposed. Better aligning the proposed reporting, trading and compliance programs with the federal systems already in place would reduce the administrative burden of the rule.	Because Virginia is linking to an existing trading program, it is not anticipated that any new Virginia-specific database will be needed. The Commonwealth is expected to use the RGGI COATS system to track allowances and emissions. The COATS system accepts emissions reporting consistent with federal requirements and is connected to EPA's emissions reporting system.
73. Appalachian Power/American Electric Power (APCo/AEP)	The higher starting cap of 34 million tons of CO_2 would mitigate the economic impact of the regulation. The higher cap would have imperceptible impact on the environmental effectiveness of the program with the benefit of lower resulting compliance costs.	The starting cap will be 28 million tons; see the response to comment 37 for more information.
74. Alliance for Industrial Efficiency	We commend DEQ for developing this regulation. Our members support market-based programs like RGGI because they account for the cost of carbon emissions while promoting economic growth. The regulation provides Virginia the opportunity to capture the economic benefits of transitioning to a low carbon economy. We applaud DEQ for recognizing the most economically efficient means for reducing CO_2 emissions in Virginia: incentives for energy efficiency. Finally, we commend DEQ for exempting certain industrial CHP units, which recognizes the emissions benefits offered by these systems. CHP systems produce heat and electricity from a single fuel source. Instead of generating power and letting the waste heat escape, CHP systems harness the thermal energy for heating, cooling, and other applications. Waste heat to power systems capture waste heat from industrial processes to make electricity, requiring no additional fuel and generating no further emissions. Not only does CHP have higher efficiencies than conventional power generation, it produces energy at the site of the end user, which eliminates line losses. CHP also provides benefits besides energy savings and resiliency and reliability benefits--it can continue to function in the event of a grid disruption. CHP should be a key element of the state's broader efforts to modernize its electric grid and make it more reliable. The General Assembly recognized the benefits of CHP in the 2018 omnibus energy bill which directs utilities to consider CHP as either a demand-side energy efficiency measure or a supply-side generation alternative.	Support for the proposal is appreciated. As discussed in the response to comment 51, DEQ believes the set-aside should be 5% in the early stages of the program; the set-aside may be revised at a later date as the state gains experience with the program and with the program DMME develops. In order to address CHPs with more clarity, the regulation has been amended to specify that the industrial exemption applies to fossil fuel CO_2 budget source located at a manufacturing facility that supplies less than or equal to 10% of its annual gross electrical generation to the electric grid, or supplies less than or equal to 15% of its annual total useful energy to an entity other than a manufacturing facility, provided that source had, prior to January 1, 2019, supplied

	The regulation requires that CHP units over 25 MW that do not qualify for the industrial exemption purchase CO_2 emissions allowances for all emissions, including those associated with useful thermal energy (UTE). In the absence of a CHP system, the host would get its thermal energy from conventional methods, such as standalone boilers, which are not subject to the regulation. To avoid this disincentive for CHP, the regulation should exclude CO_2 emissions associated with UTE from a CHP unit. Emissions associated with thermal energy should be deducted from a qualifying unit's total emissions allowances, as in Massachusetts' RGGI rule. The hallmark of a CHP system is that it produces heat and electricity from a single fuel source. Without a thermal exemption, the regulation undervalues the output of these systems. We commend DEQ for including an energy efficiency set aside, as such programs help consumers and businesses use less energy, reduce carbon emissions, and save money on energy bills. According to an Alliance for Industrial Efficiency analysis, if Virginia achieves a 1.5% annual energy savings target, the state can reduce annual CO_2 emissions by 2.6 million tons in 2030 and save businesses $4.1 billion in cumulative cost savings from avoided electricity purchases. Increasing the set-aside from 5% to 10% would create additional opportunities for energy efficiency programs and help capture more carbon reduction benefits. For example, EPA's guidance document on Establishing an Energy Efficiency and Renewable Energy Set-Aside in the NO_X Budget Trading Program recommends a set-aside of 5-10%. We recommend that DEQ clarify that energy efficiency includes CHP and would be eligible for set aside funds. Although DEQ has previously categorized CHP as a near-term energy solution to enhance energy efficiency, listing CHP incentives explicitly as eligible for set aside funds would ensure that potential project hosts are aware of the definition.	both non-electric thermal energy to a manufacturing facility and 15% or less of its annual total useful energy to an entity other than a manufacturing facility. The unit's permit must contain a condition with the appropriate restriction of either gross electrical generation or useful thermal energy.
75. Dwight Alpern	I support the proposed rule. I was the attorney-advisor for EPA's Clean Air Market Division and involved in developing regulations for allowance trading programs, including the Acid Rain Program and NO_X SIP Call. I suggest revisions to facilitate program operation and achievement of CO_2 reductions. 1. The proposal does not explain clearly how a holder of a public contract with DMME would set up and operate a conditional allowance account. The function of such an account would be similar to that of any general account established by other persons, i.e., holding and transfer of CO_2 allowances. Neither account's function would	Support for the proposal is appreciated. The commenter correctly notes that the proposed rule does not explain how a holder of a public contract with DMME would set up and operate a conditional allowance account. This process will be determined by DMME in accordance with DMME procedure. Because this process will

	include holding allowances for compliance. The simplest approach would be to revise the rule to clarify in 9VAC5-140-6020 C that accounts for handling conditional allowances are a type of CO_2 Allowance Tracking System account (in revised definitions of "CO_2 Allowance Tracking System" and "CO_2 Allowance Tracking System account") and that those accounts of holders of public contracts with DMME (but not of CO_2 budget sources) are general accounts (in a revised definition of "general account"). This would make applicable to the public contract holders' accounts the general-account provisions, e.g., for applying for an account and selecting and changing an authorized account representative, alternate, and electronic submission agent. Conforming revisions should be made to 9VAC5-140-6220 A, 9VAC5-140-6230 A, 9VAC5-140-6240, and 9VAC5-140-6250 A and B. For example, proposed 9VAC5-140-6230 A should be revised to read: Upon receipt of a complete account certificate of representation under 9VAC5-140-6110 or subsection B of this section, the department or its agent will establish a conditional allowance account and a compliance account for each CO_2 budget source or ~~and~~ a conditional allowance ~~compliance~~ account for a holder of a public contract with DMME for which the account certificate of representation was submitted. 2. The proposal requires Virginia CO_2 budget sources to hold "CO_2 allowances" for CO_2 emissions (9VAC5-140-6050 C 1 and 2 and 9VAC5-140-6260 B) but defines the term "allowance" (9VAC5-140-6020 C) by referring only to the Virginia CO_2 Budget Trading Program. That definition should be expanded to include CO_2 allowances issued by any other state participating in the RGGI program. If DEQ also decides to allow Virginia CO_2 budget sources to use for compliance offset allowances issued by any participating state, the same limitations on the use of offset allowances by other RGGI states' sources should apply to Virginia sources, i.e., limited use to cover emissions and no use for excess emission deductions. If offset allowances are to be usable, the following revisions are suggested: 9VAC5-140-6260 1. The CO_2 allowances, other than CO_2 offset allowances, are of allocation years that fall within a prior control period, the same control period, or the same interim control period for which the allowances will be deducted. ***3. For CO_2 offset allowances, the number of CO_2 offset allowances that are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of 9VAC5-140-6050 C for a control period or an interim control period may not exceed 3.3% of the CO_2 budget source's CO_2 emissions for that control period, or of 0.50 times the CO_2 budget	be governed by DMME, it is more appropriately addressed by DMME and not in this regulation. With respect to allowances usable for compliance, the definition of an allowance has been modified such that it covers any other state participating in the trading program.

	source's CO_2 emissions for an interim control period, as determined in accordance with Article 6 (9VAC5-140-6220 et seq.) of this part and Article 8 (9VAC5-140-6330 et seq.) of this part. 4. The CO_2 allowances are not necessary for deductions for excess emissions for a prior control period under subsection D of this section. 9VAC5-140-6260 C 2. The department or its agent will deduct CO_2 allowances for a control period from the CO_2 budget source's compliance account, in the absence of an identification or in the case of a partial identification of available CO_2 allowances by serial number under subdivision 1 of this subsection, as follows: i. First, subject to the relevant compliance deduction limitations under subsections A and D of this section, CO_2 offset allowances. CO_2 offset allowances shall be deducted in chronological order (i.e., CO_2 offset allowances from earlier allocation years shall be deducted before CO_2 offset allowances from later allocation years). In the event that some, but not all, CO_2 offset allowances from a particular allocation year are to be deducted, CO_2 offset allowances shall be deducted by serial number, with lower serial number allowances deducted before higher serial number allowances. ii. Second, any ~~Any~~ CO_2 allowances, other than CO_2 offset allowances, that are available for deduction under subdivision 1 of this subsection. CO_2 allowances shall be deducted in chronological order (i.e., CO_2 allowances from earlier allocation years shall be deducted before CO_2 allowances from later allocation years). In the event that some, but not all, CO_2 allowances from a particular allocation year are to be deducted, CO_2 allowances shall be deducted by serial number, with lower serial number allowances deducted before higher serial number allowances. 9VAC5-140-6260 D 1. After making the deductions for compliance under subsection B of this section, the department or its agent will deduct from the CO_2 budget source's compliance account a number of CO_2 allowances equal to three times the number of the source's excess emissions. In the event that a source has insufficient CO_2 allowances to cover three times the number of the source's excess emissions, the source shall be required to immediately transfer sufficient allowances into its compliance account. No CO_2 offset allowances may be deducted to account for the source's excess emissions.	
76. Americans for Prosperity	The regulation requires electric generators to purchase allowances to emit CO_2 in the RGGI cap-and-trade program. These allowances are equivalent to permit or license fees. In addition, the regulation delegates 5% of the allowance proceeds to DMME for CO_2 reduction projects. The Constitution of Virginia establishes	To characterize the issuance of an allowance as a permit or license fee is inaccurate; see the response to comment 62. Facilities have always

	authority to raise and spend money to the General Assembly, not DEQ (Article IV, § 11 and Article X, § 7). The regulation adopts the RGGI Model Rule, model legislation which has been adopted by the legislatures of all participating RGGI states. The General Assembly clearly opposes adoption of a CO_2 cap and trade program without legislative approval. The Senate and House passed HB1270 resolving that no CO_2 cap and trade program be adopted without authorization. In addition, the Senate Agriculture, Conservation and Natural Resources Committee rejected SB696, which would establish cap-and-trade in Virginia and bring the state's regulations into compliance with the RGGI model rule. The proposed regulation will not withstand a legal challenge.	incurred costs as they have been required to meet legal mandates to control and reduce pollution. Under a cap-and-trade program, facilities have enhanced flexibility to manage these compliance costs based on their specific business needs. As discussed in comments 139 and 159, it is necessary and appropriate for the board to promulgate state-specific regulations controlling carbon pollution. The board's legal authority to issue regulations controlling air pollution is found in the Code of Virginia at §§ 10.1-1306 through 10.1-1308; the Office of the Attorney General of Virginia issued an official advisory opinion on May 12, 2017, which concluded that the board is legally authorized to regulate carbon pollution under these sections of the code. While the board has broad authority to control air pollution, it is also responsible for achieving this goal in the most effective and cost-effective means possible, and, in the case of carbon pollution, this goal is most readily achieved through implementation of a cap-and-trade program. Cap-and-trade programs are proven means of reducing air pollution (see, for example, the response to comment 48); they incentivize pollution reduction. Unlike a "command-and-control" approach that would simply impose specific pollution

		control requirements, the trading approach maximizes the ability of a facility to flexibly make favorable business decisions while meeting the primary goal of reducing air pollution. The board furthermore has the authority to maximize the efficiency and efficacy of a cap-and-trade program by linking the program with RGGI rather than attempting to establish a new and untried state-only system. There is nothing novel about Virginia's participation in a cap-and-trade program; indeed, the Commonwealth has participated in such programs since EPA established the Acid Rain Trading Program under Title IV of the 1990 amendments to the federal Clean Air Act. Currently, Virginia is operating under the latest iteration of EPA's trading program for the control of NO_X under CSAPR. Nor is there anything novel about the regulation of carbon pollution in Virginia. Virginia's greenhouse gas permitting regulation (9VAC5-85) has been in place since 2011.
77. Americans for Prosperity	The RGGI program has not worked to reduce CO_2 emissions. CO_2 emissions fell just as fast in states with similar energy policies except for RGGI as they did in RGGI states according to "A Review of the Regional Greenhouse Gas Initiative" (Cato Journal 2018). Lower natural gas prices and EPA regulation encouraged fuel switching from coal to natural gas between 2007-15. This resulted in a 16% reduction in coal-fired electric generation, and a corresponding increase in natural gas generation of about 10% in RGGI and non-RGGI states. The same report shows non-RGGI states added generation from wind, and solar power at over twice the rate as RGGI states (5.5% compared to 2.3%). Non-	The RGGI program has been very successful at reducing emissions in participating states. Current emissions are approximately 45% lower than where RGGI started. Commenters argue that RGGI did not bring about the reductions but offers no evidence to demonstrate that RGGI did not cause—or at least contribute—to

	RGGI states also saw a faster rate of improvement in energy intensity, a measure of energy efficiency (11.5% compared to 9.6%). RGGI, Inc. claims allowance revenue was invested in energy efficiency, and wind and solar power, but the actual comparison results show no significant impact of the investments. Compare non-RGGI Virginia to the combined results in neighboring RGGI states of Maryland and Delaware. All three are in the PJM Interconnection Regional Transmission Organization. The extra costs of RGGI allowances discouraged electric generation in Delaware and Maryland where electricity imports grew 42% since 2005, while Virginia imports decreased 34%. In other words, the RGGI states simply exported electric generation and emissions to other states. Adjusting for those exported emissions, emissions rates per person fell 38.6% in Virginia since 2005 compared to a combined 37.1% for Maryland and Delaware. Importing more power from other states is not the only form of emissions leakage. RGGI allowance costs added to already high regional electric bills. The combined pricing impact resulted in a 12% drop in goods production and a 34% drop in the production of energy intensive goods. Comparison states increased goods production by 20% and only lost 5% of energy intensive manufacturing. The extra costs of RGGI allowances have turned coal-fired plants from base load providers to intermittent suppliers by dramatically lowering operating hours. Expected increases in RGGI emission allowance cost will soon have the same impact on natural gas-fired power plants. Ramping power plants up and down has dropped efficiency 18.5% which results in more emissions, not less, and further raises electricity costs. 61% of Virginia power generation comes from coal and natural gas. A national target of 28% lower emissions from power plants by 2025, and 32% by 2032 from a 2005 base established in the Clean Power Plan will be met without taxes or fees on CO_2 emissions. Over the most recent 12 months power plant emissions have already fallen 27%. The U.S. leads the world in reducing emissions. Since 2005 the U.S. has reduced CO_2 emissions twice as fast as the rest of the developed world combined. Clearly RGGI has not had the expected impact of lowering CO_2 emissions. Benefits calculated in the Economic Impact Analysis assumed the regulation would lower CO_2 emissions along with reducing SO_X and NO_X as a byproduct. A decade of experience with RGGI has shown no added reduction in CO_2 or air pollutant emissions from the RGGI program; therefore there can be no monetized	the emissions reductions in the RGGI region. While the electricity system is complex and it is difficult to separate out specific causes, adjustments to the RGGI program over the years have reduced the RGGI cap, preventing emissions from increasing and locking in reductions. This stands in stark contrast to analyses of uncapped areas of the country where emissions are expected to remain flat or slightly increase into the future. In addition to these demonstrable emissions benefits, as discussed in the response to comment 61, the RGGI program has greatly benefited local and regional economies. DEQ continues to believe that the studies and analyses developed on its behalf as well as additional information provided by RGGI and other experts in the field demonstrate that linking to RGGI will benefit the Commonwealth by cost-effectively reducing carbon pollution and stimulating clean energy growth. See comment 136 for more information on how RGGI's market mechanisms work and how they will operate in Virginia. Note that CO_2 intensity is decreasing across the RGGI region in spite of increased generation. With regard to costs incurred as a result of the CCR, the consignment auction approach means that ratepayers only bear the cost of excess allowances needed to comply.

	benefits from the proposal. To calculate the costs of the regulation an estimate of tons of annual emissions through 2030 is needed, along with an estimate of how many allowances will be available (each allowance covers one ton of emissions), and an estimate of the future price of allowances. Fortunately, the proposal provides the last two items. The SCC files an annual "Status Report: Implementation of the Virginia Electric Utility Regulation Act." The state's two largest investor owned electric utilities Dominion Energy and Appalachian Power file annual Integrated Resource Plans (IRP) which forecast future demand, supply, and pricing. Based on these documents there are planned retirements between 2017-26 of 1731 MW of oil and coal-fired capacity, and 440 MW of natural gas capacity. Between 2017 and 2019 5413 MW of new natural gas-fired capacity has already been approved by the SCC. Natural gas emits about half the CO_2 for each MWh of power generated. The retirements could be considered as offsetting emissions from 4280 MW of new natural gas capacity. That leaves a net increase of 1132 MW of new natural gas capacity. If that new capacity operates 5000 hours a year it will generate about 2.5 million tons of added CO_2. New power plants should yield less expensive power and run more hours than the older replaced plants, meaning higher emissions. Some of the retiring power plants will continue to operate after the new plants start up meaning higher emissions. Appalachian Power and Dominion own out-of-state power plants, and could shift generation out of state, meaning lower Virginia emissions, but global emissions would remain the same. The RGGI states review the program every 3 years and have worked to raise the allowance price each time, so it is likely allowance prices will rise. All of these factors will be ignored in favor of a conservative emission forecast adding 2.5 million tons to the 36.6 million tons emitted in 2016, for a total of 39.1 million tons in 2020. The proposal commits 5% of allowances for sale by DMME with the allowance revenue to be spent on CO_2 reduction projects. The Economic Impact Analysis forecasts an allowance price very close to the proposed ECR trigger price which subtracts allowances offered in an auction if the price goes below the trigger price. Our analysis uses the ECR trigger price as the forecast price. An upper range would use the CCR trigger price which runs about twice the ECR trigger price. If the CCR trigger price is exceeded extra allowances are added to the auction. From 2013-15 the CCR acted as a price signal in the auctions. The forecasted cost assumes power companies chose	

	buy the emission allowances they need to comply to maintain electric grid reliability. The alternative is to write off premature closing of existing plants, while paying premium prices for new zero or low emission generation sources. This is likely as Dominion expects demand to grow 24% by 2030 and will need the capacity. The SCC allows utilities to pass on the cost of meeting environmental requirements and would likely allow the pass through of allowance costs. There is no penalty other than allowance cost if a state misses its RGGI target. The total Net Present Value cost through 2030 of the regulation is $674 million with no offsetting benefits. The cost would be twice as high if the CCR trigger price sends the expected price signal to the auctions, so the range of cost is $0.7-1.4 billion. In 2030, the program will add $182 million, or about $20 a year to residential electric bills. Industrial bills could rise by over $100,000 a year.	
78. Business Council for Sustainable Energy (BCSE)	A regulation to reduce and cap CO_2 through a multi-state trading program makes sense for Virginia. Capping carbon from generation facilities will incentivize the use of cleaner energy resources that promote economic development and job creation in the state. Trading within a larger group of states will allow for greater market efficiency and lower compliance costs. The state will need to use the full portfolio of clean energy technologies and services, including energy efficiency programs that reduce energy consumption, cleaner burning natural gas, and renewable energy resources. BCSE supports the updating output-based allocation structure. DEQ should encourage the use of set asides granted to DMME to support of the full suite of clean energy technologies, including both supply-side and demand-side energy efficiency measures. RGGI states have benefitted from investing the multiyear funding from auction proceeds in clean energy, and BCSE encourages DEQ to consider a larger set aside amount.	Support for the proposal is appreciated, particularly support for the updating output-based allocation structure. As discussed in the response to comment 51, DEQ recognizes the value of energy efficiency programs as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement the set-aside. DEQ believes the set-aside should be 5% in the early stages of the program; the set-aside may be revised at a later date as the state gains experience with the program and with the program DMME develops.
79. Biomass Power Association	Biomass accounts for a significant portion of Virginia's renewable fuels makeup. As of 2015, biomass represented the bulk of renewable power available in the state. We commend the board for pursuing the CO_2 trading program. Only through programs like these can we seriously address the threat of climate change. By supporting a rich combination of power sources, a state can advance goals in other areas like forest management, watershed management, economic development, and transportation.	Support for the proposal is appreciated. See the response to comment 67 for further discussion of biomass.

	The regulation would apply only to fossil fuel fired-facilities, exempting biomass power. We urge Virginia to maintain this position. Aside from supplying the state with a significant portion of its carbon neutral electricity generation, biomass is a critical part of the forestry supply chain. Biomass power facilities purchase the leftovers that remain following the harvest of a forest for higher-value wood fibers, adding value to the entire supply chain. The wood fibers used to generate biomass power are typically unusable for other wood products, and emit methane during decomposition. The Association commissioned a study to determine the extent of carbon savings that can be achieved by opting for biomass over natural gas. A report is available on our website. The study examined the carbon intensity of a 50 MW capacity biomass power facility with a 43 MW net output on the electric grid, comparing it to that of a typical combined cycle natural gas facility. The study found that the use of organic residues as fuel in a biomass power plant instead of natural gas in a combined cycle facility results in immediate carbon savings of 115%, with 98% carbon savings over 100 years. Like the majority of biomass power facilities in the U.S., the subject of the study uses organic residues to generate power supplied to the grid. The fuels used at this facility are residues left over from harvesting fiber for local lumber and paper mills. These low-value materials are generated whether they are used for power or left to decay. If not used by biomass power plants, the materials typically remain in the forest as slash piles. The avoidance of carbon and methane emissions by removing and using materials that decay results in a significant GHG reduction over time. While the decay of these materials releases small amounts of methane consistently over time, methane has a 21 times higher global warming impact on the climate than CO_2. Further, with federal incentives for carbon capture and sequestration, and rapid technological advances being made in this area, biomass with carbon capture can become one of the only viable techniques that allows for the removal of atmospheric carbon. While the technology is still developing, we are optimistic that our members will soon be able to contribute to reducing the impacts of climate change in an even more meaningful way. Biomass is an essential part of any carbon reduction program.	
80. Blue Ridge Environmental Defense League (BREDL), Food and	The excessively high RGGI cap and low allowance clearing prices, combined with other flaws in the program, prevent RGGI from being stringent enough to drive any meaningful reductions in CO_2. RGGI is a weak program that has allowed power plants to emit on a business-as-usual basis. For the first 5 years of the program, the industrywide cap was set over 50% higher	The commenter suggests that RGGI allowance prices have been too "low" to drive emissions reductions. As of July 2018, RGGI allowance prices have remained between $2-4 for

Water Watch, People Demanding Action, Preserve Floyd, Renewable Energy and Electric Vehicle Association	than actual emissions. This meant fossil fuel power plants did not need to do anything to meet the overly generous cap. The initial cap allowed power plants to bank a substantial amount of unused allowances, amounting to 140 million tons of CO_2. While the cap was adjusted to address these saved allowances, this allowance surplus could continue to grow significantly due to a cap that continues to be higher than actual emissions, low allowance clearing prices, the purchasing of all available allowances and other factors. This further limits the effectiveness of the program. The CCR further disincentivizes emissions reductions by operating as a cushion by releasing additional pollution allowances on top of the cap if prices get too high. The CCR was triggered in 2014 and 2015, allowing 5 million and 10 million additional allowances to be sold. All of these allowances were purchased, and because they were not borrowed from future years, they essentially increased the cap. RGGI prices, including the reserve price, continue to be too low or too volatile to result in any meaningful carbon reductions. Most, if not all, of the current carbon markets have failed to create "a stable, market-driven price of carbon," and often prices for GHG allowances "have been so low as to create little incentive to invest in GHG reduction," according to researchers at the University of California. Structural flaws in the RGGI program prevent the purported market-based incentives from working. Moreover, polluters prefer a larger supply of low-priced pollution allowances, creating a disincentive to actually embrace a pollution price point that might be effective. No market-based pollution trading scheme will ever result in market prices sufficient to encourage all polluters to reduce their emissions. RGGI has not accounted for increased emissions of methane from the growth of fracking and natural gas infrastructure. The climate proponents and petroleum industry that favor natural gas contend that since gas-fired plants emit less CO_2 than coal-fired plants, replacing coal power plants with gas power plants reduces climate emissions. However, methane emissions throughout the natural gas supply chain can nullify or even reverse any climate benefits from switching from coal-fired. RGGI's climate projections also ignore the reality that natural gas emits more CO_2 than coal. Declining CO_2 emissions from coal-fired power plants and coal-related methane emissions have been exceeded by increases in CO_2 from natural gas-fired power plants and methane leaks related to the gas used to fuel the power plants. RGGI drives demand for new gas-fired power which provide symbiotic profit opportunities for power companies that are capitalizing on low gas prices and	70% of the auctions to date, and allowance prices have never reached $8 per ton. At the same time, emissions in RGGI have been steadily declining at a pace that exceeds the rate of decline of the RGGI emissions cap. Given the complexity of the electricity markets, it is difficult to discern the precise cause of the RGGI emissions decline in a given year or years. One econometric analysis carried out by economists at Duke University concluded that the RGGI price has indeed been a principal reason for the emissions reductions seen in the RGGI region. This suggests that even at prices between $2-4 RGGI is driving emissions reductions contrary to the commenter's suggestion. Apart from the RGGI price signal, it is clear that adjustments to RGGI's cap from time to time have locked in the emissions reductions that have been realized in the RGGI electricity sector. The commenter suggests the RGGI cost-containment reserve (CCR) has a negative impact on emissions reductions. The CCR threshold is currently set at $10, meaning that allowance prices would have to reach $10 a ton in a given auction for the CCR to be triggered. The auction clearing price for the June 2018 RGGI allowance auction was approximately $4—far below the CCR threshold. As mentioned above, RGGI allowance prices have never exceeded $8 per ton.

	fracking companies that hope the new plants will soak up supplies and ultimately raise prices enough to encourage more drilling. The Department of Energy reported that more than 420 new gas-fired power plants were proposed for construction between 2017-21. The demand for gas-fired electricity generation increases the demand for fracking and natural gas infrastructure, which further expands methane emissions.	Low allowance prices mean lower overall program costs before taking into account the mitigating impact of allocated allowances to consumer benefit. RGGI has locked in meaningful emissions reductions on the order of 45-50% since 2009, while simultaneously keeping allowance prices low. In essence, the RGGI program has achieved its program goal: controlling carbon pollution in a cost-effective and efficient manner. As discussed elsewhere, CO_2 is a global and national problem. RGGI stands for the proposition that a group of states can have a positive impact on emissions without driving emissions allowances up over $8 to date. This effectively balances the need to reduce emissions with the need to keep program costs at a reasonable level. Detailed discussion of how the consignment auction and market mechanisms operate, as well as the benefits of this approach, is available at comments 108 and 136. Executive Directive 11 directs DEQ to "1. Develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit carbon dioxide emissions from electric power facilities that: a. Includes provisions to ensure that Virginia's regulation is "trading-ready" to allow for the use of

		market-based mechanisms and the trading of carbon dioxide allowances through a multi-state trading program; and b. Establishes abatement mechanisms providing for a corresponding level of stringency to limits on carbon dioxide emissions imposed in other states with such limits." (Emphasis added.) In other words, the proposed regulation under consideration is designed to meet the Governor's mandate to control CO_2 via participation in an emissions trading program. This emissions trading program is RGGI and, as the commenter states, RGGI does not address methane. DEQ agrees that the control of methane emissions is important; however, this specific regulatory action is not the means by which that will be accomplished. Note that methane is controlled elsewhere in the board's regulations as appropriate, and other measures may be adopted at a different time and in compliance with federal Clean Air Act and state law. As discussed elsewhere, emissions trading programs are authorized under the federal Clean Air Act and are a proven means of reducing air pollution (see, for example, comment 37). Joining RGGI will impose additional controls on each source of pollution beyond technology-based emissions controls imposed by federal and state permitting programs. Note that RGGI specifically

		addresses CO_2, not methane. More information on benefits realized by RGGI is discussed elsewhere; see, for example, comments 61 and 108.
81. BREDL et al.	Because biomass is typically considered renewable under state renewable standards, RGGI does not count CO_2 emissions from biomass processing and combustion. This underestimates the amount of carbon released from this energy source by a significant amount. There is a growing consensus that biomass cannot be considered carbon neutral. Processing, transporting and burning wood at biomass plants all produce GHG emissions, which can be greater than those from coal. Carbon sequestration from the growth of woody material takes decades to occur and is counteracted by the rapid clearcutting of forests to fuel wood-fired power plants. If biomass CO_2 emissions were counted in RGGI states, total RGGI CO_2 emissions could be on average 31% higher than what is currently projected over the next 10 years. This would also undercount the CO_2 emissions from Virginia's rapidly growing biomass industry. From 2011-16, electricity generation from biomass more than doubled in the state. In 2016, 2.60% of Virginia's power came from biomass, nearly 50 times Virginia's energy generation from wind, solar and geothermal energy combined. By not counting these emissions, RGGI would promote the growth of biomass, increase harmful pollution, and suppress the expansion of genuine renewables like solar.	As discussed elsewhere, the focus of this regulation is the control of CO_2 from fossil fuel-fired generators; see the response to comment 67 for additional information.
82. BREDL et al.	RGGI proponents argue that emissions have fallen under RGGI. While CO_2 emissions have declined during the time that RGGI has been in place, there is no indication that RGGI itself has driven these reductions. Those reductions were more likely attributable to the Great Recession than to the program, since RGGI went into effect in 2009 as the economic activity declined steeply. Emissions were already declining before RGGI went into effect; emissions fell faster before RGGI was implemented. Much of the alleged effectiveness of RGGI is attributable to a massive countrywide shift away from coal and oil to natural gas that was already underway when RGGI took effect in 2009. Overall, from 2005-15, coal and oil use decreased from 32% to 9% of electricity production in RGGI states, while natural gas--which has become significantly cheaper because of the risky fracking boom--increased from 25% to 42%. RGGI effectively promotes the expansion of fracking for natural gas at the expense of renewables. From 2009-16, RGGI states have added 4 times more gas-fired electricity generation than wind and solar generation. The percentage of electricity from natural gas-fired	As noted in the response to comment 80, it is difficult to determine the precise factors that lead to a specific result in complex electricity markets. One study carried out by economists at Duke University concluded the RGGI program was in fact a significant factor on the emissions reductions realized in the RGGI region. Other factors, such as low natural gas prices, also played a role. Without a doubt, the RGGI program has effectively locked in emissions reductions of approximately 45-50% since the program began through cap adjustments. Thus, RGGI has been very

	power plants rose by 11.2% from 2009-16 but only rose 2.4% from wind and solar. Natural gas-fired power plants have relied on fracking which benefits power companies but imperils communities. Oil and gas operations have become the second greatest global source of the methane. RGGI further encourages the shift to fracked gas because CO_2 is the chief GHG pollutant emitted from coal-burning power plants. If a power company shifted its energy mix from coal to natural gas, it would accumulate RGGI allowances. While shifting to natural gas results in much lower CO_2 emissions at the power plant, the increased reliance on natural gas significantly amplifies methane emissions. RGGI's failure to consider or cap methane as a GHG allows RGGI states to overestimate climate benefits. The GHG footprint of natural gas is worse than coal and oil because methane traps more heat in the atmosphere. Utilities that switch from coal to gas reduce CO_2 smokestack emissions but could be increasing CO_2 equivalent GHG emissions from methane leaks.	effective in realizing emissions reductions from power plants in the RGGI states. RGGI is a flexible, market-based program that imposes an allowance cost on burning fossil fuels, including natural gas. It therefore tends to discourage electricity generation from natural gas relative to lower carbon sources of electricity such as wind and solar that have no allowance cost. It is wrong to suggest that RGGI promotes natural gas use over renewables. Also note that not all of the energy shift under RGGI has been to natural gas; shifts to renewable energy and energy efficiency are occurring and on the increase in RGGI and Virginia. For example, implementation of the Grid Transformation and Security Act of 2018 will encourage renewables. The set-aside will also encourage the development of renewable and efficiency projects. See the response to comment 51 for further discussion.
83. BREDL et al.	Cap-and-trade programs have the potential to form pollution hotspots and harm vulnerable communities. These populations already face higher pollution exposures because of the disproportionate location of toxic facilities in their neighborhoods. Market-based environmental policies can exacerbate hotspots that remain outside the scope of trading schemes, and they worsen pre-existing health and socioeconomic disparities. RGGI supporters point to the program's ability to raise revenue for renewable energy and energy efficiency initiatives, as well as reduce energy bills for low-income households. However, many states have used this pollution payment scheme to balance state budgets. While governments need revenue, funding from pollution means that governments will be less inclined to eliminate carbon from industry as they become	DEQ is committed to addressing the environmental and health impacts of power plants in all communities, including those communities that have historically borne a disproportionate burden from local air pollution sources. The goal of the program is to reduce carbon emissions from power plants using a tool that has proved effective at reducing air pollution at the lowest possible cost. The

	dependent on the revenue. RGGI proponents assert that the program will save households millions of dollars in electricity rates. This has not been the case. RGGI states' residential consumers have seen their bills go up $1.1 billion since the program was implemented. At the same time, industrial users have seen a $1.9 billion decrease in their electricity bills.	emissions cap is designed to ensure that carbon emissions are reduced from a baseline, meaning that overall the environmental situation is improved from the baseline. Based on the modeling carried out for the proposal, not only would the program reduce carbon emissions, but it will also produce co-benefits in the form of reductions in other harmful pollutants that contribute to low-level ozone and particulate pollution. This is good for the health of Virginians. The commenters are concerned that because the program does not require emissions reductions at specific plants it may not reduce emissions at plants in specific neighborhoods. Individual power plants are subject to facility permits that hold those plants to specific emissions limits designed to protect public health. As discussed in comments 48 and 136, cap-and-trade programs are effective pollution control programs that reduce emissions beyond permitting controls. It is important to note that Virginia is a regulated state in which costs are carefully monitored and managed by the SCC. The program is not raising revenue; the consignment approach ensures that benefits return to the ratepayers, and no funds of any kind will be available for uses other than emissions reductions. The most recent economic analysis found, that from 2015-17, RGGI lowered

		CO_2 emissions while benefiting local and regional economies.
84. Birchwood Power Partners, L.P.	Birchwood Power operates a 240 MW coal-fired cogeneration facility in King George County. Birchwood is equipped with state-of-the-art pollution controls, including low NO_X burners, over-fired air, and selective catalytic reduction to reduce NO_X; use of high quality, low sulfur bituminous coal and a flue gas desulfurization system with a dry lime scrubber to control SO_2; and a high efficiency fabric filter baghouse to control particulate matter. Birchwood provides the advantages of fuel diversification, high energy efficiency, and low emissions, and is located in relatively close proximity to load. This combination makes Birchwood an important tool for balancing grid reliability and environmental protection. Birchwood is one of the few remaining coal-fired power plants in Virginia. In 2005, coal-fired power accounted for approximately 34.6 GWh or about 46% of in-state electricity generation. By 2012, coal-fired generation in Virginia was reduced to 13.6 GWh, about 20% of in-state generation. During the same period, generation from natural gas-fired combined cycle plants increased from 7.3 GWh, 10% of in-state generation, to approximately 23 GWh, 35% of in-state power generation. Further retirements of coal plants and construction of new gas plants are underway. The 2014 Virginia Energy Plan lists Birchwood as a coal-fired plant with projected long-term operations, and it is the only such plant that operates as an independent power producer (IPP). Coal-fired generation is important for maintaining fuel diversity and reliability. Birchwood is dispatched during extreme weather events and peak power demand periods. During Polar Vortex events in 2014 and 2015, natural gas that might have been available for power generation was consumed by residential and commercial customers for heating or, if available, became very costly. The Birchwood plant, with an on-site fuel stockpile, was dispatched at a high capacity factor and was 100% available for dispatch. Birchwood is particularly important to maintaining reliability as it is located close to the Washington D.C. and northern Virginia area and can provide fuel diversity in the face of gas shortages or price spikes. Birchwood's sale of energy is currently contracted to a third-party and is unable to pass the costs of the proposed regulation through to the market. Although Birchwood will be able to include these costs in its price of energy after its contract expires, the economics of coal-fired power plants have been severely impacted by the glut of natural gas, which has reduced energy margins and dispatch of the facilities. The regulation will	The commenter's concerns are appreciated. DEQ is assisting affected sources in managing compliance costs by issuing allowances. The amount of compliance cost covered by the allowances will depend on business decisions made by any individual facility.

	put further pressure on the viability of these critical assets. Birchwood urges DEQ to adopt an approach that preserves a diversified fleet of power plants using different fuels. Diversification of the types of electricity generation sources will help maintain grid reliability during situations where there are natural gas curtailments, periods when renewable energy is limited or not available, and other events impacting individual base load units in Virginia. Birchwood's allocation will be based upon the average generation of the years 2016, 2017, and 2018. During this period, Birchwood's dispatch was at a historical low that represents only approximately 25% of its potential generation, due to the low price of natural gas. As an IPP, Birchwood would be severely disadvantaged based upon the proposed allocations of emission allowances. Accordingly, selection of a different period would more accurately represent dispatch of Birchwood.	
85. Blue Ridge Power Agency (BRPA)	The commenting members (Towns of Bedford and Richlands; Cities of Danville, Martinsville, Radford, Salem; Virginia Polytechnic Institute and State University; Central Virginia Electric Cooperative) are concerned that the board may lack statutory authority to participate in RGGI. Legislatures in most RGGI states have passed authorizing legislation. These legislatures have determined that because RGGI is a reflection of state policies and will require citizens to bear a cost to achieve those policies, those elected by the citizens of those states should make the decision as to whether joining RGGI is justified. Virginia, on the other hand, is acting without the benefit of legislative direction. Governor McAuliffe directed the board to implement RGGI. Without any support other than saying that it is "well settled," Attorney General Mark Herring determined that GHGs fall within the definition of air pollution under Virginia law. To avoid the uncertainty of protracted litigation and to ensure support for the program, the board should defer action until the General Assembly approves participation and authorizes DEQ to administer carbon-reduction programs.	As discussed in the response to comment 76, it is necessary and appropriate for the board to promulgate state-specific regulations controlling carbon pollution. See also comments 139 and 159 for further discussion.
86. BRPA	The rule would not require generators to purchase emissions allowances from the state in an auction, thus avoiding a requirement that all revenue-raising measures must be approved by the General Assembly. Instead, generators would be freely allocated allowances, which they consign to the RGGI auction. Allowances purchased at the RGGI auction would no longer be conditional, i.e., generators would surrender these allowances to DEQ in order to cover their actual annual CO_2 emissions. For each conditional allowance consigned to auction, the generator would receive the clearing price of the auction. This process allows generators to consign all of their	To date all emissions trading programs implemented by Virginia have allocated emissions allowances to the compliance entities. This is consistent with the approach recommended repeatedly by EPA in the various federal model rules offered for implementation by states beginning with

	conditional allowances but only purchase what they actually need. Unneeded allowances would be sold, with the proceeds collected by the generator. The program does not address the treatment of these windfall proceeds and, importantly, contains no provision specifying how such windfalls would be returned to consumers. The impact of the program on monthly customer bills is not reliable, and the impacts are likely to be considerably higher. The regulation preamble suggests that the average monthly bill impact for residential, commercial, and industrial consumers through the year 2031 will be nominal--never more than 1.1%. These estimates are taken from an impact analysis prepared by a consultant that assumes that "95% of revenues that accrue to utilities from the sale of carbon allowances or credits are returned to ratepayers." No factual basis exists upon which to base an assumption that 95% of the revenues accrued would be returned to customers. As DEQ recognizes, the "revenue received by CO_2 Budget Sources owned by regulated electric utilities flow to rate payers pursuant to SCC) requirements." However, there is no legislative or other mandate to require the SCC to impose such a requirement on regulated utilities. The outcome of any proceeding at the SCC contemplating a proposal to direct the regulated utilities to return RGGI windfalls to customers is uncertain. Relying on the presumed outcome of an action that may or may not be taken by a different regulatory agency as the basis for cost estimates is speculative. The cost estimates developed by The Analysis Group fail to take into account that a significant share of the covered generators are not subject to SCC jurisdiction. Approximately one-third of the energy produced in Virginia in 2015 was generated by facilities owned by IPPs., which are not regulated by the SCC and would not be subject to any regulation that may be adopted later by the SCC. These facilities sell power into the regulated wholesale markets, and those sales are subject to the exclusive jurisdiction of FERC. The consultant's study assumes that "revenues from allowances to independent power producers [would be treated] in the same way as those allocated to utilities (i.e., revenues returned to ratepayers)"; however, no state mechanism exists to assure that the benefits of allocations to IPPs actually accrue to ratepayers. The program would allow these facilities to make windfall profits off of their allocated share of RGGI allowances, and permit those profits to lay beyond the jurisdictional reach of the state's rate regulator. Surely this approach is contrary to the program's intent. The board should explain why customer bill impacts should not be adjusted to remove revenues from allowances to unregulated entities, or	the NO_X Budget Program in the late 1990s. This program will similarly allocate allowances to compliance entities. The program does two things that address the concerns voiced by the commenter. First, compliance entities will consign their allocated allowances to auction, where the allowances will be sold. Unlike previous programs, this means that the value of the allowances will be transparently known to all observers of the auction. This, in turn, means that the utility commission will have a clear valuation of the allowances to use in carrying out their responsibilities. Second, the allocations are to be made on an updating, output basis. This means that the allocation will tend to reflect the facts in the field: the plants that run more will get more allowances and the plants that run less will get less. This should greatly reduce the chances of an overallocation to individual plants. The commenter notes that independent power producers are not subject to rate regulation by the commission. To the extent the power generated by independent power producers is purchased by regulated utilities, however, the costs of that power are indeed the subject of regulation. This would include any embedded allowance costs. The commission, therefore, may

	explain what regulatory mechanisms would assure those revenues are returned to customers. The RGGI model rule leaves how to allocate allowances to states. Under the proposal, allowances will be allocated to units based on the average of the 3 amounts of the unit's total net-electric output during the 3 most recent years for which data are available prior to the start of the control period. All covered units in Virginia, regardless of whether they are regulated by the SCC, will receive an allocation of allowances based on past operation and the right to potentially convert those allowances into profits. Note that no other state has chosen to allocate 95% of allowances to generators. The allocation of conditional allowances to generators based on historical usage is arbitrary, and likely to overcompensate generators and produce excess allowances because energy production at many of the covered units will continue to decline as zero-carbon resources compete with high-carbon emitters. These excess revenues will be sold at auction or banked by the generators, but those entities that have made investments in energy efficiency and carbon-reducing technologies are provided nothing. Further, the board has stated that the SCC will need to act to require that regulated utilities return auction revenues to customers. But until those rules are finalized there is no guarantee whether or how that will be done and there is a risk that the funds will become windfall profits to the recipients of allowances. It is also unclear as to how Virginia customers will receive any benefit from the profits earned by unregulated IPPs. An alternative to the allocation of allowances to units is to directly allocate allowances to load-serving entities (LSEs) in proportion to their customers' energy consumption. The value could be passed on to those customers by way of offsetting reduction to their bills, or the benefits of programs to invest in local alternative energy projects in their service territories. This approach would not foreclose the statewide set-asides of allowances to support energy efficiency programs. The commenting members therefore strongly urge the board to withdraw the regulation for the purpose of considering whether allocation of consignment allowances should be redirected from generating units to LSEs. The preamble does not explain how the program would impact the cost of wholesale power sold to Virginia entities, which it would assuredly do for BRPA's members. These impacts take effect at the wholesale markets regulated by FERC. With respect to power purchase contracts that include a formulaic type of cost-of-service rates, the cost incurred by the owners of covered generators of procuring RGGI allowances are	have some influence over whether the costs of allowances are in fact passed on to consumers when the compliance entities have received the allocations at no cost to them. In any event, the program will make such regulatory decisions much easier than previous emissions trading programs where allowance allocations were made without the benefit of a consignment auction or without updating. See, for example, comment 136. According to the bill impact analysis conducted on DEQ's behalf, costs are expected to be minimal.

	likely to be passed through in those cost-based rates. However, it is not clear whether revenues from the auction for consigned allowances would be credited through the formula rate process and returned to our members. This is to be decided by FERC, and could leave members and consumers with the obligation to bear the costs of RGGI without any offsetting revenues. Energy prices could increase as the cost of RGGI allowances are incorporated into the energy offers that are submitted into the PJM energy markets. Energy prices in the regional markets are determined by the offer of last-dispatched and highest-price resource, and because the auction is a single-price auction the generator's cost of RGGI allowances could have region-wide price impacts. Over time, the program would ratchet up the RGGI allowance price and ratchet down available quantity, so the cost of RGGI will become more apparent in wholesale market prices. BRPA members will see a more significant impact of RGGI on wholesale power costs. Participation in RGGI has the potential to affect congestion paid by our members. Wherever power is generated, whether in Virginia or another state, it must be moved financially from that location into the Blue Ridge. Regardless of the contract price, if the price of power at the point of generation in another state is low and the price of power in the Blue Ridge area is high, the purchaser must pay for the difference, and those costs can be substantial. We ask the board to reconsider the allocation of conditional allowances to generators. The Regulatory Advisory Panel was clear: cost to customers should be a primary consideration. In fact, the panel could not come to consensus on whether LSEs or generators should receive the auction credits. Assigning allowances to LSEs is the most direct way to assure that the benefits of RGGI accrue to intended beneficiaries--retail consumers in Virginia.	
87. Calpine	Calpine supports cap-and-trade programs that place a clear price on carbon emissions in a way that allows such a price to be reflected in wholesale power prices and that are designed to minimize market distortions, including broad coverage of new and existing power generation facilities that emit GHGs; effective and equitable methods for distributing emission allowances; minimization of leakage issues that result from differing requirements from one state to the next; and setting allowance budget caps at a level that will result in meaningful carbon reductions by incentivizing environmentally efficient dispatch of power generation facilities. For these reasons, Calpine supports the proposal, including allowing Virginia sources to use allowances that either originated in Virginia or any other RGGI state. Linkage with RGGI will allow for a broader, more flexible emissions market, helping to improve	Support for the proposal is appreciated, as is the commenter's discussion of the benefits of RGGI and its market mechanisms. As discussed in the response to comment 37, a cap of 28 million tons was selected.

	market competitiveness and trading efficiency while lowering carbon abatement costs for affected generators. Because Virginia's linkage with RGGI will significantly expand the size of the RGGI market, it is important to recognize the potential impact of the level of Virginia's base budget on the RGGI program and on allowance prices. A budget that is not based on reasonable assumptions regarding the generation mix in light of a cap-and-trade program in Virginia may result in significantly higher or lower compliance costs for the overall program. In RGGI's most recent auction, CO_2 allowances sold at a relatively weak clearing price of $3.79. This suggests that a too-high base budget could further weaken the carbon price signal. At this price, the societal value of the RGGI program is largely limited to income it generates for the participating states; it is too low to impact power system dispatch to any meaningful degree. Thus, Calpine recommends that Virginia set its initial base budget to no more than 34 million tons of CO_2. The proposed budgets account for recent trends in Virginia's electric generation sector, including planned retirements of fossil fuel generators and opportunities for clean energy and energy efficiency. The opportunity to trade with other RGGI states, and the inclusion of the CCR, help ensure that a base budget no higher than Virginia's proposed levels is reasonable and will ensure sufficient overall market liquidity. Recognizing the historically low allowance prices in the RGGI region, Calpine supports the proposal to include the ECR.	
88. Covanta	We fully support efforts to reduce GHG emissions through a market-based mechanism. We are proud to be part of efforts already underway to reduce GHG emissions in Virginia. Covanta operates EfW facilities in Fairfax County and Alexandria. These facilities are recognized internationally as a source of GHG emissions mitigation and low carbon energy generation. EPA has determined that EfW facilities reduce lifecycle GHG emissions by one ton of CO_2 equivalents (CO_2e) for every ton of MSW diverted from a landfill and processed. Based on Virginia data, every ton of MSW diverted to EfWs reduces GHG emissions by roughly 0.7 tons CO_2e. Covanta's Alexandria and Fairfax facilities annually reduce GHG emissions by over 900,000 tons of CO_2e a year relative to landfilling. Capping emissions through a trading-ready approach will incentivize the use of low-carbon energy sources that promote economic development and job creation. To achieve the most cost-effective program, we support a full portfolio of clean energy technologies and services, including wind, solar, energy efficiency, and EfW. We encourage DEQ and DMME to leverage the set-aside mechanism to further support renewable generation, both for existing facilities	Support for the proposal is appreciated. DEQ agrees that EfW facilities play an important role in the reduction of carbon pollution.

	that face ongoing operating costs as well as new capacity, inclusive of both greenfield development and additional generation achieved at existing facilities. We also support the proposal to allocate allowances on the basis of regularly updated electricity output, as opposed to historical emissions. This approach provides the greatest alignment between the carbon intensity of electrical generation and the market-based policy signal.	
89. Center for Resource Solutions (CRS)	The RGGI Model Rule includes a voluntary renewable energy market set-aside provision. Virginia would be able to draw on the experiences of 8 other RGGI states that have successfully implemented this provision. We strongly recommend that Virginia incorporate this or a similar provision in order to maintain and grow the environmental and economic benefits of voluntary, private investment in renewable energy. Under the rule, GHG reductions at regulated electricity generating facilities due to renewable energy generation will be automatically counted and reported by those facilities toward compliance, and since the rule determines and fixes the level of emissions from the sector, there is no net change to emissions at regulated sources due to renewable generation. In this scenario, voluntary renewable energy can have no impact on statewide or regional GHG emissions beyond what is already required; furthermore, it subsidizes compliance for regulated entities. As voluntary renewable energy reduces emissions counted toward compliance, voluntary purchases help reduce the cost of compliance, making it cheaper and easier for regulated emitting facilities to comply. This presents a different value proposition for voluntary and corporate buyers and investors in comparison to circumstances prior to implementation of the rule. Voluntary renewable energy is not used to meet governmental targets or mandates--it stands apart from and builds on compliance efforts. This separation enables the voluntary market to make an incremental difference or "regulatory surplus." Voluntary purchasers of renewable energy tend to value this incremental impact highly. Renewable energy generation that is counted toward regulatory compliance cannot be considered surplus to regulation. Regulatory surplus with respect to GHG regulation may be important for voluntary renewable energy demand. Since many of the companies and individuals purchasing in the voluntary market do so a commitment to address GHG, an effect on emissions beyond what is required by law may be a non-financial benefit. Where renewable energy sold into the market does not have an effect beyond compliance and only helps regulated entities comply, this changes the effectiveness of voluntary renewable energy as a climate change solution for companies and individuals.	As discussed in the response to comment 51, DEQ recognizes the value of a voluntary renewable energy market as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement that set-aside. DMME may, at the appropriate time and in accordance with its regulations and policies select a voluntary renewable energy market set-aside.

	As such, voluntary demand for renewable energy may decline if these benefits do not remain intact. Virginia's program can protect voluntary renewable energy benefits and demand by incorporating a provision that sets aside and periodically retires allowances for voluntary renewable energy, effectively lowering the emissions cap on its behalf. This mechanism would counteract the automatic counting of emissions reductions associated with voluntary renewable energy and recognize those emissions reductions as incremental to what would otherwise be achieved through GHG regulations. This helps preserve voluntary demand and private investment in renewable energy as drivers of emissions reductions, which can lower the cost of and reduce the need for GHG regulations. The RGGI Model Rule contains provisions for the number of tons that would be allocated to the voluntary renewable energy market set-aside account in a specific control period, including a sample formula with which the state could calculate the quantity of set-aside allowances that would be required. Regulatory surplus is critical to sustaining clear voluntary claims and has been helpful in the RGGI region in sustaining voluntary investment in renewable energy beyond what is required. A voluntary renewable set-aside preserves regulatory surplus for voluntary renewable energy by lowering the emissions cap and recognizing those emissions reductions as incremental to what would otherwise be achieved due to the cap. A set-aside can motivate private capital to produce voluntary renewable energy generation and emissions reductions in excess of state mandates. Alternatively, where voluntary demand for renewable energy is limited, so is the development of renewable energy and associated emissions reductions. By not including a set-aside for voluntary renewable energy in the regulation, Virginia may potentially leave privately-funded emissions reductions on the table, which it will later have to regulate to achieve. Green-e sets the standard for the voluntary market . To maintain the impact of the voluntary market and meet consumer expectations, Green-e requires a set-aside mechanism or allowance procurement and retirement for certified sales in regions covered by cap-and-trade regulation. Due to lack of a set-aside, Green-e would not be able to certify voluntary sales of renewable energy from within RGGI or Virginia to customers in Virginia, unless the customer pays the additional price to independently purchase and retire an allowance. Since customers are unlikely to pay this additional cost, we anticipate that there would be no Green-e market for Virginia renewable energy generation, or for RGGI	

	renewable energy generation that is sold into Virginia. Voluntary buyers in Virginia will have to get their certified renewable energy from outside of the RGGI region. In 2016, Green-e certified over 728,000 MWh in sales to over 30,000 retail customers located in Virginia. This shows strong demand for voluntary renewable energy in the state.	
90. Dominion Energy	We support a program that would allow for emissions trading and be trading-ready. The program should reduce carbon emissions not only in Virginia, but regionally. The program should encourage the growth of cleaner-emitting generation commensurate with the Grid Transformation and Security Act of 2018, which finds 5,500 MW of new solar and wind in Virginia in the public interest, as opposed to encouraging the increase in the dispatch of higher emitting generation in neighboring states. It must recognize the benefit of reducing purchased power from out of state and its impact on the environment, the Virginia economy and Virginia jobs. The program must establish a representative baseline that accounts for the emissions serving Virginia customer energy needs from which to determine and measure emissions reduction goals. This should account for emissions from in state generation sources as well as emissions from purchased power. The plan should evaluate and set emission goals and realistic implementation timelines that will provide needed time for the ramp-up of new renewables, energy efficiency programs, and infrastructure improvements in order to maintain the state's fuel diversity and goal to become more energy independent. The program should recognize the role of extending the operation of Virginia's existing fleet of carbon-free nuclear generation and the role of natural gas as the lowest cost, cleanest and most reliable form of dispatchable generation to complement the integration of renewables to the grid. It should also account for electrification of other sectors of the economy, such as transportation, and must not hinder the growth of electric vehicles. The program should be flexible, with multi-year emission averaging and other measures so that reductions can be achieved in the most cost-effective manner. The program should address electric system reliability and rate impacts.	Support for the proposal is appreciated. Specific issues identified by the commenter are discussed in further detail below.
91. Dominion Energy	Any program setting carbon emission targets for electric generating units must accommodate for the dynamics of power generated outside of and imported into Virginia. The baseline and targets must account for the fact that Virginia is a net importer of energy from more carbon-intensive out-of-state resources. The program must also incentivize the expansion of lower-emitting cleaner generation in the state, and reduce imports of electricity. Encouraging the expansion of natural gas-fired combined cycle and renewable energy resources will grow the economy and lower emissions by decreasing reliance on imported carbon-intensive power. Setting a	In theory, emissions "leakage" occurs when an emissions cap causes generation to shift from the area under an emissions cap to an area outside the cap, and that shift leads to increase in emissions. A number of factors make emissions leakage unlikely in the case of the trading program in Virginia.

	stringent cap on already cleaner generation in Virginia absent a similar level of reductions from neighboring states or a way to address leakage would increase the cost burden to Virginia generators. This would encourage lower cost electricity imports that are more carbon-intensive and not subject to a carbon cost adder, and result in limiting the dispatch natural gas combined cycle facilities in Virginia. In the PJM Interconnect, units are dispatched based on "replacement cost" of the variable components required to run the unit. The variable components include fuel and emission allowances, such as RGGI allowances. The replacement cost changes based on the market value of the type of fuel used in a unit and the market value of the allowance. Dominion does not choose when to operate its units, units are called upon by PJM. If Dominion units are above the target price for the day, other units, generally less controlled and more carbon intensive, will be called upon to meet load demand. Due to a carbon cost adder to the unit bid price when Virginia units bid into the electric market that other PJM resources would not have to account for, Virginia generators will be less competitive, resulting in increased imports. Coupled with the retirement or curtailment of fossil fuel-fired resources, this raises reliability concerns. These concerns are borne out by modeling analyses. In support of the company's 2018 IRP, ICF provided Dominion with forecasts for cases where Virginia joins/does not join RGGI. Virginia linking to RGGI does not reduce emissions regionally. The modeling results indicate that Virginia entering RGGI in 2020 does not result in overall carbon emission reductions in the EI or PJM regions by 2030. Emissions in the entire EI in 2030 are about 10 million tons higher than emissions in 2020 and about 3 million tons higher in the PJM region during the same period. The analysis shows that emissions reductions achieved in the RGGI region are offset by emissions increases in the non-RGGI portions of the EI region. Cumulatively, over 2020-30, emissions in the portion of the EI subject to RGGI are reduced by about 75 million tons, but increase by almost 90 million tons in the non-RGGI portion of the EI In the RGGI region, emission decreases over the period 2020-30 with Virginia linked to RGGI are driven by emission reductions in Virginia emissions in the non-Virginia portion of RGGI actually increase. The modeling results also show significant increases in net energy imports in Virginia, increasing from about 28% under the case with no carbon regulations in Virginia to 48% for the case with Virginia linked to RGGI. At the same time, the weighted average capacity factor for NGCC facilities in Virginia is projected to decrease by almost 50% between 2020 and 2030 under the RGGI	The electricity markets are in a period of significant change. Retirements of older plants and construction of new plants in new locations means changes in where power is generated. In addition, plants closer to the well heads tend to enjoy lower fuel costs—the primary operating cost for natural gas power plants. The cost of transmission, in contrast, favors plants that are closer to the load the plant serves. Thus, while differences in environmental costs have the potential to change the relative costs of plants in Virginia compared to plants outside Virginia, shifts in generation are determined by a whole host of other factors that are more significant than the low RGGI allowance price. Second, the owners of generation in Virginia are unlikely to face any competitive disadvantage relative to plants outside the state because the allowances are to be allocated to compliance entities under the program, and the amount of the allocations are to be determined on an updating output basis. To the extent a generator must use an allowance to generate power and also receives an allowance at no cost, the generator does not have an increased operating cost relative to plants outside Virginia. If there is no competitive disadvantage, there can be no shift in generation caused by the program.

	case. DEQ modeling of Virginia linking with RGGI showed similar increases in power imports under both policy scenarios evaluated relative to the case with no carbon regulations in Virginia. DEQ has proposed an updating output-based allowance allocation approach that it believes will incentivize utilization of NGCC resources as a means to counter leakage. However, while an updating output-based allocation approach may be more favorable to NGCC units relative to coal-fired units, it does not address leakage. Natural gas-fired units in Virginia will still be subject to a CO_2 cost adder that units outside of the region will not be subject to. The effect of RGGI-equivalent reduction requirements in Virginia is likely to limit the dispatch of highly efficient and lower emitting NGCC facilities in Virginia and encourage the dispatch of higher emitting resources and increased emissions in neighboring states outside of the RGGI region. Average carbon intensity in 2030 of electricity serving Virginia with the state not joining RGGI is projected to be 742 lb/MWh in 2030; the carbon intensity increases to 784 lb/MWh if Virginia joins RGGI. This is a 5.7% increase in carbon intensity of the electricity used by Virginia customers largely due to increased electricity imports into Virginia, which have a higher carbon intensity than in-state generation.	Third, vertically integrated utilities have the option of self-scheduling their generation in the competitive wholesale electricity markets. This means that even where generators outside the state have a lower operating cost that is the result of the program's allowance cost, utilities may choose to run anyway because it makes economic sense to do so. Utilities, therefore, have a tool to prevent the generation shifts that might otherwise constitute leakage. Fourth, updating output-based allocation is expected to encourage generation in the state, rather than discourage it. Because power plants receive allowances only when they operate, the program is set up to discourage generation shifts by rewarding in-state generation. According to an August 2017 study conducted by researchers at the Regional Economic Studies Institute and Resources for the Future, updating, output-based allocation can be an effective tool to counter incentives to shift generation to areas not covered by an emissions cap. Fifth, if a shift in generation does in fact occur there is some question whether the shift is likely to lead to an increase in emissions. Natural gas has become the dominant fuel in PJM and typically fuels the marginal unit. To the extent

		a shift occurs between a natural gas plant in Virginia to a natural gas plant outside Virginia, there may be no increase in emissions that occurs as a result of the shift, especially to the extent adjustments to the emissions cap are made over time to address any excess allocations under the trading program. For all of these reasons, DEQ believes that emissions leakage is unlikely to occur under the program (see responses to comments 108, 136 and 144). Also note that the implementation of the DMME set-aside will also encourage the reduction of in-state demand, thereby reducing carbon pollution and further preventing leakage. To the extent the possibility of leakage may theoretically exist, current evidence suggest that it has not happened under RGGI. RGGI issued the "CO_2 Emissions from Electric Generation and Imports in the Regional Greenhouse Gas Initiative: 2015 Monitoring Report." This report, the seventh in a series of annual monitoring reports, summarizes data from 2005-15 for electricity generation, net electricity imports, and related CO_2 emissions for the participating states. These monitoring reports were called for in the 2005 RGGI MOU in response to concerns about the potential for the RGGI trading program to cause emissions leakage. The

		observed trends in electricity demand, generation, and net imports show there has been a small change in CO_2 emissions from total non-RGGI electric generation serving load in the RGGI region during 2013-15 when compared to the base period, and the CO_2 emissions from this category for 2015 show there has been virtually no change when compared to the base period. In other words, the carbon intensity of additional generation is reduced, and emissions leakage has not actually occurred. Linking to RGGI will make Virginia a participant in RGGI's scheduled program reviews, and those program reviews can address any leakage problems should they arise with the program in the future. RGGI participating states perform comprehensive, periodic program reviews to consider program successes, impacts, and design elements. Stakeholder meetings are held throughout the program review process in order to encourage stakeholder engagement and the submission of comments from interested parties. As part of this process, DEQ will evaluate how the program is working from a Virginia standpoint as well as in the context of the other RGGI states. In addition to regular RGGI program reviews, the regulation will also be subject to state periodic

		review as required by § 2.2-4017 of the Virginia Administrative Process Act. The periodic review procedure includes a review by the Attorney General to ensure statutory authority for the regulation, and a determination by the Governor whether the regulation is necessary for the protection of public health, safety and welfare, and is clearly written and easily understandable. Regulations under periodic review are subject to public comment; this would be another venue to identify concerns about program implementation.
92. Dominion Energy	Based on ICF modeling, linking to RGGI is projected to cost Virginia customers about $530 million over 2020-30, significantly less than actually joining RGGI. The modeling indicates that Virginia linking to RGGI will lower allowance prices thereby lowering the cost of carbon compliance in other RGGI states, subsidized, in part, by Virginia electricity customers. Should Virginia link to RGGI, customers in RGGI states outside of Virginia will incur $876 million less in cost related to RGGI allowance purchases from 2020-30 than the RGGI states would incur without Virginia joining RGGI. Additional costs related to carbon reductions isolated to the state and stranded investments for forced closures will be borne by customers. With the majority of the PJM region not subject to carbon regulations, the energy market will favor non-Virginia generating units, making Virginia units less competitive. This will advantage licensed competitive service providers (CSPs) that cover load through power purchases from non-Virginia-based resources. Unless these costs are non-bypassable, larger energy customers that have the ability under retail choice to purchase energy from a licensed CSP may find that CSPs can provide more attractive pricing and can avoid the costs related to carbon reductions. To the extent larger customers migrate to CSPs, remaining customers will bear the cost for compliance with the state carbon program.	The commenter is correct that the modeling showed that linking Virginia's program to RGGI did modestly reduce the modeled allowance prices for the program overall. These lower costs are exactly what one might expect when making an emissions trading market bigger. Bigger markets open up greater opportunities for lower cost reductions and lower overall costs for consumers across the entire footprint, including in Virginia. The commenter provides no evidence to support its assumption that the PJM market will favor non-Virginia units over Virginia units in the presence of the program. In general, generating units place bids to supply power to the wholesale market and those bids depend on the generator's costs to generate power. Fuel cost is the biggest component of a bid to supply power, and fuel cost depends on the

		fuel market and a plant's efficiency, not on the program. The program will allocate allowances on the basis of output from a generating unit and allocations will be periodically updated. As a result, the program will provide additional value to a generating unit in Virginia that operates. This will tend to encourage Virginia units to operate, not discourage them compared to units outside the Commonwealth that do not earn this additional value. In addition, to the extent a unit incurs an incremental cost from the program, that cost is expected to be offset in whole or in part by the allowance value received through the allocation and the consignment auction. Essentially, the outcome is an effective program with a modest price tag
93. Dominion Energy	The 33 million ton cap case uses assumptions from Dominion's 2017 IRP; the 34 million ton cap is based on RGGI assumptions. IRPs depict a suggested portfolio expansion and tend to change on an annual basis. While IRPs may provide guidance in setting long-term goals, their purpose is not to establish regulatory requirements. Fundamentals-based models, such as the IPM model, are useful for evaluating the impacts of policy strategies but should not be used to set the program baseline. Rather, an emissions baseline should be established on historic emission levels including allowance for historic variations in emission levels due to year-to-year differences in weather and fuel prices. For example, for the initial RGGI cap determination in 2005, RGGI designers set the 2009 cap about 4% above the average emission levels observed between 2000-02. Historical data have also been used by EPA in establishing baseline levels for various trading programs including CSAPR and the NO_X SIP Call. 2016 emissions for Virginia units that would be covered under the Virginia proposal were about 35.3 million tons. An analysis of statewide emissions from electric generating units in Virginia over the last 20 years shows an average annual emission level of about 35 million	As discussed in the response to comment 37, a base cap of 28 million tons was chosen as the most representative and effective starting point for the program. This number is a reasonable starting point as evidenced by the modeling results, which tend to show reasonable cost impacts from the program using this base cap number. As discussed in numerous comments elsewhere, energy efficiency and renewable energy are increasing in Virginia, and the cap-and-trade program will contribute to this trend.

	tons with ±1 0% CO_2 emission volatility. Average emissions over 2014-16 were about 34.3 million tons. Applying a 10% margin to account for variability would yield a cap of over 37.5 million tons. Applying the same 4% margin used in setting the initial RGGI cap yields a baseline of about 35.7 tons. Accordingly, the 2020 baseline should be between 35.7-37.5 million tons to provide a margin to account for year-to-year fluctuations in weather and fuel price volatility. (This analysis does not include emissions from new generation projects.) The modeling performed for DEQ by ICF projects almost 1100 MW of additional coal-fired capacity retirements by 2020 in the Virginia assumptions case and over 1500 MW of coal capacity retirements by 2020 in the RGGI case. Unit retirements should not be used to set the baseline. Efforts to reduce emissions by way of unit retirements implemented in advance of the baseline date should be applicable toward compliance and not penalized by applying them toward a further reduction to the baseline level. The data record must include the emissions from all units covered under the program, including units at which CO_2 emissions are not measured by continuous emissions monitoring systems. Coupled with the ability to credit reductions that occur prior to 2020, this would be a more fair approach. The 2020 baseline and reduction targets thereafter should not be based on a presumption that energy efficiency potential based on policies in neighboring states can be achieved in Virginia. Dominion continually works to achieve operating efficiencies to obtain more output with fewer emissions. In addition, we offer a number of end-use energy savings programs to our customers. As reported in the 2017 IRP, these programs have already achieved a substantial amount of energy savings; however, some of these programs are due to expire. Implementation of future programs is subject to approval by the SCC, which is not within the company's control. Dominion has filed approximately 36 replacement and new programs for approval by the SCC, and to date about two-thirds of them have been approved. While there remains potential for energy savings from consumer-side energy efficiency programs, this expansion is subject to state law and regulation. The success of these programs is affected by the degree to which customers choose to participate. Regardless of the success of energy efficiency programs, utilities must be prepared to serve their native load. Accordingly, the emissions target should be based on reasonable expectations of achievable energy savings and the compliance timelines must provide adequate time for the development of energy efficiency programs deemed	

	necessary to achieve such objectives. The Virginia cap should not be more stringent than levels that would have been imposed under the CPP. Although the intent of the Governor's directive is to regulate carbon in the absence of federal action, it does not compel the state to establish emission targets equivalent to or below levels that would have been imposed under the CPP, which was approximately 27.8 million tons in 2030. The mass-based carbon emissions target EPA established under the CPP underestimated potential future growth to meet energy demand and was the most costly compliance alternative identified in the 2017 IRP. The limits required under the CPP envisioned a nationwide emissions trading program. Virginia should not impose more stringent emission reduction requirements to address a global environmental issue while the states we compete with economically have no emission reduction goals or requirements. RGGI re-assesses its program every 4 years based on historical performance. Since 2009, RGGI has conducted program reviews in 2012 and 2016-17. Both reviews resulted in a lowering of going-forward CO_2 emission caps for the RGGI region. The next assessment period is scheduled to occur in 2021, which is only one year after Virginia would begin its participation in RGGI. This means that Virginia cap identified through 2030 may be re-negotiated in 2021 with other member RGGI states and may be different than what is currently proposed. Virginia's entrance into RGGI creates just two years (2020 and 2021) of "certain" CO_2 limitations. Based on RGGI's two prior re-assessments, the CO_2 cap will likely be different than what is currently proposed, which increases uncertainty in electric utility planning.	
94. Dominion Energy	We support limiting compliance applicability only to fossil fuel-fired electric generating units greater than or equal to 25 MW. Small combustion turbines and boilers below this threshold should not be subject. This is consistent with many existing federal and state-level EGU-based emission reduction programs including EPA's Acid Rain Program, CSAPR, and MATS, and the RGGI model rule. Consistent with the CPP, we support exempting units that use biomass as their primary fuel. In 2013, Dominion converted 3, 51 MW coal-fired units to 100% biomass. Close proximity to an ample supply of waste wood biomass as well as EPA's carbon-neutral policy for permitting were key economic drivers for these projects. Given Dominion's investment in renewable biomass, it is important that biomass emissions remain exempt. Any departure from EPA's prior treatment of biomass as carbon neutral or action that eliminates the use of this fuel as a creditable compliance option could raise compliance costs.	See the response to comment 67 for a discussion of biomass applicability.

	This compliance exemption should also apply to fossil fuel-fired units that are co-fired with biomass, such as the Virginia City Hybrid Energy Center (VCHEC). Under the proposal, a fossil fuel-fired unit that co-fires with biomass would be obligated to hold allowances for all of its emissions. This is a disincentive for a coal-fired power plant to reduce its carbon emissions. VCHEC burns waste coal and co-fires with biomass. In 2008, the board directed DEQ to incorporate a timetable for biomass utilization in the facility's PSD permit. According to DEQ, the board chose this approach "in order to promote further reductions in sulfur dioxide emissions and show a reduction in carbon emissions. since biomass is considered a biogenic carbon-neutral material." Requiring VCHEC to now hold allowances under a state carbon program for emissions resulting from the burning biomass in compliance with an air permit provision established to address carbon is counterintuitive. Requiring fossil units that co-fire with biomass to hold allowances would also be inconsistent with RGGI which only regulates fossil fuel fired units and provides calculations to subtract CO_2 emissions from biomass from multi-fuel fired units. To regulate biogenic emissions would be a significant departure from the existing RGGI program. It would put Virginia's forest owners and biomass-related renewable energy investments at risk, while creating unnecessary complexity. To the extent that the regulation requires biomass units to hold allowances, the budget must be increased accordingly to assure that the emissions from these facilities are included in the baseline.	
95. Dominion Energy	Dominion supports the consignment auction approach but the proposal does not provide details of the auction process and how revenue will be handled and transferred. The rule mentions that such revenue transfers will be done "in accordance with procedures established by the department." Clarity is needed as to how the Virginia allowances, which are proposed to be allocated annually, will be merged with the RGGI auctions, which are conducted quarterly. Additional legislation is required for the board to designate use of revenue associated with a trading program. Absent such authority, DEQ could not directly conduct an allowance auction or collect revenue from an auction. The consignment auction approach could provide a mechanism for the rule to proceed. Accordingly, to the extent the regulation links to RGGI via auction, we support the consignment approach. Direct auctioning would increase the stringency and cost of the program by forcing generators to purchase allowances they otherwise would have been allocated. EGUs would have to pay twice to reduce emissions: first to reduce emissions from affected EGUs or to develop	DEQ agrees with the commenter that at this time the consignment auction is a cost-effective approach for the trading program. Use of the RGGI auction platform provides an already functioning system with detailed procedures that have proven effective. Details as to how the specifics of the auction will operate will be addressed in auction "instructions" which are developed separately from the regulation. DEQ will take the commenter's concerns into account when those instructions are developed. The consignment auction is designed to be cost neutral while enabling participation

	new low-emitting generation, and second to obtain allowances to cover their remaining emissions. Modeling scenarios performed by ICF with Virginia joining RGGI with the auction proceeds returned to the state projected costs to the customer that are three times higher than costs estimated under the consignment auction approach. We support the proposal to allocate most allowances to affected EGUs using either historic generation (output based) or emissions data. This approach is reasonable, consistent with many of EPA's other emissions trading programs, such as the ARP and the CSAPR, and will help to minimize compliance and customer costs. Allocating allowances directly to affected EGUs who have a clear financial interest in complying with the rule will create a more reliable, predictable, and manageable system. Direct allocations to non-affected entities could increase the stringency of the cap by forcing affected sources to acquire allowances they otherwise would have been allocated, and under the proposed consignment auction approach, would have the opportunity to recover cost through auction revenue returned to the generator. This would increase the cost of compliance for affected EGUs and therefore ratepayers. RGGI's quarterly auctions limit how many allowances a single entity can bid (25% of the initial offering of CO_2 allowances in the auction). If Virginia participates in the RGGI auction program, such a limitation might not make it possible for all the compliance entities in the program to rely strictly on the auction to acquire their necessary allowances and they may be forced to go to the secondary market to get sufficient allowances needed to comply. This bidding limitation has not been an issue to date in RGGI because there has not been a single entity requiring enough allowances to hit the 25% limit. Virginia should advocate that RGGI amend this rule by expanding the size of the bid limitation by anyone entity such that every entity has the possibility of relying on the auction for compliance.	in the RGGI auction and providing for implementation of the CCR, ECR, and auction reserve price. Generally, the purpose of a regulation is to establish the relationship between DEQ and an affected facility; i.e., the department sets requirements that the facility must meet, and the facility does so following the provisions of the regulation.
96. Dominion Energy	An updating frequency of less than 3 years (including annually) should not be considered. A unit that retires should not be required to give back allowances it has already been allocated. The allocation approach should provide a reasonable lag time between unit retirements and the discontinued allocation of allowances to those units, an approach EPA has allowed under trading programs such as CSAPR. The updating allocation methodology will effectively transition retired units out of the allocation cycle without requiring units to give back allowances. With respect to the baseline for determining a unit's pro-rata share of the state total budget, we suggest using the average of the 3 highest years over	A 3-year period was chosen as the most realistic compromise between too much and too little flexibility. It is designed to avoid year-to-year variations that result from external factors that may influence operation and have a serious impact on allocations. At the same time, the 3-year period prevents allocations from

	the previous 5-year period. This approach, which is consistent with other successful programs such as CSAPR, would provide additional flexibility to assure a baseline representative of a unit's normal operations and filter out years when a unit experienced atypical utilization. The rule must provide a mechanism for providing allocations to units that meet the definition of an existing unit but do not have 3 years of historical operational data. In cases where a unit does not have a full year of operational data over the 2016-18 time period, the allocation could be based on an estimate of projected annual operation with a requirement that the source give back any unused allowances for redistribution to existing sources.	being coming static.
97. Dominion Energy	Under the proposal, 5% of the statewide budget would be set aside and allocated to DMME. These allowances would be consigned for auction by the holder of a public contract with DMME to assist the department in the abatement and control of air pollution. However, the proposal provides no details as to how the revenues obtained from the sale of these allowances in the RGGI auction would be used. The allowances and proceeds allocated to DMME to administer the program are revenues of the state and cannot be paid to DMME but rather would have to go into the State Treasury. DMME would only be allowed to use funds appropriated by the General Assembly to cover administrative and other costs. Although not explicitly stated, DEQ has indicated its intent to at least in part direct the 5% set-aside to encourage energy efficiency projects. To the extent the set aside is directed toward incentivizing energy efficiency, both demand- and supply-side energy efficiency improvement programs, including voltage optimization and other transmission and distribution efficiency improvements, should be eligible. Eligibility should include programs that help reduce carbon emissions such as infrastructure for electric vehicles.	As discussed elsewhere, DMME will determine how the set-aside is implemented, whether through incentivizing energy efficiency, other transmission and distribution efficiency improvements, or something else. DEQ agrees that both demand- and supply-side energy efficiency improvement programs should be eligible.
98. Dominion Energy	DEQ must explain adjusting the Virginia emission cap on the basis of banked allowances amassed over 2018-20 by affected entities in other RGGI states that Virginia affected sources will not be holding since Virginia entities will not become subject to an emissions cap or required to hold allowances until 2020. RGGI states were not subject to such adjustments through the first two 3-year compliance periods. Banking should be unlimited. Provisions to adjust emissions caps or withhold allowances based on volume of banked allowances should be delayed to provide time for the Virginia carbon market to mature. Similarly, there is no justification for applying the ECR mechanism at the inception of the Virginia program. Virginia sources will not be carrying any banked allowances during the initial compliance period. Under the RGGI model rule, states have discretion whether to implement the ECR	DEQ has developed the rule with the intent of linking to RGGI, because linking to a larger, well-functioning, existing program is a reasonable, efficient way to reduce emissions from Virginia units at the lowest cost. In establishing the provisions of the program and analyzing its potential impacts, DEQ has taken into account the provisions in the rule, including the adjustment of the allowance budget over the course of the program, and

	mechanism; New Hampshire and Maine do not intend to implement this mechanism. Accordingly, DEQ should allow the Virginia market to mature before applying any mechanism that would artificially reduce the emission cap and increase compliance costs by driving up the allowance price. Another concern with adjustment mechanisms is that compliance entities will be compelled to purchase allowances from noncompliance entities to obtain enough allowances to comply with reducing caps. This will be further complicated by the ECR that will reduce the bank of allowances. It is likely that the cost of allowances will increase as noncompliant entities seek a return on their investments, which increases compliance costs. The adjustment provisions should not be incorporated into the Virginia program without further evaluation. Applying adjustments and restrictions to the unlimited use of allowance banking would complicate and limit the very emissions trading system that the RGGI states have praised for its success.	implementation of the ECR. Both of these features were included in the modeling and analysis conducted for the program and that analysis showed the program can be implemented yielding substantial benefits at a modest cost. The bank adjustment, CCR and ECR are all required elements for participating in the RGGI program. The ECR will only be triggered if the allowance prices are lower than expected and only to the extent the winning bids at a particular auction are lower than the ECR trigger price. The ECR mechanism is designed, therefore, to operate only in those circumstances where allowance prices are below the ECR trigger price.
99. Dominion Energy	The RGGI program has always allowed for a multi-year compliance true-up timeline. For the first 6 years of the program, affected entities were required to demonstrate compliance on a 3-year cycle. Beginning in 2015, the program was modified to a tiered 3-year compliance obligation. This compliance obligation will be maintained under the revised RGGI program and model rule that takes effect beginning in 2021. This allows for a smooth transition for RGGI compliance entities into the next phase of the RGGI program with a new 3-year compliance true-up (2021-23) following the last 3-year compliance true-up (2018-20) under the current phase. DEQ proposes to implement a similar tiered 3-year compliance approach. We generally support a multi-year compliance approach as it affords compliance entities flexibility in meeting compliance obligations. Note that the CPP also allowed for a 3-year compliance true-up. Aligning true-up requirements with compatible 3-year compliance cycles in RGGI makes sense.	Support for the proposal is appreciated.
100. Dominion Energy	With the Virginia program starting in 2020, the regulation would impose a one-year initial compliance timeline (to address 2020 emissions) before converting to a 3-year compliance cycle. DEQ explains that initial 2020 allocations and a one-year compliance true-up obligation is needed to align the Virginia program with RGGI's current 3-year compliance cycle. This single year	DEQ acknowledges the commenter's concern. The department was faced with a choice: either abbreviate the normal 3-year compliance period to 1 year in order to align the

	compliance requirement places a burden on Virginia generators that no other compliance entities in the RGGI program have. In order to address this issue, DEQ should defer the implementation of the Virginia carbon program until 2021. This would fully align the compliance obligations under the Virginia program with RGGI's current 3-year cycle and provide a smoother transition to linking with the RGGI allowance system.	program start with RGGI (2021), or delay implementation and enable sources to obtain a full 3-year compliance period. There are advantages and disadvantages to either approach. DEQ based its final decision on what would best meet the overall program goal of smoothly linking to RGGI. Starting the program on time and limiting facilities to a 1-year compliance period does impose an immediate burden on sources; however, this will benefit them in the long run by giving them a longer term compliance period as well as a smooth transition to the RGGI program. Adjusting as the commenter recommends would provide relief in the short term but put facilities on a steeper, more rapid compliance period overall.
101. Dominion Energy	We support adoption of the CCR which would provide a pool of additional allowances for sale in the consignment auction if the costs of allowances exceed a certain threshold. Such a mechanism is needed to address unexpected scenarios and to address potential adverse impacts on electric system reliability, and could also offer affected entities protection in terms of not being penalized for fewer emission reductions resulting from the unpredictable performance of renewable generation units.	DEQ agrees with the commenter that the CCR is a needed mechanism; see comment 136 for more detail as to how the CCR works.
102. Dominion Energy	The regulation should include offsets as allowed under the RGGI model rule, expanded to allow offsets that will encourage the reduction of emissions from electrification of other sectors of the economy, such as transportation. EVs and charger installations should be allowed to generate offsets. In 2016, more carbon emissions came from the transportation sector than the power sector. The regulation should allow reductions in emissions from sulfur hexafluoride (SF_6), one of the most potent GHGs. This offset category was eliminated from the RGGI model rule on the basis that, to date, there had been no SF_6 projects finalized in any RGGI state. One of the reasons for this has been may be the overall low RGGI allowance prices coupled with an abundant supply of RGGI allowances rendering administration costs undesirable. However, the more stringent RGGI cap and	As discussed in the response to comment 26, offsets are not being included in the regulation at this time. DEQ agrees that control of carbon pollution from the transportation sector is important, and may be addressed in another action.

	new mechanisms designed to minimize the allowance bank and drive the allowance price higher may now make these projects more viable.	
103. Dominion Energy	Table 140-5A in 9VAC5-140-6210 D 2 and Table 140-5B in 9VAC5-140-6210 E 2 should be corrected to reflect that the annual number of CCR and ECR allowances listed are in million tons.	The proposal has been corrected accordingly.
104. DuPont	DuPont acquired the cogeneration units adjacent to its Spruance Plant as the supply contract expired and the previous owner discontinued operation. DuPont has a long-term agreement with Veolia to operate and maintain the cogeneration units that supply the Spruance powerhouse on the manufacturing campus. Veolia plans to upgrade the utilities to be more efficient, and enhance performance and reliability, which will help DuPont reduce its costs and environmental footprint. The unit that Veolia will operate and maintain for DuPont is a combined heat and power (CHP) unit. DEQ exempts certain industrial CHP units under 9VAC5-140-6060 B. However, this exemption requires that the CHP unit be owned by the industrial end user rather than a third party. DuPont has engaged Veolia to utilize their specialized expertise to operate and maintain the industrial utility, while allowing DuPont to focus on manufacturing. Rather than regulating CHP ownership, DuPont suggests that DEQ remove the phrase "owned by an individual facility and" so that 9VAC5-140-6040 B reads: "Exempt from the requirements of this regulation is any fossil fuel power generating unit located at that individual facility that generates electricity and heat from fossil fuel for the primary use of operation of the facility."	DEQ agrees that the phrase "owned by an individual facility" should be removed; see the response to comment 65. Under the RGGI Model Rule, facilities that provide less than 10% of their power output to the grid are exempt from compliance obligations and the proposal has been revised accordingly. The regulation has been further amended in order to address CHPs with more clarity; see the response to comment 74.
105. Environmental Defense Fund (EDF)	EDF strongly supports regulations to limit carbon pollution from Virginia's power sector because Virginia has profound public health and climate benefits at stake. An overwhelming majority of Virginians agree: 87% support Virginia continuing to reduce carbon emissions from power plants. The board has clear existing authority to regulate carbon emission through a statewide cap, trading program, a revenue-neutral consignment auction, and linking with RGGI. EDF supports Virginia linking to RGGI and aligning its proposed rule accordingly. An expanded regional carbon trading market in which Virginia links with the existing RGGI program has a number of benefits, including greater liquidity, streamlined administration, and additional opportunities for cost-effective compliance. The benefits of cost-effective CO_2 emission reductions from a well-designed CO_2 trading program are clear. For example, from 2012-14, RGGI added $1.3 billion in economic value in the region and led to the creation of more than 14,000 jobs. By finalizing a strong CO_2 trading program that links with RGGI, Virginia is poised to garner significant economic, public health, and environmental benefits as well.	Support for the proposal is appreciated.

	Virginia has tremendous opportunity to accelerate clean energy deployment and expand the role of renewables and energy efficiency in the state. Virginia has an estimated 89,000 MW of onshore and offshore wind capacity potential that could serve an electric load that outstrips the state's own needs. Virginia can also take advantage of tremendous solar capacity potential. Shifts in Virginia's power sector reflect national trends toward low carbon electricity. In Virginia, power sector CO_2 emissions declined by 24% from 2005-15. These reductions have been driven by falling costs of renewable energy, low natural gas prices, changing consumer preferences, and policies that incentivize clean energy deployment.	
106. EDF	Thirty million tons should constitute the upper bound for the starting budget in 2020, with strong evidence indicating an even lower budget. In addition, the budget should decline annually by a tonnage amount of at least 3% of the 2020 budget--which is in alignment with the existing RGGI program--and consider a more stringent rate of decline. Recognizing that the ability to accurately predict future emissions based on current data has limitations, EDF also recommends DEQ provide for a mechanism to adjust the base budget in 2020 or 2021 if actual emissions are lower than projected. The 2020 budget should be at or below emissions that would have occurred under a BAU scenario. This is crucial in order for the program to drive additional CO_2 reductions beyond BAU, as well as greater near-term emission reductions in the early years of the program, enabling more cost-effective reduction pathways and opening the door to achieving higher levels of mitigation over the long-term. A starting base budget can also be lower than expected emissions under BAU, since covered facilities will have time to plan ahead for compliance with the regulation--and in fact, have already had time to anticipate the general direction of the regulatory framework given the policy direction outlined in ED 11 and the ongoing rulemaking process. Cost-effective abatement opportunities in the power sector are readily available. Modeling suggests that Virginia power sector CO_2 emissions under BAU in 2020 could be as low as 24 million tons. In 2017, DEQ projected Virginia power sector emissions would be 33-34 million tons in 2020, using the Integrated Planning Model (IPM) and assumptions from Annual Energy Outlook (AEO) 2017, Dominion's 2017 IRP, and the RGGI 2016-2017 Program Review. The Natural Resources Defense Council (NRDC) in 2017 projected BAU emissions would be 32.8 million tons in 2020, using assumptions from AEO 2017. However, more recent NRDC modeling conducted in	The 2020 budget reflects the reference case used to determine the proposed base budget, and was at or below emissions that would have occurred under a BAU scenario. As discussed in the response to comment 37, a cap of 28 million tons has been selected. Because of the importance of aligning the Virginia program as closely to RGGI's as possible, the cap and rate of decline must align. This will ensure that the program operates as effectively and efficiently as possible.

	2018 used updated assumptions to project BAU emissions of 28 million tons in 2020. Meanwhile, The Rhodium Group projected BAU emissions well below DEQ's forecast, as low as 24-25 million tons in 2020, with cumulative emissions of 247-277 tons of CO_2 in 2020-30. These additional modeling efforts suggest DEQ's original projections of 2020 BAU emissions are likely to be overestimates. As new data become available, projections of 2020 BAU emissions could be expected to decline further. Recent announcements of fossil fuel deactivations, as well as new developments for renewable energy and energy efficiency, further indicate the power sector is becoming cleaner, and demonstrate a pace toward a lower-carbon electric sector in Virginia that is challenging for modeling efforts to fully capture. Clear trends toward a cleaner power sector in Virginia reflect an ongoing transformation toward a low-carbon future for the U.S. electric power sector. As of April 3, 2018, 1,721 MW of coal and natural gas generating capacity is now slated for deactivation by March 2019, according to PJM. In 2016, these units emitted 3.87 million tons of CO_2. In 2017, the units emitted 1.71 million tons. Meanwhile, recent developments suggest a promising future for zero-emitting solar and wind generation that could reduce Virginia emissions by displacing fossil fuel generation. As of April 2018, a total of 3,621 MW of solar capacity in the PJM interconnection queue is expected to enter into service by the end of 2019. The Virginia Solar Energy Development and Energy Storage Authority reported that as of November 2017, 2,703 MW of solar was under development in Virginia. In March 2018, new energy legislation in Virginia declared 5,000 MW of new solar capacity and 16 MW of offshore wind capacity to be "in the public interest." New energy legislation also paves the way for Virginia to deploy more cost-effective energy efficiency, which, by reducing demand for electricity, can contribute to avoiding CO_2 emissions. These trends combined with recent modeling indicates that 2020 BAU emissions are likely to be lower than initially estimated and could continue to decline between now and the beginning of the program. EDF recommends that DEQ set a base budget that starts no higher than 30 million tons in 2020, but encourages DEQ to consider evidence from recent modeling and power sector trends that supports the setting of a base budget that starts below this upper bound. A lower starting budget can also facilitate additional benefits that can result from a more environmentally protective program. A base budget that starts below 30 million tons would be consistent with a trajectory for Virginia to reach zero carbon emissions from the power sector by mid-century. A lower budget would also help	

	drive additional near-term emission reductions, unlocking the benefits of taking earlier actions to mitigate climate change. With annual average temperatures in the U.S. having increased by approximately 1.0°C in the last 115 years, the impacts of climate change are already apparent. Increased magnitudes of temperature rise are likely to further increase the prevalence of harmful climate changes worldwide, including severe weather events, extreme temperatures, extreme precipitation changes, and impacts to natural ecosystems and human necessities such as food security. Given cost-effective opportunities to reduce carbon emissions in the electric sector, and the lower overall emissions that can result from securing power sector decarbonization in advance of other sectors switching to electricity, it makes sense that the electric power sector should do more than its proportional share in reducing emissions, and follow a steeper trajectory earlier in time. In order to assess whether Virginia's emissions budget is consistent with this trajectory, DEQ can evaluate historical emissions data from 2016 and 2017. Using this data as one set of possible benchmarks, a straight-line decline from 2016 or 2017 emissions to zero by 2050 is consistent with 2020 emissions of 29-30 million tons or less, supporting a base budget that starts below 30 million tons in 2020. The Fourth National Climate Assessment finds, "Net cumulative CO_2 emissions in the industrial era will largely determine long-term, global mean temperature change. A robust feature of model climate change simulations is a nearly linear relationship between cumulative CO_2 emissions and global mean temperature increases. … Increasing the probability that any given temperature goal will be reached therefore implies tighter constraints on cumulative CO_2 emissions. Relatedly, for any given cumulative CO_2 budget, higher emissions in the near term imply the need for steeper reductions in the long term." Furthermore, a number of studies find that the timing of efforts to reduce CO_2 emissions can significantly impact the economic and environmental costs of action. Delayed action requires significantly accelerated mitigation efforts in later years to achieve the same cumulative emissions goals. Studies show that delaying mitigation efforts can increase the economic costs of necessarily more ambitious mitigation in the future. Delayed action also increases the risk of overshooting cumulative emission targets. Conversely, prioritizing emission reductions today can enable long-term mitigation to be more cost-effective and increase the likelihood of keeping temperature increases below target limits. By setting a lower 2020 starting budget, Virginia can facilitate long-term economic and environmental benefits of prioritizing early emission reductions and further limit cumulative CO_2 emissions from the power sector.	

	The RGGI states have determined a regional cap for 2021-30 that declines by 2.275 million tons per year after 2021--approximately 3% of the 2021 cap--resulting in a 30% reduction in the cap from 2020-30. Virginia should achieve at least a similar level of reductions as it contemplates linkage with RGGI. Furthermore, ED 11 directs DEQ to create a rule to reduce CO_2 from the power sector that provides for a "corresponding level of stringency" with CO_2 limits in other states. DEQ should also consider a steeper decline, considering the benefits of prioritizing near-term reductions and of maintaining consistency with a trajectory to zero emissions by midcentury, as discussed above. For example, a pathway to zero emissions by 2040 could imply a yearly decline equivalent to 5% of the 2020 budget, while a path to zero emissions by 2050 could imply a yearly decline equivalent to 3.3% of the 2020 budget. A steeper rate of decline at the program outset, even while retaining a lower rate of decline in later years, would also facilitate further limits on cumulative emission reductions and additional near-term reductions.	
107. EDF	EDF recommends a mechanism to adjust the emissions budget as new data and analysis emerge. An adjustment could be made to lower the emissions budget in order to achieve additional emission reductions if abatement opportunities are more readily achievable and cost-effective than forecasts show, as well as to optimize market function. DEQ could establish a mechanism to automatically adjust the budget if certain conditions are triggered, or provide for a manual adjustment early in the program. An automatic adjustment mechanism could use a pre-determined formula to tighten the emissions budget under certain conditions. DEQ could establish such a mechanism to adjust the base budget in early years of the program if actual emissions are lower than projected--not unlike how RGGI has adjusted its cap in the past to account for banked allowances. DEQ has a range of options for the timing of any such adjustment, and should consider factors such as the availability of new emissions data, ease of administration, and the timing of RGGI auctions, compliance periods, and the 2021 bank adjustment. Alternatively, DEQ could provide for a manual adjustment of the emissions budget when new data becomes available--for example, 2019 or 2020 actual emissions from the affected power sector units. Virginia has appropriately included the ECR and withholding of allowances in alignment with RGGI's Model Rule. DEQ should harmonize the minimum reserve price for the Virginia program with the minimum reserve price in RGGI. There is a continued need for emission reductions beyond 2030 to achieve climate goals and protect Virginians from the impacts of carbon pollution. DEQ should participate in RGGI program	As part of linking to RGGI, it will be essential for Virginia to participate in RGGI market controls--such as the CCR and ECR--and in periodic reviews to adjust the program as needed. There is no need for Virginia, at this point, to develop its own preemptive mechanisms. DEQ appreciates the need to respond quickly to unpredictable market fluctuations and other unknown issues; however, the best approach to do so is in concert with the other RGGI states. Should a definite state need arise, a Virginia-specific remedy may be implemented.

	reviews. Periodic program reviews are an important means to assess program success and make changes to strengthen the program. It is important for DEQ to provide as much long-term certainty around carbon regulation as possible--market certainty will contribute to a successful emissions market, and can also help ensure Virginia is at the table as a leader on climate policy in the future.	
108. EDF	EDF supports allocating allowances to covered sources with an updating output-based approach, and consignment of allowances to the RGGI auction. This design smooths integration with RGGI, facilitates transparency and market efficiencies, and mitigates leakage. Consignment auctions are a proven method to facilitate transparency and price discovery. Successful examples of consignment auctions include the federal Acid Rain SO_2 Trading Program and California's Cap-and-Trade Program. A consignment auction in Virginia should be able to integrate seamlessly with the RGGI auction and key design elements including the price floor and ECR. Consignment auctions can create further incentives to reduce electric sector carbon emissions through a carbon price signal reflected in electricity rates. Furthermore, measures can be taken to provide benefits to ratepayers alongside a carbon price signal. Analyses conducted by EDF and RFF in the context of the CPP found that an updating output-based approach can be an effective means of mitigating emissions leakage--wherein carbon emissions shift out-of-state or to sources not covered by the program through, e.g., shifting generation. Modeling conducted by RFF found that an updating approach to allocate 100% of allowances to a subset of eligible sources under the CPP (as opposed to a historic approach) could reduce leakage by up to 64% compared to a mechanism that allocated only 5% of allowances with an updating output-based approach. Similarly, EDF analysis found that allocating all or nearly all CO_2 allowances with an updating output-based approach could significantly reduce leakage. EDF encourages Virginia and other RGGI participating states to monitor and evaluate whether and to what extent emissions leakage might be occurring on an ongoing basis, and evaluate additional opportunities to effectively mitigate any leakage that may occur.	The commenter's remarks on how the updating output-based approach and consignment of allowances to the RGGI auction will address leakage are acknowledged. DEQ agrees that these mechanisms, along with robust program reviews for which RGGI explicitly monitors leakage, will discourage and limit emissions leakage. See the discussions under the response to comment 91.
109. EDF	Industrial power plants over 25 MW in size are a source of carbon pollution that DEQ proposes to exempt. Much of the literature on carbon market designs suggests that broader inclusion of sources can lead to more cost-effective and efficient outcomes. Industrial power plant sources may be included in future climate policies and Virginia can help provide regulatory certainty to these facilities by bringing them into the program and drive investments to reduce emissions now. In order to meet	See the response to comment 65 for a discussion of how industrial facilities will be handled. DEQ agrees that energy efficiency and renewable energy are important elements in a carbon reduction program, and will

	our climate goals, more emitters will need to reduce emissions. There are extensive, cost-effective opportunities for improving efficiency and increasing renewable energy use across industrial sources and DEQ should include these sources in the program.	likely continue to improve in Virginia for a variety of market- and pollution control-based reasons.
110. EDF	A strong trading program can provide important benefits for communities overburdened by pollution. Without affecting timely finalization of the rule, DEQ should conduct ongoing analysis and monitoring to ensure communities disproportionately impacted by air pollution benefit from efforts to abate carbon pollution. This analysis could include a geospatial EJ screen using demographic and environmental indicators to identify disadvantaged communities. DEQ should continue to work with affected communities and other stakeholders, such as the EJAC, to identify instances of adverse economic or pollution impacts on disadvantaged communities and take appropriate action to mitigate the effects. DEQ should also continue to engage meaningfully with EJ stakeholders and disadvantaged communities as the agency works to finalize this rule and implement the program. EDF commends DEQ for its efforts to date to hold public hearings across Virginia and invite deep engagement from diverse stakeholders, and encourage DEQ to continue this practice.	As discussed in the response to comment 55, the EO 73 EJAC Council will take the lead on directly addressing environmental justice issues. DEQ will continue its public outreach efforts in such a way as to maximize public participation from all Virginians.
111. Forest Products Industry National Labor Management Committee (LMC)	LMC opposes joining RGGI due to concerns it would increase electricity and natural gas prices for businesses and consumers. The following language should be included in the regulation: "Forest biomass, including forest products manufacturing residuals, should categorically be treated as carbon-neutral whether or not it is co-fired with fossil fuel." The carbon profile of biomass is not at all altered when co-fired with other fuels. The biomass portion of the fuel mix has the same characteristics no matter what fossil fuel it may be co-fired with. It is the characteristics of the biomass feedstock, not of the power generation process or facility, that support treatment of biomass as carbon neutral. Additionally, LMC strongly urges the regulation not be expanded beyond its focus on utilities to also apply to industrial boilers. ED 11 pertains exclusively to controlling CO_2 emissions from electric power facilities. The Economic Impact Assessment, the direction given to the Regulatory Advisory Panel, the emissions and economic modeling conducted by DEQ and its consultants, and DEQ's written and oral information supporting the proposal indicated that the regulation applied only to the electric power sector.	See the response to comments 65 and 67 for further information on rule applicability.
112. GRID Alternatives Mid-Atlantic	We understand the consignment is designed to be revenue neutral. However, DMME will have a contract with a third-party administrator that would sell allowances allocated to DMME and make the funding available for use in a variety of programs to help reduce CO_2 emissions. Accordingly, one of DMME's strategies is to accelerate the adoption of energy efficiency practices	DEQ recognizes the value of low-income solar programs as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what programs the

	and expand the deployment of renewable energy. This funding could be utilized to create new economic opportunity in the state through solar energy. Solar provides long-term financial relief to families struggling with high and unpredictable energy costs, living wage employment opportunities in an industry adding jobs at a rate of 20% per year, and a source of clean, local energy sited in communities that have been disproportionately impacted by traditional power generation. Virginia solar jobs increased by 10% in 2017, and the state now has over 3500 solar workers. Virginia is poised to experience 1.5% solar jobs growth in 2018. Low-income ratepayers pay a disproportionate amount of their income on utility bills. These customers stand to benefit most from solar energy, and must be prioritized through targeted policies and programs. The proposal assumes that all revenues raised from the auction by utilities are returned to ratepayers. In the case of distribution utilities dependent on other wholesalers for power, such as rural electric cooperatives and municipal electric entities, those wholesale contracts could impose costs on those dependent purchasers with no mechanism--and nothing that DEQ could make a requirement--for the wholesaler's auction revenues to offset those costs or return those revenues to the underlying load that is responsible for paying those costs. There may be solutions to this issue; however, those solutions would be outside DEQ's purview, either involving an order from the SCC, a mandate to run auction revenues through a FERC formulary rate in a certain way, or legislation. Low-income consumers that use electricity should not pay for the costs of carbon regulation without also receiving the benefit of revenue, if any, from allowance auction proceeds. The proposal does not fully address this issue. GRID Mid-Atlantic has seen the benefits of low-income solar programs in markets across the country. We recommend the regulation directly benefit low-income ratepayers with a solar program funded by DMME's allowance funding. A low-income solar program would have the goals of significantly reducing the electrical energy burden of Virginia's low-income ratepayers and training the next generation of solar workers. This type of programming would complement DMME's strategic objective to expand the deployment of renewable energy and overall reduction of CO_2 emissions.	allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement that set-aside. DMME may, at the appropriate time and in accordance with its regulations and policies, implement a low-income solar program set-aside. As discussed in the response to 55, affected communities will be monitored on an ongoing basis to assure that no disproportionate impacts are experienced. Note that the trading program as well as how the costs of energy in Virginia are arrived at are open and transparent. There will also be numerous opportunities to identify and remedy any identified impacts.
113. International Emissions Trading Association (IETA)	IETA welcomes this opportunity to voice strong support for the proposal. More than 50% of the world's economy is subject to some form of carbon pricing, most of which is under cap and trade systems. This growing coverage includes major international trade partners and the entire RGGI collaborative. Virginia's proposed program allows the use of market-based mechanisms and trading of CO_2	Support for the proposal is appreciated, as is the commenter's discussion of RGGI's attributes.

	allowances. It provides an important link to RGGI's program, enabling Virginia market participants to have access to a bigger, more efficient market. 9VAC5-140 will allow Virginia to join the other RGGI states as a leader in cutting emissions that lead to climate change and air pollution, while providing opportunities for in-state clean economic growth and business development. The rule would also provide regulatory certainty to Virginia's electric generation sector, including a clear price signal and incentive for electricity generators to invest in innovative lower carbon technologies. IETA sees the program having 4 fundamental advantages: flexibility, cost-effectiveness, linkability, and building on the proven success of emissions trading systems globally--and most importantly--in the context of the RGGI cap and trade program. The program accesses regional allowance auctions and gives participants across the RGGI region the opportunity to participate in the Virginia market. This will provide a broad market for program revenue, price discovery, and market liquidity. Issuing allowances to generators based on their current GHG emissions and allowing them to sell excess allowances creates an incentive for generators to be innovative in their carbon investment and compliance strategies. Compliance flexibility afforded by the program will ensure that emission reductions are realized cost effectively. Cost-containment design elements, such as an auction reserve price and price ceiling, will guarantee that the carbon price does not go above or below acceptable ranges. This approach will reduce administrative burdens for government. Virginia will be able to take advantage of economies of scale to reduce compliance costs while meeting GHG reduction goals while maintaining Virginia's autonomy and ability to act in its best interest. Linkability will also allow Virginia to take advantage of systems such as COATS without the need to develop and operate new systems and infrastructure. IETA encourages Virginia to establish an offsets policy and framework that could take advantage of existing methodologies developed by RGGI and the Western Climate Initiative. Over nearly a decade, RGGI has resulted in significant environmental and socio-economic benefits, including emission reductions and more than $2.76 billion in net economic gains. Virginia's cap and trade program can demonstrate that economic growth and carbon reductions can work together. As a global organization, IETA is aware of the broad and powerful role that programs like cap and trade can play in efforts to address the climate challenge. Adoption of 9VAC5-140 is a critical step that Virginia must take in order to reduce emissions and air pollution. At a time when Washington D.C. is regressing on climate	

	action and leadership, Virginia's progress could not occur at a more important time	
114. Institute for Policy Integrity, New York University School of Law	When Virginia joins RGGI, the total emissions regulated by RGGI will rise by over 40%. Thus, the choice of Virginia's emissions cap will substantially affect the total number of allowances available at each auction and may affect the stringency of the RGGI cap. Changing the stringency of the RGGI cap will, in turn, affect future permit prices, affecting all participants in RGGI auctions. In particular, power plants in other states will be able to purchase permits at a lower price, leading to less abatement. Therefore, the achievement of environmental goals by RGGI will also be a function of Virginia's cap choice. A new state joining RGGI could either increase or decrease the stringency of the total emission cap. The RGGI price is currently below the socially optimal price for a ton of CO_2, and the price ceiling in RGGI is also below this level, so a less stringent cap would result in lower social welfare when compared to a tighter cap. If Virginia's cap is set relatively tight, leading to a lower total number of allowances than required to maintain RGGI's stringency, then RGGI permit prices will increase, possibly even hitting the price ceiling. This would not constitute an inefficiency from a social point of view. In 2020 the Social Cost of Carbon will be $49. Even if the generators were paying the full CCR trigger price, which in 2020 will be $10.77, the permit price would still be too low to fully internalize the externality caused by carbon emissions. By the same token, depressing the allowance price by decreasing the stringency of the cap would lower social welfare. If Virginia chooses to issue allowances for more emissions than its generators would emit under a business-as-usual scenario (the "counterfactual emission level"), this will loosen the emission cap for all of RGGI. Unless allowance prices are at the price floor, the price will go down, causing the aggregate emissions to increase compared to a scenario where Virginia does not join RGGI. A fall in the permit price will also decrease the revenue that the other states receive from RGGI auctions. The magnitude of those adjustments will depend on the magnitude of the changes in RGGI's cap. For emissions to decrease, the number of permits issued in Virginia must be set below the counterfactual emission level. To achieve that goal, a reliable prediction of the future emissions path is required. However, developments that can significantly affect Virginia's emission levels are uncertain, for example the rate of fossil fuel retirements and additions of renewables. DEQ should discuss their forecast of state CO_2 emissions to help assess whether the allocation will be too high or too low. Virginia proposes to set the base budget at 33 or 34	Support for the proposal is appreciated, as is the commenter's discussion of trading programs.

	million allowances (while putting an additional 3.3 to 3.4 million allowances into the CCR). This might be too generous, even when future declines in the budget are considered. For instance, comments submitted to RGGI by Arcadia Center, NRDC and Sierra Club suggest that 2020 baseline should be set in the range of 30-32 million tons. The choice of the initial budget needs a sound justification given its potential impact on total pollution and permit prices. The allowance price will decrease slightly even if Virginia sets the cap equal to or just below its counterfactual 2020 emissions. This effect operates through two channels. Cheap pollution abatement possibilities may exist for Virginia's electricity generators that have already been implemented in the other RGGI states. And, if the RGGI cap is more restrictive than the cap chosen by Virginia, the total effective cap will be less stringent than without Virginia joining the system. However, the price decline will not be accompanied by an increase in total emissions compared to the scenario without Virginia. Therefore, a falling permit price, by itself, will not be informative as to whether RGGI's expansion will decrease total CO_2 emissions. As RGGI prices are already close to the reserve price, if Virginia enters RGGI with a loose cap, this will increase the probability of the ECR becoming operative. As Maine and New Hampshire do not intend to implement the ECR and will thus not withhold allowances when the trigger price is reached, this will create redistributional effects between the states. Adding Virginia generators to RGGI will improve market efficiency for current RGGI states and will help Virginia cost-effectively meet its carbon pollution reduction goals. Because of the consignment auction mechanism being used to distribute conditional allowances and RGGI proceeds, the SCC should ensure that all participants in RGGI are on an equal playing field to maintain market efficiency. One concern with the consignment auction is that some power generators in Virginia might be able to keep the revenue disbursed by RGGI, while, ideally, the consignment process should be revenue neutral for all compliance units. Regulated power producers in Virginia will be required by the SCC to pass all revenue from RGGI auctions on to state electricity consumers. The SCC will be in charge of verifying that the consignment auction is indeed revenue neutral for those units. Vertically integrated utilities could potentially gain revenue from the auctions by substituting RGGI-derived revenue for other customer support payments. Only newly conceived customer support programs should be funded using RGGI revenue to ensure that the support is additional to any other support that the generator might have offered. The SCC will need to be	

	proactive in protecting Virginia consumers to prevent behavior by generators that results in windfall revenue. Windfall revenues would place the producer at a long-run competitive advantage relative to electricity generators that participate in RGGI but that do not receive revenue from the auctions. Because conditional permits will be allocated based on electricity generation rather than CO_2 emissions, clean generators could even see their profits increase if they manage to receive revenue from RGGI. This could happen for a generator that receives more conditional allowances than it needs to buy from RGGI to cover its own emissions, consequently receiving more revenue from RGGI than it spends at RGGI auctions. If non-regulated, private generators in Virginia subject to the proposed regulation do not have a revenue neutrality requirement, those generators will receive a revenue windfall in the form of proceeds from RGGI auctions. Some of the cleanest private resources might experience a profit windfall. As a consequence, this might create a competitive advantage for private generators over regulated resources. This could send incentives for new private power generation to locate in Virginia rather than RGGI states. Even if these generators receive revenue from the auction, joining RGGI will improve market function relative to the current status quo. Right now, emitting generators in Virginia are receiving an implicit subsidy, as they are not paying for the environmental damage caused by their emissions. Internalizing this externality will eliminate the perverse incentives for high emitting generators to locate themselves in Virginia relative to other RGGI states. The pass-through of the permit price from generators to customers will determine the extent to which generators themselves face the incentive to reduce carbon emissions. If the SCC allows generators to increase electricity rates in response to the costs of purchasing RGGI permits, then consumers will face an incentive to reduce electricity consumption and invest in energy efficiency. At the same time, higher energy prices may slow down the rate of electrification of the automotive and heating sectors. To the extent that the SCC wants the incentive for abatement of CO_2 to fall on the generators, it should limit the pass-through of permit prices to consumer electricity prices, either through limits on the approved rate increases by regulated generators or through rebates of RGGI proceeds to consumers. Similarly, if Virginia aims to increase electrification of other sectors of the economy, it should prevent pass-through of permit prices to consumer electricity prices. Electricity generators in Virginia will be incentivized to reduce CO_2 emissions whether or not the consignment auction is fully revenue neutral. A requirement to hold a permit for each ton of CO_2 emitted provides a marginal	

	incentive to reduce emissions. This marginal incentive to abate will be present regardless of whether generators receive lump-sum revenue from RGGI. The RGGI-derived revenue would affect the long-run profitability of the generators if it is not distributed to consumers, so over time higher or lower emitting generators may be more likely to enter or exit the market. However, the marginal incentives to abate will be realized as long as the requirement to hold a permit to emit is in place. Moreover, were Virginia not to place any price on carbon, it would impede efficient market operation by implicitly subsidizing fossil power generators in the state. Therefore, including Virginia in the RGGI trading program will help improve market function and promote a level playing field between generators. The way in which the revenue from the consignment auction is passed to consumers will also have implications for environmental outcomes and energy demand. If consignment auction revenue is passed to consumers on a volumetric basis, consumers will see a lower price for electricity, reducing the incentive to pursue energy efficiency but also preserving the incentive for electrification. The design of the regulation needs to balance those trade-offs. Finally, the consignment auction mechanism also creates different incentives among the generators inside Virginia. Because the permit allocations and updates are based on net electricity output, the cleanest fossil fuel plants will have an incentive to expand their generation compared to higher emitting generators. This incentive should make the Virginia fleet even cleaner, leading to quicker decreases in emissions. In sum, adding Virginia generators to RGGI will increase environmental quality and improve market efficiency.	
115. Lena Lewis	I strongly support implementing carbon cap and trade of power plants. I congratulate DEQ on writing strong carbon cap-and-trade policy that will move Virginia forward in protecting our citizens from the worst impacts of climate change. I support linking with RGGI, which has a proven track record of success in reducing carbon emissions while keeping state economies strong. The purpose of cap-and-trade is to cause people to make different decisions than they otherwise would without the cap. Exempting biomass will create an incentive to cut down more forests, and will create the incentive for more biomass plants to be built, or for plants to be converted from fossil fuel to exclusively biomass. This will increase the incentive to cut down forests in Virginia. In addition to removing CO_2 from the atmosphere, these mature forests provide many other ecosystem services, such as cleaner drinking water, reduced erosion, and oxygen production. Keep in mind	Support for the proposal is appreciated. See, for example, comment 67 for further discussion of biomass, and comment 65 for more information on the industrial exemption. A base cap of 28 million tons tons has been selected; see the response to comment 37 for additional information. As discussed elsewhere, the purpose of the regulation is to control carbon pollution emitted by fossil fuel-fired electric generating facilities.

	that carbon is just one element among many in our ecosystems. Carbon policy that exempts biomass risks increasing the destruction of biodiversity in forest ecosystems and reducing other benefits that they provide. Proponents of biomass say that it is carbon neutral because the energy source will absorb CO_2 as it grows back. A large body of scientific literature explains that the truth is not so straightforward. One essential question is the time frame needed in order for a harvested forest to grow back enough to absorb all of the carbon released from burning. This time frame depends on many variables, including age of trees, species, amount of fossil fuels required to harvest trees, temperature, and growth rate of species. We are on the verge of a tipping point with climate change. Harvesting forests for biomass fuel will increase carbon emissions in the near term. In the decades it will take for those forests to reabsorb that carbon, the added CO_2 in the atmosphere will contribute to accelerated release of carbon from melting permafrost in the tundra and reduced albedo in at the poles due to melting ice cover. Some public comments express concern that including biomass in the carbon cap will hurt the paper industry and tree farmers. The point of a market-based solution is to change behavior. If paper factory owners assess that carbon allowances no longer make it profitable to burn residuals, they are not required to burn their wood waste. Nor are they stuck in a situation of profit loss. Paper factory owners are free to innovate to find new ways to use residual wood waste. They may discover a new application that brings in more money than burning waste wood. Market-based solutions such as cap-and-trade promote innovation. Exemptions do not. The climate crisis calls for innovation across all sectors of society, and should not exempt the paper industry or the biomass industry. Though Virginia does not currently have large power plants that incinerate municipal or industrial waste to produce energy, a cap that does not include them will promote their development. Because MSW burned for energy is predominantly plastic that could otherwise be recycled, it is a potential source of carbon emissions and would promote the destruction of otherwise recyclable materials. Rather than wait for these plants to be built before regulating them, the regulation should state that plants burning MSW and industrial waste must retire carbon allowances to do so. The level of the initial cap is important because subsequent reductions are percentages, not set amounts. DEQ's proposed initial cap of 33-34 million	

	tons is based on the electricity utilities' flawed projections of energy demand. The point of the cap is to reduce carbon emissions, not to give utilities a new source of revenue through selling allowances. Such a high number of allowances will flood the market, reducing the clearing price of allowances in the RGGI market and reducing revenue for RGGI states. Furthermore, a cap of 33-34 million will not change Virginia's carbon emissions. The cap must put downward pressure on carbon emissions from the first year. Virginia's electricity consumption is growing very slowly. Expected electricity demand growth over the next 15 years is less than 1% a year. The DEQ scenario of 33-34 million tons assumes an annual growth rate of 1.9-3%. It does not take into account the amount of utility scale solar projects already in the construction pipeline, nor the increase in rooftop solar. Anticipated energy demand depends on which historical data is considered. When looking at 2012-16, one could conclude that energy demand is increasing. However, 2012 had a mild winter and cool summer. Energy demand from 2005-16 resulted in emissions of just under 32 million tons of CO_2. Therefore, the cap should be lower than 32 million in 2020 to account for increased solar and natural gas, and to put downward pressure on emissions from the first year. Even if a business-as-usual scenario predicts a decrease in carbon emissions, the purpose of a cap is to decrease carbon emissions by a greater amount than under business as usual. Therefore, I recommend a starting cap of 30 million tons.	
116. Malin Moench	My comments go to the relative harm that coal, natural gas, and biomass do to the climate and to human health from the toxins that they generate when they generate electric power. Incentives should double down on energy efficiency and on renewables that are truly clean. The Clean Power Plan provided for gas-shift emission rate credits for utilities that replace coal-fired production with gas turbine production. Virginia's plan should not include such credits. Producing and burning natural gas is as climate forcing as coal largely because the effect of fugitive methane is far bigger. About 3.8% of conventional natural gas production and about 12% of shale gas production is fugitive methane. After properly accounting for fugitive methane, and using a 20-year impact analysis, it may very well be that gas-shift penalties are needed, rather than gas shift credits. Biomass should not be eligible for renewable energy credits. Burning wood scraps for power is not climate neutral. Per Btu, it emits 10-35% more CO_2 than burning coal, depending on the moisture content of the fuel, combustion efficiency of the plant, and processing losses. Regrowth of clear-cut hardwood forests will not offset the higher CO_2 intensify of burning wood scraps until the year 2100. By then, under current CO_2 emission	The commenter's observations about biomass are appreciated. Although toxic and criteria pollutants from biomass are indeed a source of concern, they are not regulated by this particular program, nor is methane. These pollutants are more appropriately addressed in other areas of the board's regulations. See the response to comment 67 for more detail.

	trends, the world will have blown past critical tipping points in the carbon cycle. Burned biomass also exceeds coal in its emissions of toxins. Like coal emissions, wood smoke is an extreme public health hazard, containing over 200 toxic chemicals and particulate matter. The component of burned biomass that harms human health the most is fine particulate matter. Wood-fired power plants and coal-fired power plants are primarily neurotoxin and carcinogen factories from a physician's point of view, but on a Btu-equivalent basis, wood-fired is much worse. They should not get a free pass.	
117. National Alliance of Forest Owners (NAFO), Virginia Forestry Association (VFA)	Excluding biomass CO_2 emissions is good environmental policy and supported by scientific studies. There is an extensive record supporting a decision to differentiate biogenic CO_2 emissions from fossil fuel GHG emissions. Importantly, there is scientific consensus that, because it is part of the natural carbon cycle, the potential for impacts on atmospheric GHG levels from biogenic carbon is fundamentally different than fossil carbon. In the forests of Virginia, biogenic CO_2 emissions are more than balanced by carbon sequestered in growing forests. Studies show that combusting biomass for energy offers substantial GHG mitigation benefits when compared to fossil fuel. There is strong evidence that forests are currently being managed sustainably and will be for the foreseeable future. Thus, when forest carbon stocks are evaluated over appropriate time and spatial scales, there is ample support for the proposition that forests are capable of meeting increased demand without reducing overall forest carbon stocks. It is well-established that all wood products, including biomass combusted for energy, are part of the natural forest carbon cycle. CO_2 is sequestered in forests through photosynthesis and emitted through decomposition and combustion. As long as forest carbon stocks remain stable or increase over time, biomass energy and other forest product uses do not increase atmospheric GHG. In contrast, CO_2 emissions from fossil fuel combustion permanently increase atmospheric GHG concentrations because they release carbon that has been geologically stored for millennia. Sustainable management of forested lands provide distinct climate change mitigation benefits which reduce net GHG emissions over time: 1) durable forest products continue to store carbon for decades after harvest, 2) manufacturing forest products is much less carbon-intensive than alternative products such as concrete or steel, and 3) biomass used for energy can directly displace fossil fuel emissions over multiple harvest cycles. Many studies evaluating biomass energy have found significantly lower net GHG emissions when compared to fossil fuel. Recent studies have attempted to quantify in	See comment 67 for further discussion of biomass.

	absolute terms the GHG mitigation benefit of substituting biomass energy for fossil fuels. These studies also identify substantial reductions in GHG emissions, but do not directly answer the question whether biomass combustion for energy results in any net CO_2 emissions. However, these studies consistently conclude that active forest management focused on supplying forests products and biomass energy produces the greatest GHG mitigation benefits from forested lands. Stability or growth in forest carbon stocks is essential for establishing that biogenic CO_2 emissions do not increase atmospheric CO_2. If forests are converted to other land uses after harvest, the carbon cycle is broken. Thus, given urban development and other external pressures, it is essential to ensure that forest carbon stocks are not depleted as a result of biomass energy. However, projections by the U.S. Forest Service suggest that forest stability will continue for decades to come. Whether viewed nationally or regionally, studies consistently find that forest carbon stocks have remained stable or increased over the past 60 years despite increases in demand for forest products. Timberland in Virginia has a highly positive net growth/removal ratio, meaning that through sustainable management, our forests are growing more than twice as much wood as is harvested. Despite the stability in U.S. forest carbon stocks over time, some have expressed concern that increased demand for biomass energy will reduce the amount of carbon that would otherwise be stored in forests. However, these concerns are inconsistent with the market factors that influence forest management decisions. Studies have repeatedly found that forest owners will respond to increased demand for biomass energy (or any other forest product) by increasing production, and thereby increasing forest carbon stocks. In the case of biomass energy, such responses can include increased consumption of existing harvest residuals, increased productivity through management practices, and land use changes. Biomass energy relies on low-cost biomass feedstocks to remain competitive with other types of energy. Thus, biomass energy feedstocks are commonly composed of residues and other low-grade feedstocks. In contrast, high-grade trees are reserved for saw timber and similar products that command higher prices and generally result in products that store carbon for decades. Given the price differential between low-grade feedstocks and saw timber, it is unlikely that high-grade, mature trees would ever be harvested exclusively for energy production. While increased demand for biomass energy could increase prices to some degree, even optimistic projections would not raise feedstock prices to the point that landowners would manage forests for energy	

	instead of saw timber. NAFO and VFA support the proposal to exclude 90-100% biomass-fired facilities from the rule. The proposal is supported by scientific consensus that biogenic CO_2 should be regulated as being carbon neutral and is consistent with the RGGI Model Rule. We understand that at least one other commenter has raised the issue of how emissions from biomass are treated under the proposal. NAFO and VFA are sensitive to the issue of emissions of all kinds from biomass materials; however, these issues that are beyond the scope of the proposal. The proposal addresses CO_2 emissions from electric power generating units in Virginia, not other pollutants. Pollutants like benzene and formaldehyde are governed by other federal and state regulatory regimes already being administered in Virginia. The board should continue to focus the proposed regulation on CO_2 emissions and let existing laws and regulations govern non-CO_2 emissions from electric power generating units. We encourage the board to allow operators that co-fire biomass with fossil fuels to deduct the biogenic CO_2 emissions from the total CO_2 emissions the unit must cover with allowances. It is consistent with carbon-neutral environmental policy, and would bring Virginia in line with the RGGI Model Rule, as well as other RGGI states like New York. The Department of Forestry recognizes the sustainable development value and economic benefits of promoting use of biomass and biogenic fuel sources in Virginia, stating that the "benefit[s] of expanded utilization of biomass include: [p]rovid[ing] new markets for waste wood, manufacturing residues, and materials from forest management activities; … [r]educ[ing] material going to landfills, being dumped or open burned, such as woody debris and other wood waste; [r]educes site preparation costs for artificial regeneration; [r]educ[ing] pollution compared to using fossil fuels …." Congress also understands the environmental and sustainable development benefits of biomass-based fuel. In a display of bipartisan support, Congress passed the Consolidated Appropriations Act of 2018, where it directed the Department of Energy, the Department of Agriculture, and the Environmental Protection Agency to "establish clear and simple policies for the use of forest biomass as an energy solution, including policies that (A) reflect the carbon-neutrality of forest bioenergy and recognize biomass as a renewable energy source, provided the use of forest biomass for energy production does not cause conversion of forests to non-forest use; (B) encourage private investment throughout the forest	

	biomass supply chain … (C) encourage forest management to improve forest health; and (D) recognize State initiatives to produce and use forest biomass." Encouraging the biomass fuel market to grow in Virginia will continue to help the board achieve the purpose of the regulation: "to control CO_2 emissions in order to protect the public's health and welfare." As reported in The Economic Impact of Virginia's Agriculture and Forest Industries (2017), "Biomass energy production has emerged in recent years as a significant new market for surplus wood residues in Virginia. Federal clean and renewable energy programs and Virginia's voluntary Renewable Portfolio Standard offers incentives to the state's power companies to produce electricity from renewable resources. Woody biomass accounted for most of Virginia's renewable power generation in 2015 and approximately 5% of total power generation in the state. Since 2012, Virginia has added over 300 MW in electrical power generation capacity." Also, "Virginia hosts 10 wood pellet plants, most of which have been established in the last decade. Collectively, they processed over 1.4 million tons of wood, mill, and forest residues." NAFO and VFA can vouch that a broad range of robust markets for all Virginia wood and fiber are in the best interests of forest health and sustainability, the economic prosperity of the state, and the welfare of citizens of the state. Markets for low value wood that may not have other outlets are critical to woodland owners and to lumber manufacturers searching for purchasers of sawmill residues. Energy production from woody biomass aids in reducing the threat of wildfire and insect infestation, and can enhance wildlife diversity. It is vital to have markets for wood during the clean up of biomass debris resulting from natural disasters. By exempting biomass-only and near biomass-only facilities, the board has demonstrated that it agrees biogenic emissions are inherently different from fossil fuel carbon emissions. We urge the board to consistently apply these conclusions by allowing operators that co-fire biomass with other fuel sources to deduct their biogenic emissions when calculating compliance. This policy has already been developed in the RGGI Model Rule and in 6 of the 9 RGGI states. Virginia would be an outlier by disallowing biogenic CO_2 deductions. Since RGGI began, it has engaged working groups to develop Model Rules that can be reviewed, adapted, and implemented by states joining the system. Many stakeholders participate in these reviews and many states have chosen to adopt in full substantive provisions of the Model Rule. In every iteration of the Model Rule, RGGI has allowed operators that co-fire biomass with fossil fuels to deduct the emissions	

	attributable to biomass from the total amount of CO_2 emissions for compliance purposes. The RGGI Model Rule is not an abstract framework; most states that participate in RGGI have adopted it almost verbatim and implemented it with great success. The rule should allow operators co-firing biomass with fossil fuels to deduct biogenic emissions from annual CO_2 compliance accounting. It is consistent with the environmental and economic policies built into the regulation. NAFO and VFA encourage the board to add a definition of biomass. This will add clarity to the issue of biomass exemptions and allow the board to more easily review the exclusion of biogenic emission from CO_2 co-firing facilities. The legislature has already provided such a definition in VA Code § 10.1-1308.1.	
118. National Council for Air and Stream Improvement, Inc. (NCASI)	The rate at which global CO_2 emissions are increasing and the implications for global temperatures in the near- and long-term has led to calls for steep near-term reductions in emissions. IPCC indicates that, with respect to emissions of CO_2, it is cumulative emissions that will determine peak global temperature. IPCC notes that, "…taking into account the available information from multiple lines of evidence . . . the near linear relationship between cumulative CO_2 emissions and peak global mean temperature is well established in the literature and robust for cumulative total CO_2 emissions up to about 2000 petagrams of carbon. It is consistent with the relationship inferred from past cumulative CO_2 emissions and observed warming, is supported by process understanding of the carbon cycle and global energy balance, and emerges as a robust result from the entire hierarchy of models." IPCC indicates that, "A number of papers have found the global warming response to CO_2 emissions to be determined primarily by total cumulative emissions of CO_2 , irrespective of the timing of those emissions over a broad range of scenarios." One study cited by IPCC states that ". . . the relationship between cumulative emissions and peak warming is remarkably insensitive to the emission pathway (timing of emissions or peak emission rate). Hence policy targets based on limiting cumulative emissions of CO_2 are likely to be more robust to scientific uncertainty than emission-rate or concentration targets." It is only by reducing cumulative CO_2 emissions and thereby peak global temperature that ecological tipping points can be avoided. Near term increases in CO_2 that allow later reductions in cumulative CO_2 emissions are different from those that do not. In this context, it is not uncommon for increased use of forest bioenergy to result in near-term increases in atmospheric CO_2, compared to continued use of fossil fuels. However, as long as land remains in forest, increased use of forest bioenergy to displace fossil fuel accomplishes longer-term reductions	See comment 67 for further discussion of biomass.

	in cumulative CO_2 emissions. The time required for increased use of forest bioenergy to transition from net CO_2 emissions to net CO_2 reductions depends on a number of factors. In the case of certain residual materials, the transition is essentially immediate. In other cases, this transition requires more time. Increased use of forest bioenergy to displace fossil fuels is likely to result in net benefits to atmospheric CO_2 within a decade or two. After this transition is completed, the benefits of forest bioenergy continue to accrue. Even critics of forest bioenergy acknowledge the long-term benefits of displacing fossil fuel with forest bioenergy. A report prepared on behalf of the National Wildlife Federation and SELC, for instance, found that "…using southeastern forests for an expansion of electric power generation produced a significant long term atmospheric benefit, but at short term atmospheric cost." In the this study, a 35- to 50-year breakeven period was estimated, but this study did not account for reduced deforestation and increased afforestation associated with increased demand for wood, a well-documented phenomenon. Near-term increases in CO_2 emissions must be judged in the context of whether they are associated with reduced cumulative CO_2 emissions in the longer term. This is because of the insensitivity of global temperature to near-term CO_2 emissions, and the need to reduce cumulative CO_2 emissions to limit peak global temperature. These considerations are directly related to questions about biogenic CO_2 resulting from increased use of forest bioenergy. Increased use of forest bioenergy often results in higher near-term CO_2 emissions compared to continued use of fossil fuel but, as long as land remains in forest, cumulative CO_2 emissions are reduced in the longer term when fossil fuels are displaced by forest bioenergy. This phenomenon needs to be considered when contemplating potential regulation of biogenic CO_2 emissions from biomass energy production. The two cases in which emission profiles argue for differential treatment of biomass are 1) when the material used for fuel would have ended up being emitted to the atmosphere even if not used for energy production, and 2) when sustainable management of the biomass resource ensures that ongoing growth will remove equivalent quantities of CO_2 from the atmosphere. In the first case, the biomass emissions that would have occurred anyway will prevent fossil fuel emissions associated with producing the same amount of energy. In the second case, a sustainably managed resource grows biomass equal to or exceeding the amount of biomass harvested, ensuring that the resource is not a	

	net source of CO_2. In both cases, it is the characteristics of the biomass feedstock, not the characteristics of the power generation process or facility, that support treatment as carbon neutral. By exempting facilities using 90% or more biomass feedstock, the regulation implicitly acknowledges the environmental and atmospheric benefits of biomass compared to fossil fuels. The regulation takes an all or nothing approach: either all of a facility's emissions are exempt (if it uses 90% or more biomass fuel) or none of its emissions are exempt. This removes any incentive to use biomass as part of a fuel mixture in fossil-dominant plants. We have evaluated the carbon stock in trees on timberland across the U.S. South. Carbon stocks increased from 4.9 billion to 5.6 billion tons from 2005-16, an increase of 14.5% over a period with an average of 104 million tons of carbon removed annually during harvests. Even if all the biomass harvested from the forest during this time was immediately converted to CO_2 and emitted to the atmosphere (far from the actual situation), the fact that forest carbon stocks continue to increase is proof that biogenic CO_2 from biomass removed from the forest is more than offset by removals of CO_2 from the atmosphere by growing forests. In Virginia alone, tree carbon stocks on timberland rose from 503 million tons in 2005 to 589 million tons in 2016, a net increase of 17% while carbon removals from harvests were 7.4 million tons annually. In summary, when biomass from residuals or from sustainably managed forests replaces fossil fuels, there are climate change mitigation benefits. A large body of scientific evidence supports the environmental benefits of biomass energy, regardless of whether the biomass is combusted alone or as part of a biomass-fossil mix.	
119. Northern Virginia Electric Cooperative (NOVEC)	While NOVEC's power supply portfolio is predominantly natural gas-fired, NOVEC is keenly aware of its responsibility to provide renewable energy; as such, NOVEC's waste wood-fired biomass plant, landfill gas-fueled generation, and solar energy resources provide over 8% of NOVEC's system energy requirements. The definitions of "fossil fuel" and "fossil fuel-fired" are appropriate and should not be modified. Waste wood-fired, biomass-generating facilities should remain excluded. NOVEC owns and operates a 49.9 MW generating facility in Halifax County that is fueled exclusively by waste wood products that come predominantly from logging operations. This facility provides a winning solution to the management of wood waste products and the production and delivery of renewable energy to the	See comment 67 for further discussion of biomass.

	power grid. NOVEC's mission includes the provision of a low-cost, reliable, and environmentally sound energy supply. NOVEC built this facility in response to member requests for additional renewable energy in its resource mix. NOVEC located the facility in an area that was already active in logging woodlands to supply the construction, furniture, and paper industries. Doing so minimized the need to transport waste wood over long distances; a side benefit was an economic boost to local communities. NOVEC does not log for the plant's fuel. Instead, purchasers of high quality timber hire loggers to clear land and deliver the high quality round wood for lumber products. The remaining un-marketable wood, known as "slash," remains in the form of branches, limbs and stumps. The region that provides slash to NOVEC's facility produces more than 1 million tons of this waste product annually. Land owners typically want the slash removed, as leaving it in place reduces the amount of land available for growing the next generation of trees. Harvesting slash is superior to sending it to landfills, as the volume would fill up landfill capacity. While slash can be disposed of through uncontrolled burning, there is no control of SO_X, NO_X, particulates, or other emissions. The NOVEC biomass model is the best alternative to open burning or leaving slash in the forest. NOVEC purchases slash already chipped and delivered in truckloads. Small businesses create jobs associated with chipping activities and delivery of wood chips. The facility's air quality permit limits the amount of certain emissions that result from combustion of wood chips. The heat generated during uncontrolled burns is wasted. At the NOVEC facility the heat produced from the combustion is captured and converted to electric energy, reducing the amount of electricity needed from other power plants. Fly ash produced by the plant is used as a soil nutrient by nearby farmers. In summary, NOVEC's biomass power plant is a win for the environment, the local economy, and Virginia. As such, biomass should not be included in the definition of fossil fuels. NOVEC pays a forestry tax to the Department of Forestry that is used to fund the re-planting of trees throughout Virginia. The forestry tax can be viewed as a carbon tax that is already in place and paid by biomass plants. Young trees take in a higher amount of CO_2 compared to older trees for the same acreage. Combusting wood slash does not emit any carbon that is not already in the natural life cycle. Biomass plants in economically challenged areas provide jobs and investments as well as tax revenues for schools and other local government services. Unlike natural gas or coal, biomass fuel is produced close to the plants and the harvesting/chipping/delivery of slash is a	

	significant economic engine for the locality and region.	
120. Northern Virginia Electric Cooperative (NOVEC)	Resolution of the unresolved revenues allocation methodology should be directed to the SCC for development of an equitable distribution formula that includes all electric utility ratepayers across the state. Even though the Regulatory Advisory Panel was unable to reach a consensus on a distribution approach for the revenue, the RAP ranked the following allocation goals as the two most important: 1) protect electricity customers, and 2) promote cost-effectiveness. The rules in this area reference the December 4, 2017, presentation before the Joint Committee on Electric Utility Regulation; it stated that the "revenue received by CO_2 Budget Sources owned by regulated electric utilities flow to rate payers pursuant to SCC requirements." This statement failed to recognize that Virginia ratepayers served by utilities that do not own CO_2 Budget Sources but purchase power from the PJM wholesale power market (presumably the CO_2 Budget Source entities market for their power) would see their power prices increase as a result of these rules as currently envisioned but would be unable to mitigate the increases in power prices through an allocation of the auction revenue as would be available to a select group of Virginia ratepayers. Making this potential treatment of utilities and its customers that do not own CO_2 Budget Sources is arbitrary and capricious. Assigning the resolution of this matter to the SCC and tasking the SCC to finish the job of developing an equitable distribution formula that includes all ratepayers across the state can achieve both of the original objectives of the RAP.	DEQ appreciates the commenter's concerns, however, this issue is beyond the scope of the regulatory action and the authority to address it rests with the SCC.
121. Natural Resources Defense Council (NRDC)	Because of immediate and growing health and economic dangers, Virginia law clearly encompasses CO_2 in its definition of air pollution. Limiting and reducing carbon pollution would also achieve the board's charge to prevent harm to public health, safety and welfare. Because of the health and economic dangers that unmitigated carbon pollution poses to Virginia's human health, its economy, and property, we broadly support the proposed rule, using the same means already proven effective in 1 in 5 states in the country: a sensible, achievable limit on electric sector carbon pollution, with subsequent annual reductions. NRDC supports DEQ's proposal to ensure allowances comport with, and are fully tradable on, RGGI's pre-existing platform, due to its low administrative costs, third party market monitor reports, and robust cybersecurity. NRDC recommends that the rule set a 2020 baseline of 28.0 million tons. In order to determine the state's business-as-usual emissions and an appropriate annual reduction trajectory, DEQ should review reputable data and projections to establish a baseline that is not artificially high. To do so, DEQ should rely on up-to-date estimates of what Virginia's business-as-usual emissions	Support for the proposal is appreciated. The baseline has been set at 28 million tons, as discussed in the response to comment 37.

	will likely be in 2020. Similarly, DEQ should avoid industry-derived emissions projections that appear to be set unrealistically high, such as Dominion's 2017 IRP. DEQ's own proposal of either 33 or 34 million tons in 2020 is similarly flawed. An incorrectly high year-1 baseline budget would undermine the entirety of the program and jeopardize Virginia's ability to access the marked benefits of linking with the larger RGGI market. To set an appropriate baseline, DEQ should consider multiple up-to-date projections. The federal EIA's Annual Energy Outlook (AEO) from 2018 shows emissions decreasing in the Virginia-Carolina region by 27% between 2017-20. NRDC's IPM modeling, conducted by ICF, predicts similar emissions declines in Virginia between 2017-20. Preliminary results from NRDC's updated IPM modeling for Virginia (utilizing an updated 2018 data set) projects the state's power sector emissions to be 28.0 million tons in 2020. This more up-to-date modelling accurately reflects the reality of today's power sector in Virginia. Not only are additional coal retirements planned, but renewable energy installations are increasing, concurrent with recently lower or declining demand growth across the state in 2017. The factors of lower in-state electricity demand, persistently declining gas prices, and growing low-cost renewable energy resources mean the state's emissions will be well under 33 million tons in 2020. NRDC's IPM modeling supports the adoption of a 28 million ton baseline as a likely-to-occur starting point in 2020. A sufficiently ambitious program will drive significant economic and health benefits, including lower energy bills and rates, as well as improved public health resulting from cuts in co-pollutants like NO_X and SO_X.	
122. NRDC	DEQ must ensure the economic efficiency of the program by directing allowance value toward consumer benefit. Therefore, the proposal is correct to avoid imposing costs on Virginia families and businesses by awarding allowances directly to emitting generators for free. Doing so would allow the ultimate price of those allowances to be borne by Virginia families and businesses in the form of higher wholesale electricity costs, while providing a windfall profit to generators. NRDC therefore supports the consignment auction, as that mechanism provides an opportunity to recapture revenue that would otherwise be a windfall to generators. Indeed, these carbon allowances are inherently a public good, and thus their value must be captured and utilized on behalf of all Virginians. However, DEQ should amend the rule at 9VAC5-140-6215 to allocate allowances directly to distribution companies, based on pro rata share of load served, to ensure that allowance revenue goes directly to customer benefits. In order to ensure market efficiency and a transparent, undistorted allowance price that levels the playing field for all	The consignment auction is designed to be cost neutral, and RGGI employs various market control mechanisms to ensure a balanced and consistent flow of prices. In addition, Virginia is a regulated state; thus, it is the responsibility of the SCC to maximize economic efficiency for Virginia citizens. As discussed elsewhere, implementation and performance of the program will be continual, with RGGI program reviews and Virginia APA rule reviews providing opportunity for public comment should issues with program

	generators, achieve maximum economic efficiency for Virginia citizens through allowance allocation, and align with the Grid Transformation and Security Act of 2018, a standing Emissions Trading Stakeholder Advisory Group should also be established to monitor implementation and performance of the final rule.	implementation be identified.
123. NRDC	Many forms of biomass fuel are used or under consideration in Virginia, including landfill gas recovery, agricultural plant residues and animal wastes, forest harvest residues, energy crops, whole trees, and industrial waste. Many of these feedstocks can generate carbon benefits compared with fossil fuels, while others can have significant negative carbon impacts. We focus on "forest-derived" biomass, specifically, categories of forest-derived feedstocks used to produce electricity: 1) whole trees and other large diameter wood that would otherwise be used in merchantable end uses; 2) harvest residues that would otherwise be discarded or left to decay; and 3) industrial and mill waste produced at a forest products processing facility that would otherwise be burned. We support the proposal to require co-fired facilities to hold allowances for the CO_2 they emit, whether those emissions be from forest-derived biomass or fossil fuels. We urge Virginia to issue a final rule that covers the net carbon emissions from all utility sector biomass power facilities larger than 25 MW. Specifically, Virginia must account for the net emissions from forest-derived biomass combustion from power sector facilities greater than 25 MW, including both dedicated biomass-burning units and those that cofire with forest-derived biomass, and cover these facilities under the cap. We recommend that Virginia regulate net emissions from forest-derived biomass as follows: 1) CO_2 emissions from onsite waste that would otherwise be burned in an industrial setting without energy recovery will require zero allowances for each ton of carbon emitted; 2) CO_2 emissions from forest-derived residues that would otherwise decay will require approximately 0.69 allowances for each ton of carbon emitted; 3) CO_2 emissions from whole trees and large diameter materials that would otherwise have a merchantable end-use, including pulp, paper, fiberboard, engineered wood or lumber will require one allowance for each ton of carbon emitted. Virginia should also require EGUs to furnish to DEQ an estimate of the proportion of their total forest-derived feedstocks annually that fall into these categories. Finally, Virginia must reject sustainable forestry as a proxy for carbon impacts of forest-derived biomass. "Sustainability," however defined, is not a measure of carbon impacts.	See the response to comment 67 for a discussion of biomass.
124. NRDC	DEQ should design an economically efficient program with minimal market distortions, maximizing consumer	By linking to RGGI, Virginia will be linked to and

	benefits through efficiency investments by allocating allowances to distribution companies, and driving significant levels of in-state renewable energy development. Leakage can be minimized through the cost-effective development of untapped, clean resources like solar and energy efficiency. To ensure the program does not inadvertently lead to increased fossil-based electricity imports, DEQ should establish an annual program review process to assess whether interstate power flows are shifting as a result of the carbon price. A modest price on carbon is but one of many variables that can influence interstate power flows; any such analysis would need to account for those in a comprehensive manner. The RGGI states have already built in such emissions monitoring and reporting that assesses leakage, and we urge Virginia to do so as well.	involved in basic RGGI processes such as the routine program reviews and monitoring for potential leakage; however, recognizing the potential for any possible leakage to have an impact on disproportionately affected populations, a provision providing for review of impacts on such communities has been added. See the responses to comments 55 and 91 for further information.
125. NRDC	Climate change is inherently an environmental justice issue, as coastal communities and low-income communities ultimately bear the worst brunt of its impact. Therefore, the program should make significant cuts to CO_2 and ensure the consumer and energy efficiency benefits flow to the low-income citizens most impacted not just by climate change, but energy costs as well. Additionally, because CO_2 is not harmful in locally-higher concentrations, and there do not appear to be specific Virginia plants in proximity to at-risk communities whose capacity factors will increase under a carbon program, a carbon market in Virginia appears unlikely to create hot spots of pollution in frontline communities. And as the cap for carbon emissions is lowered, it can also create additional benefits of further reducing associated co-pollutants that cause health problems in communities close to their source. To ensure this is the case, the regular program review should also incorporate an annual environmental justice review. As RGGI demonstrates, it is good practice to build in regular program reviews to ensure the framework is working effectively. As Virginia adopts and implements its program, it may need to be adjusted over time, to ensure it is functioning efficiently and is driving significant and additional carbon pollution reductions. Program reviews can ensure that the cap is set and updated at the correct level to drive carbon emissions reductions beyond BAU, while maximizing the development of a clean energy economy. Virginia's program should undergo internal review on a regular basis, including stakeholder and public input as RGGI has done. The first review should occur in 2020, to review 2019 emissions and ensure the 2020 budget reflects the reality of Virginia's power sector emissions. As Virginia pursues linking with RGGI, it should integrate itself directly into that program's review processes.	As discussed in the responses to comments 55 and 91, Virginia will participate in RGGI program reviews, and a Virginia-specific program review will be conducted to ensure that EJ communities are monitored.
126. National Wildlife	We applaud Virginia's plan to confront the growing threat of climate change by creating a carbon market that can	Support for the proposal is appreciated, and the

Federation and the Virginia Conservation Network	link with RGGI. According to the National Climate Assessment, with 3 feet of sea level rise between 162 to 877 miles of roads could be inundated. Further, the gradual subsidence of coastal land in Virginia is magnifying the impacts of sea-level rise in the region. The rising seas threaten the coastal tourism industry in Virginia, a critical component of the state's economy. For examples, tourism contributed $1.4 billion to the economy of Virginia Beach in 2015, which resulted in $256 million in salaries and more than 12,900 jobs. Virginia's beaches and coastal waters also support 5 of the 7 sea turtle species found worldwide. Every year between 5,000-10,000 sea turtles swim into the Chesapeake Bay. Most of these turtles are the threatened species, which depend on the bay for food and safety. The loggerhead sea turtle depends on the bay's sandy beaches and dunes for nesting habitat. As the sea level rises and extreme weather events occur more frequently, these nesting habitats are being washed away. Likewise, the bay is also experiencing the impacts of rising sea levels and warmer water. Warming temperatures and increased runoff from flooding are making the bay and its tributaries susceptible to harmful algal blooms--a threat to people and wildlife. These changes alter the abundance and migration patterns of wildlife in the bay, leading to declines in waterfowl and commercially important shellfish. Virginia is home to the U.S.'s largest clam aquaculture industry, with an average annual economic impact of $60 million; the seafood industry in Maryland and Virginia support almost 34,000 jobs. RGGI is a highly successful cooperative effort to harness market forces to cap, price, and curb harmful carbon emissions that are contributing to the climate change threats facing Virginia. RGGI states account for one-sixth of the U.S. population and one-fifth of the nation's GDP. Since the program began, RGGI states have experienced a net gain in economic growth, increased jobs, long-run electricity cost reductions, and decreased emissions. By establishing a program to trade carbon that will link with RGGI, Virginia can enjoy the benefits of a carbon trading system while adding momentum to the effort to mitigate climate change by ensuring that, with California's carbon pricing system and New Jersey rejoining RGGI, 1 in 3 Americans will live in states with carbon pricing policy designed to drive down carbon pollution. Tackling carbon emissions is important for avoiding dangerous levels of warming that will have high costs for Virginia. Though there has been a downward national trend in emissions from the power sector in recent years, carbon pollution from Virginia's power plants has risen from 23 million tons in 2012 to 34 million tons in 2016	commenter's observations on the threat of climate change are recognized.

	and is expected to rise to 37 million tons in 2019. Linking to RGGI will reverse this trend for Virginia, propelling it to become a world leader in clean energy development, protecting the state's treasured natural resources and wildlife while creating new jobs and boosting the state's economy. While RGGI is considered to be an excellent example of a multistate program that encourages innovation and collaboration, there are still areas in which it can be improved. As an independent state linking with the RGGI carbon market, Virginia would have a unique opportunity to strengthen and advance the program. By doing so, Virginia has the potential to cement itself as a gold standard for carbon pricing.	
127. National Wildlife Federation, Virginia Conservation Network	Virginia could provide a model to improve RGGI's approach to biomass. While some biomass practices can reduce carbon emissions compared to other fuels, other practices increase near-term emissions and degrade wildlife habitat. One model for carbon accounting is the Net Emissions Impact, which applies multipliers for each unit of carbon from different biomass feedstocks. We urge Virginia to consider the nuances of biomass and weigh the potential for negative repercussions. The demand for low-value wood for pellets is driving a shift in the southeast from natural forests to pine plantations--a significant downgrade in habitat value. Unrestricted harvests leave high conservation value species and ecosystems vulnerable to biomass harvests, particularly wetland forests like bottomland hardwoods. Research has found that biomass from southeastern forests takes 35-50 years before it performs better than fossil fuels. This is far too long to mitigate the impacts of climate change, and not in line with he governor's executive order to reduce carbon pollution. We encourage measures to protect wildlife and habitat while pursuing measures to address climate. The state can reinforce the RPS limit on non-waste feedstocks by applying it to its carbon market as well. The state should preclude biomass sourced from high conservation value areas, and limit growth in the biomass market to truly sustainable feedstocks. Virginia must establish best practices for biomass production that lead to benefits for both wildlife and climate.	As discussed in the response to comment 67, and discussed in great detail elsewhere, there are pros and cons associated with using biomass as fuel. DEQ agrees that some biomass practices can reduce carbon emissions, and should include measures to protect wildlife and habitat.
128. Old Dominion Electric Cooperative (ODEC), Virginia, Maryland and Delaware Association of Electric Cooperatives	ODEC and the Association have significant concerns regarding the impact of this regulation on the electric bills of its ultimate consumers. Even a modest increase in bills in the territories served by ODEC and member cooperatives will be problematic, and larger increases in costs will turn electricity into a luxury item. The Cooperatives' service territories are predominantly rural and residential. The majority of rural areas in Virginia have seen both a declining population and sluggish to negative economic growth. The Cooperatives' service territories have high numbers of low- and middle-income families, families and seniors on fixed incomes, and	DEQ agrees with the commenter that costs to consumers are an important consideration, and has worked to develop a rule that minimizes costs while maximizing benefits associated with reducing carbon pollution. Implementing a cost neutral consignment auction is expected to minimize cost

	families suffering from unemployment and underemployment. The Cooperatives' service territories do not have significant non-residential loads--the service territories are over 80% residential. From 2011-15, many of Virginia's rural counties experienced negative job growth. Current Department of Labor Statistics show that many of the rural counties in Virginia have significantly higher unemployment rates than the urban and suburban areas of the state. Historically, most Cooperatives have per capita annual incomes that fall 22% below the statewide average. For Cooperatives that are more rural, that percentage is 260%, and for three of the most rural Cooperatives, the percentage is 30% or more below the statewide average. Historically, 13% of Cooperative member-owners are over 65 years of age, and unemployment in Cooperative territories is generally 1-4.5 percentage points above statewide unemployment rates. Based upon the 2010 Census, median household income in rural areas is less than half that of the suburban counties. Concerns over increased costs to consumers are not simply based on future projections. EIA Power Monthly indicates that there is already price pressure indicated on electric rates in RGGI participating states. Every state that participates in RGGI had average retail rates higher than the national average and 4 out of 5 of the states with the highest average retail rates in the U.S. participate in RGGI. The Cooperatives have only their ratepayers from which to recover costs; there are no separate stockholders. Furthermore, electric distribution cooperatives receive their generated electricity by contract. These contracts directly pass on the costs of any regulatory or environmental compliance to the distribution cooperatives, which then recover that cost from their consumers through a cost recovery mechanism in electric rates. Smaller cooperatives, including those wholly dependent on investor-owned utilities for their electricity, could be hit especially hard, as the costs of the regulation could be passed directly to those cooperatives and their consumers, with no mechanism for those suppliers to pass through proceeds from any sales of allowances back to the distribution cooperatives or their consumers.	impacts to consumers. To the extent that power is purchased from a regulated entity in Virginia, costs will be controlled through the auction and subject to SCC oversight.
129. ODEC et al.	There is no modeling that can show the projected local benefits based upon the anticipated program reductions. The modeling for economic impact of this type of regulatory effort can be severely compromised based upon a variety of unknowable factors: market assumptions, regional power flows, projected resource mix, and demand considerations. In this case, there has been very little analysis done to support the anticipated and likely impacts on electric rates. The limited modeling that has been done could be significantly understating the impacts of the regulation, and by the time we see the	DEQ understands that impacts on electric rates are important, and several cost/benefit analyses were conducted; see response to comment 61 for more information. No significant impacts to consumers are anticipated.

	results, it will be too late to make adjustments. We recommend a more holistic analysis be performed encompassing total energy consumption. Potentially higher future electric costs may produce unintended consequences in the form of shifts in energy usage or choice of fuel. An example would be a homeowner having an efficient electric heat pump choosing to produce some of the heat for their home via natural gas, propane, oil, or woodstove. In addition to the potential for additional emissions from these other alternate energy sources, one would also see increased CO_2 emissions from the delivery/transportation of these sources.	
130. ODEC et al.	Regulating CO_2 at the state level is not as effective as a broader regional or national approach. Putting this additional burden on Virginia generation will encourage imports from other states, potentially requiring the construction of additional transmission infrastructure to maintain reliability. This is already occurring where the RGGI regulation in Maryland has contributed to the construction of new transmission lines to facilitate the import of power from adjoining non-RGGI states. PJM, as a regional transmission organization, allows for cost-effective exchange of electricity throughout its territory, which includes the majority of Virginia. Inconsistent state CO_2 policies within PJM create distortions in generation dispatch that can increase regional emissions. For example, the cost of CO_2 allowances from the RGGI program in one state can discourage a low-emitting in-state natural gas plant from operating, only to make way for imported coal power from a neighboring state because the out-of-state plants do not incur CO_2 cost. We recommend adding a provision for an analysis of trends in imports in Virginia once the program has been implemented. If there is a significant increase in imports, Virginia should be able to adjust the regulatory requirements for in-state generators to deter the import of out of state generation. The board should consider "safety valve" measures--for consumer protection from price increases, for reliability of the electricity system, and for imports from out-of-state. The additional burden of this program could result in premature retirement of coal facilities, such as the Clover Power Station. These plants were designed, built and permitted in compliance with federal and state regulations to meet long-term electricity needs. This regulation may reduce the remaining useful life of these assets which are still being paid for by our consumers. Virginia needs to develop a mechanism to compensate consumer-funded prematurely-retiring coal generation. One possible way would be to carve out allocations for retired consumer-funded generation for a significant number of years after their retirement. This would remove a barrier to the closure of consumer-funded coal generation by providing allocated allowance revenue to	Virginia's program is not at a purely state level; rather, Virginia is linking to a larger group of states in order to leverage its carbon control abilities to the maximum. As discussed elsewhere, leakage will be monitored for and addressed as needed; see, for example, the response to comment 91. If the cost of allowances become too high the CCR is triggered; see comment 136 for more information. DEQ agrees that existing coal plants were designed, built and permitted in compliance with federal and state regulations to meet long-term electricity needs. Most of Virginia's coal fleet is owned and operated by Dominion Energy, which has the ability to adjust its electric generating portfolio to meet its business needs while protecting its customers' interests. See the response to comment 67 for additional discussion of biomass.

	offset the stranded costs. Other mechanisms would likely require legislation to implement. Those renewable generation resources owned directly by Cooperatives should continue to be counted as renewable resources and excluded from the proposed regulation. This includes not only solar PV projects, but also the NOVEC wood waste biomass plant in Halifax County.	
131. ODEC et al.	While it is true that some form of consignment auction has been used for other allowance programs, it is a wholly new concept to "link" Virginia to RGGI. We do not believe that the mechanisms that will have to be put in place to track allowances, as well as the increased burden on DEQ, have been fully factored into the cost of the program. Additionally, administrative costs have not been fully analyzed. Given that Virginia is not joining RGGI, but "linking" to it, we are unsure how administration of the consignment would be paid for. DEQ has no mechanism to recover its own administrative costs. As a not-for-profit cooperative, ODEC is exempt from federal income taxes as long as it receives no more than 15% of its revenue from non-members. This rule applies to all of the electric distribution cooperatives in Virginia. Cooperatively-organized businesses are designed, from their foundation, to serve their members, who are also their customers. Therefore, ODEC has concerns about the potential accounting and tax impacts of receiving "revenue" in the form of proceeds from the RGGI auctions. This concern would apply to any cooperatively-organized entity receiving auction proceed revenues. To the extent that the regulation maintains the concept of a consignment auction, consideration should be given to this unintended consequence. A solution could be to allow cooperatives to offset any allowance requirement with an equal amount of allocated allowances without the requirement to auction the allowances.	The consignment auction is designed to be cost neutral. This approach has been carefully crafted to minimize costs. Program design elements such as the unlimited banking of allowances may mitigate this issue further.
132. ODEC et al.	Virginia has seen a downward trend in energy consumption and CO_2 emissions. Virginia's energy resource mix is evolving, with more investments in clean energy resources and renewables, regardless of CO_2 regulation. As reported in January 2018, Virginia has reduced its overall CO_2 emissions from all energy-related sources from 123.1 million tons in 2000 to 103.0 million tons in 2015. That 16.3% reduction ranks Virginia as the 16th highest reduction among all states and significantly higher than the national average reduction of 10.3%. This includes all energy related sources of CO_2 emissions including utility generation, transportation, industrial, commercial and residential sources. Even more impressive is the reduction in average CO_2 emissions per person where Virginia reduced its average emissions per person by 28.9%, ranking it the ninth highest reduction in the nation and significantly better than the national average reduction of 21.1%. The	The commenter correctly asserts that investments in clean energy resources and renewables are increasing. The 28 million ton cap, as discussed in the response to comment 37, was selected. The RGGI program already contains multiple "safety valves"; the program is continually monitored and adjusted in order to protect reliability and resilience. See also the response to comment 33 for a discussion of modeling and emissions.

	current trends support the initial budget being set at 34 million tons. While the trend has been declining over the years, there has been a great deal of recent investment in new clean combined cycle generation that would be subject to the program. Virginia should be allowed to enter the RGGI program with a budget that is fair to Virginia given the current generation resources. Even with the budget set at 34 million tons, with the new generation assets, the goal will still be challenging. Given that Virginia generators are just now entering the RGGI-linked program, the banking adjustments that have been calculated by RGGI and are being proposed to be applied to subsequent years, should not be applied to the Virginia budget. These banking adjustments are based on participants outside of Virginia banking more allowances than anticipated, and not the actions of any generators in Virginia. Such an adjustment should only be applied to existing RGGI participants. In addition, there should be a reliability and resiliency safety valve. Such a mechanism would recognize that overreliance on intermittent generation or a single fuel such as natural gas may negatively impact reliability and resilience. Analyses should be performed to assure that resiliency is maintained and that critical generation resources are not retired because of the regulation. In the case where retirement of critical resources is likely, adjustments to the allowance allocations should be contemplated.	
133. ODEC et al.	We generally support the provision establishing that 95% of the budget will be allocated to the generators. Particularly for the Cooperatives, revenues from the allocations will go directly to consumers. This is a critical means to reduce the net cost impact on electric consumers. Setting a price on CO_2 emissions as this program does is enough incentive for all sectors to seek ways to reduce emissions. Even when allocated allowances, utilities will still have an incentive to pursue low or non-emitting resources and energy efficiency measures. Not having allowances granted to such sources and forcing electric ratepayers to foot the bill for CO_2 emissions would be a significant cost impact and can be somewhat mitigated by allocated allowances to generators as proposed. Any utility with a wholesale power contract could be adversely affected by a system where their consumers pay for the costs of CO_2 emissions and receive nothing in return. This could be resolved by flowing auction revenues through applicable FERC ratemaking mechanisms using FERC Form 1 data.	Revenues will only be realized if there are excess allowances. It is beyond the scope of this regulation and the department's authority to direct auction revenues through FERC.
134. ODEC et al.	We recommend allocation based on emissions, not megawatts generated. Incumbent utilities have made significant investments under the existing regulatory compact to provide power economically and reliably to meet retail loads. There should be an appreciation for	See comment 136 for a discussion of allocations.

	the value associated with these investments in electric generating plants. The conditional allocations being allocated on an emissions basis will provide a glide path for the existing resources to continue to operate within their remaining useful life, rather than having significant stranded resources. Coal generators would still have an incentive to operate efficiently since the allowance price will set the value of each ton of CO_2 emitted irrespective of who is given the allowances.	
135. Partnership for Policy Integrity (PFPI), Appalachian Mountain Club, Center for Biological Diversity, Dogwood Alliance, Michelle's Earth Foundation	We analyzed Energy Information Administration (EIA) 2016 data on the fuels burned and energy generated from Virginia's power sector and calculated CO_2 emissions using EIA emissions factors for each fuel. To achieve effective carbon reductions, and to administer the program fairly, Virginia should cover all plants greater than 25 MW, including industrial facilities that generate heat and power, standalone bioenergy plants and waste-to-energy plants in the utility sector. This would reduce CO_2 emissions more effectively, remove incentives to re-fire fossil plants with biomass, and reduce air pollution at some of the most polluting plants in Virginia. Industrial power plants are a significant source of CO_2 in Virginia. As a whole, the industrial sector emitted 16% of power sector CO_2 in 2016. The proposal would exclude some of the biggest polluters in Virginia. For instance, the WestRock Covington plant would under the industrial exemption as a plant that generates on-site heat and power. This facility burns natural gas, bituminous coal, distillate fuel oil, residual fuel oil, black liquor, and wood, and was responsible for 7% of Virginia's power sector CO_2 emissions in 2016. The company brought a new 75 MW wood-fueled generator online in 2013, which led to a dramatic increase in wood consumption and emissions. The facility is a large source of conventional pollution, and has recently been penalized by EPA for excessive particulate matter emissions. Similarly, the WestRock West Point mill burns coal, black liquor, distillate fuel oil, natural gas, residual fuel oil, sludge waste, and wood solids. It was responsible for 3.3% of the state's CO_2 emissions but as an industrial burner would be exempt, as would be the International Paper Franklin mill, which emitted about 700,000 tons of CO_2 from black liquor and natural gas in 2016. Failure to cover dedicated biomass-fueled power plants will exempt a significant amount of CO_2 pollution from coverage, and, like the industrial exemption, give a free pass to some of the largest sources of air pollution. The 50 MW Halifax County plant is a standalone facility shown as burning less than 300,000 tons of wood in 2016 although its capacity is upward of 600,000 tons. The plant has recently been subject to consent decrees for air quality violations. Dominion operates the 83 MW Pittsylvania station, and recently converted 3 coal plants	See the response to comment 65 for a discussion of industrial facilities, and the response to comment 67 for a discussion of biomass. The regulation has been amended in order to address CHPs with more clarity; see the response to comment 74.

	to burn biomass at Altavista, Hopewell, and Southampton, for a total of about 153 MW. Their combined permitted emissions annually were 253.2 tpy $PM_{2.5}$, 114.6 tpy SO_2, 1,237 tpy NO_X, 2,748 tpy CO_2e, and 129.4 tpy VOC. Dominion also built the 585 MW Virginia City plant to burn up to 20% wood with 80% fossil fuels; this facility would need to purchase allowances for biomass-derived CO_2 under the plan. The plan also apparently exempts plants that generate electricity by burning municipal waste, a portion of which is considered biogenic. Combined, biomass burned in Virginia facilities emitted over 8 million tons of CO_2 in 2016; the non-biogenic portion of municipal waste emitted another 1 million tons. However, under the Virginia plan, only about 2.5% of this CO_2 would be regulated under the cap--the approximately 230,000 tons emitted by co-firing biomass at Virginia City. Covering biomass will dramatically increase the plan's effectiveness because it will regulate a large source of CO_2, and remove an incentive for fossil-fired plants to use biomass. Burning biomass undermines efforts to reduce emissions because biomass fuels inherently emit a large amount of CO_2 per unit energy. In 2016, the top 3 highest-emitting categories of solid fuel per unit energy were biomass. When fuels are burned in a power plant, the efficiency of conversion of fuel to energy affects the CO_2 emission rate on an output basis. Wood-burning power plants are inefficient, in part because wood tends to have a high moisture content. This further increases the GHG impact of bioenergy. We also support including emissions from co-fired biomass. The high moisture content of biomass co-fired with fossil fuels can decrease the efficiency of the facility overall, meaning that it emits more CO_2 per unit energy. In comments to DEQ, Dominion claimed the following: "In 2013, Dominion made significant investments to converted three 51 MW units that used coal to 100% biomass, encouraged by EPA's prior determination that biomass was carbon neutral for PSD permitting. Close proximity to an ample supply of waste wood biomass as well as EPA's carbon-neutral policy for permitting under the PSD effective at that time were key economic drivers for these projects. Given Dominion's significant investment in renewable wood waste and forest residuals biomass, it is important for our customers that biomass emissions be considered carbon neutral." This statement highlights how treating bioenergy as having zero emissions is an incentive for more tree-burning power plants. Beyond that, it contains several inaccuracies. Dominion did not convert three "51 MW units that used coal." The units were 63 MW and the boiler de-rating that occurred with the conversion to biomass downgraded the units to 51 MW. It is not true	

	that EPA had made a "prior determination that biomass was carbon neutral" when the Dominion plants were permitted. When EPA began regulating power plant CO_2 under PSD permitting in early 2011, biomass power plants were regulated alongside fossil fueled power plants--all the CO_2 was counted. In July 2011, EPA suspended regulation of CO_2 from bioenergy facilities under PSD for 3 years and convened a panel of its Science Advisory Board to advise the agency on how to regulate biogenic CO_2. EPA had not determined that bioenergy was carbon neutral--it admitted the topic required study, while suspending regulation. The suspension was challenged, and in 2013 EPA's regulatory deferral for biogenic CO_2 was vacated . The court identified nothing in the Clean Air Act that would allow EPA to exempt biogenic CO_2 from being counted when determining whether a facility meets the emissions thresholds that trigger PSD permitting. The permit for Dominion's first conversion (Altavista) is dated May 2012--prior to the ruling but concurrent with the court case. Dominion knew that EPA had not concluded that bioenergy was carbon neutral and knew there was a possibility that plants would be regulated in the future. Further confirming that Dominion knew the status of bioenergy GHG permitting was indeterminate, the company submitted comments to the Science Advisory Panel requesting that the panel make an a priori determination that biomass is carbon neutral. The issue was still in play in 2014, when EPA published an NSPS for GHG emissions. The NSPS both acknowledges the importance of feedstocks for net carbon impacts and conclusion of the panel that biomass cannot be considered carbon neutral. A 2013 article by a Dominion employee mentions several reasons for the coal plant conversions, stating "Benefits to the environment would include reductions in nitrogen oxides, sulfur dioxide, particulate matter and mercury"--but nowhere mentions a reduction in CO_2 emissions as a rationale. Perhaps this particular executive was aware of the skepticism that met Dominion's claims about bioenergy at the SCC when the company applied to convert the plants. In its application and 2011 testimony, Dominion made numerous claims regarding biopower. Dominion described that residues would decompose in 10-15 years, or 25 years for large logs, and that burning these residues should be considered carbon neutral. While this argument might be valid if Dominion's converted coal plants operated for a single year and then shut down, for facilities in continuous operation, the net cumulative atmospheric CO_2 loading over this period would be many millions of tons more than if the residues had simply decomposed.	

	Dominion and other bioenergy proponents also argue that as long as forest growth exceeds harvesting, that burning wood should be considered as having zero emissions. When forests are cut and burned for electricity or heat, the forest bank's deposits are smaller than they would have been if the trees had been left standing, and there is more CO_2 in the atmosphere. When the bioenergy industry claims that current forest growth should be considered as offsetting bioenergy emissions, the bioenergy industry is effectively arguing that the bank's deposits can be transferred from one customer's account to another to cover up for the fact that some customers have withdrawn their money. This violates the concept that mass must be conserved. As the IPCC states, "If bioenergy production is to generate a net reduction in emissions, it must do so by offsetting those emissions through increased net carbon uptake of biota and soils." The biomass industry argues that the IPCC treats bioenergy as carbon neutral. The IPCC GHG reporting protocols count carbon loss from bioenergy in the land-use sector, when trees are harvested, and thus to avoid double-counting, does not count it in the energy sector--not the same as treating it as having zero emissions. The false representation of this position has become so pervasive that the IPCC has stated, "The IPCC approach of not including bioenergy emissions in the Energy Sector total should not be interpreted as a conclusion about the sustainability or carbon neutrality of bioenergy." DEQ's decision to count biomass emissions from co-firing should be extended to cover emissions from utility sector and industrial sector bioenergy emissions. Adding these plants would require raising the cap but should not entail other difficulties; the plants would simply increase the number of units covered, and should not interfere with the program's ability to interface with RGGI. Policy precedents for counting biomass carbon exist elsewhere. Massachusetts ended renewable energy subsidies for utility-scale wood-burning power plants in 2012, and the District of Columbia enacted a similar law in 2015. Treatment of bioenergy as having zero emissions under the E.U.'s carbon trading program has led to explosive growth of the wood pellet industry in the U.S. southeast, including Virginia. Forests, including areas that represent some of the most carbon-rich and biodiverse ecosystems in the U.S., are being clear-cut for biomass fuel. DEQ has gone part of the way toward regulating bioenergy emissions by proposing that co-fired facilities be required to hold allowances for 100% of the CO_2 they emit, whether it be from biomass or fossil fuels. We appreciate that DEQ has not repeated the mistakes of the RGGI	

	program in allowing "eligible" biomass to be treated as having zero emissions when it is co-fired in electric plants and defining eligible biomass as sustainably harvested wood. "Sustainably harvested" is a largely undefined term and is not meaningful for carbon accounting. However, it is important for DEQ to cover all plants under the cap, including those that primarily or exclusively burn biomass. This might be facilitated by counting bioenergy net emissions under the carbon plan rather than stack emissions. Net emissions are a cumulative measure assessed over some time period, and represent the difference between stack emissions and emissions if the biomass underwent some alternative fate. Four categories of wood-derived biomass are defined by the alternative fate if the material is not burned in a power plant: trees that would continue growing or be harvested for another purpose; residues that would remain onsite to decompose or be burned; residues that would be incinerated; and residues that can be used for other purposes like mulch or particle board. This framework matches in part Dominion's argument about forestry residues that "Unless re-purposed for other uses, such as energy production, this material is often left on-site after a harvesting operation is completed and will eventually be burned on-site or nearby, or will decompose, releasing carbon into the atmosphere and turned into organic matter on the forest floor and soil." Emissions from burning residues for energy are significantly greater than those from decomposition over decades, and thus net emissions should be regulated. The NEI at year 10 is 70%, meaning that 70% of the direct stack emissions represent a net increase of CO_2 over that time period. Applying this figure to carbon trading would mean that facilities burning forestry residues would be obligated to purchase 0.7 allowances for every ton of CO_2 they emitted. For facilities burning materials where the alternative fate was incineration, the net difference between direct emissions and alternative fate emissions is zero. Since many industrial facilities burn residues that may be incinerated if not burned for energy, this provides an exemption based on a scientific rationale rather than an arbitrary exemption. We support counting CO_2 emissions at the stack as the best way to account for CO_2 emissions from industrial, waste-to-energy, and biomass facilities. Counting stack emissions is a closer approximation of the net atmospheric impact than the assumption that emissions are zero, which is the outcome of not regulating wood-burning power plants. Stack emissions are an underestimate of the actual net carbon impact of cutting and burning whole trees that would have otherwise continued growing and removing CO_2 from the	

	atmosphere. As a secondary option, we support the NEI methodology because it is relatively simple, science-based, and would ensure that some emissions are counted even if companies claim to use residues and in fact use whole trees. It would also exempt facilities that burn materials where the alternative fate is genuinely incineration. Regulating these facilities is important because they can be large sources of CO_2, and need the same incentives as the rest of the power sector to reduce emissions. CHP plants contributed 22% of Virginia's power sector CO_2 in 2016, and electric-only plants emitted 78%. Most CHP plants are in the industrial sector; those not designated as industrial include Hopewell Cogeneration; Spruance Genco, a coal-burner; and Dominion's Southampton biomass power station, which reported a total heat input of 25% greater than its heat input for electricity only. This plant received 4% of its heat input from distillate fuel oil in 2016. DEQ will need to find a way to accommodate cogeneration plants outside the industrial sector even if the industrial exemption is maintained. However, we recognize DEQ not wanting to overregulate CHP if it leads to reductions in fuel burning. To incentivize CHP, DEQ should cover CHP plants, but provide a reduction in allowance obligations based on generation of useful thermal energy. It is not advisable to simply exempt CHP plants. Some plants may claim to operate as CHP plants, but not generate a meaningful amount of useful thermal energy. Many industrial sector CHP plants burn a variety of dirty and inefficient fuels. Subjecting these plants to trading will ensure that they seek to minimize emissions and generate energy from zero-emissions technologies.	
136. Resources for the Future	The regulation will distribute most of its allowances to compliance entities without charge. However, the allowances have conditional value that cannot be realized and the allowances cannot be used for compliance until they have been submitted on consignment to auction for sale. The state proposes to link with RGGI and the consignment to auction would be integrated as part of the RGGI auction. The compliance auction is a good option for Virginia if the state decides that it cannot directly auction allowances. Under the compliance auction, Virginia compliance entities that were the original holders of the conditional allowances will receive the auction value of their consigned allowances, once sold, in proportion to their original allowance shares. Those entities can purchase the allowances they need for compliance in the auction or in the secondary market. Virginia's consignment auction is not unique. Previous experience with consignment in emissions markets include the SO_2 trading program established under the	The commenter's observations are appreciated. DEQ agrees that the updating output based allocation approach will effectively control CO_2 emissions while being cost-effective and transparent.

	1990 Clean Air Act. In that program the emissions allowances were initially distributed without charge to compliance entities, but those entities were required to submit a fraction of their allocation under consignment to an auction held by EPA. In retrospect, economists describe that consignment auction as an important element of the overall program's marked success. Currently, the Western Climate Initiative runs an auction that is very similar in its basic design to the RGGI auction. In that auction, allowances that have been initially distributed to investor-owned utilities in California must be consigned for sale in the auction, with the revenue returned to the utilities on a proportional basis. The California auction also has a price floor and a cost containment reserve, and the program has worked without a problem. The consignment approach should integrate seamlessly with the existing auction in which allowances are submitted for sale by the RGGI states. The auction outcome does not depend on whether the sold allowances are submitted by a state or if they are submitted by a compliance entity through consignment. From the perspective of other buyers and sellers including the other RGGI states, the auction works equally well in either case. Consigned allowances from compliance entities in Virginia will also work seamlessly with other features of the RGGI program. The consignment auction approach is a valuable feature because it enables the price floor, the ECR, and the CCR to function seamlessly with respect to the aggregate supply of allowances, including both the consigned and state-held allowances. The consigned allowances will be indistinguishable from state-held allowances in the auction, and these auction mechanisms will affect all the allowances in the same way. The same price floor and price points for the ECR and the CCR can apply to the consigned and state-held allowances in like fashion. The consignment approach is transparent, in that all observers can witness the original holders of the allowances, as well as the flow of revenues back to the original allowance holders. This transparency has value to Virginia regulators and it enables evaluation of market performance that is regularly conducted by the RGGI market monitor. Moreover, the consignment approach creates a program design that could seamlessly segue to a revenue raising auction if the state were to choose to move in that direction. The regulation describes a CO_2 allocation methodology to distribute allowances among compliance units based on their share of total electrical output across all units that are eligible to receive an allocation. This "updating	

	output based allocation" approach has been used in previous emissions trading programs including by some of the states in the NO_X Budget Program. This approach provides an ongoing incentive to reduce the emissions intensity of electricity generation. In this regard, it is far superior to an approach that would distribute the emissions allowances across compliance entities based on a static, historic measure of emissions or heat input. The proposal aligns incentives associated with the award of allowances with overall program goals and can be expected to improve program's cost effectiveness. An important motivation for using updating output based allocation is that it provides a production incentive, because the greater the production at a facility the greater the share of the emissions budget that would be awarded to that facility. Detailed simulation modeling at Resources for the Future has shown that this approach to allocation can mitigate potential leakage of electricity generation from the state. Because updating output based allocation provides an incentive to increase generation, it helps to mitigate leakage. Consequently, this choice of allocation method helps protect economic interests in the state while helping to achieve environmental goals. It also works well with the consignment auction. Under free allocation with a consignment auction, the Virginia compliance entities that were the original holders of the conditional allowances will receive the auction value of their consigned allowances, once sold, in proportion to their original allowance shares. Because most compliance entities are owned by companies regulated by the state, the value of the consigned allowances would contribute to meeting the revenue needs and thereby benefit electricity consumers. To strengthen this relationship between the source of revenues and their use, the state might require that some portion of the allowance value be invested in program-related efforts such as energy efficiency or renewable energy. In Virginia, the value of consigned allowances returns to regulated companies, and because of state regulatory oversight that value is expected to accrue to the benefit of rate payers. This outcome is somewhat similar to the practice in some other RGGI states such as Maryland, where a portion of allowance value has been returned on the electricity bill. In the future, if the program were to become substantially more stringent either as a regional program or as a model for a national program, the return to rate payers would be more substantial. However, if the value reduces the consumer's monthly electricity bill, then from the perspective on consumers, their cost of electricity would appear to not reflect the carbon price. In	

	turn, this would deny consumers the information they need to make decisions about energy-efficient investments in household appliances and in their regular electricity consumption. As a result, the regulation may have minimal effect on overall electricity demand. An alternative to returning the value of consigned allowances to the rate base and thereby reducing monthly consumer bills would be to return the value to electricity consumers on an equal and periodic (i.e., six month) per-customer-account basis. Consumers would see higher prices in most months, reflecting the value of allowances, thereby providing an incentive to conserve energy. Periodically, they would receive a dividend that preserves distributional goals and provides a program feature that is likely to be popular with recipients, which in turn builds constituent support for the program. The consignment auction preserves many of the benefits of a direct auction of allowances; however, a direct auction has further advantages. A revenue-raising auction would provide state agencies with financial resources to make investments in carbon mitigation, to address distributional goals, or to address the consequences of a changing climate. Public finance economists suggest that in the long-run, great value is associated with a tax swap, with revenues from the carbon price used to reduce other taxes in the state and thereby to help attract economic activity to the state. Another option would be to use revenues to provide dividends that directly compensate households as the common property owners of the atmosphere. The state of Virginia should consider an approach that would directly auction allowances to raise revenue to address these pressing needs to address the challenge of climate change. Two important elements of the RGGI program are provisions to contain emissions and costs when changes in electricity markets lead to outcomes that are unanticipated. The ECR constrains the quantity of allowances that would be sold in the auction when the auction price falls below a specific level. At an even lower price level, the price floor provides an absolute minimum price for the sale of allowances. As a complement, the CCR makes allowances available in addition to the intended cap if the auction price rises to a specific level. Together, these features make the supply schedule for emissions allowances responsive to the equilibrium price in the auction, which is a characteristic of commodity markets in general, but rare in environmental markets. Among other effects, this design helps to reduce price volatility in the allowance market. Empirically, the more important of these provisions is the ECR (and the price floor) because experience in	

	emissions markets around the world shows a consistent tendency for prices to fall below expected levels. The ECR automatically restricts the supply of allowances if the cost of emissions reductions falls, and the CCR automatically expands supply if the cost increases. This feature helps boost confidence in the allowance market and reinforces the goals of the trading program in a transparent way by reducing emissions automatically when it is unexpectedly inexpensive to do so. The RGGI auction has a bid limitation that limits the share of allowances that any one entity can purchase to 25% of all allowances that are sold. This bid limitation is a feature to guard against potential manipulation of the auction or the allowance market. When Virginia links to the RGGI program, the bid limitation in the auction might not make it possible for all the Virginia compliance entities to rely strictly on the auction to acquire their necessary allowances if they chose to do so. Virginia should work with RGGI to amend this rule by expanding the size of the bid limitation such that every entity has the possibility of relying on the auction for compliance. A change from 25% to 30% should be adequate. That change would be modest, and will not create a meaningful possibility for market manipulation, because still, no single entity would constitute a sufficient share of demand in the auction to exercise strategic behavior. Further, the largest compliance entities in Virginia operate under cost-of-service regulation, unlike many other firms in the RGGI market that are IPPs. A regulated company would not have the same potential incentive for possible manipulation as would competitive companies because advantageous rewards would be expected to flow to rate payers rather than shareholders; this may lessen the incentive for strategic behavior and mollify potential concern. Nonetheless, the RGGI market monitor should remain vigilant about market disruptions due to manipulation or strategic behavior; however, the concentration in the market held by the largest entity after Virginia begins to participate in RGGI is not sufficient to increase that concern and the expanded size of the market overall should reduce concern. Given that Virginia's regulatory design is very complementary to the RGGI program, the only substantial issue is the relative emissions budgets of Virginia and RGGI when Virginia enters the program. Virginia and the RGGI states will want to look for the right balance among costs incurred by all the states. One of the reasons why the states conduct modeling is to anticipate this type of issue and plan for eventualities. Virginia and RGGI's actions model this and address forecasted emissions is the right process to provide analysis that can support decisions that enable the reduction of emissions on a broad regional basis.	

	However, the assumptions in the modeling will directly influence the results and it appears that the scenarios that were modeled took a very cautious approach, meaning that they lead to forecasts for emissions that are greater than are likely to occur. On a national basis, the demand for electricity fell during the Great Recession but it has remained nearly level since then, reflecting a decreasing energy intensity of economic activity. In Virginia, demand has fallen and subsequently risen, where most of that rise has been associated with large data storage facilities. That increase is more than adequately represented in even the most modest forecast of demand growth by DEQ. A second factor is the emissions intensity of electricity generation in the state. Over recent years there has been a substantial growth in natural gas generation that has a lower emissions rate than coal. Much of the new natural gas has reduced imported power, but it has also reduced the use of coal for electricity generation in the state and that trend is expected to continue, and to result in the retirement of coal-fired capacity over the next few years. At the same time, a substantial growth in renewable energy resources is anticipated. Indeed, some of the companies associated with the recent growth in electricity demand for data storage are advocates of renewable energy and have pledges to their customers to link their consumption to expanded renewable generation. In summary, these secular changes appear to indicate that the state of Virginia is on a pathway that will see declining emissions soon. At present, Virginia is considering annual base budgets of either 33 or 34 million tons per year. The considerations I discuss point to the 33 million ton value for the base emissions budget; although a compelling case could be made that the budget could be lower still. Use of a consignment auction coupled with updating output based allocation for the initial distribution of emissions allowances is a strong design for the trading program. The value of allowances submitted to the consignment auction is expected to flow to the benefit of ratepayers, but as that value increases the state should consider separating the value from monthly electricity bills and return it to customers on an intermittent basis. There are additional benefits from directly auctioning allowances that could help the state address a variety of climate-related goals, and this should be considered also. An especially important feature of the RGGI program design is the ECR, which Virginia should support. There is a provision in the RGGI auction design that limits the bid quantity by a compliance entity; this provision could be inconvenient for RGGI and should be	

	considered further in collaboration with RGGI. Finally, the lower of the two emissions budgets is more appropriate given current trends in the industry in Virginia, and an even lower budget could be justified.	
137. Regional Greenhouse Gas Initiative (RGGI)	The RGGI states applaud Virginia's progress toward implementing a market-based program to reduce GHG emissions. In considering Virginia's potential participation in our existing RGGI market, the RGGI states recognize many benefits of an expanded trading market, including increased economic efficiency and mitigation of the possibility of emissions leakage. Participation in RGGI has helped our states create jobs, save money for consumers, and improve the public health, while reducing power sector emissions and transitioning to a cleaner energy system. If implemented successfully, expanded RGGI participation will serve to amplify these benefits. The RGGI states recognize the importance of ensuring that any new entrant into the RGGI market is fully compatible with our existing program. In studying Virginia's potential compatibility, we considered the alignment of key program elements, consistency in the use of regulatory language, and comparable stringency of the program as a whole. Expanding the RGGI trading market brings many benefits provided that compatible programs can be established. Making the changes outlined above to Virginia's regulation will help to ensure compatibility so that, as a regulatory matter, Virginia can be considered a RGGI Participating State. The RGGI states are excited by the prospect of Virginia's potential participation in the RGGI program, and applaud Virginia's plans for investment in complementary programs such as energy efficiency and clean and renewable energy. We see an opportunity for Virginia to realize a measure of climate leadership by adopting a lower starting allowance budget than the 33-34 million tons currently proposed. The RGGI states' comments have been informed by productive conversations with Virginia state staff and Agency Heads. States hope to continue the discussions in the future as Virginia makes further refinements to this proposed rule. The RGGI states are available to assist Virginia in addressing these comments as the state continues towards the development of a compatible program.	Support for the proposal is appreciated. As discussed in the response to comment 37, the initial base cap has been set at 28 million tons.
137-1. RGGI	The proposed rule states at 6020 C: *"Allowance" means an allowance up to one ton of CO_2 purchased from the consignment auction in accordance with Article 9 (9VAC5-140-6410 et seq.) of this part and may be deposited in the compliance account of a CO2 budget source.* The RGGI states suggest that this definition be replaced by the following, in order to be consistent with the definition of "CO_2 allowance" in the 2017 Model Rule. This change would help ensure the proper functioning of the RGGI allowance market, including for purposes of	The proposal has been revised accordingly.

	tracking of allowances to be used for regulatory compliance with the RGGI program: *"CO_2 allowance" means a limited authorization by the* [REGULATORY AGENCY] *or a participating state under the CO_2 Budget Trading Program to emit up to one ton of CO_2, subject to all applicable limitations contained in this Part."*	
137-2. RGGI	a. The proposal is silent regarding the potential use of CO_2 offset allowances. The RGGI states recommend that the Virginia rule specify that CO_2 offset allowances will be accepted for compliance, up to a maximum 3.3% of any entity's compliance obligation. The RGGI states intend to amend the 2017 Model Rule to clarify the limit on offset allowance use. The RGGI states recommend inclusion of the following regulatory language on offsets, in order to be consistent with the to-be-amended 2017 Model Rule: *For CO_2 offset allowances, the number of CO_2 offset allowances that are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of* [Section XX] *for a control period, initial control period, or an interim control period may not exceed 3.3 percent of the CO_2 budget source's CO_2 emissions for that control period or initial control period, or may not exceed 3.3 percent of 0.50 times the CO_2 budget source's CO_2 emissions for an interim control period, as determined in accordance with* [Subparts XX]. b. A definition of "CO_2 Offset Allowance" will be necessary to support inclusion of the offset language offered above. The 2017 Model Rule defines "CO_2 offset allowance" as: "*CO_2 offset allowance. A CO_2 allowance that is awarded to the sponsor of a CO_2 emissions offset project pursuant to section XX-10.7 and is subject to the relevant compliance deduction limitations of section XX-6.5(a)(3).* c. Note that these recommendations pertain to the fungibility and acceptance of CO_2 offset allowances for compliance under the RGGI trading program. The RGGI states leave it to Virginia's discretion whether Virginia wishes to establish state-specific offset protocols, and to issue CO_2 offset allowances to qualifying projects within the state. The proposed rule does not provide for the issuance of CO_2 offset allowances.	a. The proposal has been revised accordingly. b. The proposal has been revised accordingly with some modification. c. As discussed in the response to comment 26, Virginia is exercising its discretion to not implement offsets at this time.
137-3. RGGI	The proposed rule states at 6020 C: *"CO_2 Budget Trading Program" means the Regional Greenhouse Gas Initiative (RGGI), a multi-state CO_2 air pollution control and emissions reduction program as a means of reducing emissions of CO_2 from CO_2 budget sources.* The RGGI states suggest that this definition be replaced by the following, in order to be consistent with the definition of "CO_2 Budget Trading Program" in the 2017 Model Rule. Because this defined term is part of the regulatory definition of "Participating State," this change would help ensure that Virginia is considered a RGGI Participating State and that Virginia-issued allowances are fully fungible across the RGGI program: *"CO_2 Budget Trading Program" means a multi-state CO_2 air pollution*	The definition of "CO_2 Budget Trading Program" has been revised accordingly with some modification. No change has been made to the definition of "participating state" because the need for corresponding regulations is addressed in the CO_2 Budget Trading Program definition.

	control and emissions reduction program established pursuant to this Part and corresponding regulations in other states as a means of reducing emissions of CO_2 from CO_2 budget sources.	
137-4. RGGI	The proposed rule states at 6020 C: "*Beginning in 2020 and each calendar year thereafter, the CCR trigger price shall be 1.025 multiplied by the CCR trigger price from the previous calendar year, rounded to the nearest whole cent. The CCR trigger price in calendar year 2021 shall be $13.00. Each calendar year thereafter, the CCR trigger price shall be 1.07 multiplied by the CCR trigger price from the previous calendar year, rounded to the nearest whole cent, as shown in Table 140-1A."* The RGGI states note that the 2017 Model Rule modifies the CCR trigger price trajectory after 2020. The 2017 Model Rule states that the RGGI CCR will be $13.00 in 2021 and increase by 7% per year in the years following. To be compatible, RGGI states suggest the following: *"The CCR trigger price in calendar year 2020 shall be $10.77. The CCR trigger price in calendar year 2021 shall be $13.00. Each calendar year thereafter, the CCR trigger price shall be 1.07 multiplied by the CCR trigger price from the previous calendar year, rounded to the nearest whole cent, as shown in Table 140-1A."* Virginia's proposed rule displays a list of CCR trigger prices in Table 140-1A. These prices differ from those shown in the RGGI 2017 Model Rule by one cent, for the prices starting in 2024 and ending in 2030. Likewise, Virginia's proposed rule displays a list of ECR trigger prices in Table 140-1B. These prices differ from those shown in the 2017 Model Rule by one cent, for the years 2026, 2029, and 2030. Revised tables are provided.	These corrections have been made.
137-5. RGGI	The proposed rule states at 6020 C: *"'Conditional allowance' means an allowance allocated by the department to CO2 budget sources and to DMME. Such conditional allowance shall be consigned by the entity to whom it is allocated to the consignment auction…after which the conditional allowance becomes an allowance to be used for compliance purposes."* The RGGI states suggest a change to the final clause of this section, to clarify the relationship between a conditional allowance and a CO_2 allowance: "*…after which the conditional allowance becomes a CO_2 allowance once it is sold to an auction participant."* A similar issue exists in 6430, p. 959, where the proposed rule states: *"At the completion of the consignment auction, a conditional allowance shall become an allowance used for compliance purposes."* The RGGI states suggest a change to this language, to clarify the relationship between a conditional allowance and a CO_2 allowance: "*At the completion of the consignment auction, a conditional allowance sold at auction shall become a CO_2 allowance."*	The proposal has been revised accordingly.
137-6. RGGI	The proposed rule states at 6020 C: *"'Minimum reserve price' means, in calendar year 2020, $2.00."* The	The proposal has been revised accordingly.

	minimum reserve price for RGGI auctions in 2020 will be $2.32. The RGGI states recommend correcting this number in order to be compatible with the 2017 Model Rule.	
137-7. RGGI	The proposed rule states at 6020 C: *" 'Receive' or 'receipt of' means, with regard to CO_2 allowances, the movement of CO_2 allowances by the department or its agent from one COATS account to another, for purposes of allocation, transfer, or deduction."* This definition should match the updated definition in the 2017 Model Rule: *" 'Receive' or 'receipt of' means, when referring to the* [REGULATORY AGENCY] *or its agent, to come into possession of a document, information, or correspondence (whether sent in writing or by authorized electronic transmission), as indicated in an official correspondence log, or by a notation made on the document, information, or correspondence, by the* [REGULATORY AGENCY] *or its agent in the regular course of business."*	The proposal has been revised accordingly.
137-8. RGGI	The proposed rule states at 6020 C: *"'RGGI, Inc.' means the 501(c)(3) non-profit corporation created to support development and implementation of the Regional Greenhouse Gas Initiative (RGGI). Participating RGGI states use RGGI, Inc., as their agent to conduct the consignment auction, and operate and manage COATS."* The RGGI states recommend deleting the definition of RGGI, Inc., while retaining the general concept of an agent designated to conduct auctions and manage allowance tracking.	The proposal has been revised accordingly.
137-9. RGGI	The proposed rule states at 6020 C: *"'State' means the Commonwealth of Virginia. The term 'state' shall have its conventional meaning where such meaning is clear from the context."* In clarifying the "conventional meaning" of the word "State," the rule should also incorporate the broader 2017 Model Rule definition: "*A State, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, and American Samoa and includes the Commonwealth of the Northern Mariana Islands."* Also, the RGGI states recommend that the broader term "State" not be used in the Virginia regulation where the more specific term "Participating State" would be more appropriate. Where the term "Participating State" is used in the 2017 Model Rule, this term should also be used in the Virginia regulation instead of "State." This would help avoid confusion and ensure compatibility.	The proposal has been revised to eliminate the definition of "state" altogether and rely instead on the definition of "participating state." "State" is a commonly understood term, and there is no need to define it in this regulation. "Participating state" is an important term of art, and is properly defined separately.
137-10. RGGI	The proposed rule states in 6200 A & B: "*A. The department may retire undistributed CO_2 allowances at the end of each control period. B. The department may retire unsold CO_2 allowances at the end of each control period."* Conditional allowances should not be allowed to be transferred, except to be sold at auction, retired, or withheld as part of an ECR trigger event. Accordingly, this phrase should reference undistributed and unsold "conditional allowances" instead of "CO_2 allowances":	The proposal has been revised accordingly.

	"Undistributed or unsold conditional allowances shall not be transferred, with the exception of a transfer to consign them to auction, retire them, or withhold them in the event of an ECR trigger event. The department may retire undistributed conditional allowances at the end of each control period. B. The department may retire unsold conditional allowances at the end of each control period." A similar issue exists in 6210 E, where the proposed rule states: "*The department will convert and transfer any CO2 allowances that have been withheld from any auction or auctions in the prior year into the Virginia ECR account…The department will withhold CO2 ECR allowances as follows."* "Conditional allowances" should replace "CO_2 allowances." Also note that "in the prior year" has been removed from the 2017 Model Rule, and should be removed here: *"The department will convert and transfer any conditional allowances that have been withheld from any auction or auctions into the Virginia ECR withholding account…The department will withhold CO_2 ECR allowances as follows."*	
137-11. RGGI	The proposed rule states in 6210 I: *"Timing requirements for CO_2 allowance allocations shall be as follows. 1. By May 1, 2019, the department will submit to RGGI, Inc., the CO_2 conditional allowance allocations, in a format prescribed by RGGI, Inc., and in accordance with 9VAC5-140-6215 A and B, for the initial control period (2020). 2. By May 1, 2020, and May 1 of every third year thereafter, the department will submit to RGGI, Inc., the CO_2 allowance allocations, in a format prescribed by RGGI, Inc., for the applicable control period, and in accordance with 9VAC5-140-6215 A and B."* The RGGI states suggest removing references to RGGI, Inc. and replacing them with "its agent." This section should also replace "CO_2 conditional allowance" and "CO_2 allowance" with "conditional allowance": "*Timing requirements for CO_2 allowance allocations shall be as follows. 1. By May 1, 2019, the department will submit to its agent the conditional allowance allocations, in a format prescribed, and in accordance with 9VAC5-140-6215 A and B, for the initial control period (2020). 2. By May 1, 2020, and May 1 of every third year thereafter, the department will submit to its agent, the conditional allowance allocations, in a format prescribed, for the applicable control period, and in accordance with 9VAC5-140-6215 A and B."*	The proposal has been revised accordingly with some additional modification to improve clarity.
137-12. RGGI	The proposed rule states in 6020 C: *"'Fossil fuel-fired' means the combustion of fossil fuel, alone or in combination with any other fuel, where the fossil fuel combusted comprises, or is projected to comprise, more than 10% of the annual heat input on a Btu basis during any year."* This definition is inconsistent with and less stringent than the 2017 Model Rule, which sets a threshold of 5% of the annual heat input on a Btu basis during any year. The applicability provisions of the	The proposal has been revised accordingly.

	Virginia rule should be consistent and at least as stringent as those of the 2017 Model Rule. This change is necessary in order to ensure that Virginia's regulation is a corresponding CO_2 Budget Trading Program regulation, such that Virginia can be considered a RGGI Participating State.	
137-13. RGGI	The proposed rule states in 6040 B, p. 938: *"Exempt from the requirements of this regulation is any fossil fuel power generating unit owned by an individual facility and located at that individual facility that generates electricity and heat from fossil fuel for the primary use of operation of the facility."* This provision does not set a threshold for what constitutes "primary use of operation of the facility." In the 2017 Model Rule, facilities that provide less than 10% of their power output to the grid are exempted from compliance obligations. The RGGI states suggest that the Virginia rule consistently adopt this 10% threshold. The applicability provisions should be consistent and at least as stringent as those of the 2017 Model Rule. This is necessary in order to ensure that Virginia's regulation is a corresponding CO_2 Budget Trading Program regulation, such that Virginia can be considered a RGGI Participating State.	The proposal has been revised accordingly.
137-14. RGGI	The proposed rule states in 6210 D 1: *"The department will initially allocate…CO_2 CCR allowances for calendar year 2020."* RGGI states suggest that Virginia clarify how the CCR provisions will work.	The proposal has been modified to specify that CCR allowances will be allocated on a pro rata basis to CO_2 budget sources.
137-15. RGGI	The proposed rule states in 6260 A: *"CO_2 allowances that meet the following criteria are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of 9VAC5-140-6050 C for a control period or an interim control period."* This section mentions requirements for both a "control period" and an "interim control period." However, the Virginia proposed rule includes a third type of control period, the "initial control period.” This "initial control period" includes only the year 2020, as a means of synchronizing with the RGGI states' compliance schedule. RGGI states suggest that the "initial control period" should also be mentioned here, to specify that compliance requirements apply in 2020: *"CO_2 allowances that meet the following criteria are available to be deducted in order for a CO_2 budget source to comply with the CO_2 requirements of 9VAC5-140-6050 C for an initial control period, a control period, or an interim control period."*	The proposal has been revised accordingly.
137-16. RGGI	The proposed rule states in 6430, p. 959: "*[C]onditional allowances shall be consigned by the CO2 budget source…or DMME to each auction on a quarterly pro rata basis in accordance with procedures specified by the department."* The RGGI states understand the "quarterly pro rata basis" to mean that generators must consign one quarter of their yearly total of conditional allowances at each auction, rather than distributing the	The proposal has been revised accordingly.

	consigned amount over the quarterly auctions at their own discretion. RGGI states suggest that this language be made more explicit in the Virginia rule: "*One quarter of the annual conditional allowance allocation shall be consigned by the CO_2 budget source…or the holder(s) of a public contract with DMME to each auction in accordance with procedures specified by the department."*	
138. Richard Ball	A baseline as high as 33 or 34 MMT of CO_2, as proposed, would be much too high and lead to much less reduction in Virginia CO_2 emissions by 2030 than is feasible and desirable. For example, the ICF/DEQ Policy scenarios show very low reductions in CO_2 emission reductions. Emissions have already been coming down since 2016 and most projections indicate that a trend in that direction is likely to continue in that direction even in the absence of the proposed regulation. I offer several lines of evidence for that, including calculations of actual 2017 emissions in Virginia for overall electric power emissions and emissions specifically from likely EGUs covered by the regulation. If the baseline is set in the range of 30-34 MMT of CO_2, the program might fail to achieve CO_2 reductions that are substantially greater than what would happen even in the absence of the ED 11 program. My conclusion is that it would be feasible to achieve reductions under a base cap of 28 MMT with an aggressive, but feasible solar or wind expansion program and phasing out a substantial amount of higher ED 11 CO_2 carbon sources along with considerable natural gas generation while maintaining a steady level of total Virginia generation. It also implies that it makes little sense to continue expanding natural gas generating sources since they are likely to be constrained in their generation. A steady level of generation would be consistent with an aggressive program of energy efficiency measures, which might be implemented as a result of new legislation enacted in the 2018 session of the General Assembly. RGGI expects Virginia to reduce its baseline cap, although they did not specify a particular value. In my analysis, I have borrowed results on the likely list of ED 11 EGUs that will be covered under ED 11 and the associated estimated generation, and CO_2 emissions from the comments submitted by the Virginia Chapter of the Sierra Club. Another conclusion is that the ICF modeling results published by DEQ in the autumn contained some out-of date assumptions due to subsequent events. I conclude that: the ICF results were furnished in autumn, 2017 before actual 2017 results for Virginia were known and before SB 966 was passed in the 2018 Session of the General Assembly, and before the announcement of retirement plans for a number of EGUs, so those factors	Support for the proposal and the commenter's observations on the base cap are appreciated. As discussed in the response to comment 37, the base cap has been set at 28 million tons.

	could not be reflected in the modeling. In particular, CO_2 emissions by 2020 EGU-covered units in 2017 was overestimated in the ICF modeling as 32 MMT CO_2 , compared with the Sierra Club's estimate of 29 million tons based on actual 2016 data. Those factors also may have led to overestimation of subsequent modeled results for 2020 through 2030. Hence I look at likely emission reductions for other baseline cap values than just 33 MMT under several different policy assumptions.	
139. Southern Environmental Law Center (SELC)	DEQ has broad legal authority to promulgate regulations to reduce CO_2 pollution through an emissions trading program. Specifically, the board is authorized to regulate air emissions, which includes CO_2. The Virginia Code authorizes the Air Board to "develop a comprehensive program for the . . . abatement and control of all sources of air pollution in the Commonwealth." This power includes the ability to "promulgate regulations . . . abating, controlling and prohibiting air pollution[.]" The law defines "air pollution" as "the presence in the outdoor atmosphere of one of more substances which are or may be harmful or injurious to human health, welfare or safety, to animal or plant life, or to property, or which unreasonably interfere with the enjoyment by the people of life or property." CO_2 clearly qualifies as a "pollutant" subject to board regulation. Indeed, it is well settled on a national level that CO_2 is a pollutant needing regulation. The Supreme Court held in Massachusetts v. EPA that GHG, including CO_2, are "without a doubt" pollutants under the Clean Air Act. Subsequently, EPA determined that GHG emissions endanger the public health and welfare. Virginia Code requires the board to "make . . . such investigations and inspection and do such other things as are reasonably necessary to carry out the provisions of this chapter . . . including the achievement and maintenance of such levels of air quality as will protect human health, welfare and safety[.]" At the state level, carbon pollution is a clear threat to Virginian's health, welfare and safety. Virginia's coast faces the highest level of sea level rise on the Atlantic Coast of the U.S. Sea level rise is also a threat to public and private property, including the Norfolk Naval Base and the Hampton Roads region, which is becoming increasingly vulnerable to flooding. A report issued by the Virginia Institute of Marine Science predicts sea level rise will increase in the Hampton Roads area by more than a foot between 2018-50. Moreover, in Virginia, climate change is exacerbating chronic respiratory diseases. Because of the clear danger carbon emissions pose to human health, welfare and safety, it is well within the board's broad legal authority to regulate these harmful pollutants. Linking to RGGI preserves Virginia's autonomy, while addressing the threat carbon emissions pose to the state in a cost-efficient manner.	Support for the proposal is appreciated. As discussed here and, for example, the response to comment 76, the board clearly has the authority to address demonstrated negative GHG effects in accordance with its mandate to protect public health and welfare.
140. SELC	Covering new and existing fossil fuel-fired units prevents	See the response to

	a market perversion where power generators could shift generation away from regulated plants to new, unregulated power plants, which would not produce a reduction in statewide carbon emissions. We are also glad to see that the regulation applies to all CO_2 emitted from co-firing units that include at least one fossil fuel-fired unit. However, the final regulation should include all electric power facilities that emit CO_2, regardless of fuel type. Specifically, the regulation should apply to any 25 MW unit that burns biomass. The science is clear that burning certain biomass, particularly forest-derived biomass, increases net atmospheric CO_2 for 35-100 years or more, compared to fossil fuels. Numerous studies have shown that burning chips or pellets made from standing trees puts more CO_2 in the atmosphere than continuing to burn coal in existing or new power plants. One report showed the use of whole trees from naturally regenerated forest in the U.S. for power production could result in four times the amount of carbon in the atmosphere versus burning coal over a 100-year timeframe. Thus, it is critical that the regulation cover all net carbon emissions. Straightforward carbon accounting protocols such as those advocated by the Partnership for Policy Integrity (PFPI) demonstrate that even under the best case scenario, emissions from wood-burning plants exceed those from fossil fuel-fired plants for periods of one to two decades and beyond. As a result it is most reasonable to include all biomass stack emissions under the cap. Should DEQ wish to provide some credit to generators who are burning true wastes or residues, PFPI has offered a calculator that can be used to find the net emissions over the regulatory time frame. This framework would appropriately weight emissions from industrial facilities burning black liquor as having nearly zero net emissions, as the framework assumes that black liquor would be burned for disposal even if energy recovery does not occur. It would also reflect the net impact of burning wood residues more accurately than the current effective assumption that emissions are zero, when biomass facilities are not covered under the cap. DEQ should amend the regulation to include "any unit combusting carbon-based fuels that serves an electricity generator with a nameplate capacity equal to or greater than 25 MWe . . . and any sources that includes one or more such units shall be a CO_2 budget sources, subject to the requirements" of the regulation.	comment 67 for detailed discussion of how biomass will be treated.
141. SELC	SELC supports a 33 million ton base budget and 3% reductions annually thereafter, but encourages DEQ to consider actual emissions data from 2019 to determine whether the 2020 cap should be revised down. Contrary	As discussed in the response to comment 37, a cap of 28 million tons has been set.

	to concerns raised in comments to the NOIRA, compliance with Version 1 is in fact readily achievable. Dominion's 2017 IRP created a Plan Alternative for Clean Power Plan compliance which readily met the Virginia limit of 27,830,174 tons of CO_2 by 2030. Version 1 of the regulation requires 23.10 million ton cap by 2030. However statewide carbon emissions in 2017 were 31.2 million tons, which are lower than the Version 1 baseline of 33 million tons. Also note that SB966, passed by the General Assembly in 2018, proposes 5,000 MW of renewable, carbon-free generation and over $1 billion in energy efficiency investment between now and 2028. With this new landscape, we encourage further modeling to predict what 2018 and 2019 emissions are likely to be and recommend a starting baseline that is the lower of Version 1 or DEQ's updated forecast for actual 2019 carbon emissions. This allows DEQ to avoid setting a baseline cap that is higher than actual emissions in the first compliance year. A lower initial base budget and more stringent overall cap by 2030 also better achieves the goal of reducing CO_2 emissions, growing Virginia's clean energy economy, and protecting the public health and welfare. We support the decision to implement a 3.0% per year reduction in carbon emissions over 10 years beginning in 2020. This results in a base budget of 23.10 million tons by 2030. While this is a good initial reduction and sensible 10-year goal, SELC encourages a 10 year review provision. This 10-year review provision would ensure that Virginia continues to reduce its carbon emissions beyond the initial 10-year goal and determine emissions reduction goals beyond 2030.	The regulation has been amended to specify that the department will review the base budget and recommend appropriate adjustments in the base budget for 2031 and succeeding years, considering the best available science and all relevant information and policies available from any CO_2 multi-state trading program in which Virginia is participating. In the context of the RGGI program as a whole, it is important to remember that the program is subject to routine program review. As discussed elsewhere, the RGGI states routinely review and evaluate how current strategies are working, and look ahead to what changes are needed to the program to insure its ongoing effectiveness. RGGI's comprehensive program reviews will consider program successes, impacts, and design elements. As part of this process, DEQ will evaluate where Virginia needs to go with respect to budgets and allowances. In order to be transparent and effective, this must be effected through the program review process in concert with the other RGGI states.
142. SELC	SELC supports the 5% set aside to assist DMME in efforts to abate and control air pollution, although we encourage DEQ to evaluate whether a 10% set aside would produce more benefits than it would increase costs for covered entities. SB966's commitment to energy efficiency is a notable improvement on the role efficiency will play in Virginia's energy future, but there can always be better and more diverse initiatives to bring this lowest-cost resource to Virginia. Despite being the lowest-cost energy resource, energy efficiency measures	Support for the proposal is appreciated. As discussed in comments 51 and 83, a relatively small 5% set-aside is appropriate in the early stages of the program, although this amount may be revisited as a result of program review.

	are also among the most labor-intensive, which means that the effect of every dollar spent on efficient has greater economic ramifications that dollars spent on more traditional, supply-side energy resources. A recent study by Applied Economic Clinic of Virginia's possible energy efficiency future found that under a "medium efficiency" scenario, total annual electricity sales in Dominion's territory could actually decrease. As Virginia's in-state generation fleet becomes less carbon intensive as a product of SB966, a decrease in total energy sales only amplifies the possible reduction in statewide carbon emissions. The study also confirmed that a "medium efficiency" scenario could lower customer bills by up to 0.3% by 2028. The 5% (or possible 10%) set aside can play a key role in helping Virginians achieve lower carbon pollution and lower electricity bills.	
143. SELC	The proposal includes several important cost management mechanisms, similar to those provided for in the RGGI program. SELC supports the inclusion of these provisions as they are designed to provide enhanced market flexibility and stability, and have proven to be important in establishing a successful cap-and-trade program. Consistent with the RGGI program, the regulation allows covered entities to bank unlimited CO_2 allowances. SELC supports this provision, so long as it is clear banking can occur for allowances purchased at auction. Banking provides flexibility and has been shown to encourage sources to reduce their emissions sooner and below required levels. Banking ensures that all CO_2 reductions have a long-term economic value, and not merely short-term value for immediate compliance purposes. By using banking, participants are very adept at smoothing the supply of allowances over time--for example, banking allowances in early compliance periods in anticipation of increased allowance scarcity in later periods. Research on other cap-and-trade programs without banking indicates that such programs typically result in "just-in-time" emission reductions, rather than encouraging cost-effective, long-term emissions reductions. The budget adjustment for banked allowances is necessary due to the high volume of allowances banked during early compliance periods where the volume of RGGI allowances far exceeded actual emissions. Although the RGGI states significantly lowered the regional cap to more closely reflect actual emissions, participants had already banked large numbers of allowances. In 2014, for example, there were an estimated 140 million tons of banked allowances, significantly exceeding that year's emission cap of 91 million tons. Even with the significant cap reduction in 2014, emission reductions were unlikely to occur without further adjustment to account for the volume of banked allowances. These adjustments have been in place for	DEQ agrees that RGGI's cost management mechanisms will ensure that the emissions cap is maintained while managing prices and assuring a stable market.

	several compliance periods, with the third such adjustment period applying to allocation years 2021-25. Virginia sensibly includes this adjustment, which should further the goal of reducing CO_2 emissions in an economically efficient manner. SELC supports the CCR allocation, although improvements should be considered in the coming years to ensure that such reserves are only triggered during truly unexpected price spikes. In the event the allowance price exceeds a specified price ("trigger price"), the CCR mechanism introduces a limited quantity of additional allowances into the auction to increase the supply and thereby reduce the cost. After being implemented in 2014, the CCRs have already been triggered twice, which raised concerns that the containment mechanism is not functioning as intended. Instead of being reserved for truly extreme and unexpected market spikes, the CCR trigger prices may have been set too close to anticipated allowance prices, resulting in 15 million reserve allowances being added to the market. Some have argued that these additional allowances were unnecessary, given the large quantities of banked allowances. In 2017, after another design review, RGGI implemented several changes to the CCR mechanism, which should help prevent unnecessary allowances from being released into the market. For example, the trigger price was initially set at $4 in 2014 raising to $10 in 2017, and thereafter escalating by only 2.5% each year. Now the trigger price will be set a $13.00 in 2021 and increase by 7% every year. Additional changes to the CCR mechanism should be considered. Most importantly, the proposal, consistent with the RGGI program, provides that every year, additional allowances--up to 10% of the emissions cap--can be allocated and sold at auction in the event of a trigger. While this mechanism should help to contain cost, it also effectively increases the overall cap. Virginia, along with other participants in the RGGI auction process, should consider whether additional modifications could better balance carbon emission reduction with cost concerns. For example, it may be more effective to generate CCRs by borrowing allowances against future years or from allowances unsold at auction, rather than generating additional allowances. This sort of program-level borrowing would maintain the overall emissions cap across the initial 10 year program, while still protecting against short-term price spikes. SELC also supports the ECR. There is inherent price uncertainty in a market-based cap-and-trade program due to factors such as natural gas price volatility, variable electricity demand, uncertainties associated with nuclear projects, and evolving renewable energy programs. Where prices are significantly higher than	

	anticipated, the CCR is designed to increase supply and reduce cost. Prior to 2017 changes, however, there was not an analogous mechanism if prices were lower than anticipated. Instead, the RGGI program relied only on a reserve price--a minimum acceptable bid. In 2017, the RGGI program changed its model rule to incorporate an ECR, which Virginia has incorporated into the regulation. In the event allowance prices fall below established triggers, Virginia, like other RGGI states, will withhold up to 10% of its allowances from circulation. According to the RGGI model rule, the ECR trigger price is set at $6.00 in 2021 and will rise at 7% each year. This cost management mechanism should help further Virginia's overall policy goal of reducing carbon emissions in the event that emission reduction costs are lower than projected. Initial modeling of this mechanism indicates that it should further incentivize carbon emission reductions. In situations of low demand and low prices, i.e., situations where the emissions containment reserve is likely to be triggered, a cap-and-trade program is typically not driving emission reductions. Modeling of the emission containment reserve should better align incentives for individual actors in the region and make the auction price more responsive to supply.	
144. SELC	SELC supports the 3-year review, updating output-based allowance allocation method. This method of allocating allowances based on a rolling average of emissions over the past 3 years ensures that where generators do not use the full amount of allowances received over 3 years, these allowances can be retired or banked, and not hoarded by the generator. To the extent any parties express concern about leakage, we believe DEQ has adequately addressed that issue with its continually-updating output system. In any event, emissions leakage is not likely to become an issue. Some critics have argued leakage would occur in RGGI states, yet studies have found that these concerns have not materialized. Indeed, RGGI's most recent Monitoring Report found no evidence of significant leakage. Moreover, Dominion Energy's 2017 IRP demonstrated Clean Power Plan compliance was possible without significant increases in purchased power. While Plan CT is not an exact match to the proposed trading program, it demonstrates Dominion's ability to comply with a significant carbon emissions reduction program without resulting in emissions leakage. Thus, while leakage is unlikely to become an issue under the proposed system of emissions reduction, the allocation method used in the proposal should address concerns raised by those who fear leakage to be an issue with cap and trade systems.	DEQ agrees that the 3-year review, updating output-based allowance allocation method will best control allowance distribution while avoiding potential leakage.
145. SELC	The regulation should ensure the program is the most economically advantageous for customers and families. While we support banking of allowances, we only support banking of allowances that a unit has purchased in the market, not banking of allowances received at no	The commenter's concerns are appreciated. The definition of "conditional allowance" has been amended to specific that a

	cost from DEQ and not submitted to the RGGI auction. Article 9 must make clear that all generators are required to sell all allowances back into the consignment auction. Without a full-market participation requirement, a generator could hoard a large share of CO_2 allowances in order to influence prices or prevent competitors from obtaining allowances. To ensure this anti-competitive behavior does not occur, the regulation must ensure 100% of conditional allowances make it to the consignment auction. While the system appears designed in such a way, additional language could help clarify this important point. Generators initially receive conditional allowances for free, prior to selling into and buying back from the consignment auction. Systems with free allowances have commonly led to windfall profits for generators, to the detriment of customers. However, free allocation systems can be done in a way that prioritizes customers. The final regulation should include a review mechanism to prevent these windfalls for generators and ensure that customers benefit. One means to achieve this is through SCC review of how these windfall profits are used. Indeed there are a number of ways that customers could benefit from allowance profits, whether directly through rate credits, or indirectly through greater emissions reductions, investments in energy efficiency, or other reductions in compliance costs. SELC urges the board to collaborate with the SCC in its review of how generators use windfall profits in order to achieve the greatest level of carbon emissions reduction in the most economically advantageous way for customers. For instance, one possible windfall could occur where a generator sells more allowances in RGGI than it buys back for its own compliance, making it a net seller. In that scenario, the generator is revenue positive as a result of the trading program, but DEQ will have information regarding how many allowances that utility received, how many it surrendered in compliance, and what the various market prices were, which DEQ could make public and also provide to the SCC as it reviews utility earnings and expenses in upcoming triennial rate cases and annual fuel factor dockets. DEQ should also include some failsafe mechanism to ensure that the generator does not profit from the trading program at customer expense as a result of inadequate SCC oversight.	conditional allowance becomes a CO_2 allowance once it has been sold to an auction participant. The RGGI states suggested this change to clarify the relationship between a conditional allowance and a CO_2 allowance. DEQ agrees that collaboration with the SCC is an important element of ensuring that the carbon trading program operates properly in the context of SCC responsibilities
146. Virginia Chapter of the Sierra Club, Appalachian Voices; Virginia Interfaith Power and Light;	Virginia's proposal to develop a CO_2 trading program that links to the existing RGGI program is an appropriate mechanism to begin reducing CO_2 emissions in Virginia. Although improvements should be made, we support action to limit and reduce CO_2 emissions from power plants and to link to RGGI's larger market. The proposal's goal of reducing CO_2 by 30% from 2020-30, at an annual rate equal to 3% of the base year allowances, is modest and can readily be achieved as demonstrated	Support for the proposal is appreciated. DEQ agrees that linking to RGGI will benefit the Commonwealth by protecting public health and welfare in a fiscally responsible way.

Environment Virginia; Chesapeake Climate Action Network.	by planned actions that will reduce emissions and by actual experience in the RGGI states. Importantly, the proposal intends to achieve actual CO_2 reductions, not reductions in carbon intensity which can disguise emissions increases as decreases in the rate of emissions-per-MWH of generation. Dangerous climate change is driven by actual CO_2 emissions and atmospheric CO_2 levels, not the intensity of emissions. While Virginia could potentially implement CO_2 reduction requirements without tradable emissions allowances, linking Virginia's proposed plan to RGGI is a good choice. Through 2016, RGGI states had reduced CO_2 emissions from covered power plants by 40% from 2008. RGGI reduced CO_2 emissions at faster rates and with lower costs and greater benefits than predicted. Moreover, those emissions reductions were achieved while customer bills were reduced and while the economies of participating states grew. Reductions in air pollution in RGGI states have improved health outcomes. RGGI's program has been so successful that its member states recently agreed to build upon CO_2 reductions already achieved, so that covered sources reduce CO_2 by an additional 3% per year for 10 years between 2020-30, achieving an overall reduction of more than 65% compared to its initial 2009 cap. Joining this established CO_2 market will help Virginia reduce CO_2 smoothly and cost-effectively, and would avoid the potential pitfalls from implementing a Virginia-only market. The market for allowance trading will enable power plant operators to buy or sell allowances as appropriate to their individual circumstances, while aggregate CO_2 emissions decline. Since RGGI is both very successful and the only functioning CO_2 market in the eastern U.S., it would make no sense to go it alone. Under a consignment auction approach, the value of allowances will go to covered power generators, and utilities will be able to use the funds, subject to regulatory oversight, to reduce electricity rates and to support incremental investments in zero-carbon energy sources and energy efficiency. Such zero-carbon energy investments will further mitigate electric energy costs by reducing fuel purchase requirements. In its 2017 IRP proceeding, Dominion acknowledged that solar costs have fallen dramatically and that solar is now the cheapest form of energy. Both utility and non-utility generators should be required or encouraged to invest such funds in renewable energy and energy efficiency, or, at minimum, to pass consignment revenues through to retail customers. The allocations of conditional allowances can be reconsidered if consignment revenues are not used to advance the rule’s goals. The emission reductions contemplated by ED11 are	

	readily achievable. RGGI's market began full operation in 2009. By 2012-14, the average annual CO_2 emissions from the 2009 baseline had been reduced by 35.7%; and annual emissions in 2016 were 40% below those in 2008. Those reductions occurred in far less than 10 years, and RGGI reduced caps to reflect the more rapid progress. RGGI is now planning to reduce its CO_2 cap by an additional 3%/year from 2021-30, thereby achieving a 65% reduction from its initial 2009 allowance cap. Significantly, AEP recently announced its voluntary commitment to reduce its CO_2 emissions from power production by 60% from 2000 levels by 2030 and by 80% by 2050. Its planned CO_2 reductions will be achieved through increased reliance on wind and solar energy, retirements of coal-fired plants, natural gas, greater energy efficiency and grid modernization, and the reductions are to be achieved even as electric demands may increase with greater electrification of the economy. Although AEP's planned reductions fall short of what will ultimately be needed to adequately mitigate global warming, they nevertheless illustrate that willing electric utilities can substantially reduce CO_2 emissions, consistent with customer and shareholder interests. AEP explains that its new clean energy strategy is driven by investors, business risks and the known need to reduce CO_2 in order to limit the global average temperature rise to less than 2°C. In short, the proposal is modest, achievable and reflects the unquestionable need to shift to clean energy as soon as practicable.	
147. Virginia Chapter of the Sierra Club et al.	The mix of generation and emissions is changing rapidly and will change more by 2020. The proposed initial aggregate cap of 33-34 million tons for 2020 is too high and out of date. A too-high initial cap will distort RGGI's markets by artificially inflating the pool of allowances. It would fail to produce real reductions in CO_2 and could lead to higher emissions. The 2020 cap should be set below 30 million tons, subject to updating the 2020 level in a proceeding to be held in early 2019. Updating the 2020 baseline based on the latest available information would be fair to the public and all parties. At the same time, setting a cap below 30 million tons would reflect the most current information and would give better planning notice to owners of budget sources than overstated estimates of 33-34 million tons. However, if the baseline is set at 33-34 million tons, then the annual rate of reductions should be increased to 3.5% per year, which would still be slower than RGGI's average annual reduction over its first 10 years. Changes in the fuel mix are occurring now and more changes are expected. The 2020 baseline should take into account all planned fossil fuel retirements and deactivations between now and 2020. It should also recognize that approved new natural gas facilities will displace emissions from coal plants that remain open.	A base cap of 28 million tons has been selected; see the response to comment 37 for more information.

	Between 2016-17, natural gas use in Virginia's electric power sector rose, while coal-combustion fell and retail sales fell. From 2016-17, the capacity factors of two of Virginia's largest coal-fired plants dropped by over 40%, and the CO_2 emissions just from those plants dropped by 4,989,186 tons, from 11,783,154 in 2016 to 6,793,968 tons in 2017. Recent additions of natural gas-fired generation have occurred and more are expected; they will continue to push out dirtier coal-fired plants. Traditional coal plants emit roughly 2.75 times as much CO_2 per MWH than new combined cycle plants, so the trend is toward a much lower CO_2 baseline in 2020. We estimate that the addition of the Greensville plant could displace 7 million tons of CO_2 from coal plants even at a modest 70% capacity factor. Beyond 2017, a number of retirements are expected. In its 2017 IRP, Dominion discussed potential fossil fuel plant retirements. On January 16, 2018, Dominion announced a number of retirements by filing with PJM deactivation requests for 9 fossil fuel units. Collectively, these units have a combined nameplate capacity of over 1,700 MW and emitted around 2.4 million tons of CO_2 in 2016, or 7% of the state's reported power emissions. In addition, Dominion announced the planned retirement of Yorktown 1 & 2. The Spruance and Edgecombe Genco plants have also notified PJM of their intent to retire in 2019 and 2020. Combined, this merchant capacity reflects another 300 MW of capacity and 1 million tons of annual CO_2 emissions. These announced retirements (which would account for 3.4 million tons of CO_2) and any other planned retirements or cold storage of units should be incorporated into calculation of the 2020 baseline. We looked at data for units that operated in 2016-17 and are not scheduled for retirement, and found that 2017 CO_2 emissions from covered fossil-fuel units that will still be operating in 2020 were approximately 29 million tons and the trend was downward, particularly for coal-fired units. The 2020 baseline should incorporate planned renewable energy developments through 2020. Energy from utility scale solar and wind is cheaper than from fossil fuels, and many customers are willing to provide the capital for small-scale solar. The estimates should reflect the improved prospects for renewables, which were boosted by recent legislation as well as by the low cost of solar and wind generation. According to the 2017 Virginia Solar Energy Development and Energy Storage Authority Annual Report, there are presently 219 MW of solar installed and an additional 2,703 MW under development. The PJM queue identifies 8 solar projects with a combined nameplate capacity of 717 MW with projected in-service dates between 2018-20 that would interconnect in Virginia. It is likely that additional solar	

	will be added through 2020 as a result of third-party investments or arrangements with utilities, such as the agreement between Dominion and Amazon to install solar. Recent legislation calls for approximately 5.5 GW of solar generation by 2028. These developments must be accounted for in developing the baseline. Since Dominion serves an integrated system in Virginia and North Carolina, the 2020 cap should also take into account solar connected to Dominion's system in North Carolina which will tend to reduce Dominion's need to generate energy in Virginia. Dominion has emphasized the growing electric demand for data centers. However, such loads are specifically asking for renewable energy. Those loads will add more to zero-carbon generation than to fossil fuel generation. A group of data companies submitted a September 2017 letter to the SCC in Dominion's IRP docket. They asked regulators to take energy resource preferences into account when deciding on future energy infrastructure projects to meet energy load growth from data centers. Citing economic, environmental and market needs, they explained why they wanted more renewable energy and why the IRP under-deploys renewable energy. Thus, demands for solar energy will limit future CO_2 increases even if load grows. This should be considered in setting a baseline below 30 million tons. Electric loads have flattened in recent years. Virginia's retail electricity usage declined between 2016-17. To the extent DEQ's analysis of the 2020 cap relies on Dominion's load forecasts, it should step back. Dominion's forecasts of load growth have been consistently overstated. Virginia's baseline should also account for the state's untapped energy efficiency potential and reflect savings that can be achieved by 2020 and beyond. Electricity generators should not get a higher CO_2 cap for 2020 because Virginia's utilities failed to meet the goal for efficiency-driven demand reductions of 10% compared to 2006 demand. Virginia should not reward its utilities with a higher baseline for CO_2 emissions, which would elevate emissions caps for at least a decade, based upon an indifferent approach to efficiency.	
148. Virginia Chapter of the Sierra Club et al.	We strongly support the proposed definition of "fossil fuel-fired" which would cover most co-firing of biomass and fossil fuels. However, the requirement to purchase CO_2 allowances should be extended to cover all biomass generation meeting the otherwise applicable size requirements. The requirement to purchase allowances should extend to new and existing biomass-fueled units, particularly those that burn wood-based biomass, which is the least likely to result in CO_2 recapture within a time frame helpful to avoiding the looming climate crisis.	The commenters' concerns about biomass are recognized; see the response to comment 67 for more information.

	The premise for exempting generators that burn biomass is that the emitted CO_2 will eventually be recaptured by regrowth of the feedstock and that is sufficient to mitigate the climate damages from current CO_2 emissions. Those assumptions are faulty in several respects. Biomass burns less efficiently than coal or natural gas so more biomass must be burned to produce each MWH of electricity, resulting in CO_2 emissions that are substantially higher than from coal and natural gas. Co-pollutants from biomass combustion are large and harmful to human health. Gradual deterioration of wood residues occurs over many years, but the net CO_2 emissions impacts from burning even residues remain large. Adverse climate and health impacts from burning biomass will not be offset by resequestration of CO_2 in the future, even assuming that the biomass is replaced with comparable forests. Exempting biomass from carbon prices would undercut beneficial investments in zero-carbon alternatives, which mitigate climate harms in the near- and long-term. There is no support for the assumption that forests will be regrown in a sustainable way or in sufficient quantities to recapture that CO_2. Furthermore, past investments in large biomass facilities do not deserve special treatment any more than past investments in fossil fuel-fired facilities. The public and climate are harmed by CO_2 emissions in both cases. The climate crisis will never be resolved if previously built emitters are granted exemptions. In any event, value of allowance auction revenues can be passed through to customers to mitigate cost impacts.	
149. Virginia Chapter of the Sierra Club et al.	The rule should be amended to require continued annual reductions of the CO_2 cap beyond 2030, at the same annual quantities as from 2021-30, until the rule is modified. This could be achieved by altering 9VAC5-140-6190 C to state: "For 2031 and each succeeding calendar year, the Virginia CO_2 Budget Trading Program base budget will be reduced by the same annual quantity as the reduction between 2029 and 2030." Continuing to reduce CO_2 at the same annual rate would mean a reduction of approximately 1 MM tons/year, which would achieve a 90+% reduction by 2050. The key is to clearly indicate that reductions will continue until climate stabilization is achieved. If a specific post-2030 target is desired then the rule could provide that yearly reductions of the annual cap will continue, for example, either until the emissions cap on covered sources has been reduced by 90% from the 2020 base budget or until the emissions cap on covered sources has been reduced by the same percentage as has been achieved by RGGI member states relative to their pre-auction emissions. Since RGGI's announced 2030 reduction target is more than 65% below its 2009 cap the latter measure would continue reductions until at least that percentage of emissions reduction is achieved in Virginia--or until greater reductions are achieved if RGGI extends its	The proposal has been amended to clarify that CO_2 reductions will indeed continue to be required after 2030; see the response to comment 141.

	annual reductions beyond 2030. This would assure that Virginia eventually catches up with a level of reductions that RGGI has shown are achievable. At minimum, it is necessary to clarify that the emissions trajectory post-2030 will be at least as stringent as that agreed to by the RGGI states in subsequent program reviews for the post-2030 years. Absent emission reductions that continue to at minimum match the stringent of the RGGI program beyond 2030, Virginia would be unable to continue to link its program with the RGGI states and reap the benefits of the larger carbon market.	
150. Virginia Chapter of the Sierra Club et al.	Climate change disproportionately harms the poor and other disadvantaged communities. Residents near and downwind of fossil-fuel power plants suffer disproportionate health impacts from co-pollutants such as particulates, SO_2, ozone, and mercury, and are disproportionately low-income or minority. Generating electricity with biomass also produces high levels of harmful air pollution. In contrast, solar, wind and efficiency do not produce any carbon pollution or co-pollutants. Over half a million people in Virginia live within three miles of a power plant that was to be covered by the Clean Power Plan. Of these, 52% are minority and 34% are low-income, while Virginia has a total minority population of 35% and low-income population of 26%. According to the U.S. Office of Minority Health, black people are three times more likely to die from asthma-related causes than white people. Capping and steadily reducing aggregate CO_2 emissions and co-pollutants will generally improve health outcomes in Virginia and benefit all communities, including disadvantaged communities. This positive benefit from reducing CO_2 has been documented in RGGI states, which have experienced improvements in health outcomes since RGGI's carbon limits took effect. RGGI states have also seen dramatic reductions in SO_2. It is possible that trading could allow some fossil fuel plants to use allowances to continue or increase polluting operations. As a result, localized harms may occur even if the rule produces overall progress. It is therefore critical that DEQ commit to conduct EJ and emissions studies; to continuously monitor and report concentrations of CO_2 and non-CO_2-pollutants to ensure that disproportionate concentrations do not harm particular communities or regions; to investigate detected concentrations as well as any complaints of disproportionate local impacts and to pursue appropriate remedial actions. We urge DEQ to consider amending the rule to prohibit plants fired with coal, biomass or heavy oil from acquiring allowances to increase their annual emissions over historic levels without first obtaining a permit.	DEQ agrees that disadvantaged communities must be specifically addressed in the context of wider EJ programs at the state level and has amended the proposal accordingly; see the response to comment 55.
151. Virginia Chapter of the	The proposal to cover existing units serving a generator of 25 MWe or larger is generally consistent with RGGI's	The applicability limit is indeed designed to be

Sierra Club et al.	existing rule. However, the rule should be amended to state that the 25 MWe threshold only needs to be crossed once to trigger coverage by the rule. This is important so that coverage cannot be avoided through manipulation of a unit's size or configuration. 9VAC5-140-6040 A should be modified to state that the rule covers units serving all generators having a nameplate capacity of 25 MWe or more "at any time on or after" a fixed date. To be consistent with RGGI's model rule, it would be reasonable to adopt January 1, 2005 as the on-or-after date. Alternatively, the on-or-after date could be shortly prior to the first notice that a plant might be covered by CO_2 regulations. The rule should be modified to require new units serving generators with a nameplate capacity less than 25 MWe to obtain emissions allowances. We suggest the threshold for new generators be set at 15 MWe or less. This is needed in order to send CO_2 regulatory and price signals to a broader pool of new generators and to prevent gaming that would undermine the regulation's CO_2 reduction goals and that would be unfair to existing generators. Within the RGGI region, there are recent proposals for multiple generation fossil fuel-fired units each just below the 25 MWe compliance threshold. Since economic efficiencies and operating efficiencies would ordinarily support larger units, the sizing appears to be driven by a desire to emit CO_2 without limits, thereby undercutting public health and the goals of the regulation. Since it is essential to reduce future emissions, there is no reason to encourage new generation that emits CO_2. With coverage of new units, the rule would better protect the public from CO_2 and co-pollutants, remove an incentive for building less efficient fossil fuel generators, and protect the integrity of allowance markets. Since developers would have notice of the allowance requirement for new generation, no unfairness would result from imposing a lower size threshold for such generation. Units placed in service after January 1, 2019 would fairly be considered new.	consistent with the RGGI Model Rule. Current state regulation (9VAC5-20-70) prohibits circumvention of air quality requirements by constructing multiple facilities in a piecemeal fashion in order to avoid regulation. DEQ believes that the declining emissions cap will encourage the development of renewable energy and energy efficiency, not the construction of multiple smaller facilities which, as the commenter points out, are less efficient.
152. Virginia Chapter of the Sierra Club et al.	Allocations of conditional allowances is a pragmatic choice designed to implement tradable emissions allowances. However, recipients of economically-valuable conditional allowances should be encouraged to use that value to promote the carbon-reduction purposes of the rule, not to produce windfalls. The proposal presumes that utilities will utilize revenues received from the consignment-and-auction process for the benefit of customers, either through incremental investments in energy efficiency or zero-carbon generation or applying the revenues to reduce retail rates. While this seems to be a reasonable assumption in light of SCC regulation of utilities, it is not a guarantee. DEQ should monitor how the auction revenues are utilized and consider adjusting the method for allocating allowances if the revenues are	The commenter correctly asserts that the SCC regulates and monitors utilities in order to assure that customers are protected. It is unclear how additional reporting requirements would ensure that these goals are effected.

	not used to advance the purposes of the rule. Recipients of allowances should be required to report annually how the auction revenue funds were used, including whether they were passed through to retail customers, used to reduce CO_2 emissions, used for other corporate purposes, or retained as earnings. Generators in other RGGI states do not expect funding from the auctions, and Virginia companies should not get auction revenues unless they promote the purposes of the rule.	
153. Virginia Chapter of the Sierra Club et al.	We support consigning a portion of the conditional allowances to holders of public contracts with DMME for the abatement and control of CO_2. RGGI member states use a much larger share of their auction revenues for such purposes by supporting measures to increase energy efficiency or zero-carbon renewable energy within their borders. It is reasonable for Virginia to do so with at least part of the revenues from the consignment auction process. Nevertheless, 5% is a small starting point. Consideration should be given to reallocating conditional allowances from non-utility generators or utilities to public contractors for implementing energy efficiency and renewable energy, particularly if the covered generators do not invest their auction revenues to expand zero-carbon energy solutions in Virginia.	As discussed in comments 51 and 53, a 5% set-aside is a reasonable figure in the early stages of the program.
154. Virginia Chapter of the Sierra Club et al.	Dominion's Mt. Storm is a large coal-fired electric generating facility located in West Virginia that is included in Virginia retail rates and is dispatched through PJM. DEQ should consider inviting Dominion to include Mt. Storm as a CO_2 budget source subject to the program, provided that the arrangement does not violate any West Virginia CO_2 rule and is acceptable to RGGI. The plant is old and a substantial source of CO_2 and other pollutants. We are not aware of any barrier to Dominion's agreeing to subject this plant to Virginia's CO_2 program, which would affect PJM's economic dispatch of the plant, but not require any plant modifications or state permits. Dominion and its customers could benefit from phasing down Mt. Storm's operations and shifting CO_2 allowances to newer, cleaner facilities located in Virginia.	Unless and until West Virginia links to the RGGI program, it is unlikely that they would expect for Mt. Storm to submit to RGGI requirements.
155. Virginia Chapter of the Sierra Club et al.	The proposal wisely does not provide for creating offset allowances. Offset allowances would require large investments of Virginia's administrative resources to analyze, approve and enforce proposals. Nearly 30% of the RGGI Model Rule text is devoted to standards and procedures for evaluating, approving, and enforcing offset projects. That is not a burden that Virginia should take on, particularly since it may require physical and economic processes beyond those DEQ normally oversees. Further, the value of offsets is dubious. Even if they reduce CO_2 somewhere, offset schemes may not provide ancillary benefits from reducing power plant emissions of CO_2, including benefits from reducing co-pollutants. Indeed, offset projects may increase the danger that local pollution will increase as a result of	DEQ agrees with the commenter that implementing offsets is not desirable at this time; see the response to comment 26.

	purported CO_2 reductions at remote locations as has happened under California's program.	
156. Tenaska Virginia Partners, L.P.	DEQ projects annual CO_2 emissions from covered facilities to be 36.8 million tons in 2019. Under the 34 million ton alternative, a 7.6% reduction would be required in the first year of the program. If the more stringent 33 million base budget were used, a 10.3% reduction would be required. These are 2.5-3.5 times the proposed 3% annual cap decline in subsequent years. Tenaska strongly suggests DEQ consider a higher base budget, such as 35 million tons, in the event the 2019 emission projection is proven accurate. At the very minimum, 34 million tons should be used. Tenaska strongly favors the "generation updating" approach, whereby covered facilities are allocated allowances according to their respective historical annual net generation as compared to the total aggregate generation from covered facilities, averaged over the immediate 3 calendar years, updated annually (i.e., on a rolling 3-year average). Tenaska believes this approach best meets the intent of the regulation, in that it incentivizes more efficient units that emit less CO_2 per unit of power produced. Note that Regulatory Advisory Panel (RAP) participants favored this option. As presented during RAP meetings, Tenaska's Virginia Generating Station in Fluvanna County currently operates under a long-term contract or "tolling agreement" with a third party, whereby the third party procures the fuel and purchases the generated electricity. The term of the agreement is 20 years and expires in May 2024. Under the terms of the agreement, Tenaska believes it has the ability to pass through to its customer costs for things such as emissions allowances, whether they be for the Acid Rain Program, CSAPR, or any future carbon trading scheme. However, Tenaska's customer has taken the position that Tenaska does not have such a pass through right. These costs are projected to be $2.30/MWh in 2020 and $3.78/MWh in 2031, representing an increase of 14.6-18.9% over the projected wholesale power price. To the extent Tenaska is required to purchase allowances and is unable to pass through those costs to its customer, it will be disadvantaged compared to other generators that can either recoup those costs or that have no costs due to their location in another PJM state without a carbon pricing scheme (e.g., Pennsylvania and West Virginia). Several RGGI states and every major proposed federal CO_2 cap and trade legislation has recognized this predicament and provided various forms of relief, such as creating an allowance set-aside for free allocations or offering allowances at a reduced price. Tenaska requests DEQ also recognize this and either create a	See response to comment 37 for a discussion of how the final base cap was determined. DEQ is assisting affected sources in meeting compliance costs by issuing allowances. The amount of compliance costs covered by the allowances will depend on business decisions made by any individual facility. If a facility stays within the budget, it will not incur costs.

	set-aside sufficient to cover net allowance obligations for LTC holders or simply exempt LTC holders for the life of the applicable contracts. The set-aside would be less disruptive to the program as it would alleviate units entering and exiting.	
157. Tenaska Virginia Partners, L.P.	We encourage DEQ to expand the scope of the regulation to include additional sources and seek meaningful reductions in other sectors of the economy (via alternative pathways), including mobile sources, if the dire consequences referenced are to be avoided. One such way is to remove the exemption in 9VAC5-140-6040 B for units that generate electricity and heat "for the primary use of operation of the facility." CO_2 emissions from such facilities are no less potentially harmful than those from units that generate electricity for off-site use. Neither the RGGI Model Rule nor the environment make such a distinction and neither should DEQ.	As discussed in the response to comment 65, this exemption is appropriate. While DEQ agrees that other pathways to CO_2 reductions are important, the scope of the regulation is limited by executive order and state law. DEQ believes that the 5% DMME set-aside as well as other ongoing programs such as the Grid Transformation and Security Act of 2018 will provide additional incentives for energy efficiency and renewable energy.
158. U.S. Green Building Council (USGBC)	We agree with the proposal to link Virginia with RGGI, creating opportunities for cost and resource reduction. DEQ should reconsider the 2020 emissions baseline to ensure it meets the objective of capping emissions. The 33 million ton baseline is higher than the 2017 carbon emissions of 31.2 million tons, while energy productivity is increasing. These data suggest that a lower baseline will be more successful at driving reductions. Subsequent to DEQ projections, the General Assembly passed SB966, which could affect the baseline generation from fossil fuel power plants and their carbon emissions. We recommend increasing the 5% set aside. Such set-aside funds are critical to expand DMME programs, which for some sectors are the primary potential source of energy efficiency assistance given SCC limitations on efficiency programs. The majority of the set aside should directly benefit low and moderate income persons and areas. It is well established that disadvantaged populations are disproportionately impacted by air pollution. Moreover, programs aimed at increased efficiency in low and moderate households have a co-benefit of reducing their vulnerability to electricity rate increases. The regulation should provide for DMME to actively seek public input on use of the set aside including how the proposed use benefits target populations. DMME and DEQ should study and monitor potential impacts of the regulation on low and moderate income households, and periodically report findings to the public.	See comment 37 for a discussion of how the final base cap was determined. As discussed in the responses to comments 51 and 53, a 5% set-aside is appropriate in the early stages of the program. The specifics of how this set-aside will be managed will be determined by DMME. DEQ agrees that vulnerable communities must be addressed, and the program contains multiple opportunities to do so; see the response to comment 55 for more information.

159. Environmental and Regulatory Law Clinic, University of Virginia	Given the climate change-related threats facing our state--and considering the sources of pollution in Virginia that contribute directly to those threats--it is entirely appropriate and necessary for the board to initiate a regulatory program linking Virginia to RGGI. The Office of the Attorney General issued an official advisory opinion that analyzed the relevant statutory and administrative authority and concluded "that the State Air Pollution Control Board is legally authorized to regulate GHG emissions." Specifically, the Attorney General noted that the board is authorized to regulate "air pollution" in the state, and observed that GHGs unquestionably fall within the definition of "air pollution." The Attorney General further concluded that because of its "broad statutory authority" under Va. Code § 10.1-1307(A), the board can exercise its regulatory authority through imposition of a "statewide cap on GHG emissions." The board also has the authority to maximize the efficiency and efficacy of a statewide cap by linking the program with RGGI. A state-led program is not preempted by the federal Clean Air Act, and is, in fact, specifically authorized by the Clean Air Act's state law savings clause (42 USC § 7416).	Support for the proposal is appreciated. DEQ agrees that the board and department have the legal authority to develop the proposed regulation; see the response to comment 76 and, for example, comment 139.
160. Virginia Loggers Association (VLA)	Virginia's land cover is approximately 62% forested; in total, 15.8 million acres of forest with about 12.2 million acres are owned by private individuals, corporate and non-profit organizations. The majority of Virginia's forests are owned by individuals. Timber production is an important part of Virginia's economy and environment. The most recent study released by Governor McAuliffe shows that our forest products industry is the third largest contributor to Virginia's economy. The study revealed that almost $9.3 billion were added directly due to forests. Most of these forests are managed through the most current science enabling our forests to be productive for timber products and environmental benefits. Our forests are healthy and have increased in volume since inventory studies in 1940s. Virginia's forests are growing at a faster rate than harvest removal and mortality. The latest inventory shows that softwood annual growth to annual harvest is at a ratio of 2.2:1 and hardwood annual growth to annual harvest is 2.4:1. Our forests clean the air, sequester carbon, and improve water quality, wildlife habitat and recreational opportunities while producing products for many. Biomass is an important component of Virginia's energy policy. Many of our members invested millions of dollars in equipment to provide biomass to utilities across Virginia. We ask that any regulation recognize the investments made by our mills and logging businesses as well as the renewable natural qualities of forests. Some areas of the proposal would require our mills to invest further for monitoring biomass sources currently not required. We ask that you remove any additional requirements on biomass based sources. Continue to	The commenter's concerns are appreciated. See the responses to comments 65 and 67 for further detail.

	treat biomass as carbon neutral. Finally, we ask that DEQ maintain the current exemption of industrial boilers.	
161. Virginia Energy Efficiency Council (VAEEC)	Energy efficiency is one of the most cost-effective tools to reduce energy consumption and dependence on fossil fuels, which in turn helps reduce carbon emissions. We applaud the inclusion of the 5% set aside for energy efficiency programs. Expanding energy efficiency provides Virginia residents with affordable energy bills and healthier, more comfortable homes. Last year, the American Council for an Energy-Efficient Economy (ACEEE) listed Virginia as one of the most improved states in their 2017 State Energy Efficiency Scorecard. Moving from 33rd to 29th place underscores the work VAEEC, our members and our partners have done to advance energy efficiency policies and initiatives. But there is more that can be done to help Virginia break into the top 25. The passage of the Grid Transformation and Security Act paves the way for greater opportunities as well. These programs, in addition to the energy efficiency carve out will propel Virginia into the spotlight as a leader on energy efficiency.	Support for the proposal is appreciated. DEQ agrees that energy efficiency is an essential component of reducing carbon emissions.
162. Virginia Coal and Energy Alliance (VCEA)	The benefits provided by the coal and coal-related industries should only be placed at risk if the justification for doing so is clear--that is, if the benefits from the burden placed on those industries are greater than the benefits they provide. Unfortunately, the justification provided for the CO_2 Trading Rule is anything but clear, as it unfairly compares an underestimated assessment of real-world local costs and economic impacts to a theoretical and now-rejected overestimate of global benefits. The justification proffered for the proposal contains a logical disconnect. The justification, which is based on the Report of the EO 57 Work Group, proceeds as follows: 1) climate change causes certain harms in Virginia (e.g., heavy storms, water shortages, and warmer temperatures); 2) therefore, reducing the GHG emissions in Virginia will reduce those harms and benefit Virginia. However, that assumes that reducing CO_2 emissions will address harms here. Contrary to that assumption, reducing emissions in Virginia will not have any impact on the earth's climate. Emissions from Virginia--indeed, the entire U.S.--are such a small portion of total global emissions that any reductions are almost certain to have no meaningful effect. The benefits alleged in support of the rule are based almost entirely on the "social cost of carbon," a metric crafted by a disbanded interagency working group under the Obama Administration. The Trump Administration has rejected that metric and directed that it no longer be used to justify federal regulations. The social cost of carbon analysis admits a critical point: "[e]ven if the United States were to reduce its greenhouse gas emissions to zero, that step would be far from enough to avoid	The board is within its legal authority to address carbon pollution, which poses serious threats to the Commonwealth, through a cap-and-trade program; see the responses to comments 61 and 76.

	substantial climate change." That confirms that even those in favor of climate change policies must recognize that the reductions from any one country, much less any one region or state, will not change anything. The social cost of carbon itself is flawed because it relies on a highly speculative evaluation of global benefits, followed by an unfair comparison of those worldwide benefits to domestic costs incurred within the U.S. alone. Not only is that comparison unreasonable, since worldwide benefits will always dwarf the costs incurred by a single nation, it also represents a break from the manner in which the impact of regulations has always been evaluated. U.S. costs have always been compared to U.S. benefits in order to provide a fair basis for the comparison, even for regulations that may benefit other countries. With the withdrawal of the social cost of carbon from federal policy, federal agencies must now return to that more reasonable and well-understood approach, and DEQ should do the same. The other justification relies on co-benefits associated with reductions in other pollutants, such as NO_X, SO_2, and particulate matter, which can directly impact human health (unlike CO_2). Co-benefits are not a reasonable basis upon which to justify the rule because the other pollutants are already well controlled by other Clean Air Act programs. Only a small portion of the state is nonattainment for ozone, due to its proximity to the D.C. metropolitan area, not emission sources located in Virginia, and sufficient rules are in place to address those air quality concerns. The rest of the state complies with EPA standards set to protect public health, and no further reductions are needed to maintain compliance with those standards. Claiming that reductions in other pollutants as a justification amounts to double-counting of air quality benefits already achieved and paid for. Although the rule would adopt a seemingly small 3% per year reduction, those compounding reductions will be more significant than the analysis suggests because it ignores and essentially prohibits growth in emissions that would otherwise occur. Whereas the supporting analysis claims a reduction of 30% (from 33-34 million tons in 2020 to 23-24 million tons in 2031), in effect it will actually require reductions of nearly 50% when compared to what would otherwise occur without the program (40-50 million tons). The result will be an increase in the cost of electricity of over 7% and present a significant burden on the coal and coal-related industries. The assertion that emission reductions of a similar magnitude under the proposed rule will have only a minimal impact on the economy of the state is difficult to believe.	

	To combat concerns about the impacts to the economy and the cost of electricity, an analysis was prepared to focus on individual utility bills. The conclusion of that study suggests that the impact to ratepayers will be minimal. However, if that is in fact the case, it must mean the analysis assumes the regulation will not significantly affect the market; that is, the study must have assumed that the market itself would likely encourage nearly the same emission-reducing behavior based solely on the demand for and supply of energy. But if that is true, then the regulation would not be responsible for any of the emission reduction benefits claimed. The supporters of the proposal cannot have it both ways--either the program will require reductions that would not otherwise occur under existing market forces, in which case significant costs will be incurred in working against the market, or else the market would already encourage the reductions now sought via regulation, in which case the regulation is unnecessary. The General Assembly has already decided that the CO_2 Trading Rule is not in the best interest of Virginia and passed HB1270 to prohibit the very type of program contemplated by the proposal. The Governor vetoed the law and is charging ahead via executive fiat to establish such a program. This scenario is similar to what has transpired at the federal level. Despite the fact that Congress rejected efforts over more than a decade to enact a climate trading program, the Obama Administration decided to establish one through executive authority by issuing the Clean Power Plan, which was based on a few ambiguous and general sentences of the Clean Air Act. So too here, given that the authority claimed by the Attorney General as the basis of the regulation is merely the general authority "to promulgate regulations, including emergency regulations, abating, controlling and prohibiting air pollution." Legislatures grant bold powers in clear terms, and executive agencies should not try to invent bold powers out of ambiguous language. This principle should have equal effect at the federal and state levels, since both governments are based on the same fundamental principle: the legislative branch makes the laws, and the executive branch wields only the authority granted to it by the legislature. Nothing in the Clean Air Act clearly authorized EPA to issue the Clean Power Plan, and that is likely why the Supreme Court stayed it. Those same concerns appear relevant to the proposal, but perhaps to an even greater extent. Unlike Congress, which has been unable to pass a climate change bill, the Virginia legislature did pass one, but one that prohibits what the executive branch is now trying to do on its own. That executive action is only legal if the legislature has	

	already authorized such a program in a previous statute, but it did no such thing. Rather, the statute claimed to be the underlying authority for the regulation is the same type of highly general authority found in the Clean Air Act. Such general grants of authority to issue regulations to address air pollution provide no clear authority for the policy shift the Governor seeks to implement, which represents a decision of economic and political significance. The Governor should not invent that authority, particularly in light of the statement to the contrary recently made by the legislature.	
163. Virginia Conservation Network (VCN); Virginia League of Conservation Voters (VaLCV)	VCN and VaLCV encourage DEQ to select an emissions baseline that best achieves the goals of reducing statewide carbon pollution. This baseline should be the most stringent, lowest possible science-based figure supported by modeling. For additional details on the stringency of the carbon program, as well as modeling results, please see the technical comments from our partners at NRDC, Sierra Club, and SELC. We are thankful that the regulation covers both current and future fossil fuel-fired units. We were glad to see the inclusion of co-firing units that include at least one fossil fuel-fired unit; however, it should include all electric power facilitates that emit carbon, regardless of fuel type. Specifically, the regulation should apply to any unit at or above 25 MW that burns biomass. For additional details on biomass, please refer to the comments submitted by the National Wildlife Federation. We appreciate and support the 5% set aside of allowances to assist DMME in efforts to address carbon emissions. We encourage DEQ to consider increasing this to 10%, with the understanding the benefits of increasing this figure should be greater than the costs associated for covered sources.	Support for the proposal is appreciated. The commenters' specific issues are discussed elsewhere. See the response to comment 37 for a discussion of the baseline emissions cap, comment 67 for a discussion of biomass, and comment 51 for set-asides.
164. Veolia North America	We commend DEQ for exempting certain industrial combined heat and power (CHP) units from the regulation. CHP plays an important role in the state's clean energy and resilience goals and merits additional support. CHP units deserve special treatment as they have been designed to optimize the efficient production of heat and power for industrial facilities. While the exemption sets a positive policy direction, it needs to be modified to ensure that it rightfully applies to all relevant industrial CHP units. The exemption only contemplates the CHP unit being owned by the industrial end user rather than by a third party. This is counter to the trend of more industrial end users moving to outsource ownership, operation and maintenance of their central utilities. In this model, the industrial company can focus on executing its core business while relying on a specialized third party whose core business is owning, operating and maintaining industrial utilities on a safe, cost effective and reliable basis. As such, the ownership status of the CHP unit is	DEQ agrees that the phrase "owned by an individual facility" should be removed. Under the RGGI Model Rule, facilities that provide less than 10% of their power output to the grid are exempted from compliance obligations; the proposal has been revised accordingly. The regulation has also been amended in order to address CHPs with more clarity; see the response to comment 74.

	not relevant to the key issue: does the CHP exist to primarily provide service to the industrial end user? Relying on "primary use" intent, rather than regulating CHP ownership, would better focus the regulation on GHG reduction while also allowing the industrial and manufacturing sector in Virginia greater flexibility to achieve this regulatory purpose. We suggest that DEQ remove the phrase "owned by an individual facility and" from the industrial exemption. To qualify for the exemption the useful energy output (thermal and electric) of a CHP needs to be "for the primary use of operation of the facility"; however, "primary use" is not defined. We urge DEQ to clarify the meaning of primary use by considering the magnitude of a CHP's generation of useful thermal energy (UTE) relative to useful electrical energy and by the application of an appropriate CHP efficiency standard. One of CHP's benefits is that it can produce both UTE and electricity from a single fuel source. It is not uncommon for a host to have a high need for thermal energy and a low need for electricity. In order to efficiently service an industrial facility's steam load, a CHP unit may need to be designed in a way that exports a substantial portion of its electric power to the grid. The need to export to the grid is important in circumstances where utility franchise rights prevent third party CHP facilities from delivering power to industrial sites. The integrity of the industrial exemption will be maintained if the focus is on UTE. The industrial exemption can be strengthened by adding an efficiency requirement. This will provide CHP units incentive to maximize requirements of its host rather than exports to the electrical grid. The Virginia legislature recognized the need to encourage CHP systems in the Grid Transformation and Security Act, which requires that the total efficiency, including the use of thermal energy, for eligible CHP facilities meet or exceed 65% (Lower Heating Value) annually. A similar requirement for the industrial exemption would ensure consistency. Veolia recognizes the concept of tying the industrial exemption to a unit "voluntarily restricting its electrical output to the grid (through permit condition) to less than or equal to 10% of the units annual gross generation of the unit." This approach too narrowly restricts what industrial facilities can do with electric generation and conflicts with the broader intent of primary use. Recognizing that not all CHP units will qualify for the exemption, but acknowledging that these units still deliver valuable GHG reductions, we recommend a UTE exemption. CHP units over 25 MW that do not qualify for the industrial exemption, must procure CO_2 allowances for all emissions, including those associated with UTE (i.e., microgrid, district energy, process steam, hot	

	water). Absent production at a CHP unit, the UTE would be produced by conventional methods, such as standalone boilers. These conventional methods of generating UTE are not subject to the regulation, and thermal generation-only unit owners are not required to procure CO_2 emissions allowances. If CHP units over 25 MW are required to procure CO_2 allowances for all emissions, including those associated with UTE, it will create a counterincentive and potentially increase GHG emissions. To avoid this, the regulation should exclude CO_2 emissions associated with UTE from a CHP unit. When determining the RGGI emissions allowance compliance obligation for a CHP unit, emissions associated with UTE of that unit should be deducted from the unit's total emissions. There is precedent for adopting a UTE exemption based on existing UTEs in federal and state agency carbon trading programs. EPA's Clean Power Plan included a UTE exemption for CHPs. Several RGGI states have adopted a UTE exemption in different forms. For example, Massachusetts has an exemption for any CHP CO_2 budget source that allows the CHP unit to subtract from its total CO_2 emissions the amount of CO_2 emissions attributable to the production of useful net thermal energy. The Massachusetts regulation acknowledges that, absent production in a cogeneration unit, UTE would be produced in a standalone boiler. These boilers do not have a compliance obligation under any RGGI program, and have no mandated efficiency targets. With this UTE exemption structure, a generation unit has an incentive to maximize useful outlets for its waste heat. The Massachusetts UTE exemption is the most effective and straightforward approach, and we encourage DEQ to adopt a similar exemption. Under this approach, emissions associated with UTE are calculated on a formulaic basis and are subtracted from a CHP's compliance obligation. Note that the exemption is only for emissions associated with UTE. CHP units that fall under RGGI will still be required to procure allowances for any emissions not associated with UTE. However, with the UTE exemption, CHP will be on equal footing with conventional generators whose only output is electricity. By reducing a unit's environmental compliance costs, the UTE exemption removes a potential barrier for investment in CHP. The ability for a CHP unit to exclude emissions from UTE from its compliance obligation will become even more important in the future. With the RGGI emissions cap declining each year, it is likely that RGGI allowance prices will continue to increase. As RGGI allowance prices increase, they will drive up compliance costs and increase the economic disincentive faced by CHP units. Without a UTE exemption, there will be a similar adverse	

	effect on existing facilities that have the option of using CHP to generate UTE or using stand-alone boilers. As the costs of CHP rise due to higher RGGI compliance costs, the dispatch of equipment may change resulting in more standalone generation of UTE and higher regional carbon emissions.	
165. Virginia Forest Products Association (VFPA)	VFPA does not support joining RGGI because it would raise electric power and natural gas rates. This is a grave concern to our small businesses, as even small sawmills without kilns have electric bills that average $6,000/ month. Kiln dryers add substantially to that monthly bill, and larger mills with kilns have monthly electric bills in excess of $20,000. Our primary competition is in North Carolina, not the RGGI states, and an increase in our utility rates will put us at a competitive disadvantage. A more critical concern is the potential impact if emissions from the combustion of biomass are treated as GHG. Lumber production produces manufacturing residuals in the form of mulch, sawdust and chips. Even a small mill can produce 25 tons per day of dust and chips each. There is a ready supply of wood residuals from sawmills in the state that require a variety of markets. Having ready outlets to dispose of residuals is critical; we can't saw lumber if we can't move residuals off the yard. We are extremely concerned that disincentivizing the burning of biomass for power could negatively impact sawmills, loggers, and landowners by reducing or eliminating that market. The boiler fuel outlet for residuals is key to our survival; if it is treated the same as any other fossil fuel but costs more for the utility to procure, they will no doubt select the less expensive option since the benefit is removed. The science on the carbon neutrality of woody biomass is solid, and VFPA supports the comments and supporting data submitted by AF&PA and AWC. Harvesting wood for energy does not contribute to net carbon emissions in cases where the harvesting, measured over a broad region, is offset by wood growth and associated carbon sequestration. The most recent data from the U.S. Forest Service indicate that timberlands in Virginia, the U.S. south, and the entire country have highly positive net growth/removal ratios. The Virginia Department of Forestry's Reforestation of Timberlands Program has reforested 1.8 million acres since the program's inception. This program provides cost-share assistance to landowners in planting, replanting, and managing forest acreage. Since 1970, landowners and industry have reforested 4 million total acres in Virginia. U.S. Forest Service data from 2016 shows growth/removal ratios for timberlands in Virginia, the U.S. South, and the nation as a whole are 2.29, 1.76, and 1.94, respectively. In other words, Virginia's	The commenter's concerns are recognized. See the response to comment 67 for a discussion of biomass. The industrial exemption will be maintained; see the response to comment 65.

	timberlands are growing more than twice as much wood as harvested, while timberlands in the south grow 76% more than is harvested. When environmental organizations cite the cutting of trees by the forest product industry as inherently negative, they ignore the cyclical nature of managed timberlands. The most significant pressure on forests is permanent conversion to non-forest uses, such as development. However, strong markets for wood are the most powerful incentive to keep forests in production. From the sawmills' perspective, markets for the finished product and residuals on the back end are as important as the supply of trees on the front end. A balance in supply and demand will keep businesses and forests healthy. A 2014 article in the Journal of Forestry noted that if mill residues were not used for energy, most of these materials would be wastes that would either be incinerated, in which case the atmosphere would see the same CO_2 emissions as if the material had been burned for energy, or disposed of in landfills. The article further states that the net impact of burning for energy on biogenic emissions in terms of warming can be less than zero because of the warming potency of methane generated in landfills. In the past, many sawmills burned wastes on site in large incinerators as there were not enough markets for the materials. Residuals build up quickly in the process of sawing lumber. If today's mills lose too many markets for residuals, the financial burdens of incinerating on site or the costs of landfill tipping fees for disposal of thousands of tons of residuals would force many sawmills to cease operation. From economic and environmental perspectives, treating biomass as carbon neutral in energy production makes dollars and sense. VFPA respectfully requests that Virginia not join RGGI. However, if the state does join RGGI, we ask that biogenic carbon emissions be recognized as carbon neutral regardless of whether other fuels also are co-fired; and that the exemption for industrial boilers be retained. This regulation is designed to address utility electrical generation only; the exemption for on-site industrial generation should remain in the final rule. This is also important because of potential market impacts to saw mills if large industrial users lose this incentive for firing with biomass.	
166. Virginia Chamber of Commerce	The Virginia Chamber recently released Blueprint Virginia 2025, a plan that outlines the business community's priorities and recommendations for making Virginia the best state for business. Throughout our stakeholder engagement process, which included over 6,000 members of the business community, we heard from business leaders on how important affordable, reliable energy is to Virginia's economic competitiveness.	The regulation is designed to impose regulatory requirements only as strictly necessary in order to participate in the highly successful RGGI program without affecting economic competitiveness. As

	Energy affordability was identified by 55% of Blueprint survey respondents as their top energy concern. Unfortunately, RGGI is not consistent with the Chamber and Governor's goal to make Virginia the best state for business, as it will increase electricity rates and make Virginia less competitive. The Chamber supports policies that promote energy independence and the development of a robust supply of energy. We advocate an energy portfolio that promotes economic development and job growth through traditional and alternative energy investments, and believe that environmental protection and energy independence are compatible goals. It is expected that energy consumption in Virginia will continue to rise, reflecting the increase in population, economic growth, and electrification of the transportation system . To ensure a growing economy, we must develop strategies for an ample supply of affordable and reliable energy. Part of achieving our goal of being the best state for business is to protect our competitive rates for electricity. Business climate rankings factor energy and utility costs into their "cost of doing business index," which can influence our overall position. Favorable energy costs are important in order to remain economically competitive. By joining RGGI or initiating a cap-and-trade program, energy costs for employers and residents will rise. According to a recent Cato Institute study, the RGGI program creates higher electric bills and shifts jobs to non-RGGI states. According to the U.S. Chamber of Commerce's Global Energy Institute, the average electricity rate of the RGGI states is 39% higher than the national average. By contrast, Virginia has the nation's 19th lowest average electricity rates, 12% cheaper than the national average. Virginia's affordable rate provides the state a competitive advantage when it comes to attracting manufacturing and other energy intensive industries, such as high-tech data centers. Any program that would increase electricity rates--such as RGGI--would reduce this competitive advantage. Further exacerbating the negative effects to our economic competitiveness is the problem of carbon leakage. The state's own modeling illustrates the potential impacts of leakage that could result from partnering with RGGI. Participating in RGGI is likely to increase electricity imports into the state. Because many of the neighboring states in the PJM electricity region do not participate in RGGI but are powered by resources with a higher carbon intensity, shifting generation from Virginia into these states may result in an increase in emissions. Under this scenario, Virginia suffers the economic consequences of joining RGGI while achieving no progress toward its environmental goals.	discussed elsewhere, the regulation retains exemptions for certain industrial and biomass facilities, and provides for free allowances. Note that RGGI's "CO_2 Emissions from Electric Generation and Imports in the Regional Greenhouse Gas Initiative: 2015 Monitoring Report" demonstrates that carbon emissions in the RGGI are decreasing in intensity; essentially, carbon intensity is being decoupled from electricity generation. See, for example, the response to comment 61. The regulation has been carefully designed to be least restrictive to Virginia business, does not hurt the state's economic competitiveness, retains an industrial exemption, exempts certain forms of biomass, and provides for free allowances.

	While RGGI backers cite the program as a successful cap and trade model, there is little evidence to suggest that the program has been effective at reducing emissions. The Agency Background Document states that a primary advantage to the public of joining RGGI would be "health and welfare benefits associated with controlling carbon pollution." In the Economic Impact Analysis, DPB estimates that the benefits of the state's effort to reduce CO_2 would be between $42-50 million annually between 2021-30. Note that the social costs of carbon are controversial and uncertain, based on long-term assumptions about the damages that may result from increased carbon emissions. As DPB notes, the $42-50 million of CO_2 reduction benefits are global, not Virginia-specific. DPB states that it is "not possible to quantify the Virginia-specific benefits," but this is not accurate; a number of analysts employ the use of "equity weighting" as a means to compare impacts to different regions. EPA and other federal agencies now use this method to develop domestic-only estimates of the social cost of carbon (SC-CO_2). We can estimate the benefits to Virginia similarly. When applied to calculate a Virginia-specific benefit, the mid-range of OPB's estimate of $46 million in SC-$CO_2$ benefits is reduced to a mere $250,000. This is because, at the mid-range of the program (2025), U.S. GDP is projected to be 20.5% of global GDP, and Virginia GDP is 2.7% of U.S. GDP ($46 million X .205 X .027 = $250,000). Divided by Virginia's estimated reductions of 1 million tons per year, this equates to a benefit to Virginia of 25 cents per ton of CO_2 reduction. Viewed in this Virginia-specific manner, it is difficult to see how the program's costs justify its projected benefits. If Virginia does move forward with this proposal, we ask that the regulation be least restrictive to Virginia businesses, does not hurt the state's economic competitiveness, retains an industrial exemption, treats biomass as carbon neutral, and provides for free allowances as opposed to an auction.	
167. Virginia Housing Alliance	We recommend that the 5% allocation be used for energy efficiency services for renters in multifamily housing. Energy efficiency in multifamily housing can help Virginia meet the state's voluntary goal to reduce electricity consumption for commercial and residential buildings by an amount equal to 10% of 2006 consumption by 2020 in addition to reducing carbon pollution for compliance with ED 11. If used for energy efficiency, the allocation will reduce energy use and carbon emissions, reduce the need for added electric generation, improve public health and environmental quality, boost job creation, and preserve affordable housing. We support Virginia's entrance into RGGI and hope that energy efficiency will be regarded as a	DEQ recognizes the value of energy efficiency in multifamily housing as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement renewable energy and energy

	necessary and cost effective tool for Virginia's transition to a clean energy future.	efficiency programs. DMME may, at the appropriate time and in accordance with its regulations and policies, implement a set-aside for energy efficiency in multifamily housing. See the response to comment 51 for more information.
168. WestRock; Covington, Hopewell and West Point mills	While WestRock generates a considerable portion of its own energy at our largest manufacturing facilities, having access to sufficient quantities of utility-provided electricity at reasonable prices is critical for reliability and economic reasons. Some of our mills are entirely energy independent, but others must purchase a significant portion of their electricity from the grid. Our converting operations in Virginia rely heavily on purchased electricity. West Rock spends over $100 million annually on energy in Virginia. As a large electricity consumer in the state that also uses considerable amounts of biomass for energy generation, WestRock will be substantially affected by the proposed rule. We are a member of AF&PA and NCASI, and support the comments submitted by these organizations.	The commenters' concerns are acknowledged. See the responses to comments 65 and 67.
169. WestRock; Covington, Hopewell and West Point mills	The proposed rule states that if biomass comprises 90% or more of the total heat input to an electric generating unit, the unit and its biogenic CO_2 emissions are not regulated. However, if biomass comprises less than 90% of the heat input to an electric generating unit, biogenic CO_2 emissions are regulated and allowances must be remitted for CO_2 emissions from that unit. This treatment of biogenic CO_2 emissions is arbitrary and capricious. Biomass carbon neutrality does not change based on the amount of biomass fired, nor does it change when biomass is co-fired with other fuels. The treatment of CO_2 emissions from the combustion of biomass represents a significant departure from current U.S. federal law, internationally-accepted carbon accounting protocols, and the RGGI model rule. The carbon benefits of biomass are best understood in the context of the entire carbon cycle. As forests grow, CO_2 is removed from the atmosphere through photosynthesis. This CO_2 is converted into organic carbon and stored in woody biomass. Trees release the stored carbon when they die and decay or are combusted. As the biomass releases carbon in the form of CO_2, the carbon cycle is completed. The carbon in biomass will return to the atmosphere regardless of whether it is burned to produce energy, allowed to biodegrade, or lost in a forest fire. Overall, the flow of forest CO_2 is carbon positive when forests are sustainably managed and the forest system remains a net sink of CO_2 from the atmosphere. Carbon stock accounting shows that carbon storage in U.S. forests is	The commenters' discussion of biomass and forest lands is appreciated. As discussed in the response to comment 67, certain biomass facilities will not be subject to the program. RGGI states allow CO_2 budget units that co-fire eligible biomass to deduct CO_2 emissions attributable to the burning of eligible biomass from their compliance obligation in accordance with the RGGI model rule. The regulation has been amended in order to address CHPs with more clarity; see the response to comment 74.

	positive and currently offsets about 12% of total U.S. CO_2 emissions annually. In Virginia, the growth of the state's forests offsets about 14% of the total annual CO_2 emissions. In 2014, the ratio of the forest's annual growth compared to harvest volume was more than 2.1:1 for softwood and 2.2:1 for hardwood. This amounts to an annual surplus of 8.4 million tons of softwood and 14 million tons of hardwood. Biomass residuals from the manufacturing process are used as the primary fuel to power paper mills. If these residuals are landfilled instead of being used as fuel, they would release GHG to the atmosphere, increasing emissions of methane, which has a global warming potential 25 times higher than CO_2. In addition to utilizing residuals, more than 97% of electricity produced by pulp and paper mills is generated through the use of highly efficient CHP. CHP provides energy efficiencies in the range of 50% to 80% at forest products mills. In the 2018 Consolidated Appropriations Act, Congress directs EPA, DOE, and USDA to ensure that federal policy relating to forest bioenergy is consistent across all federal agencies and recognizes the benefits of forest biomass for energy, conservation, and responsible forest management. Several states also have laws recognizing the carbon neutrality of biomass, including Washington and California, and RGGI itself states: "CO_2 emissions from eligible biomass reduce the total CO_2 allowance compliance obligation of the emitting unit. Emissions from eligible biomass should be deducted from the regional total of CO_2 emissions for purposes of calculating emissions from CO_2 budget sources subject to RGGI CO_2 allowance compliance obligations." Biomass CO_2 emissions are either not reported or reported separately or for information purposes in many domestic and international GHG regulations and protocols, including the World Resources Institute/World Business Council for Sustainable Development, and the U.N. Intergovernmental Panel on Climate Change. The board seeks comment on the potential impacts of the rule on forest land preservation. Studies show that recognizing the carbon neutrality of biomass will not negatively impact forest inventories due to the availability of lower cost renewable fuel options. In one such study, the Energy Information Administration (EIA) modeled the potential impact of the Clean Power Plan on the use of biomass for energy generation. In all EIA scenarios, co-firing biomass was projected to decrease under the CPP. In the long term, biomass is not a strategic, large scale, cost-effective alternative to fossil fuel. EIA modeling shows that standalone biomass energy plants are not considered cost competitive. In a recent article, EIA discusses the costs of various electricity generation technologies. The article shows that by 2022, onshore	

	wind will have a lower levelized cost than biomass in all U.S. regions, and solar photovoltaic will be less costly than biomass in some regions. Subsidies will tend to make solar and wind even more competitive. Studies also show that demand for biomass helps prevent forest land from being converted to other uses. A Department of State report shows that demand for forest products will increase forest carbon stocks through landowner investment. Markets for biomass and other forest products stimulate forestland ownership and encourage investment in healthy forest management practices. Farmers and forest owners, as with all business owners, respond to markets and produce more when demand increases. The most significant deforestation threat in the U.S. is forest conversion. Current forest inventories and the net sink are subject to the protections of a state law that caps the amount of biomass that Virginia utilities may use for energy under the Renewable Portfolio Standards program. Virginia Code 23 VAC 56-585.2 states: "Utilities participating in such program shall collectively, either through the installation of new generating facilities, through retrofit of existing facilities or through purchases of electricity from new facilities located in Virginia, use or cause to be used no more than a total of 1.5 million tons per year of green wood chips, bark, sawdust, a tree or any portion of a tree which is used or can be used for lumber and pulp manufacturing by facilities located in Virginia, towards meeting RPS goals, excluding such fuel used at electric generating facilities using wood as fuel prior to January 1, 2007." To the extent the regulation requires the monitoring and reporting of GHG emissions, WestRock urges the board to allow covered facilities to separately calculate and report biogenic and fossil fuel CO_2 emissions as is currently allowed under various established GHG reporting protocols.	
170. WestRock; Covington, Hopewell and West Point mills	The proposal excludes industrial sources from coverage, and WestRock supports this. EO 57 and ED 11, the authorities upon which the proposal is based, limit the scope of the rulemaking to the electric power generation sector. ED 11 states that the DEQ Director shall, in coordination with the Secretary of Natural Resources, "develop a proposed regulation for the State Air Pollution Control Board's consideration to abate, control, or limit CO_2 from electric power facilities." EO 57 is similar. These directives manifest a clear intention to exclude industrial sources. Neither the Economic Impact Assessment, the proposed emissions cap, nor the allowance allocation and price modeling conducted by DEQ and its consultants included emissions from industrial sources. Similarly, the charge given to the Regulatory Advisory Panel did not include industrial	The industrial exemption is discussed in the response to comment 65. Consistent with the RGGI model rule, the proposal has been amended to remove the phrase "owned by an individual facility" in order to ensure that facilities are not be penalized for employing more energy efficient and less polluting generating systems that may be operated by a third party on behalf of the primary facility. The

	sources. Inclusion of industrial sources is unnecessary and cannot be justified on a cost/benefit basis. According to EIA, industrial sources in Virginia emit 11.6 million tons of CO_2 and comprise 11 % of emissions in the state compared to 30% by the electric utility sector, and 43% by the transportation sector. EPA data indicates that GHG emissions from Virginia's industrial sector have decreased 31% since 2000. On the other hand, including industrial sources would cost Virginia businesses $18.9 to $41 million. The exemption is consistent with the intent and scope of the existing RGGI program, which does not regulate emissions from industrial sources. In fact, except for the purposes of reporting, there do not appear to be any industrial sources listed in the RGGI CO_2 Allowance Tracking System's list of regulated sources. Including industrial sources would not only put the state at odds with other RGGI participating states, it would put Virginia industry at a competitive disadvantage. RGGI allowance prices are based on the marginal cost to reduce GHG emissions from the utility sector and do not reflect the ability for industrial sources to reduce emissions. Subjecting industrial facilities to allowance markets that are not reflective of their own marginal costs would be unfair and poor public policy. The exemption should be clarified by adding the definition of electric generating unit found in VA Code 10.1-1328 to distinguish between industrial and electric power facilities as it relates to the term "primary use." Steam and electricity generation at an industrial facility is almost without exception for the primary use of the facility. However, actual flows of electricity may reflect buy-sell contractual arrangements or engineering constraints. It is not uncommon for an industrial CHP facility generating electricity to meet the primary needs of its operation, to export all that it generates and purchase 100% of its electricity needs. For the purposes of determining "primary use of the operation," it is imperative that net electricity flows be considered to ensure that industrial generation is not unintentionally included simply by virtue of contractual arrangements or the nature of its physical connection to the grid. Although WestRock owns its onsite CHP operations, in some cases CHP operations may not be owned by the facility where they are located due to financing arrangements. To promote the use of CHP, DEQ should remove the requirement that fossil fuel power generating unit located at an industrial facility also be owned by the facility.	regulation has been amended in order to address CHPs with more clarity; see the response to comment 74.
171. WestRock; Covington,	If the rule is promulgated, electricity costs in Virginia will rise. DEQ's economic analysis suggests that the impact of this cost increase will be no more 1.1% by 2031.	As discussed in the response to comment 91 and elsewhere, while

Hopewell and West Point mills	However, other studies suggest that the increase in electricity prices may be far more significant. According to a report cited by VMA in its comments, electricity costs in the RGGI states rose by 4.6% between 2007-15, which was 64% higher than the increase in electricity costs in a sampling of 5 non-RGGI states. Increases in the cost of electricity for large consumers like WestRock may make Virginia a less attractive place for investment than neighboring states without carbon reduction mandates. Increases in electricity costs may lead to the use of more imported electricity from areas without CO_2 reduction mandates, which may undermine any environmental improvements from the proposal. We encourage the retention of free allowances and a cap of 34 million tons (or higher), both of which may help moderate the cost of the program. WestRock, the industrial sector, and the utility sector have significantly reduced their GHG emissions through capital investment in more energy efficient energy generation, production processes and the use of lower carbon fuels. This trend is expected to continue both through ongoing capital investment and as part of the commitments made by WestRock and others to meet voluntary GHG reduction goals.	generation shifts are common in a regional electricity market, there are many reasons to believe that the trading program is unlikely to cause generation shifts and, if it does cause some shifting, reasons to doubt those shifts will lead to emissions leakage. The RGGI states have not found leakage to be a problem for the program in 10 years the program has operated. The program is quite modest relative to other cost factors in the regional electricity markets and any shifting is likely to substitute one gas plant for another, meaning the emissions consequences are not significant. The Virginia program includes an allowance allocation approach that will directly counteract any leakage pressure, because in-state generators will be rewarded with valuable allowances when they operate, while generators outside Virginia will not be so rewarded. In addition, vertically integrated utilities can self-schedule their generators to run knowing that they will receive allowances at no cost under the program, offsetting any compliance cost the generators might otherwise incur. For all of these reasons, leakage is not expected to present a problem. DEQ expects to monitor this issue as RGGI has done and will address the issue should it be necessary in a future program review. The cap will be 28 million tons (see comment 37), and the allowances will be provided at no cost.

172. Wild Virginia	Article 1 states that the trading program is "designed to reduce anthropogenic emissions of CO_2." However, if the rule applies only to fossil fuels and not other carbon emitting generation, it cannot achieve its goal. According to EPA, total CO_2 emissions from the burning of woody biomass in the electric power sector was 22,900,000 tons in 2016. The proposal applies only to fossil fuels, not biomass or municipal waste. This would allow Virginia's wood burners to continue polluting without regulation and reward coal-fired power plants that switch to burning wood from forests. Burning wood to produce electricity increases CO_2 and particulate emissions compared with fossil fuels. Besides undermining efforts to expand clean energy sources, burning forests for energy destroys forest ecosystems which are a defense against climate change. The regulation could encourage more biomass generators to be implemented. Westrock operates the world's largest solid bleached sulfate board paper mill in Covington. It is powered by a biomass boiler and a 75 MW steam turbine generator. In 2016, this facility emitted 2,020,927 tons of CO_2. NOVEC's Halifax plant generates 50 MW of energy, sourcing wood and whole trees from a 75-mile radius while claiming that its energy is carbon neutral. The 585 MW Virginia City Hybrid Energy Center co-fires coal with 20% wood. It emitted 3,101,460 tons of CO_2 in 2016. Dominion's 83 MW Pittsylvania station unloads an estimated 3,300 tons of wood daily. Dominion's Altavista plant turns pellets, chips, slash, or whole trees into 51 MW of energy, and in 2015 released 393,183 tons of CO_2. Dominion received regional renewable energy and federal incentives by converting 3 coal-fired plants to burn wood. In 2016, Dominion's conversion from coal to wood in Hopewell and Southampton has more than doubled carbon emissions from those facilities. In 2016, these facilities together emitted 885,063 tons of CO_2. Wood-burning power plants pump about 50% more carbon pollution per megawatt-hour into the atmosphere than coal plants. Combined, Virginia’s wood-pellet manufacturing and wood-burning power plants send more than 5 million tons of CO_2 mostly from forest wood into the atmosphere each year. Power plant carbon pollution warms the climate just as effectively whether it comes from burning trees or fossil fuels, which highlights the critical fallacy of treating biomass power plants as "carbon-neutral." Virginia's plan isn’t unique in ignoring emissions from wood-burning plants. The problem also exists with California's cap-and-trade plan, RGGI, and the E.U. trading program. Much of the emissions reductions claimed by the E.U. come from converting coal plants to burn wood pellets imported from the U.S. and Canada,	See the response to comment 67 for further discussion of biomass.

	then assuming the emissions will be offset by future tree growth. As a result, millions of tons of trees are harvested, pelletized and shipped overseas as fuel. The pellet industry is responsible for logging tens of thousands of forest acres each year. Burning municipal waste is also a large emitter of carbon. For example, the Hampton/NASA Steam Plant released 24,653 tons of carbon in 2016. We request that the regulation include carbon accounting for all large scale industrial emitters of atmospheric carbon, including biomass and solid waste burning energy producing facilities.	
173. World Wildlife Fund on behalf of Eastern Mennonite University Creation Care Council, Emory and Henry College, Hollins University, Lynchburg College, Randolph College, Washington and Lee University	As academic institutions, we understand the importance of reducing carbon pollution and the opportunities provided by clean energy. Colleges and universities are committing to reduce their carbon footprint and increase the use of clean energy, because it is the right thing to do and because it makes business sense. Eleven Virginia colleges and universities have committed to becoming fully carbon neutral no later than 2050. Clean energy allows us to save money, hedge against volatile fossil fuel prices, and lock in predictable energy prices. Market-based carbon-reduction initiatives have been highly effective in reducing electric-sector GHG emissions while fostering economic growth and spurring innovation in clean energy technology. We recognize the importance of strong, stable policies that aim to account for the cost of carbon emissions and provide market certainty, allowing colleges and universities to plan and invest for the future. In Virginia, the proposed carbon reduction program would incentivize investments in renewable energy and energy efficiency--creating good-paying jobs for our graduates and others across the state, attracting world-class students, faculty, and staff to our institutions, improving the well-being of our communities, and making Virginia an even more attractive place to live and work. The regulation will be beneficial for Virginia's economy as a whole. This smart initiative will grow Virginia's nascent clean energy industry, help the state stay competitive, reduce energy costs, and improve the resiliency of our electrical grid. It will help utilities transition to a cleaner electric grid while offering more options for higher education institutions, businesses, and residents to access cost-competitive renewable energy. Our institutions value an affordable, reliable, and clean electricity supply, and we commend the Northam Administration for its commitment to lead Virginia in the transition to a low-carbon economy. We appreciate the many months of compiled research and feedback the previous administration gathered from energy stakeholders to develop forward-thinking carbon reduction measures. Steady carbon reduction policies	Support for the proposal is appreciated. DEQ agrees that the program will benefit the state's economy while reducing carbon pollution and its negative impacts on health and welfare.

	will signal that Virginia is committed to embracing clean energy innovation, allowing institutions like ours to thrive for years to come.	

Comments received during the second public comment period (February 4 through March 6, 2019); references to comments and responses relevant to the initial proposal are identified as "initial comment" and "initial response," comments and responses relevant to the re-proposal are identified as "current comment" and "current response":

Commenter	Comment	Agency response
1. About 246 individual commenters	General support for the proposal was expressed.	Support for the proposal is appreciated.
2. About 116 sponsored comments	Thank you for moving Virginia forward to become the first southern state to cap carbon pollution from power plants. This is an important step in tackling climate change. As people of faith, we know that being good stewards means more than praying for resilience, it means standing up for our planet. Throughout the process to link with RGGI, this carbon rule has demonstrated a shift for the better. The lower cap not only shows Virginia takes environmental issues seriously, but will also help heal our Earth to ensure that our children and families have a healthy place to live. All individuals are integral to a just transition to a clean energy future. This cap will give us an advantage to adapt to all possibilities climate change may bring by including communities most impacted by environmental injustices. We give thanks for our governor’s commitment to climate action and look forward to a policy that works toward the benefit of us all.	Support for the proposal is appreciated.
3. About 246 sponsored emails and 846 petition signatories	I support the Clean Energy Virginia Initiative, a proposed regulation that would establish a program to reduce harmful carbon emissions from Virginia power plants and fight climate change. This program would allow Virginia to trade carbon allowances with 9 other states in RGGI to reduce the amount of emissions coming from power plants. This is the ambitious effort we need to combat climate change and will result in the reduction of an additional 5 million tons of carbon between 2020-2030 compared to initial proposals. I urge the board to	Support for the proposal is appreciated.

	adopt this regulation for the good of our climate, economy and public health in Virginia.	
4. About 1225 petition signatories	The final standard should: 1. Retain the base year emission cap of 28 million tons. 2. Fully cover carbon pollution from biomass facilities, which can be more climate polluting than fossil fuel power plants. Virginia's first ever plan to reduce carbon pollution from power plants shouldn't be weakened by special interests. Exempting biomass makes Virginia's carbon program less effective and gives monopoly utilities like Dominion even more of an unfair economic advantage. 3. More fully articulate plans for EJ considerations for program monitoring and evaluation, and require DEQ to include mitigation measures for any adverse program impacts on vulnerable, environmental justice and under served communities that are identified through DEQ's evaluation of the program. 4. More fully articulate DEQ's plan for increasing participation of environmental justice communities in the review of impacts of the program on those communities. This plan should be consistent with the National Environmental Justice Advisory Council's Model Guidelines for Public Participation.	Support for the proposal is appreciated. The commenters' specific concerns are discussed in further detail below.
5. About 336 sponsored emails	Thank you for moving Virginia forward to become the first southern state to cap carbon pollution from power plants. This is an important step in tackling climate change in the state. Throughout the process to link with RGGI, this carbon rule has only gotten better. The reduced pollution cap will make sure Virginia is on track to address with urgency one of the most pressing problems of our time. Lowering the carbon limit will have additional benefits for the health of our children and families. I also appreciate the increased effort to recognize and work with communities most impacted by environmental injustices. These affected individuals are integral to Virginia's just transition to a clean energy future and I look forward to DEQ conducting robust	Support for the proposal is appreciated.

	conversations with leaders from our most vulnerable neighborhoods. I thank you for your commitment to climate action and look forward to the finalization of these important regulations.	
6. About 474 sponsored emails	I am thrilled to see Virginia making history as the first southern state to link with RGGI, and am writing today to ask that you ensure the final standard to cut Virginia's carbon emissions from power plants is as strong as possible. We are already seeing the results of a warming world in our everyday lives: The sea levels along our coast are rising, our risk of heat-related illnesses is increasing, and the lengthening allergy season is boosting rates of asthma attacks. We have no time to wait. We need to lead the South, and we need to act as soon as possible.	Support for the proposal is appreciated.
7. About 902 petition signatories	As a Virginia resident, I'm writing in support of a strong statewide carbon standard. I support your proposal to put a 28 million ton limit on Virginia's carbon pollution next year and your plan to subsequently reduce the amount of harmful pollution emitted by 3% annually. A strong carbon standard will grow our clean energy economy, make our air cleaner, save Virginians money on electric bills, and hold big polluters accountable through a cap-and-invest model. I oppose any loopholes that let polluters burn trees for electricity. Virginians are ready for strong climate action, and we, along with future generations, are counting on you to do the right thing for both the climate and our forests.	Support for the proposal is appreciated. The commenter's specific concerns about biomass are discussed in further detail below.
8. About 165 individual commenters	General opposition to the proposal was expressed.	The commenters' concerns are recognized.
9. 98 petition signatories	On behalf of the Pulp and Paper Resources Council, a grassroots labor organization led by hourly employees advocating for the U.S. forest products industry that supports policies that encourage economic growth, abundant and sustainable fiber supply, and sensible science-based environmental policies, we are writing to oppose the re-proposed regulation. We request that the	The commenters' concerns are recognized. The applicability of non-fossil fuels such as biomass is discussed in greater detail under current comments 24 and 40.

	regulation be revised to make it clear that it only regulated GHG from fossil fuel combustion, and that new and existing industrial facilities are clearly exempt from any allowance obligations. The U.S. forest products industry is vitally important to our nation's economy, employing about 950,000 people. We rank among the top 10 manufacturers in 45 states, and represent 4% of the total U.S. manufacturing gross domestic product. The WestRock Paper Mill is a significant economic driver for our communities, providing over 500 jobs and supporting over $100M in local investment. If care is not taken, the regulation could have a serious and negative impact on the mill. One of our chief concerns is the treatment of energy from biomass, which is crucial to the mill's operation. We encourage DEQ to include a clear and specific exemption for CO2 from non-fossil fuel sources such as biomass. The regulation should also be amended to allow new industrial facilities to qualify for an exemption, as well as existing facilities, to allow for continued growth.	
10. 2 individual commenters	Entering RGGI would require the state's utilities to pay a carbon tax on their fossil fuel power plants and to reduce operation of those plants. This cost would be passed on to consumers and could cost ratepayers of Dominion Energy Virginia $3.3-5.9 billion over the first decade, according to an SCC staff estimate. This is just a backdoor tax and does nothing to solve any problem related to climate change, sea level rise or clean air. I oppose this cap and trade bill that will benefit those selling the credits by picking our pockets and would hurt those who are already struggling on fixed incomes and the poor.	The definition of "tax" is well established in state and federal law. The purpose of the regulation is to control and abate carbon air pollution, not to generate revenue. Rather than impose a tax, the regulation requires the issuance of allowances by the department to CO_2 budget units, which are then traded within the confines of a consignment auction. No money is generated for or sent to the state. Costs to consumers will be minimal, if not lowered; see the initial response to initial comment 61. DEQ reviewed the SCC analysis, and finds a number of issues with its assumptions, as discussed in the current response to current comment 20.
11. 3Degrees	3Degrees strongly recommends that DEQ include a voluntary renewable energy market set-aside in order to foster private demand for renewable energy in Virginia. Private demand for	DEQ recognizes the value of the voluntary renewable energy market as an important tool in reducing carbon pollution but has decided not to implement a separate voluntary

	renewable energy is evidenced by the success of renewable energy programs offered by both IOUs, the introduction of new renewable energy purchase options such as community solar, and the growing demand from corporate purchasing of renewable energy in the form of Green Tariffs that directly support renewable energy generation. These purchasing options are often pursued by customers who are motivated to address climate change by supporting local renewable energy development and accelerating grid decarbonization. The proposal does not provide any avenues for voluntary market customers to ensure that their renewable energy purchase contributes to emissions reductions beyond regulation. As such, a customer purchasing renewable energy generation from Virginia once the program is in place will no longer be able to credibly claim that this renewable energy leads to an avoided emissions benefit on the grid beyond what is required by the program. In order to ensure that the renewable energy contributes to emissions reductions beyond regulation, carbon allowances must be paired with the renewable energy in an amount equal to the avoided CO_2 emissions associated with the generation of the renewable energy. The Voluntary Renewable Energy Market Set-aside allows allowances to be paired with voluntary market renewable energy at no added cost to the voluntary market. In order to support private investments in renewable energy, 7 of the existing RGGI states and California have all implemented a renewable energy set-aside. RGGI provides language for a renewable energy set-aside mechanism in § XX-5.3(l) of the RGGI Model Rule. This mechanism sets aside roughly 2% of the total allowances in a state in any given year and makes them available for free to be paired with voluntary renewable energy purchases in the state.	renewable energy set-aside. The structure of the general 5% set-aside will be under the purview of DMME, which is the appropriate state agency to implement renewable energy and energy efficiency programs. DMME may, at the appropriate time and in accordance with its regulations and policies, seek to implement a voluntary renewable energy market set-aside or its equivalent. However DMME structures the set-aside, it is important to bear in mind that energy efficiency will be an important tool in the control of carbon pollution. Energy efficiency programs reduce in-state demand, which results in the reduction of carbon pollution and the control of potential leakage. DEQ expects that opportunities for voluntary renewable energy projects will be encouraged as a result of this initiative. Although the RGGI model rule does offer offsets, only a single offset project has been implemented in the RGGI region thus far. Given the uncertainty of any benefits associated with a complex offset program, DEQ is not, at this time, proposing to implement offsets; see current response to current comment 25.

	Many local projects risk losing voluntary market support if the renewable energy set-aside is not included in the program. 3Degrees has worked closely with a number of small-scale and residential solar and wind projects in Virginia, supporting the projects by facilitating the sale of the premium RECs from these projects for use by voluntary customers. Through these transactions and other sales, 3Degrees has purchased and facilitated voluntary customer purchases of RECs representing over 340,000 MWh of Virginia-sited renewable energy since 2009. From our experience, the voluntary market is generally providing funding for projects that would not receive funding from compliance REC markets, and often providing more funding per MWh. In some cases the projects would be not financially viable without this revenue stream. If the voluntary renewable energy set-aside is not included in the program, there would no longer be an opportunity for 3Degrees to support projects of this kind in Virginia. 3Degrees urges DEQ to continue to encourage private capital investing in renewable energy in Virginia by implementing the set-aside mechanism. The renewable energy set-aside will lead to continued voluntary demand in Virginia for instate and RGGI-located generation and allow the generation to continue to be eligible for Green-e Energy certification. In addition to the avoided emissions benefit being critically important in the private investment decisions of many voluntary purchasers, it is also a requirement of Green-e Energy certification. Green-e Energy certifies tens of millions of MWh of renewable energy every year, including renewable energy generated in Virginia, and, as the only certification for the voluntary renewable energy market in the U.S., is the de facto	

	standard for private purchasing of renewable energy. Where states have introduced cap-and-trade regulation without a renewable energy set-aside, Green-e has required that Green-e Energy certified renewable energy be matched with purchased allowances equal to the generation's emissions reduction benefit on the grid. This adds a significant cost to renewable energy, such that they generally exit the Green-e/voluntary market. Where private purchasing of allowances is not possible, as is the case in RGGI states, there are no avenues to reclaim the avoided emissions benefit. 3Degrees encourages DEQ to include § XX-10 of the RGGI Model Rule in Virginia regulation. This will allow the issuance CO_2 emissions offset projects from Virginia-sited projects. High-quality carbon offsets can be an important tool for a successful and economic cap-and-trade program. Carbon offsets will be an important tool for achieving emissions reductions cost effectively while encouraging and stimulating innovative climate solutions within Virginia. CO_2 emissions offset projects can address emissions reductions in uncapped sectors and provide other co-benefits to the state.	
12. Alliance for Industrial Efficiency	We commend DEQ for recognizing the most economically efficient means for reducing CO_2 emissions in the regulation: incenting energy efficiency. We also commend DEQ for exempting certain industrial CHP and WHP units, which rightly recognizes the emissions benefits offered by these systems. The Alliance offers recommendations that further recognize the multiple economic, energy efficiency, and GHG reduction benefits that CHP and WHP systems provide: 1. eliminate ownership language in the applicability guidelines; 2. define "primary use" and add system efficiency requirements to the applicability guidelines; 3. add "or facilities" to account for district energy systems in the applicability guidelines; 4. add a	Support for the proposal is appreciated. 1. No further change is needed to account for district energy systems. These facilities must be "located or adjacent to" whether a single facility or multiple facilities. 2. This change is not needed because they are already exempt. It doesn't matter what particular type of power is involved--as long as they meet the requirements of this provision, an industrial facility is exempt. 3. As discussed in the current response to current comment 11 and elsewhere, DMME will determine how the set-aside is allocated.

	thermal energy use exemption; 5. explicitly state CHP and WHP projects are eligible for set aside funds. We greatly appreciate DEQ accepting our recommendations for both eliminating ownership language in the applicability guidelines, and defining "primary use" in the applicability guidelines, as they provide important clarity for potential CHP hosts. Furthermore, we urge DEQ to consider 3 other recommendations which will further encourage greater use of emissions-reducing CHP and WHP systems in Virginia in a way that is consistent with the goal in Virginia's 2018 Energy Plan to deploy 750 MW of CHP by 2030: 1. Add "or facilities" to account for district energy systems in the applicability guidelines. District energy systems capture and reuse waste heat, distributing it through underground piping to provide energy services to neighboring buildings. As written, we are concerned that the proposed rules limit the exemption to CHP that produces heat and electricity for a single building. Instead, we recommend clarifying that the exemption is open to multiple facilities serviced by a CHP system. 2. Add a thermal energy use exemption to the regulation. The hallmark of a CHP system is that it produces both heat and electricity from a single fuel source. Without providing a thermal exemption, the proposed regulation undervalues the full energy output of these systems and the emissions reduction they deliver. 3. Explicitly state CHP and WHP projects are eligible for set aside funds. We commend DEQ for including a set aside for air pollution abatement, such as energy efficiency programs, and we encourage DEQ to add language to the proposed regulation clarifying that such projects are eligible for set aside funds. This	

	will help ensure that potential project hosts are aware of the opportunity. Explicitly clarifying in the regulation that set-aside funds are available for CHP and WHP projects (which are already included under the definition of "energy efficiency programs") would eliminate confusion surrounding eligible projects and would encourage additional CHP and WHP deployment.	
13. American Council for an Energy-Efficient Economy (ACEEE)	Energy efficiency is an important strategy to reduce emissions in the electric power sector. As it lowers electricity use, energy efficiency avoids emissions of CO_2 and other harmful pollutants, often at lowest cost. ACEEE estimates that by implementing energy efficiency programs and policies, Virginia could exceed the emissions reductions required through the proposal in 2030. In an allowance trading program, CO_2 reductions from energy efficiency will help sources meet the state's CO_2 emissions limit by reducing electricity production. These reductions in energy consumption can lead to big gains in public health. Reducing annual electricity use by 15% nationwide would prevent nearly 30,000 asthma episodes each year and save Americans up to $20 billion through avoided health harms annually. Virginia ranked among the top 15 states that would see the largest avoided health harms from investing in energy efficiency and thereby reducing emissions in the electric power sector. While supplying affordable, reliable electricity to residents and businesses, energy efficiency is also a lowest-cost option to reduce CO_2 emissions. Research shows that at a range of about 2-5 cents per kWh and an average of 2.8 cents per kWh, energy efficiency programs cost 2-3 times less than generating power from traditional sources. States that invest in energy efficiency can reduce emissions at a lower cost than is possible through other options. However, this does not mean that	DEQ recognizes the value of energy efficiency as an important tool in reducing carbon pollution; however, the structure of the set-aside and to what programs the allowances will be allocated will be under the purview of DMME, which is the appropriate state agency to implement the set-aside. DMME may, at the appropriate time and in accordance with its regulations and policies, implement an energy efficiency set-aside as described by the commenter. The set-aside will be 5% in the early stages of the program; the set-aside may be revised at a later date as the state gains experience with the program and with the program DMME develops. In particular, the commenter notes the health impacts associated with changes in air quality due to RGGI. Virginia's own analyses of health benefits corroborate the RGGI studies, as discussed in initial response to initial comment 61. Most recently in November 2018, for the purpose of this re-proposal, an analysis using the COBRA model was run in order to determine the health benefits of emission reductions from implementation of this regulation. Again, this analysis showed a significant health benefit, with totals for the years 2025, 2028 and 2030 between $18M - $41M. DEQ agrees that there are advantages to both the consignment and direct auction approaches; at this time, Virginia is relying on a consignment approach in order to ensure that the program will be implemented in compliance with Virginia law.

	energy efficiency deployment will necessarily increase, even when it is more cost-effective than other CO_2 reduction options. Current market and regulatory barriers to investment in energy efficiency can hinder its use as a compliance strategy in a trading program. DEQ should consider several strategies to encourage deployment of energy efficiency to help reduce energy use, energy bills, and energy-related emissions. ACEEE supports the role of energy efficiency in the proposal and recommends that the state further encourage and support the use of energy efficiency in an allowance trading program. DMME will be allocated 5.0% of the base or adjusted budget allowances to be consigned to auction by the holder of a public contract with DMME to assist in the CO_2, by implementing programs that lower base and peak electricity demand and reduce the allowances to be budgeted for energy efficiency programs. ACEEE supports this provision, and recommends that DMME use this set-aside to invest in energy efficiency projects that save energy and reduce utility costs for public and private sectors alike. While investing in energy efficiency can reduce emissions at a lower cost than is possible through other options, there are also significant ancillary benefits, such as improving air quality and human health, and enhancing community resilience. An analysis by Abt Associates assessed the public health impacts associated with changes in air quality due to RGGI implementation from 2009 to 2014. The results estimate the program avoided 300-830 premature deaths, realized $5.7 billion in health savings and other benefits, and avoided more than 8,200 asthma attacks. The analysis highlights the impact of energy efficiency investments contributing to the high emission reductions and health gains in the start of the analysis period and	

	targeting peak demand periods with high emissions. These findings underscore the significant health gains that can be achieved through allowance trading programs to combat climate change that include investments in energy efficiency. Energy efficiency is also an ideal component of any resilience strategy because it aids emergency response and recovery, helps with climate change adaptation and mitigation, and provides social and economic benefits. By reducing energy demand in buildings, improving transportation efficiency, and deploying CHP, communities can experience important resilience benefits that reduce vulnerability and increase capacity to cope with the impacts of climate change. ACEEE recommends the state recognize these multiple benefits by investing auction revenue into energy efficiency programs. Proceeds from a revenue-raising auction can be reinvested in energy efficiency to further reduce emissions, as seen in the states participating in RGGI where energy efficiency accounted for 58% of cumulative investments through 2016. RGGI states have invested more than half of the $3 billion in revenue proceeds over the life of the program to fund a variety of energy efficiency programs. These investments are augmented by complementary policies in RGGI states, including energy efficiency resource standards, building energy codes, state government-led initiatives, transportation and land-use policies, and appliance standards. The emissions reductions and economic benefits of energy efficiency can be amplified by implementing energy efficiency policies alongside an allowance trading program. ACEEE recommends Virginia look to states participating in RGGI as examples of how to increase investment in energy efficiency. Investments from RGGI reach a variety of customer types, including	

	businesses, municipalities, and low-income communities. States invest much of the auction revenue in utility energy efficiency programs, state green banks, and/or programs run by state energy offices offering incentives, technical support, and financing. Further, ACEEE recommends that Virginia utilities align their spending of allowance revenues to complement utility-funded energy efficiency programs set forth over the next decade. Utilities could design energy efficiency programs to deliver new measures and serve new customer segments. In addition, utilities could offer measures that aim to mitigate indoor health and safety risks while saving energy for customers. Investing in addressing health and safety measures can improve the health of residents while increasing participation in weatherization programs. Investing revenues in energy efficiency drives considerable energy savings and emissions reductions, helping to cut emissions beyond what a carbon price alone could achieve. In addition, these energy savings reduce the cost of carbon pricing to households and businesses.	
14. American Electric Power/Appalachian Power Company (AEP/APCO)	Regulation of CO_2 emissions should not be pursued by individual states. EPA is currently evaluating a national policy for reducing CO_2 emissions from fossil fired generating units and has existing regulations to monitor and report CO_2 emissions. A patchwork of individual state regulations in front of this federal plan may hamper the state through placing added hardship on sources within the state should the state's requirements be more stringent than the federal plan. Where future state regulatory actions will differ from other states or the federal to be made that may be less effective in reduction of emissions and costlier than if the compliance plan can be based on a uniform set of rules among the states. This state-specific proposal imposes additional requirements on APCO and will significantly increase compliance	DEQ agrees that climate change should be addressed through a coherent national program. However, in the absence of a coherent national program, the Commonwealth is well within its authority to address air pollution within its borders. Linking to RGGI is not a "go it alone" approach; it will enable Virginia to leverage its pollution reduction efforts with a well-established, proven effective interstate program. Note that the proposed ACE program is for improving efficiencies, and is not an explicit emissions trading program. It is unlikely that it will conflict with existing emissions trading programs. Indeed, participating in RGGI may give Virginia facilities an advantage in meeting GHG controls from other GHG reduction programs sooner than had they not participated. RGGI gives sources flexibility in compliance, and participation in ACE can only help them comply with RGGI.

	costs to our operation without yielding any additional reduction in CO_2. Those additional costs will be borne by the industrial, commercial and residential customers within the state. Additional costs to businesses under the proposal will put Virginia at a relative disadvantage to other states for business development with no environmental benefit. The total emissions from the state are estimated to be about 1% of the nation's total emissions and less than 0.01% of the world's annual emissions (based on 2015 data from EIA and IEA). Reductions of CO_2 by local sources will not change the local ambient concentrations since this gas is a well mixed parameter of the atmosphere. In reality, a total elimination of CO_2 emissions from all sources in Virginia will have no significant effect on the global concentration. Of particular concern is the lower emission cap of 28 million tons. The proposed reduction of the emission cap will increase the stringency of the program, thereby increasing the cost of compliance, which will be borne by Virginia ratepayers. The board has not provided adequate information to support the establishment of a lower emission cap. As evidenced by Virginia's small contribution to global GHG emissions, the proposed reduced cap appears to be both arbitrary and capricious. The current control technology for capturing CO_2 remains in the developmental stage. Other administrative items of note include the need to maintain a new database for GHG emission reporting, operating and maintaining a new database and software program for allowance trading, and maintaining records associated with CO_2 emissions and accompanying reports for 10 years. The CO_2 emission reporting is required on a quarterly basis. The records for CO_2 emissions are already reported in two other programs. The	The new 28 million ton cap is a more realistic reflection of emissions, and will result in a more realistic emissions reduction path. Yet this more stringent cap has been demonstrated to not create significant additional costs to generators or consumers; see, for example, initial comment 61. It is unclear how maintaining records for this emissions trading program will be significantly different from any other emissions trading program implemented in Virginia. Because Virginia is linking to an existing trading program, it is not anticipated that any new Virginia-specific database will be needed. The Commonwealth is expected to use the RGGI COATS system to track allowances and emissions. The COATS system obtains CO2 emissions data from the EPA CAMD data system and therefore no redundant emissions reporting will be needed to support the RGGI process. DEQ does not expect any additional data recording or tracking requirements of the program to be overly burdensome to the regulated sources.

	CO_2 is reported into CAMD quarterly as the diluent for measurement of other parameters for Title IV and CSAPR and is reported annually along with other GHG parameters separately as required by the GHG rule (40 CFR Part 98). The federal program for GHG emission reporting requires a certified inventory to be submitted annually for each source at the facility. CO_2 is also used as a diluent for other Title IV related reporting and is reported into CAMD quarterly. This proposal will require additional reporting into a separate database operated by RGGI. The database operated by RGGI and the allowance tracking system is outside the current system utilized for Title IV and CSAPR databases. The facilities will have to maintain a separate account for the allowances and track progress in separate systems. The proposed rule does not detail the cap and trade program mechanics to allow adequate review and comment on the impacts and associated costs of this program to either the affected sources or the customers within Virginia. All other programs require records to be maintained for 2 years for Title IV and 5 years for Title V and CSAPR. Additional storage capacity for maintaining emission records are needed to satisfy this proposal. In summary, the current proposal will result in significant additional costs to the Virginia ratepayers but will not lower GHG and could result in premature retirement of Virginia generating units. The rule would discourage development of new fossil generation in Virginia, forgoing potential employment, economic and tax base benefits associated with such projects. The development and availability of CO_2 controls are in the early stages of development and are not proven on any industrial scale operations. As such, compliance with the proposed regulation will require curtailment of fossil-fired generation within Virginia, requiring other sources to be used, at a higher cost and	

	possibly outside Virginia's borders. Therefore, AEP recommends that the board not move forward on this proposal.	
15. Calpine	As expressed in our April 2018 comments, Calpine continues to strongly support Virginia's carbon cap-and trade regulation. We continue to support the implementation of a program in Virginia that places a clear price on carbon emissions and that allows for trading with the RGGI market. Calpine supports cap-and-trade programs that place a clear price on carbon emissions from both new and existing power generators in a way that allows such a price to be reflected in wholesale power prices and that are designed and administered in a way that minimizes market distortions. Virginia's program can be finalized to achieve that objective, but it is important for DEQ to finalize an allowance budget at a level that will result in meaningful carbon reductions by incentivizing environmentally-efficient dispatch of power generation facilities. For these reasons, we support the re-proposed regulation including the proposed emissions budget of 28 million tons in 2020. Recognizing the historically low allowance prices in the RGGI region and the fact that Virginia's linkage with RGGI will significantly expand the size of the RGGI market, the budget must be based on reasonable assumptions about the expected generation mix in Virginia given market dynamics. We support the need for the reduced emissions budget based on the revised projections related to electricity demand, lower natural gas prices, and the projected generation from renewable resources. Overall, Calpine supports additional states participating in the RGGI program to support a broader, more flexible emissions market, helping to improve market competitiveness and trading efficiency while helping to lower carbon abatement costs.	Support for the proposal is appreciated, particularly support for the emissions cap.
16. Center for Resource	The RGGI Model Rule includes an optional VRE set-aside provision,	As discussed in the response to comment 11, DEQ recognizes the value of the

Solutions	which a state regulatory agency may use to allocate a certain number of tons from the CO_2 budget to a VRE set-aside account for each control period based on voluntary purchases of renewable energy generation located within RGGI. Under an emissions cap, renewable energy generation reduces emissions but does not affect the cap. As a result, the emissions reductions from renewable energy generation driven by voluntary and corporate purchases can be reversed if those actions are not considered in the design of the cap-and-trade program. In other words, VRE can simply create space under the cap for more emissions. Without a VRE set-aside, there can be no verifiable avoided grid emissions associated with renewable energy purchases, and voluntary action may just reduce compliance obligations for regulated entities. For this reason, voluntary sales of renewable energy generated within RGGI to customers in a RGGI state without a VRE set-aside are not eligible for Green-e certification. If Virginia does not adopt a VRE set-aside, then Virginia customers may be restricted from buying certified renewable energy from facilities located within RGGI, and renewable energy providers in Virginia may see reduced in-state demand in the voluntary market. Furthermore, VRE purchasers often consider geographic location when evaluating renewable energy purchasing options; forcing them to choose between their proximity to the renewable energy they purchase and the avoided emissions value of this generation presents an unnecessary obstacle to impactful procurement. A cap on emissions from the power sector not only affects the claims associated with the emissions benefits of VRE but also impacts voluntary demand for and investment in renewable energy. Companies and individuals that purchase and invest in renewable energy voluntarily often do	voluntary renewable energy market as an important tool in reducing carbon pollution but has decided not to implement a separate voluntary renewable energy set-aside. The structure of the 5% set-aside will be under the purview of DMME.

	so in order to take steps beyond the actions attributable to state or federal policy. In this way, their investment has an incremental impact, particularly with respect to GHG emissions. This difference is referred to as "regulatory surplus." However, where renewable energy sold into the voluntary market does not have this effect, and instead only serves to help regulated entities comply with existing regulatory requirements, this production cannot be considered surplus, therefore undermining demand for VRE. Where voluntary demand for renewable energy is limited, by extension, so is the overall development of renewable energy and the associated emissions reductions. Regulatory surplus is critical to sustaining clear voluntary claims and has been helpful in sustaining voluntary investment in renewable energy beyond what is already required by regulation in the RGGI region. Because a set-aside mechanism preserves regulatory surplus for VRE, it can help leverage private capital to drive renewable energy generation in excess of state mandates. In the last 5 years, there have been approximately 3.8 million MWh of Green-e certified sales to retail customers in Virginia. In 2017, this included nearly 700,000 MWh sold to about 35,000 individual customers. This shows considerable voluntary demand for renewable energy in the state. If Virginia does not include a VRE set-aside, it is unlikely that renewable energy from any RGGI state could be sold in a Green-e certified product to customers in Virginia. Adoption of a VRE set-aside would allow this demand to continue to be met by resources in Virginia, allowing the state to capture private investment dollars that could otherwise go elsewhere. In other words, the implementation of a VRE set-aside would remove a significant	

	barrier to investment in and development of renewable energy in Virginia beyond that which is mandated by RPS regulations, and this could lead to increased revenue resulting from growing voluntary and corporate participation in renewable energy markets.	
17. Ceres on behalf of Adobe, eBay Inc., Gap Inc., IKEA USA, JLL, LinkedIn, Mars Inc., Microsoft, Nestlé USA, Outdoor Industry Association, Salesforce.com Inc., Starbucks Corporation, Unilever, and Worthen Industries	On behalf of several large businesses with operations and employees throughout Virginia and across the U.S., we write to express our strong support for the re-proposed regulation. Companies across Virginia are setting goals to reduce their GHG emissions and increase their use of clean energy because they know it is the right thing to do for both the environment and their bottom lines. More than 43 major Virginia companies have set goals to power their operations with 100% renewable energy, and many more have set other goals to scale up renewables, improve the energy efficiency of their facilities, and reduce their carbon footprint. Market-based programs such as RGGI have proven successful in decarbonizing the electricity grid while scaling up clean energy resources and providing enormous net benefits to the economy. Virginia's participation in RGGI is supported by many companies with major operations in the state, and will allow Virginians to reap the benefits of cleaner air, a more resilient electricity grid, reduced exposure to high electric fuel prices, and more local clean energy jobs. It would also make Virginia more attractive to innovative, forward-thinking companies and their products and services. We appreciate the stronger baseline of 28 million tons of CO_2, as it will be more in line with the state's actual 2020 emissions. We also encourage Virginia to include power facilities that co-fire with woody biomass under the emissions cap, as such facilities can be a significant source of carbon pollution that would otherwise go unaccounted for. We encourage adoption of the many renewable energy and energy	Support for the proposal is appreciated, especially from CERES members with significant operations in Virginia. DEQ agrees that energy efficiency is an important tool in the control of carbon pollution. See the current responses to current comments 24 and 40 for further discussion of biomass.

	efficiency technologies that will help keep electricity costs down. Renewable energy technologies are increasingly more cost-effective than fossil fuel sources. Meanwhile, energy efficiency consistently remains one of our least expensive resource options. As has been proven in RGGI states, concurrent investment in energy efficiency can reduce electricity prices even further.	
18. Dominion	Virginia linking to the RGGI program does not reduce emissions regionally. DEQ's modeling results indicate that Virginia entering the RGGI program in 2020 with a statewide emissions cap at the reduced levels proposed and imposing RGGI's approximate 3% per year cap reduction to achieve a 30% emission reduction over 2020-2030 does not result in overall carbon emission reductions in the Eastern Interconnect (EI) or PJM regions by 2030. The analysis shows, when comparing emissions in the reference case where Virginia is not linked to RGGI with emissions in the policy case where Virginia is linked to RGGI, that emissions reductions achieved in Virginia and the RGGI program are largely offset by emissions increases in the non-RGGI portions of the EI and PJM regions. Cumulatively, over 2021-2030, emissions in the portion of the PJM region subject to RGGI are reduced by about 45 million tons, but increase by the same amount in the non-RGGI portion of PJM. In the EI region, as a whole, cumulative emissions over the 10-year period are only reduced by 3 million tons, with about a 57-million tons reduction in the RGGI portion of the EI offset by a 54-million ton increase in the remainder of the EI outside of the RGGI program. Since modeling information provided for incremental generation was confined to the RGGI states and not provided for states outside of the RGGI region, it is difficult to determine whether the minimal carbon emission reductions modeled for the entire EI region were the result of the RGGI program or the result of "natural" retirement of older	DEQ's modeling results demonstrate the proposal will be effective at reducing CO_2 emissions from Virginia's electricity sector. While the Commonwealth cannot control the actions of other states in the region, a number of other governors have taken or appear poised to take steps to reduce emissions from the power sector in the region. It is also likely that the federal government will move to reduce emissions from the electricity sector during the time horizon contemplated by the proposal. Thus, it is difficult to predict what emissions trends will be outside of Virginia and outside of the RGGI states. DEQ notes that the proposal will allocate emissions allowances on an updating, output basis. This means that the more electricity generated by a covered unit, the more allowances it will receive under the program. The program thus rewards the generation of electricity within Virginia, while generators outside Virginia will have no such incentive. Reputable independent analyses have tended to show that updating, output-based allocation is an effective method of deterring the shifting of generation from an area with an emissions cap to an area without such a cap. The analysis completed for DEQ by ICF does not factor in this allocation approach and therefore it likely overstates the extent to which generation will shift to areas outside of Virginia. Regardless of how the commenter chooses to characterize emissions reductions achieved by RGGI, reductions will be achieved both within the RGGI program and within Virginia borders due to the downward moving cap. These reductions are essential at the

	coal plants in the region. DEQ's modeling did not include New Jersey joining RGGI in its policy case. New Jersey plans to rejoin RGGI and, like Virginia, New Jersey has proposed a regulation to begin implementing the RGGI model rule beginning in 2020. Their modeling, which includes both New Jersey and Virginia in RGGI, shows generally similar results with emission reductions achieved in the RGGI states mostly offset by emissions increases outside of the region. The modeling showed only about a 0.6% reduction in emissions across the entire PJM region comparing the policy case to the reference case.	cooperative state level in the absence of any federal leadership. Virginia faces some of the most severe impacts in the country related to climate change, and leadership in this area is essential.
19. Dominion	If Virginia joins RGGI, the projected increase in emissions in states outside of the RGGI program suggests emissions leakage will occur as a result of increased energy imports from more carbon-intensive energy sources in states that are not part of the RGGI program. This is borne out by modeling results that show significant increases in power imports into Virginia. With Virginia linked to RGGI, net energy imports into Virginia by 2030 increase by about 28% with approximately 8.2% of total net generation from imported power under the case with no carbon regulations in Virginia to about 10.5% of total net generation from imported power for the case with Virginia linked to RGGI. DEQ's latest proposal includes an updating output-based allowance allocation approach that it believes will incentivize utilization of NGCC resources as a means to counter leakage. Under this approach, allowances are allocated annually to affected generating units based on generation output (MWh of operation) averaged over the previous 3-year period. However, while an updating output-based allocation approach may be more favorable to NGCC units since they emit much less carbon per unit of output, it does not address	The increase of energy imports to Virginia projected in the IPM modeling results is overstated. The difference between 8.2% of total net generation to about 10.5% is actually a 2.3% difference, not a 28% increase. Even this 2% increase in imports may be overstated because the IPM modeling conservatively did not take into account the proposed updating output-based allocation method. Under this updating output-based allocation, the more electricity generated by a covered unit, the more allowances it will receive under the program. The program thus rewards the generation of electricity within Virginia, while generators outside Virginia will have no such incentive. Contrary to the comment's assessment, reputable independent analyses have tended to show that updating, output-based allocation is an effective method of deterring the shifting of generation from an area with an emissions cap to an area without such a cap. For example, independent research conducted by the Regional Economic Studies Institute and Resources for the Future and released in August 2017, concluded that updating, output-based allocation can be an effective tool to counter incentives to shift generation to areas not covered by an emissions cap. (See "Using Production Incentives to Avoid Emissions Leakage," 2017 (Dallas Burtraw, Karen Palmer, Anthony Paul and Hang Yin), *Energy Economics,* 68: 45-56 and

	leakage. Natural gas-fired units in Virginia will still be subject to a CO_2 cost adder that units outside of the carbon constrained program will not be subject to. Thus, the effect of RGGI-equivalent reduction requirements in Virginia is likely to limit the dispatch of highly efficient and lower emitting NGCC facilities in Virginia and encourage the dispatch of higher emitting resources and increased emissions in neighboring states outside of the RGGI region. This will increase the carbon intensity of the electricity used by Virginia customers. Virginia's carbon footprint from electric power generation is already significantly cleaner than many of its neighboring states and PJM as a whole. With the federal CPP currently stayed and proposed to be replaced with the ACE rule, few states outside of the RGGI program and along the west coast have or are proceeding with definitive carbon regulations. This includes all of the remaining states that are part of PJM (except Maryland and Delaware which are part of RGGI). In the PJM Interconnect, units are dispatched based on replacement cost of the variable components required to run the unit. This is known as economic dispatch. The variable components include fuel and emission allowances, such as RGGI allowances. The replacement cost changes are based on the market value of the type of fuel used in a unit and the market value of the emission allowance. Dominion does not choose when to operate its units, but instead, units are called upon by PJM. If Dominion units are above the target price for the day, other units, generally less controlled and more carbon intensive, will be called upon and operated to meet the PJM load demand due to their ability to operate at a lower cost. PJM does not take environmental impact into account when dispatching units. When Virginia units bid into the electric market, their bids will incorporate a RGGI-based	https://www.rff.org/publications/testimony-and-public-comments/comments-for-virginia-on-the-co2-budget-trading-program/. The commenter correctly notes that the value of the emissions allowances are one factor in bids into the PJM wholesale market. The commenter neglects to consider that under the proposal regulated units will receive allowances from the state at no cost. To the extent a free allowance adds no cost because it is acquired at no cost, there is no added variable cost to add to unit's bids into the PJM wholesale market. Similarly, to the extent updating, output-based allocation results in more free allowances simply by generating more means the allowance allocation functions as a subsidy for VA units earning the extra allowances. Importantly, the IPM modeling did not analyze the effect of allowance allocation and should be viewed as a very conservative take on potential shifts in electricity production. Numerous monitoring, review and compliance checks are already built into the RGGI program as well as in Virginia law. See the initial response to initial comment 91 and the current response to current comment 31 for a discussion of leakage. The updating output-based allocation is expected to encourage generation in the state, rather than discourage it. Note that carbon intensity in the region is declining, not increasing; see, for example, current comments 31 and 46.

	carbon cost that bids from other PJM resources outside of the RGGI program will not have. As a result, Virginia generators will be economically disadvantaged, and increased imports will be dispatched into Virginia. Coupled with the possible forced retirement and curtailment of fossil fuel-fired resources, this raises reliability concerns with increased dependence on out-of-state, more carbon-intensive power.	
20. Dominion	DEQ's consultant, the Analysis Group, analyzed monthly electricity bills for Virginia residential, commercial and industrial consumers. The results, which were summarized in a presentation posted on DEQ's website, projects that electricity bills will be lower with Virginia participating in RGGI. According to the study, higher firm power prices under the cap-and-trade program are more than offset by projected revenue from the sale of CO_2 emission allowances that are passed (by assumption) on to consumers. The Department of Planning and Budget (DPB) reviewed the study and largely concluded that it lacked the resources to verify the model or its assumptions. The SCC reviewed the DEQ cost impact study and performed its own analysis. SCC estimates the total cost to Dominion customers to be $3.3 billion for Virginia linking to RGGI or $5.9 billion for Virginia joining RGGI over 2020-2030. Based on SCC analysis, typical residential customer bills are estimated to increase by $7-12 per month over the 2019-2043 study period, with an average $6.95 per month with Virginia linking to RGGI . These costs are significantly higher than the minimal impact estimated by DEQ. SCC states that RGGI compliance increases the dispatch cost of fossil generation making it less competitive. This causes such generation to run less or be taken out of service. SCC further explains that the DEQ study modeled Dominion and AEP as deregulated utilities in a competitive market with merchant	The comment refers to an analysis by State Corporation Commission (SCC) staff based on modeling conducted by commenter. DEQ staff reviewed the SCC staff statements and the commenter's modeling analysis. What follows is a brief assessment of this analysis. SCC staff relies on modeling that was conducted in private by Dominion, the state's largest utility and one of the parties to be regulated by the proposed electricity sector cap. The results of any modeling exercise depend on the assumptions used. Many key assumptions used by Dominion in its modeling analysis for SCC staff have not been disclosed, making it hard to assess the reasons for Dominion's modeling results. Among these is the method used by Dominion to capture the energy efficiency investments required under state law, in particular the Grid Transformation and Security Act (GTSA). To the extent Dominion's modeling assumptions were disclosed, they suggest that Dominion and in turn SCC staff significantly overstate the potential costs of the program. Dominion's analysis assumes that Virginia generators will be limited to the number of allowances allocated by the state. This reflects a basic misunderstanding for how a regional cap-and-trade program works. Virginia generators will have access to all of the allowances issued by any of the RGGI states. Dominion's analysis also assumes a price for allowances that significantly exceeds what is expected. The table below shows the allowance

<table>
<tr>
<td></td>
<td>power plants. While much of the power generated in the RGGI states is supplied by merchant power, most of the power generation in Virginia is owned and operated by regulated utilities and the cost of compliance is borne by customers. SCC also identified that the Analysis Group applied a low discount rate for the weighted cost of capital projects that may be needed to replace generation from early retirements and therefore understated the cost of future capital investments by Virginia utilities.</td>
<td>prices expected in DEQ's analysis, which matches the analysis of the RGGI states, compared with the prices assumed by Dominion and SCC staff. Dominion assumes prices that are between 50--99% higher.

SCC staff acknowledges that Dominion assumed an allowance price higher than the price expected by DEQ, the RGGI states and other independent analysts. SCC staff also acknowledges that this assumption contributes to their conclusion that bill impacts will be higher.

The SCC analysis used the ECR trigger price as the RGGI allowance floor price instead of using the RGGI program's actual floor price, which is significantly lower. This misconstrues the rule's ECR provisions--while intended to boost allowance prices, the ECR will not act as an allowance price floor. The SCC analysis, therefore, projects much higher future RGGI allowance prices, and hence compliance costs, than does DEQ's IPM modeling. DEQ's modeling takes into account the rule's ERC provisions, but nevertheless projects future allowance prices that fall below the ECR trigger, despite the withdrawal of the ECR allowances from the allowance market.

Dominion's analysis for SCC staff assumes that certain coal units will not retire for economic reasons in the absence of a carbon cap. The basis for this assumption is not known and may not be reasonable. To assume that the Chesterfield coal units will continue to operate in the 2034-39 timeframe (70 years after that plant was put into operation) when similar coal units are expected to retire for economic reasons,</td>
</tr>
</table>

		raises questions about the validity of Dominion's analysis for SCC staff. Similarly, the units at Clover are assumed to continue to operate until their 55th birthday. In addition, based on publicly available information from EIA, operation of the Chesterfield units has decreased by approximately 50% over the past 10 years, and operation of the Clover units has decreased 33%. This suggests that these coal units--like coal units everywhere in the U.S.--are under considerable economic strain already because of low natural gas prices and low renewables costs. Dominion under-estimated the share of allowances it would receive under DEQ's proposed allocation rules. Under the proposal, generators are allocated allowances according to their generation. Even though Dominion has access to generation totals in its analysis, it chose to assume a flat rate of allocations. Further, that flat rate was likely an under-estimate: Dominion assumed it would receive 70% of allowances available to regulated entities, despite currently owning and operating facilities responsible for roughly 80% of the electricity to be covered by the program (Source: 2016 and 2017 EIA Data). The SCC rejected Dominion's load forecast in its 2018 IRP analysis. It is not clear how the Dominion modeling used in the SCC analysis forecasted load or whether the load forecast was any different from the one rejected in the IRP context. This is important because an overstated load forecast will yield overstated bill impacts. Many of Dominion's results were not disclosed. SCC only disclosed average costs to ratepayers over a 25-year time period, with no explanation of what impacts are borne when, making it impossible to fully understand or evaluate Dominion's results. SCC staff provide no explanation for the math that leads to their estimates of bill impacts. Without transparency around these calculations, it is not possible to

		fully assess their methodology. To the extent the calculations are disclosed, they appear to double count the cost to Dominion. DEQ's analysis uses the IPM model--the same model used by Dominion and many other utilities to forecast the wholesale electricity market. In DEQ's analysis, both Chesterfield and Clover retire for economic reasons even if Virginia does not implement a cap on carbon emissions. Thus, the chief difference between Dominion's modeling and DEQ's modeling is the timing of the retirements of Chesterfield and Clover. As noted above, Dominion's analysis rests on the unlikely assumption that these aging coal plants will operate well into the 2050s. SCC staff provide no consideration of impacts in Virginia as a whole. Since the analysis was performed by Dominion, it ignores the rest of the state, which has important implications for the analysis, especially given the key role of the Clover facility in the analysis, which is co-owned by Dominion and ODEC. Also see, for example, a discussion of heath benefits in initial response to initial comment 61 and current response to current comment 13.
21. Dominion	Linking to or joining RGGI will impose significant additional cost to Virginia electricity customers while achieving insignificant emission reductions regionally. It will encourage lower cost electricity imports from out-of-state sources that are more carbon-intensive. Reductions in carbon emissions in Virginia and the RGGI region will be offset by emission increases elsewhere within the non-RGGI portion of PJM and the EI. DEQ's modeling also shows that although about a 5% reduction in Virginia CO_2 emissions is achieved cumulatively over 2020-2030, emissions through much of the 10-year period are projected to be above the state-level emission cap. This implies that compliance with the program will require allowance purchases over and above the	See the current response to current comment 20 for a detailed discussion of the SCC analysis. For a response to comment on electricity imports and leakage, see the response to comment 19. The ability to access low-cost allowances from other states lowers the cost of the proposal and allows commenter and other regulated entities in Virginia the flexibility to operate when it is in the best interests of Virginia. As discussed in current comment 71, note that SCC rejected Dominion's 2018 IRP in part due to the failure to include $870 million in proposed energy efficiency investments in the IRP load forecasting. Dominion's IRP analysis appears to suffer from many of the same defects as the analysis Dominion

	amount of allowances DEQ will allocate to Virginia sources. The revenue from the purchases of these additional allowances will flow to other RGGI states while the cost of compliance will be borne by Virginia electricity customers. Dominion has modeled RGGI impacts to Virginia customers in the 2018 IRP proceeding filed May 2018, which shows that the cost increase to Virginia customers is over $1.5 billion net present value which equates to a monthly average rate increase of $4.10. Joining RGGI would increase cost to Virginia customers to over $4 billion net present value which would equate to a monthly average rate increase of $6.83. This modeling was based on the initially proposed 33-34 million ton cap, which has now been reduced by 15% to 28 million tons. Although the analysis did not include specific elements of the GTSA, which was not final at the time modeling assumptions for the 2018 IRP were locked in, it did include over 4.5 GW of new solar and offshore wind--an amount comparable to the renewable build specified in the GTSA.	completed for SCC staff, discussed more fully in the response to comment 20.
22. Dominion	Part of DEQ's explanation for the reduced baseline emissions cap includes the incorporation and assumption of the deployment of additional clean energy programs in other RGGI states. DEQ does not provide a description or any detailed information regarding these programs and the extent of additional emission reductions they may achieve. It therefore is difficult to assess how much of a driver these programs served in the decision to lower the Virginia baseline cap. Nevertheless, it does raise question as to why such programs served as drivers for DEQ to adjust the Virginia baseline cap while no additional adjustments will be made to the emission caps in the other RGGI states within which these very programs will be implemented. To the extent that the future, planned deployment of clean energy programs in other RGGI states are deemed	This comment mischaracterizes the basis for the emissions cap in the proposal. The IPM analysis projects that emissions in Virginia will be 28 million tons of CO_2 in 2020. This projection is based on the best modeling inputs available, including inputs relating to expected energy efficiency and renewables investments in Virginia and elsewhere in the EI. This approach is consistent with best modeling practices. Thus, the 2020 Virginia emissions cap is set at the expected emissions level in 2020. The input file for the latest IPM modeling rule included not only clean energy and efficiency programs expected in Virginia, but also included updates from all the other RGGI states on these programs as well. A significant additional investment in renewable energy generation was captured in these inputs along with further investments in energy efficiency projects. This input file is available and

	influential in establishing Virginia's 2020 baseline budget, it is logical to assume that the planned implementation of the GTSA in Virginia likewise could factor into the future budgets of the other RGGI states. This suggests that any modifications to RGGI state budgets attributed to these various state clean energy programs should be spread across the entire RGGI region and not just Virginia. An additional consideration regarding the proposal to reduce the baseline cap is that RGGI re-assesses its program every 4 years based on historical performance. Since 2009, RGGI has conducted two program reviews, one in 2012 and one in 2016-17. Both of these reviews resulted in a reduction of going-forward CO_2 emission caps for the RGGI region. The 2016-17 program review led to the decision to increase the annual reduction of the regional emission cap beginning in 2021 from the current 2.5% per year rate to 3% per year through 2030. The next assessment period is scheduled to occur in 2021, which is only one year after Virginia would begin its participation. This means that the significantly reduced Virginia cap may be re-negotiated as early as 2021. In addition to the annual 3% per year reduction, the RGGI model rule includes 2 elements that can reduce the regional cap even further: (1) a banked allowance adjustment, to be determined in 2021 and applied over 2021-25, based on the size of the allowance bank amassed across the current RGGI region over the period 2018-2020; and (2) a new ECR mechanism that would allow the RGGI states to withhold an amount of allowances up to 10% of the statewide emissions budget from offer in the RGGI auction if the auction clearing price falls below the ERC trigger price. The proposal includes both of these RGGI elements that would further reduce the Virginia emissions cap	has been provided upon request to several stakeholders. The commenter correctly notes that the RGGI states conduct periodic program reviews to assess the program. These reviews may result in changes in the emissions caps (either up or down) based on conditions observed in the region.

	beyond the 3% per year reduction already imposed. DEQ's modeling projects an adjustment of 75 million tons to the RGGI regional cap over 2021-25 from the banked allowance adjustment provision. In our original comments, we requested that DEQ explain adjusting the Virginia state emission cap on the basis of banked allowances amassed over the period 2018-2020 (prior to Virginia's linking to the RGGI program) by affected entities in other RGGI states that Virginia affected sources will not be holding since Virginia entities will not become subject to an emissions cap or required to hold allowances until 2020. We therefore advocated that proposed provisions to adjust emissions caps and/or withhold allowances based on the volume of banked allowances should be delayed in the Virginia rule to provide time for a nascent Virginia carbon market to mature. These issues are even more pertinent with the proposed reduced cap. Given these issues, DEQ should defer any decision to modify the originally proposed 2020 baseline emissions cap. To the extent DEQ moves forward with a Virginia cap-and-trade program, it should proceed on the basis of the 33-34 million ton range in the original proposal. An evaluation as to whether adjustments are necessary can be performed during the next RGGI program review (expected to begin in 2021) at which time the impacts of the additional clean energy measures and programs expected to be implemented in the RGGI states including the GTSA in Virginia can be used to inform the effectiveness of the RGGI regional cap as a whole.	
23. Dominion	The revised proposal includes a new provision in 9VAC5-140-6190 C that requires DEQ to review the cap in 2030 and recommend "appropriate adjustments" for post-2030 years. Absent any adjustment, the cap will be reduced (by default) by an additional 840,000 tons/year each year beginning in 2031. This provision	DEQ agrees that participation in the RGGI market must be fully compatible with the existing RGGI program; see current comment 54 for further discussion.

	is premature and unnecessary. The RGGI states conduct a program review every 4 years. On this schedule, subsequent reviews of the program will be conducted in 2021, 2025 and 2029 at which time the effectiveness of the regional program and assessments as to whether "appropriate adjustments" are necessary will be made. The RGGI states themselves note that the re-proposed regulation specifying the additional reductions to the Virginia budget between 2030 and 2040 is inconsistent with the RGGI model rule and that the periodic RGGI program review is the appropriate vehicle to effect changes to the RGGI regional long-term cap trajectory. In addition, § 2.2-4017 of the APA requires agencies to review regulations every 4 years. For these reasons, 9VAC5-140-6190 C should be stricken. At a minimum, the default 840,000 ton per year additional reduction beyond 2030 should be removed.	
24. Dominion	As explained in previous comments, we strongly support DEQ's proposal not to impose any compliance obligations upon units that use biomass as their primary fuel. No emissions attributed to biomass firing should require allowances. This would be consistent with EPA's approach in developing the CPP, which did not include biomass generation in establishing the baseline and state emission reduction targets and did not require biomass units to hold emission allowances under the mass-based model trading rules or surrender emission rate credits under the rate-based model trading rules. This compliance exemption should also apply to the emissions apportioned to the burning of biomass for fossil fuel-fired units that are co-fired with biomass, such as Dominion's Virginia City Hybrid Energy Center (VCHEC). Whether a unit burns biomass as its primary fuel or co-fires biomass with fossil fuel, the emissions from biomass should be treated the same. Under the rule, as currently proposed, a fossil fuel-fired	DEQ agrees that the clarifying language should be restored, and the re-proposal has been modified accordingly (note that the term has also been restored in 9VAC5-140-6040 B). As discussed in greater detail in the initial response to initial comment 67, DEQ recognizes that pollution emitted from biomass-fired plants is a subject of concern for many parties. However, the ED 57 Work Group, EO 11, and the Attorney General's opinion were all expressed in the context of a regulatory process to establish a trading-ready carbon emissions reduction program for fossil fuel-fired electric generating facilities. See also the discussion in current comment 40. DEQ has not taken the position that biomass is carbon neutral, but it has made it clear the applicability of this program is not appropriate for biomass at this time. As a matter of science, forest biomass energy is not carbon neutral and can have other negative environmental impacts. While biomass represents a miniscule fraction of the electricity generation in the Commonwealth, DEQ would view a significant shift toward the

	unit that cofires with biomass would be obligated to hold allowances for all of its emissions (fossil fuel and biomass-based). DEQ seeks comment on whether 9VAC5-140-6050 C 1 should be amended to specify that the total CO_2 emissions related to CO_2 allowances only includes emissions resulting from the combustion of fossil fuel and whether such an amendment to the standard requirements would provide clarity and consistency with the fossil fuel focus of ED-II. 9VAC5-140-6020 C defines "fossil fuel," "fossil fuel fired," and a "CO_2 budget unit." The regulatory requirements for units subject to the rule are established in 9VAC5-140-6050 C. As currently proposed, the rule would require any unit that meets the definition of a fossil fuel-fired unit and a CO_2 budget unit defined in 9VAC5-140-6020 C and the applicability provisions of 9VAC5-140-6040 A to hold CO_2 allowances in an amount no less than the total CO_2 emissions. Thus, a fossil fuel-fired unit that co-fired with biomass (a non-fossil fuel), such as the unit at VCHEC, and meets the applicability criteria of the rule and thus the definition of a CO_2 budget unit would be required to hold allowances for all of its CO_2 emissions including emissions attributed to burning biomass. VCHEC is a 610-MW electric generating station that burns waste coal and co-fires with biomass (it can co-fire with biomass up to 20% of its capacity or 122 MW) as part of its fuel stream using circulating fluidized bed (CFB) technology. CFB is proven clean-coal technology that also enables the using of run-of-mine coal, waste coal, and renewable energy sources such as waste wood. CFB technology combined with modern post-combustion controls yields low emissions of SO_2, NO_X, PM and mercury. In June 2008, the board directed the DEQ to incorporate a provision in the facility's PSD permit to construct and operate in	use of forest biomass for power generation as a negative development. DEQ will be monitoring trends and reserves the right to use existing authority to regulate carbon emissions from biomass in the future.

	accordance with 9VAC5-80 establishing a timetable for biomass utilization at the facility. According to DEQ, the board chose this approach "in order to promote further reductions in SO_2 emissions and show a reduction in carbon emissions, since biomass is considered a biogenic, carbon-neutral material." Requiring VCHEC to now hold allowances under a state carbon program for emissions resulting from the burning of biomass fuel in compliance with an air permit provision established specifically to address carbon is counterintuitive. As currently proposed, the regulation would require VCHEC to hold approximately 8% more allowances than would be required if the rule did not apply to the emissions from biomass. This percentage will increase over the next several years since the air permit requires a stepwise increase in the percentage of biomass fuel up to a minimum of 10%. This will add to the cost of dispatching the unit, which will have direct cost impacts to customers. Requiring fossil units that co-fire with biomass to hold allowances would also be inconsistent with the existing RGGI program which only regulates fossil fuel-fired units. Clarifying language is needed to assure that the limitation of applicability to emissions from fossil fuel would apply to a unit that meets the definition of a fossil fuel-fired unit but co-fires with biomass and that such a unit would not be required to hold CO_2 allowances for emissions associated with the burning of biomass. Accordingly, DEQ should include the clarifying amended language it brought before the Board in September 2018 (shown in brackets) in 9VAC5-140-6050 C 1 and C 2 to preserve the intent of ED-11. C. CO_2 requirements shall be as follows. 1. The owners and operators of each CO_2 budget source and each CO_2 budget unit at the source shall hold CO_2 allowances available for	

	compliance deductions under 9VAC5-140-6260, as of the CO_2 allowance transfer deadline, in the source's compliance account in an amount not less than the total CO_2 emissions [that have been generated as a result of combusting fossil fuel] for the control period from all CO_2 budget units at the source, less the CO_2 allowances deducted to meet the requirements of subdivision 2 of this subsection, with respect to the previous two interim control periods as determined in accordance with Article 6 (9VAC5-140-6220 et seq.) and Article 8 (9VAC5-140-6330 et seq.) of this part. 2. The owners and operators of each CO_2 budget source and each CO_2 budget unit at the source shall hold CO_2 allowances available for compliance deductions under 9VAC5-140-6260, as of the CO_2 allowance transfer deadline, in the source's compliance account in an amount not less than the total CO_2 emissions [that have been generated as a result of combusting fossil fuel] for the interim control period from all CO_2 budget units at the source multiplied by 0.50, as determined in accordance with Article 6 (9VAC5-140-6220 et seq.) and Article 8 (9VAC5-140-6330 et seq.) of this part.	
25. Dominion	We support the recognition of CO_2 offset allowances from other participating states. However, the re-proposed regulation is ambiguous. It refers to CO_2 offset allowances "generated by" other participating states. This formulation could be misread to limit eligibility to allowances only from projects that are actually located in other participating states. We recommend that the provision refer instead to CO_2 offset allowances "awarded by" other participating states. This alternative language more accurately tracks the language of the offset process in the RGGI Model Rule and in the	As discussed in greater detail in the initial response to comment 26, although the RGGI model rule does offer states the option to award offset allowances for projects outside of the electric power generation sector, only a single offset project has been implemented in the entire RGGI region since the program's inception. One of the reasons offsets have been little used in RGGI is the low allowance prices to date. It appears that regulated entities have had little need to use offset allowances to date. Should this change, the need for an offsets program in Virginia can be revisited at a later date. Additionally, the board's ability to address transportation sector emissions is limited

	regulations promulgated by other participating states. Further, it makes clear that DEQ will recognize CO_2 offset allowances awarded by a participating state, even if the underlying project is located in another state. The RGGI Model Rule has authorized a pathway for awarding CO_2 offset allowances in such circumstances. The process, which has been adopted by other participating states, involves entering into a memorandum of understanding with the non-participating state. The proposal includes the establishment of an arbitrary restraint on offsets in the proposed program. It would deny the opportunity for projects located in Virginia to earn CO_2 offset allowances. Under the proposed approach, Virginia-based projects not only could not apply to Virginia for CO_2 offset allowances, they also could not apply for CO_2 offset allowances from other RGGI participating states. Under the RGGI Model Rule and corresponding participating state regulations, a project is only eligible to receive CO_2 offset allowances from the state in which the majority of reductions occur. Accordingly, a Virginia-based project could not apply to other participating states that award CO_2 offset allowances to projects. Rather, the door would be closed to Virginia-based offset projects, including projects that could otherwise meet the eligibility criteria of the RGGI program. We urge DEQ to revisit this approach and open the door to worthy projects from Virginia. By making it possible for projects in the state to earn offset allowances, DEQ would make it possible for a greater number and variety of Virginia entities to participate in the state's efforts to address climate change. The program would provide incentives for mitigation activities and technological innovation across additional sectors, including the agriculture, manufacturing, and transportation sectors. At a minimum,	by statute. Given the uncertainty of any benefits associated with a complex offset program, DEQ will not, at this time, implement the offset option.

	DEQ should allow for projects deemed eligible under the RGGI model rule. In particular, there is great potential for offset projects in Virginia's agricultural sector, including projects that capture waste methane from hog farms and convert it into renewable natural gas (RNO) that can heat homes and provide power to local businesses. By capturing methane that would otherwise be released into the atmosphere, the use of RNO leads to a significant reduction in methane emissions. Allowing Virginia projects to earn CO_2 offset allowances and allowing a CO_2 budget source the flexibility to meet a limited portion of its compliance obligation with offset allowances also would moderate the costs of compliance with the program and the resulting impacts on ratepayers and consumers. Offset projects expand the universe of emission reduction activities that can be used for compliance, including activities that could have a lower per-ton cost than measures implemented at CO_2 budget sources. The compliance cost flexibility offered by offsets will be important in the RGGI program as its stringency increases. In the past, offsets have played only a small role in the RGGI program. However, the RGGI states, including Virginia, have committed to emissions caps in 2020 and beyond that are significantly more ambitious than the caps that have applied to date. Already, the RGGI allowance market is adjusting to this expected trajectory of more stringent limits. The first RGGI allowance auction in 2017 had a clearing price of $3.00. By the December 2018 auction, the clearing price was $5.35, a 78% increase. Another indicator of the growing demand for RGGI compliance instruments can be found in the futures market. The RGGI market monitor has determined that the overall volume of futures trading in the third quarter of 2018 was up 55% from the previous quarter, and 36% higher than the third quarter of the	

	previous year. The market monitor also found that options trades in the third quarter of 2018 had strike prices at $4.50 for December 2018 options, rising to $6.00 for December 2019 options. And these trades predated DEQ's proposal to substantially tighten the emissions cap for Virginia. In other words, all indicators point to rising prices for allowances, and therefore higher compliance costs. These are conditions for which offset projects would provide a significant cost-mitigating influence. These conditions suggest that demand for compliance instruments in the RGGI program could increasingly approach the demand in jurisdictions participating in the WCI. In those jurisdictions, ambitious emissions caps have yielded significant demand for offset credits, even though the economy-wide scope of the cap-and-trade program means that regulated entities can draw on reductions from multiple sectors; and there are strict limits on the amount of offset credits that regulated entities can use for compliance. California's compliance offset program alone has approved over 370 projects and issued over 140 million offset credits. Without those credits, allowance prices and resulting compliance costs would have been significantly higher. In 2010, CARB modeled how the state's cap-and-trade program would perform by 2020 under various scenarios, including a case in which the cap-and-trade program did not allow the use of offsets. CARB's modeling found that the allowance price in 2020 under its base case (the cap-and-trade program with offsets) would be $25/t$CO_2$e. In the case of the cap-and-trade program without offsets, the price was $148/t$CO_2$e. The WCI experience makes clear that there are significant risks to imposing arbitrary limits on the scope of offset projects that can generate CO_2 offset allowances. Importantly, offsets are a cost containment mechanism that ensures	

	that the cap-and-trade program can continue to deliver expected environmental benefits. Offsets are an important complement to the CCR, which is designed to help prevent allowance prices from exceeding unreasonable and unmanageable levels. The CCR achieves this by making additional allowances available in the RGGI allowance auction at the CCR trigger price thereby increasing the emissions cap in response to a price spike. By contrast, the offsets mechanism contains costs by expanding the universe of emission reductions that can be used for compliance purposes, without increasing the emissions cap. The two cost containment mechanisms can work well together. By making it possible for a CO_2 budget source to use CO_2 offset allowances to meet a portion of its compliance obligation, the program makes it less likely that allowance prices will spike to the level of the trigger price and thereby relax the emissions cap. In other words, offsets can ensure that activation of the CCR is the last resort that it should be. Denying eligibility to state-based projects would not only jeopardize the cost containment benefits of offsets; it would also deny Virginia other important benefits delivered by offset projects. These include air and water quality improvements as well as new jobs. Indeed, DEQ's proposed approach is the inverse of the approach adopted in the WCI. California mandates that at least half of the credits that a covered entity submits for compliance come from projects that provide "direct environmental benefits in the state." By contrast, DEQ's proposed approach effectively establishes a preference for other states to enjoy these co-benefits. DEQ said that one of the reasons not to promulgate rules and procedures to award offset allowances to Virginia projects is that an offset program is	

	"complex" to manage. Yet DEQ already has long experience with offsets programs. The General Assembly expressly authorized DEQ to assess and issue credits to offset projects, and DEQ has exercised this authority for many years in the context of the federal Clean Air Act. Given this experience, DEQ is certainly no less capable of managing a CO_2 offsets program than the 7 other RGGI states that have agreed to review in-state projects, and New Jersey intends to join their ranks. There is no good reason for Virginia to be an outlier among participating states. To address any complexities, DEQ can draw on the extensive experience of other jurisdictions that have managed carbon offset programs. CARB has expanded its administrative reach by using private, non-profit offset project "registries" to do some of the initial work of project documentation review. For these reasons, there are no meaningful legal or administrative barriers to DEQ implementing Virginia-based offset projects. Given the increasing stringency of the Virginia emission caps and the RGGI program as a whole, we urge DEQ to expand the scope of eligible offset projects to include projects that reduce sulfur hexafluoride (SF_6) in the electricity transmission and distribution sector. Such projects reduce highly potent GHG emissions not otherwise covered by RGGI emission caps. According to the United Nations, the global warming potential of SF_6 is 23,900 times as great as carbon dioxide over a 100-year period. Once emitted, SF_6 remains in the atmosphere for 3,200 years. Entities in the power sector do not have legal requirements to reduce SF_6 emissions, and there are no meaningful economic gains from such projects. Accordingly, such activities meet the "additionality" criteria for offset projects. SF_6 reduction projects are well understood, with well-established methodologies for measurement and verification. An	

	earlier version of the RGGI Model Rule included SF_6 projects on the list of eligible project types. The combination of low demand and high administrative costs discouraged the development of SF_6 projects for RGGI purposes. As discussed above, however, there is every reason to expect substantially greater demand for offsets in the RGGI states in the future, which provides a reason for DEQ to revisit and streamline the rules and procedures for SF_6 projects. We urge DEQ to establish the eligibility of projects that reduce CO_2 emissions in the transportation sector through electrification, including development of charging infrastructure. Across the U.S., transportation sector CO_2 emissions now exceed those from the power sector, and are continuing to increase. Rising transportation sector emissions complicate the efforts of Virginia and other states to achieve climate policy objectives. A number of studies have concluded that it will only be possible to achieve decarbonization objectives for the transportation sector through electrification of much of the sector. Electrification, in turn, will only be possible through a build out of charging infrastructure. Electric vehicles are becoming an attractive choice for more consumers; however, potential buyers identify the lack of charging stations as a major obstacle. State incentives can playa key role in this necessary build-out of charging infrastructure. Furthermore, utilities are well positioned to lift the market for charging infrastructure off the ground. Utilities can offer experience with infrastructure development, the benefits of grid coordination, expertise with customer pricing models with the grid, and experience developing services for disadvantaged communities. For these reasons, we recommend DEQ create a market-based incentive for charging station development by owners of CO_2 budget sources in the form of CO_2 offset allowances. The CO_2 offset	

	allowances would correspond to the CO_2 emission reductions attributable to the electricity provided by the station to electric vehicles, which would displace the use of higher carbon-intensity gasoline that conventional vehicles would otherwise use. This incentive mechanism would give Virginia a jump start on its development of policies under the Transportation and Climate Initiative.	
26. Dominion	The deadline in 9VAC5-140-6215 C 1 for affected entities to submit initial generation output data (2016-2018) to DEQ for the initial 2020 allocation determination needs to be extended. The March 1, 2019 date will certainly precede any date for which the regulation, if finalized, would become effective. The submittal deadline for initial generation output data should be changed to 60 days after the effective date of the regulation. Likewise, the May 1, 2019 deadline for DEQ to submit to the auction agent conditional allowance allocations for the initial 2020 control period in 9VAC5-1400-6210 H 1 must be extended at least 60 days after the deadline for submittal of the initial generation output data specified in 9VAC5-140-6215 C 1.	These corrections are acceptable, and the proposal has been amended accordingly.
27. Dominion	The change below in brackets is needed in 9VAC5-140-6420 A 2, which specifies the number of CO_2 CCR allowances that would be offered for sale during an auction, in order to provide the intended citation to the conditions that would trigger the CCR provisions. "The number of CO_2 allowances that will be offered for sale at the auction if the condition of [B] 1 of this subsection is met. . . "	This correction is acceptable, and the proposal has been amended accordingly.
28. DuPont, Veolia	DuPont owns and operates the Spruance Plant, a large manufacturing facility that is interconnected with an adjacent cogeneration plant that provides steam to the plant. DuPont has recently entered into a long-term agreement with Veolia to operate and maintain the cogeneration facility. Veolia is significantly modifying the cogeneration plant to convert the fuel from coal to natural gas, as well as	Support for the proposal is appreciated.

	performing other efficiency upgrades. After the modifications, the electricity generating capacity of the cogeneration plant will be reduced and it will primarily operate as a steam plant that makes only a small amount of electricity. Chief among the prior DuPont comments on the original proposal was a request that the industrial exemption contained in that initial draft regulation be clarified and broadened to better reflect the realities of industrial power generation. DuPont is pleased that DEQ took the time to address the public comments about the industrial exemption concept and for the reasons set forth below, DuPont supports the regulation as re-proposed. The regulation provides two paths to qualify for the industrial exemption and introduces the concept of "total useful energy," which includes either electrical energy or thermal energy. The conditions that allow an entity to qualify for the industrial exception are: 9VAC5-140-6040 B. The addition of the second standard involving a threshold on total useful energy rather than just electrical generation is the key to addressing the concerns of a facility like the Spruance Plant. At this plant most of the energy generated and used by the plant is thermal, but 100% of the electrical production (which is a small amount of the overall energy production) is supplied to the grid. DuPont has consulted with Veolia and confirmed that the cogeneration plant can meet the less than or equal to 15% standard. We also appreciate DEQ broadening the scope of tile industrial exemption by removing the previous language requiring that the industrial facility and the power-generating unit serving the facility had to be under common ownership in order to qualify for the exemption. The new standard provides flexibility for operating	

	arrangements when the power-generating unit and the industrial facility have been split up to gain operational and economic benefits. DuPont appreciates the work DEQ has done to complete the regulation and supports Virginia's goal of achieving meaningful reductions in GHG emissions.	
29. Environmental Defense Fund (EDF)	As discussed in our comments on the original proposal, the board has ample existing statutory authority to adopt a cap-and-trade program that reduces statewide emissions of GHG. We incorporate those comments by reference and discuss in further detail why key aspects of the re-proposal are also well supported from a legal perspective. The board's proposed set-aside comports with its statutory authority. The board has specified that the proceeds from set-aside allowances will fund "the implementation of programs that lower base and peak electricity demand and reduce the cost of the program to consumers and budget sources." The agency would be well within its statutory authority to adopt a rule that includes a set aside of this nature. The board has broad authority under § 10.1-1308 of the Air Pollution Control Law of Virginia to promulgate regulations abating, controlling and prohibiting air pollution throughout the state. An allowance set aside designed to reduce greenhouse gas emissions would "abat[e] . . . air pollution" if the allowance allocation supported emission reducing projects within DMME's purview, such as deploying energy efficiency and renewable energy. In the final rule or in implementing the rule, the board or DEQ, in collaboration with DMME, should specify the factors by which projects will be evaluated for allowance allocation and demonstrate their potential to abate air pollution to protect human health, welfare, and safety, protect the environment, and promote economic development.	Support for the proposal is appreciated, as is the commenter's discussion of the legal authority to proceed with this action. As discussed in the current response to current comment 11, implementation of the set-aside will be developed by DMME in accordance with its regulations and policies. The CCR is designed to be consistent with the RGGI CCR, and no changes to the set-aside or the CCR mechanism are necessary.

	The board's broad authority to mitigate air pollution and to design air pollution policies to serve a diverse set of statutory directives under § 10.1-1308 is made clear by § 10.1-1306, which instructs that the board: "shall make, or cause to be made, such investigations and inspections and do such other things as are reasonably necessary to carry out the provisions of [Code of Virginia, Title 10.1, Subtitle II, Chapter 13], within the limits of the appropriations, study grants, funds, or personnel which are available for the purposes of this chapter, including the achievement and maintenance of such levels of air quality as will protect human health, welfare and safety and to the greatest degree practicable prevent injury to plant and animal life and property and which will promote the economic and social development of the state. Under this mandate, the board must act to protect the public from air pollution and weigh, in designing air pollution reduction policies, opportunities to further economic and social development of the state. Allocating a portion to support energy efficiency projects, which will both reduce emissions of greenhouse gases and other harmful air pollutants and reduce the cost impacts of the emission reduction program, furthers the statutory mandate to abate pollution and supports economic development at the same time. Thus, the proposed set aside for energy efficiency projects is well within the board's statutory mandate. We urge the board to clearly provide that the set aside allowances could be allocated to a variety of projects that would reduce emissions and facilitate greater emission reductions going forward, such as renewable energy projects. DEQ would "allocate 5.0% of the Virginia CO_2 Budget Trading Program base or adjusted budget allowances, as applicable, to DMME to be consigned to auction by the holder of	

	a public contract with DMME to assist the department for the abatement and control of air pollution, specifically CO_2, by the implementation of programs that lower base and peak electricity demand and reduce the cost of the program to consumers and budget sources." The board may include in its regulation criteria and other requirements for DMME to apply in contracts with a third-party administrator based on its authority to "cooperate with . . . all agencies of the Commonwealth . . . in furtherance of the purposes of this chapter." Possible criteria for project selection could include the quantity and type of emission reductions that the project is likely to achieve, the time within which the project will likely achieve emission reductions, the cost-effectiveness of the project, economic benefits, and the potential for the project to support mitigation of air pollution and energy costs in at-risk communities. The implementing regulations should provide for projects to report on the emission reductions achieved as well as the achievement of any other projected benefits. The regulations should further ensure that projects and project developers that upon review fail to deliver emission reductions or other benefits due to what DMME determines to be avoidable failures by the project developers be made ineligible for allowances or otherwise subject to heightened scrutiny going forward. We also recommend that if any allowances from the set-aside are not used, they become additional CO_2 CCR allowances. The purpose of the set-aside and the allocation of allowances to DMME is to "assist the department for the abatement and control of air pollution." Given this purpose, if DMME is unable to use the allowances, we recommend that the set-aside allowances become part of the CO_2 CCR allowances because that would ensure that these allowances will still serve the purpose	

	of abating and controlling air pollution by reducing emissions unless the CCR trigger price is met, in which case they will promote the statutory purpose of economic and social development of the state by controlling costs.	
30. EDF	The board would be well justified in establishing an initial base budget of 28 million tons of CO_2. The proposed rule originally sought comment on whether the initial base budget should be 34 or 33 million tons of CO_2; the board has revised that number to 28 million tons. This adjustment would, relative to the originally proposed budgets, better fulfill the board's statutory duty to "achieve . . . such levels of air quality as will protect human health, welfare and safety and to the greatest degree practicable." Setting the base budget at a level that reflects this statutory mandate is particularly important because incremental reductions from the initial budget that must be met in future years are determined relative to this initial emissions budget. The evidence before the board in the record already compiled--including DEQ modeling--indicates that the initial base budget must be revised downward in order to fulfill board's statutory obligations. While modeling is not necessarily a perfect predictor of what will happen in the future, it does provide important insights into likely trends and future outcomes that can appropriately inform this decision. Recent modeling updates show lower emissions in 2020 than DEQ originally projected, along with trends indicating continued emission reductions from Virginia's power sector. We discussed several such findings in our April 2018 comments on the original proposed rule. Since then, DEQ released new IPM modeling--using appropriately updated assumptions about natural gas prices, electricity demand growth, and emission reductions projections from increased renewables and energy efficiency development under the GTSA--that supports projections of a lower 2020 emissions baseline.	Support for the proposal is appreciated, particularly the discussion of the appropriateness of the new baseline cap. See also the discussion in the initial response to initial comment 37.

	Modeling from Rhodium Group, using a modified version of the National Energy Modeling System with updated assumptions, also projects lower 2020 baseline power sector emissions than previously projected for Virginia. These findings indicate that a 2020 base budget of 28 million tons of CO_2 is appropriate. The proposed revision to the 2020 initial budget, by responding to the data submitted by stakeholders and the analysis by the agency itself, is appropriately fact-based and reasonable rulemaking in accordance with the principles of administrative law. EDF is currently modeling state and regional electric sector CO_2 emission outcomes (through 2030 and beyond) under a range of policy scenarios. Preliminary results from the modeling indicate that under business-as-usual conditions, electric sector CO_2 emissions in Virginia could continue to increase significantly above the proposed base budget by 2030. Thus, we anticipate that Virginia's adoption of a CO_2 budget trading program with the proposed CO_2 emission budgets would result in critical CO_2 emission reductions.	
31. EDF	Analysis from RGGI indicates that leakage effects--the potential increase in CO_2 emissions from generators outside the RGGI region due to shifting generation from covered sources as a result of the RGGI carbon price--are likely to be much smaller than the substantial environmental benefits of Virginia's program. Nevertheless, we urge the board to adopt a rule that takes steps to mitigate any significant leakage that may occur because doing so would further the statutory purpose of protecting health and welfare. DEQ names several reasons why leakage is unlikely in its responses to comments on the original proposed rule. In part, DEQ explains, "the owners of generation in Virginia are unlikely to face any competitive disadvantage relative to plants	As discussed in the initial response to initial comment 91, neither DEQ nor RGGI anticipate leakage issues. Regardless, the program will be closely monitored by both Virginia and RGGI to assure that this continues to be the case. DEQ appreciates the commenter's concerns, but points out that there are multiple layers of monitoring and reporting that will be ongoing for the lifetime of the program. Note that RGGI monitors for and reports trends in leakage annually; see, for example, the most recent "CO_2 Emissions from Electric Generation and Imports in the Regional Greenhouse Gas Initiative: 2015 Monitoring Report." Although a slight increase in imports of electricity is projected in the IPM modeling, this modeling is conservative in that it does not take into account the

	outside the state because the allowances are to be allocated to compliance entities under the program, and the amount of the allocations are to be determined on an updating output basis." Moreover, "updating output-based allocation is expected to encourage generation in the state, rather than discourage it" DEQ also writes, "The implementation of the DMME set-aside will also encourage the reduction of in-state demand, thereby reducing carbon pollution and further preventing leakage." We agree that the updated output-based allocation and the efforts to reduce in-state emissions through the set-aside should reduce leakage and may be sufficient mechanisms to address leakage, but urge DEQ to include its assessment of leakage risk and strategy for mitigating the risk in the official record for the final rule, as well as a commitment to monitor leakage going forward and to take steps to address significant leakage if it is observed. Specifically, EDF also urges DEQ to provide within the final rule a detailed explanation of the measures Virginia is taking and will take to mitigate the potential for leakage. In particular, EDF supports the proposal to evaluate leakage as part of the periodic program review process. We also encourage DEQ to work with RGGI states to monitor and analyze power flows and emissions from RGGI and non-RGGI generating sources for signs of leakage as part of RGGI's annual electricity monitoring process, and to work with other RGGI participating states to evaluate and adopt mechanisms to effectively address leakage in the periodic region-wide program review. Further, Virginia should also consider (now or in the future) extending the carbon cap to account for emissions attributed to electricity imports into Virginia. This approach would likely be the most effective mechanism to mitigate leakage, as it ensures that any emissions associated with generation dispatched to serve	updating, output-based allocation approach. This allocation approach has been shown to reduce the pressure to import electricity by rewarding in-state generation. (See current response to current comment 19.) Also note that carbon intensity in the region is decreasing, and carbon pollution effects from any increase in imports are therefore likely to be minimal. See, for example, current comments 19 and 46.

	electric load in Virginia will be covered by the cap, eliminating any economic incentive for uncovered generating units from out-of-state to serve Virginia load. Accounting for carbon emissions associated with imported electricity under the cap ensures statewide emission reductions, while mitigating any market distortion between units serving the same load. Virginia should engage with RGGI and PJM states to explore and pursue the development of strategies within the PJM market region to provide the state with the information it would need to deploy such a solution.	
32. EDF	EDF supports DEQ's proposal to use an updating output-based approach to allocating conditional allowances to covered sources. Analyses conducted by EDF and RFF in the context of the federal CPP found that using an updating output-based approach can be an effective means of mitigating emissions leakage. Modeling conducted by RFF found that using an updating approach to allocate 100% of allowances to a subset of eligible sources under the CPP (as opposed to a historic, "grandfathering" approach) could reduce leakage by up to 64% compared to a mechanism that allocated only 5% of allowances with an updating output-based approach. Similarly, EDF analysis found that allocating all or nearly all CO_2 allowances with an updating output-based approach could significantly reduce leakage compared to alternative approaches.	Support for the proposal is appreciated. DEQ particularly acknowledges the observation that the updating output-based approach will likely minimize any leakage.
33. EDF	EPA defines environmental justice as, "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation and enforcement of environmental laws, regulations and policies." A regulatory process that prioritizes meaningful involvement and secures outcomes that ensure no community is disproportionately harmed--and that underserved communities receive an equitable share of the benefits--is a vital goal. It is important to note that	Support for the proposal is appreciated. It is important to note that Virginia will be the first RGGI member state to explicitly incorporate consideration of environmental justice issues in its RGGI regulatory program. As discussed in greater detail in the initial response to initial comment 55, DEQ has a robust community involvement program, and the addition of environmental justice review and analysis in this regulation builds on this important commitment. This commitment is buttressed by ongoing RGGI and state-

	finalizing the program with an environmentally protective emissions budget that declines over time consistent with best available science and modeling is vital to advancing environmental justice. Fossil fuel-fired power plants tend to be disproportionately located in or near communities of color and low-income communities. Moreover, according to the U.S. Global Change Research Program's Fourth National Climate Assessment: "Social, economic, and geographic factors shape the exposure of people and communities to climate-related impacts and their capacity to respond. Risks are often highest for those that are already vulnerable, including low-income communities, some communities of color, children, and the elderly. Climate change threatens to exacerbate existing social and economic inequalities that result in higher exposure and sensitivity to extreme weather and climate-related events and other changes." By reducing CO_2 and co-pollutant emissions across the board, a stringent emissions budget can benefit communities that tend to bear disproportionate harms. EDF welcomes the board's commitment to evaluate potential impacts of the program on vulnerable and underserved communities. The program will be one of a broad set of policies and programs that potentially affect environmental justice issues in the state. Analyzing the potential impacts of RGGI on vulnerable communities will be an important part of the broader suite of actions Virginia agencies are taking to address environmental justice. EDF urges the board to prioritize meaningful involvement of environmental justice communities and experts in developing and executing a robust and transparent environmental justice analysis. The board should work closely with community stakeholders to define the scope of the analysis, methodology, outreach strategy, and	required program reviews, which will provide multiple opportunities for public review and participation.

	actionable steps to strengthen the program and mitigate environmental justice effects.	
34. EDF	The regulation should require any base budget allowances that are not allocated to be added to the total conditional CCR allowances. This will help ensure the program's emission reduction and cost containment goals are met. It can be accomplished by adding the following provision to section 9VAC5-140-6070 of the regulation as subsection B and making the existing language subsection A: B. Notwithstanding 9VAC5-140-6070 A, any Virginia base budget allowances that are not allocated pursuant to the valid provisions of this regulation shall be added to total conditional CCR allowances for the appropriate calendar year listed in 9VAC5-140-6200 and allocated accordingly. As discussed in our comments on the original proposed rule, EDF supports the inclusion of the RGGI price floor and ECR. These are important features of RGGI to ensure proper functioning of the CO_2 allowance market and provide opportunities to drive additional emission reductions if compliance costs are lower than anticipated. EDF also supports the proposed changes to clarify the allocation formula and function of the CCR.	Support for the proposal is appreciated. DEQ agrees that the price floor, CCR and ECR will enable the program to continue to function properly.
35. EDF	The 2021 adjustment for banked allowances would lower the RGGI cap for 2021-2025 to account for banked allowances in excess of 2018-2020 emissions from RGGI covered sources. The adjustment is apparently intended to preserve stringency of the RGGI cap in future years by guarding against an excess of allowances in the bank--while not unduly penalizing sources for abating emissions early. In Virginia, CO_2 Budget Sources will not face a compliance obligation until 2020--and therefore have no incentive to bank allowances until then. The board should accordingly revise Virginia's contribution to the RGGI 2021 bank adjustment by accounting	The bank adjustment process is a fundamental component of the RGGI program and Virginia's participation in the adjustment is necessary to keep the Virginia program consistent and viable with the RGGI program. Therefore, the Virginia program is designed to be as compatible and consistent with the RGGI program as possible, including the treatment of banked allowances. The commenter correctly describes the effect of the bank adjustment and this effect was well known in the development of the proposal. The bank adjustment changes the number of emissions allowances in circulation and therefore the stringency of the program. The IPM

	for banked allowances in excess only of 2020 emissions from Virginia CO_2 budget sources.	modeling took the bank adjustment into account. Because the proposal is to link to the larger RGGI program, participating in the bank adjustment while taking into account its impact on program stringency in Virginia was the most prudent approach to ensuring that the proposal could be linked to the larger RGGI program, bringing to Virginia all of the benefits that linking provides.
36. EDF	The board should take steps to ensure CO_2 emissions from the power sector decline to zero before mid-century. EDF welcomes the board's commitment in the re-proposed rule to, at minimum, continue annual tonnage reductions through 2040 and encourages the board to consider steeper reductions beyond 2030 to ensure the power sector is nearly or fully decarbonized by 2040. This provides critical long-term certainty around carbon regulation for regulated facilities and others doing business in Virginia--and this market certainty will contribute to a successful and robust emissions market, and can also help ensure Virginia is at the table as a leader on climate policy in the future. We also support DEQ's commitment to engage in RGGI program review processes in order to continue to evaluate where Virginia needs to go beyond 2030, in concert with the other RGGI states. As we discussed in our earlier comments, it would be prudent for the board to work with other RGGI states to act sooner rather than later to reduce emissions more quickly in the near-term, in order to minimize economic costs and secure the greatest environmental benefits. The need for Virginia to continue reducing carbon pollution from the power sector beyond 2030 to zero emissions before mid-century remains urgent. The 2018 report from the Intergovernmental Panel on Climate Change notes that a key characteristic of the 1.5°C mitigation pathways include "strong upscaling of renewables and sustainable biomass and reduction of unabated fossil fuels,	Concerns about ongoing carbon reductions are well taken, and DEQ agrees that program needs beyond 2030 must be addressed. However, participation in the RGGI market must be fully compatible with the existing RGGI program, and requiring specific reductions through 2040 conflicts with RGGI's well-established and well-functioning collaborative process and program review process; see current comment 54 for further discussion.

	along with the rapid deployment of CCS, [which] lead to a zero-emission energy supply system by mid-century." In our comments on the proposed rule, we wrote, "A number of recent studies suggest that in order to limit global temperature increases to less than 1.5°C or 2°C above pre-industrial levels, global carbon dioxide emissions must reach net-zero by mid-century." Recent landmark findings from the Intergovernmental Panel on Climate Change (IPCC) and U.S. Global Change Research Program suggest emissions must decline at an even faster rate to avoid catastrophic impacts of climate change. Specifically, the IPCC finds that global warming 1.5°C above pre-industrial levels will result in dramatic, harmful impacts to human health, U.S. and global economies, and the environment. In addition, as we also described in our earlier comments, Virginia could leverage readily available emission reduction measures to cut carbon pollution from the power sector at a faster rate. A steeper rate of decline in the trading program than the 3% of the 2020 budget per year currently proposed could facilitate the more rapid emission reductions in the power sector that are needed to achieve our climate goals. Revising the power sector CO_2 budget downward to match or exceed the reduction trajectory charted by the IPCC would unlock opportunities for other sectors to reduce emissions at lower cost and at a faster pace via electrification — providing greater certainty that Virginia will cut climate pollution from across the economy at the scale and level of ambition required to avoid catastrophic climate change impacts.	
37. EDF	DPB's Economic Impact Analysis of the re-proposal included analysis that showed Virginia electricity consumers will see lower average monthly electricity bills with the re-proposal policy in place versus the reference case without it. This is consistent with independent analysis of the broader RGGI program. A 2018 report by	Support for the proposal and for the supporting economic analyses developed for this regulatory action is appreciated.

	Analysis Group, for example, found that in the RGGI region consumers' electricity bills go down over time, due in part to investments in energy efficiency. Another analysis found that average electricity prices decreased by 6.4% in the RGGI region since the inception of the program.	
38. National Alliance of Forest Owners (NAFO)	As Virginia's third largest industry, forestry is a critical economic force. According to The Economic Impact of Virginia's Agriculture and Forest Industries, "the forestry sector had a total impact of over $21 billion in total output, approximately 107,900 jobs, and $9.3 billion in value-added." This annual economic contribution in large part depends on Virginia's 15.72 million acres of forestland, of which more than 13 million are privately owned working forests. State policies that incentivize the use of biomass as a prioritized alternative fuel source provide a market for lower value or underutilized timber and harvest residues as well as residuals from manufacturing; consequently, such policies deliver a valuable economic rationale for private forest owners to keep lands forested. Generating and selling biomass fuel components from privately owned Virginia forestland will support these forest owners in the state and continue to develop a carbon-neutral fuel source in a state already committed to moving beyond a traditional fossil fuel-powered infrastructure. In Virginia, harvest residues such as tops, limbs, and undersized stems, are often chipped in the field to generate mixed chips, which are then sold to power generation facilities to produce heat or electricity. These mixed chips are supplements to mill residues and other used wood materials that can be burned to generate power. According to the Department of Taxation and the Department of Forestry, mixed chips produced in 2015 and 2016 represented approximately 19% of the total cubic feet of Virginia forest products generated in those years,	Although DEQ recognizes the importance of the forest product industry, DEQ is also aware of air quality issues related to the combustion of biomass, and is not attempting to definitively regulate or establish a specific policy for biomass combustion with this regulatory action. Nonetheless, as discussed in greater detail in the initial response to comment comment 67, DEQ is adhering to the specific requirements of ED 57, EO 11, and RGGI, and limiting this particular regulation to fossil fuel-fired facilities. As more fully discussed in the current response to current comment 40, the board amended the initial proposed regulation, while the initial Agency Background Document (including the initial response to comments) reflected DEQ's original position. This document has been corrected, and the regulation has been amended based on the re-proposed public comment received. DEQ believes that the restoration of the original language related to fossil fuels adequately demonstrates their exemption from the rule. Reducing the fossil fuel threshold from 10% to 5% is needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program. Adding a specific definition of biomass as the commenter requests may have the unintended consequence of creating or removing applicability of certain projects beyond what the commenter currently anticipates. DEQ believes that the simple limitation to fossil fuel is clear and appropriate.

	with the remainder being the actual logs harvested for pulp and wood manufacturing. While mixed chips are the lowest-value forest products, they represent an important source of income for private forest owners. Making clear in the final regulation that biomass emissions are excluded from the carbon dioxide accounting requirements will help to further encourage development of this robust and competitive biomass market in Virginia. A majority of states that participate in the RGGI carbon trading system fully exempt biomass from the program. Aligning on this policy issue with other RGGI states will encourage Virginia electricity generating facility owners and other industrial sources to avail themselves of the abundant biomass products sustainably harvested in the state. Moreover, excluding biomass from the final rule will provide a more economical fuel alternative to facility owners. Exempting biomass will incentivize co-firing, and thus provide access to a readily available, Virginia-based fuel without the additional cost burden of obtaining CO_2 allowances that will be imposed on carbon emissions from fossil fuels. NAFO urges DEQ to fully and explicitly exempt biomass emissions from co-firing operations in the final RGGI regulations. NAFO is concerned the text of the re-proposed regulations does not implement the policy position stated in the preamble and DEQ's response to comments on its earlier proposed rule. In its October 2018 response to comments, DEQ stated it would amend the proposal to indicate that a CO_2 allowance is a limited authorization to emit up to one ton of CO_2 that has been generated as a result of combusting fossil fuel. In the response to comments, DEQ made plain its intent to define "CO_2 allowance" to be "a limited authorization by the department or another participating state under the CO_2 Budget Trading Program to emit	

	up to one ton of CO_2 that has been generated as a result of combusting fossil fuel." Although the proposed regulation did not otherwise define biomass, limiting the rule's coverage to emissions generated "as a result of combusting fossil fuels" would provide clarity – as it would thereby explicitly exempt non-fossil fuel emissions from regulation. The preamble to the re-proposed regulation follows the statement in DEQ's response to comments and confirms DEQ's intent to explicitly exempt biomass emissions from the regulations. As DEQ stated: "Other substantive changes in the reproposed action include … exemption of fossil fuel units that co-fire with biomass from CO_2 accounting…." However, the published definition of CO_2 allowance does not include the critical limitation of "as a result of combusting fossil fuel." Omitting this language undercuts DEQ's intent to codify the biomass exclusion in the final regulation. DEQ should reincorporate into the definition of "CO_2 allowance" the limiting language of "CO_2 that has been generated as a result of combusting fossil fuel" in order to effect DEQ's decision to substantively "exempt[] …fossil fuel units that co-fire with biomass from CO_2 accounting." While revising the text would provide clarity, DEQ should consider providing an affirmative definition of biomass in the final regulations. As discussed in our earlier comments, the Virginia Legislature has already provided such a definition of biomass in the state code. Defining "biomass" similarly and excluding it from the regulation, rather than by implication, would provide further clarity. Defining biomass and then excluding emissions from biomass from the rule would also be consistent with both the RGGI model rules and most other RGGI states. Finally, as discussed in our earlier comments, DEQ should also consider revising the definition of "fossil fuel-	

	fired" to change the threshold of fossil fuel burned from "5% or more" back to "10% or more." Excluding entirely from the regulations facilities that burn 90% or more, rather than 95% or more, of biomass as their primary fuel source better reflects the policy that biogenic emissions are fundamentally distinguishable from fossil fuel emissions. Virginia should be encouraging this important economic engine for the state's economy, rather than restricting the standards for future development of near biomass-only facilities.	
39. Natural Resources Defense Council (NRDC)	NRDC's IPM modeling, conducted by ICF, predicts the same Virginia emissions in 2020 as that indicated by DEQ's own analysis: NRDC's IPM modeling for Virginia projects the state's power sector emissions to be 28 million tons in 2020. This modelling accurately reflects the reality of today's power sector in Virginia. First, in-state coal units no longer compete on the open market, and thus no longer have an outsized impact on statewide emissions under business-as-usual conditions. Specifically, only one Virginia coal plant exceeded a 40% capacity factor in 2018 (VCHEC, at 54%). As such, coal units now account for less than 10% of Virginia's annual generation. Meanwhile, renewable energy installations, most notably solar energy, are steadily increasing. In 2018, Virginia's solar capacity grew by 158%, the fourth-highest in the nation. This is largely due to the steady decline in the cost of renewables, with utility scale solar costs falling 13% last year (on top of an 88% drop in the past nine years). The steep decline in coal generation and renewables costs is concurrent with lower demand growth projections across the state and region. As a result, the U.S. EIA's Annual Energy Outlook 2019, for example, anticipates carbon emissions in the Virginia-Carolina region will already decrease by 35% from 2017 levels by 2021. Combined, the factors of lower in-state electricity demand growth, persistently declining gas prices, and	Support for the proposal and the discussion of the appropriateness of the new cap is appreciated.

	growing low-cost renewables (and their impact on coal's ability to compete in the marketplace), make 28 million tons a sensible starting point for the program, one that reflects the reality of today's energy marketplace. A sufficiently ambitious program will also drive significant economic and health benefits, including lower energy bills and rates, as well as improved public health resulting from cuts in co-pollutants like NO_X and SO_2.	
40. NRDC	DEQ's proposed rule clearly requires that co-firing facilities hold allowances for the CO_2 they emit, whether those emissions be from forest-derived biomass or fossil fuels. While Governor Northam unexpectedly removed coverage of biomass co-firing emissions in the version presented to the board in October 2018, the board rightly voted to remove that newly-inserted exemption of biomass co-firing. (Note that DEQ inaccurately describes an "exemption of fossil fuel units that co-fire with biomass" in the summary of the regulation, a description that is at odds with the wording of the regulation and the intent of the board.) The board's inclusion of biomass co-firing under the rule is sensible and reasonable. Forest-derived biomass is not categorically a carbon neutral fuel, so its emissions cannot be assumed to be zero. Stack emissions of CO_2 from burning forest-derived biomass are typically comparable to, or greater than, coal per unit of energy produced (due to the inefficiency of biomass combustion), even according to industry analyses. The assertion that biomass is a carbon neutral source of energy has been falsely promoted by the Trump administration and more generally by industry interests. These assertions have been widely rejected in the scientific peer-reviewed literature, which has shown that most forms of forest-derived biomass increase CO_2 emissions in the atmosphere for many decades to centuries. In particular,	Based on public comment and internal staff review, DEQ originally proposed what was intended to be clarifying applicability language (adding "generated as a result of combusting fossil fuel") to the board at the October 2018 meeting. At this meeting, a board member asked staff why the additional fossil fuel terminology was added, to which staff responded that it was intended to clarify the regulation's applicability given that EO 57, ED 11, and the Attorney General opinion were all directed specifically toward fossil fuel. Staff also pointed out that the issue of how to address biomass is so complex that it could not be addressed in this particular regulatory action. The board member suggested that the issue had been addressed in the definition of "fossil fuel-fired," and that the additional language was unnecessary, confusing, and redundant. Staff and the board agreed that it could be considered during the new comment period on the re-proposal, and the board agreed. At no time did any board member suggest that the purpose of removing the additional language was intended to ensure that the regulation applied to facilities firing or co-firing a certain amount of biomass. While the board did approve the removal of the fossil fuel specification for the purposes of the re-proposal and public comment, and the re-proposed regulation was modified accordingly, the accompanying Agency Background Document was not concurrently modified, and discussion of the clarifying language originally recommended by staff remained in error. Those provisions of the background document (primarily in the

	assumptions about the categorical carbon neutrality of biomass from managed forests have been rejected by the EPA Scientific Advisory Board. If Virginia were to exempt all biomass, including co-firing, from the rule--even if deferring biomass policy formulation until some later time--its action would send a damaging signal that crucial, state-level carbon trading rules can nonetheless embrace the anti-science policies of the Trump administration. We therefore urge DEQ to maintain its coverage of co-fired biomass in the rule as proposed, and in line with the board's binding vote on the matter on October 29, 2018. Biomass co-firing coverage as proposed in the current revised rule is also consistent with DEQ's past actions in this regulatory process. DEQ has consistently asked in past and current comment periods for specific input on how to cover biomass emissions under the rule. Indeed, biomass coverage has always been explicitly contemplated and therefore expected, starting with EO 57 and ED 11. Just as important as maintaining this well-established intent, covering emissions from biomass co-firing is consistent with RGGI policy, with which DEQ rightly seeks to align. The RGGI program requires participants to count emissions from biomass when it is co-fired with fossil fuel (while also providing an exemption from the requirement for eligible feedstocks under prescribed circumstances). To avoid litigation and to align with that larger market, DEQ should unambiguously avoid arbitrary polluter exemptions and retain biomass co-firing coverage in its final rule.	response to comments) have been corrected accordingly in this new background document for the final regulation. Comment was received both in favor of and against the inclusion of the original staff-recommended language emphasizing that the rule is intended only to address the combustion of fossil fuel. Based on comment received during the re-proposal, it appears that removing the fossil fuel provisions has resulted in more confusion than clarification, and thus staff recommends that the clarifying language be restored. DEQ continues to maintain that the scope of this regulation is limited to fossil fuel combustion. DEQ is aware of the concerns associated with biomass, and discussed the pros and cons of including or excluding biomass units with the Regulatory Advisory Panel. The group did not reach consensus on an approach for dealing with biomass; given that, and given the numerous, detailed comments received during the public comment period, DEQ recognizes that this is a polarizing subject. However, the ED 57 Work Group specifically recommended that the Governor consider taking action via a regulatory process to establish a trading-ready carbon emissions reduction program for fossil fuel-fired electric generating facilities. The RGGI Model Rule provides that a biomass-fired facility may be a CO_2 budget source if the use of fossil fuel combusted comprises, or is projected to comprise, more than 50% (commence operation pre-2005) or 5% (commence operation post-2005) of the annual heat input on a Btu basis during any year. Additionally, most RGGI states allow CO_2 budget units that co-fire eligible biomass to deduct CO_2 emissions attributable to the burning of eligible biomass from their compliance obligation in accordance with the RGGI model rule. As of this writing, no RGGI state covers biomass. Finally, regularly scheduled program reviews at both the RGGI and state level

		will provide opportunities to adjust the exemption should implementation issues be identified by Virginia, RGGI, or the general public.
41. NRDC	DEQ should work to ensure the integrity of the program is not eroded by emissions leakage. Leakage is the increase of emissions from power plants outside Virginia to supply in-state load due to a carbon price on in-state generation, beyond business-as-usual import levels absent a Virginia carbon price. DEQ can avoid leakage by (1) designing an economically efficient program with minimal market distortions; (2) ensuring consumer benefits are maximized through efficiency investments; and (3) driving significant levels of in-state, cost-effective renewable energy development. These will all deliver least-cost carbon reductions and mitigate the impact of carbon prices on the flow of carbon-derived power flows across state lines. To verify the program does not inadvertently lead to increased fossil-based electricity imports from out-of-state, DEQ should establish an annual program review process for the duration of the program, to assess whether interstate power flows are shifting as a result of the carbon price. Importantly, a modest price on carbon is but one of many variables that can influence interstate power flows; therefore, any such analysis would also need to account for other potential factors (including changes in fuel prices and potential changes in both load and generation in the interconnection region), in order to draw appropriate attribution conclusions. RGGI has already built in such emissions monitoring and reporting that assesses changes in power flows, and we urge Virginia to do so as well.	As discussed in the initial response to comment 91 and current response to current comment 31, neither DEQ nor RGGI anticipate any leakage issues. Regardless, the program will be closely monitored to assure that this continues to be the case. Note that RGGI monitors for and reports trends in leakage annually. The regulation is based on the RGGI model rule and, as such, includes RGGI's emissions monitoring and reporting requirements.
42. NRDC	Climate change is inherently an environmental justice issue, as coastal communities and low-income communities ultimately bear the worst brunt of its impact. Therefore, the program should make significant cuts to CO_2 and ensure the consumer and energy efficiency benefits flow to the	Support for the proposal is appreciated. Environmental justice is discussed in greater detail in the current response to current comment 33. As noted there, Virginia will be the first RGGI member state to explicitly require environmental justice consideration and review in its RGGI program requirements.

	low-income citizens most impacted by climate change and energy costs. Additionally, because CO_2 is not harmful in locally-higher concentrations, and there do not appear to be specific Virginia plants in proximity to at-risk communities whose capacity factors will increase under a carbon program, a carbon market in Virginia appears unlikely to create hot spots of pollution in frontline communities. And as the cap for carbon emissions is lowered, it can also create additional benefits of further reducing associated co-pollutants that cause health problems in communities close to their source. To ensure this is the case over the course of the program, we support DEQ's inclusion of environmental justice review.	
43. Old Dominion Electric Cooperative (ODEC) and the Virginia, Maryland and Delaware Association of Electric Cooperative	The ICF analysis shows an increase in electricity imports to Virginia by as much as 4 TWh (4 million MWh) on an annual basis or approximately 15% of Virginia's electric usage. Coal units across state lines in non-RGGI states with low utilization are well positioned to ramp up their dispatch to supply these imports, increasing the regional CO_2 emissions by approximately four million tons annually. This would largely cancel the reductions outlined in the re-proposal. As a result, it is likely that CO_2 emissions would be increased by utilization of more carbon-intensive plants in adjacent states. Ultimately this shift from generation within Virginia to generation from just outside Virginia's border will impact Virginia and the region as a whole. The region immediately surrounding and including Virginia may not see an actual decrease in carbon emissions as a result of this regulation. This particular issue of the actual transmission flows requires more study to evaluate what specific generation in adjacent states will be increased and what the overall impact on regional emissions is as a result of the re-proposal. One of the key assumptions made in	See the response to current comment 19 on the topic of electricity imports and the effect of the proposal's allocation approach to encourage in-state generation. As a region, the RGGI states monitor imports and the potential for emissions leakage on an annual basis. Like the other states, Virginia intends to participate in periodic program reviews to assess the effectiveness of the program. To date, those reviews have not concluded that imports or emissions leakage are a problem for RGGI. Should that conclusion change, measures to address emissions leakage could be considered. The commenters' acknowledgment that the value of allowances will indeed be returned to commenters customers is appreciated. With respect to the statements about investor-owned utilities, note that the SCC is charged with protecting utility customers and in carrying out its statutory duties are meant to ensure that utilities return the value of allowances to utility customers. With respect to the energy efficiency inputs to the model, DEQ consulted with Dominion to understand the current savings achieved per dollar spent and

	the economic analysis is that all revenues from the allowance consignment auctions are returned to ratepayers, thus reducing the projected impact on ratepayers. This assumption is stated in the presentation on customer bill analysis. This assumption is inconsistent with the re-proposal. The rule states that the proceeds from the consignment auctions are returned mostly to affected generators with a small carve out for DMME. While ODEC, as a member-owned cooperative, will return its revenues from the consignment auction to its member-ratepayers by virtue of its business and organizational model, some of the affected generation in the state is owned by independent power producers who will keep all proceeds from the consignment auction. Even the regulated, investor-owned utilities may decide not to return all auction revenues to ratepayers, nor can the rule require this. Further, if legislation granting the state permission to administer the funds instead of returning it to generators is promulgated, then none of the consignment auction revenues will be necessarily automatically returned to ratepayers. The ICF analysis assumed a flat load forecast as a result of GSTA, which includes "significant energy efficiency investments by regulated utilities (close to $1 billion)." The documentation of how much energy efficiency can actually be achieved with this investment has not been studied by ICF, and, was rather, estimated using data that was not appropriate for large scale applications. By forecasting no load growth, the ICF analysis makes compliance seem easy and cheap, because emissions levels, plant generation needs, CO_2 prices, and firm power prices are all lower when loads are assumed to be low. The ICF results are only valid for a scenario with this load assumption. Future compliance costs are understated if	determined the modeling inputs with the information in hand. With respect to offshore wind, the modeling did not assume new offshore wind for Virginia other than the small demonstration project that is indeed expected to be completed and operational.

	Virginia's economic expansion and data center expansion outpaces the likely-overstated energy efficiency reductions achieved by the GTSA spending. The recent announcement of Amazon's choice of Virginia for its HQ2 location is key evidence that low- to no-load growth is not necessarily going to occur. Virginia, in fact-and especially Northern Virginia-continues to be a high-growth area. The ICF analysis assumes that several off-shore wind projects will come to fruition. The off-shore resources are being used in the study to meet incremental demand. These projects are being opposed, and may not actually occur. While an assumption like this may seem trivial, if these projects are not constructed the expected generation need to replace these projects would equate to roughly 14% of the overall RGGI allowance cap which would have a significant impact on RGGI allowance prices and ultimately the cost of compliance for Virginia utilities. These issues related to the modeling of the potential impacts highlight the complex nature of the proposal and the need to take more time to assess the real impacts of linking to RGGI. We urge that the implementation of the regulation be postponed until a more thorough evaluation can be performed.	
44. ODEC	We have significant concerns regarding the anticipated impact of this regulation on the electric bills of its ultimate consumers. In the service territories served by ODEC and Association, many rural consumers are having trouble paying their bills. Even a modest increase in bills will be problematic, and larger increases in costs will turn electricity into a luxury item. The Cooperatives have only their ratepayers from which to recover costs; there are no separate stockholders. This fact makes the implementation of this rule all that much more troubling for the Cooperatives. This program has the	The bill impacts of the proposal are expected to be very small. Historically, RGGI allowance prices have been lower than projected in the IPM modeling and if this historical trend continues, we can expect the bill impacts to be very low. In addition, if the allowance prices happen to be higher than expected, the proposal includes a Cost Containment Reserve that will essentially relax the emissions cap to lower allowance prices. The commenter refers to the letters filed with state legislators by the SCC staff, which in turn relies on a modeling analysis conducted by Dominion. DEQ was not consulted on this analysis nor

	potential to produce a multitude of unintended consequences, each of which could, individually, have sizable cost implications. The Cooperatives are particularly concerned about protection of our consumers. We reference the letter to Delegate Kilgore from SCC staff citing results of their modeling of bill impacts due to the implementation of the re-proposed rule and the SCC letter to Delegate Poindexter which followed it. Based upon their analysis, impacts on average for Dominion customers was an average monthly bill increase of $7 to $ 1 2. The SCC used Dominion's PLEXOS model, but a number of the assumptions which they listed were similar, if not identical to assumptions made in the ICF modeling runs that were used in the impact projections presented by Analysis Group in support of the re-proposal. These include: using the price floor for carbon emissions published by RGGI; using a discount rate of 6.31%; modeling DOM zone costs recognizing that that customers pay whether a unit runs or not; assuming that the 5,000 MW of solar, 30 MW of battery storage and $870 million of spending on energy efficiency programs, all of which is mandated under the GTSA, came to fruition; and using the 28 million tons with a 3% reduction through 2030 consistent with the re-proposal. SCC's concerns should have been addressed by DEQ working closely with the SCC. DEQ's rule will obligate Virginia to reductions that RGGI desires while not properly addressing the utility regulatory aspects that is one of the foundations of the RGGI organization. The RGGI Board is comprised of two representatives from each state, one from the utility regulatory area and the other from the environmental agency. These two representatives conceptually work in concert to establish balanced reductions for their own participating state with minimal impacts to consumers. It is quite obvious that	given an opportunity to comment on the assumptions used or methodology employed. The commenter is incorrect that the Dominion modeling uses the same assumptions as that used in the IPM analysis. The Dominion modeling and SCC assessment were conducted in private and the assumptions and methodology are not yet known. Nevertheless, from what has been disclosed there appear to be a large number of defects in Dominion’s modeling approach and in the SCC’s reliance on that analysis. See the current response to current comment 20. Also note that in addition to issues identified in current response to current comment 20, the SCC statements and the related Dominion modeling do not relate to commenter, commenter's service area, or commenter's customers.

	there is not alignment among the state agencies regarding the potential impacts to consumers from this re-proposal. Considering this fact alone, DEQ is encouraged to delay implementation and take the time to form a multi-year regulatory working group that closely integrates environmental and utility regulators, and outside experts from across stakeholder groups, to more fully vet the re-proposal before it is enacted. Finally, under the regulation, there is no established legal requirement to return revenues to ratepayers. These numbers greatly concern us. The impacts to the Cooperatives' member-consumers could be significantly different from what the SCC has projected for Dominion customers, and the SCC letter to Delegate Poindexter indicates that they have not even begun the process of modeling those impacts. While Dominion supplies the majority of electric consumers in Virginia (5 million customers), our Virginia Cooperatives served by ODEC equate to approximately 1.1 million consumers. There are fewer ratepayers over which to spread any cost increases. Based upon the difference in Dominion as an investor-owned utility versus the Cooperatives as not-for-profit member-owned utilities, there could a much wider range of financial impacts that have yet to be fully vetted. While it has long been accepted in the promulgation of any regulation that there are various models and economic analyses to show the cost impacts of the rule, the simple fact that this pollutant cannot be controlled with specific and defined commercially-available control equipment, as is the case with other criteria and hazardous air pollutants, makes the rule problematic. There is no environmental modeling that can be run to show any projected local benefits based on the anticipated program reductions.	
45. ODEC	As we have commented previously, regulating CO_2 at the state level is not	A regional approach is indeed better than a single state approach. The proposal is

	as effective as a broader, integrated regional or national approach, particularly when the regulation of CO_2 is in a state that is surrounded by states that are not regulating CO_2. There are numerous unintended consequences that may arise from such a market distortion. By putting this additional financial burden on Virginia generation, the effect will be encouraging imports of electricity from other states, potentially requiring the construction of additional transmission infrastructure to maintain reliability. DEQ's modeling clearly shows these effects with projections of 16% of electricity needs coming from imports in 2020 and rising to 25% by 2030. If the proposal is to move forward, we recommend adding a provision for an analysis of trends in imports in Virginia once the program has been implemented. If there is indeed a significant increase in imports, Virginia should have the ability to make programmatic adjustments to scale back the regulatory requirements for in-state generators to deter the import of out-of-state generation. The board should consider any number of safety valve measures-for consumer protection from price increases, for reliability of the electricity system, and for imports from out-of-state. The additional burden of this program could result in premature retirement of coal facilities or significantly reduced utilization of existing coal resources. These Virginia power generation resources were designed, built, and permitted in strict compliance with federal and state regulations to meet the long-term electricity needs for ratepayers. Implementation of this rule may reduce the remaining useful life of these assets which are still being paid for by all consumers, and certainly are still being paid for by the ODEC Member Systems' member consumers. At the very least, Virginia needs to develop a mechanism to compensate consumer-funded, prematurely-retiring coal generation.	designed to make Virginia a part of a regional emissions trading market to provide generators with maximum flexibility and to make sure reductions are cost effective. The analyses conducted suggest that the cost impacts of the program will be minimal. As discussed in the initial response to comment 91 and current response to current comment 19, neither DEQ nor RGGI anticipate leakage issues. Nevertheless, the program will be closely monitored to assure that this continues to be the case.

	One possible mechanism would be to carve-out allocations for retired consumer-funded generation for a significant number of years after their retirement. This type of solution would also remove a barrier to the closure of consumer-funded coal generation, by providing allocated allowance revenue to offset the stranded costs paid for by consumers. Other mechanisms could also be considered, and make more sense, but those would likely require legislation to implement. Those renewable generation resources owned directly by Cooperatives should continue to be counted as renewable resources and excluded from the Regulation. This includes not only solar PV projects, of course, but also the carbon-neutral wood waste biomass plant in Halifax County serving member-consumers of Northern Virginia Electric Cooperative. Beyond increasing imports using current transmission infrastructure, recent changes in PJM's market efficiency process will promote construction of new transmission from outside Virginia into the Dominion zone. State participation in RGGI coupled with PJM's market efficiency process set the stage for economically encouraging increased use of existing coal facilities and construction of new gas facilities just outside Virginia's border to incrementally meet Virginia's energy needs in the future. As noted above, this could very well result in no net reduction in regional CO_2 emissions despite the increased cost to Virginia rate payers. The issue of leakage is a very complex issue for which states continue to grapple. Virginia, as part of the PJM RTO, may very well have to grapple with this issue, and spend significant resources in the future to control leakage. Leakage is not just a theoretical modeling concern, but is a real problem that is already happening in existing RGGI states. The second fact is that despite RGGI's requirements to consider	

	leakage and to make adjustments to address it, RGGI clearly has not done so and cannot be relied up on to correct the problem for Virginia. The proposal should include Virginia-specific rules to reduce or eliminate leakage.	
46. ODEC	Virginia has seen an overall downward trend in carbon intensity of its generation. Virginia already has one of the lowest carbon intensities among the PJM states, which also includes RGGI states that have been involved in the program since its inception. It is not appropriate to reduce the starting budget to 28 million tons given the past trends and the progress that has already been made in the absence of any rule. Current trends support the initial budget higher than 28 million tons. While the trend has been declining over the years, there has been a great deal of investment in new clean combined cycle generation which would be subject to this program. Virginia should be allowed to enter the RGGI program with a budget that is fair to Virginia given the current generation resources. The aspect of the program bank adjustments being applied to Virginia as we are just entering the RGGI market puts a greater burden on Virginia sources than is warranted, as we have outlined in greater detail in the subsequent section. Additionally, as is highlighted within the VMA comments, there are significant concerns regarding the extent of the industrial exemption that is provided in the proposal. DEQ has stated that their assumptions in the modeling are that no industrials would be considered affected units. If that is truly the case, then the language which provides for that exemption should be very clear. Otherwise, the budget would need to be re-evaluated simply to account for any potentially affected industrials.	It is true that both Virginia and the RGGI participating states have seen a downward trend in carbon intensity, which is why a lower budget of 28 million tons is more appropriate than a higher budget. Regarding the basis for the emissions cap in the proposal, the IPM analysis projects that emissions from covered sources in Virginia will be 28 million tons of CO_2 in 2020. This projection is based on the best modeling inputs available, including inputs relating to expected energy efficiency and renewables investments in Virginia and elsewhere in the EI. This approach is consistent with best modeling practices. Thus, the 2020 Virginia emissions cap is set at the expected emissions level in 2020 and does not disadvantage Virginia entities. Note that the RGGI states conduct periodic program reviews to assess the program. These reviews may result in changes in the emissions caps (either up or down) based on conditions observed in the region.
47. ODEC	ODEC understands that there is a strong desire by the Administration to start participation in RGGI, and that negotiations have been centered around Virginia entering in 2020.	RGGI allowance auctions are already open to participation by Virginia entities, meaning Virginia entities can acquire emissions allowances that can be used for compliance even though Virginia

	However, beginning in 2020, the last year of a 3-year control period, puts additional strain on generators for procurement of allowances. Virginia generators will not have any time to determine changes in the overall market. Normally, generators would have 3 years to be able to optimize their allowance procurement strategy before the final true-up. In Virginia, all the generators will have only one year to ensure they procure enough allowances to cover the emissions for that initial participation year. To alleviate this burden, assuming the regulation goes forward, we propose that the start of implementation of the program not commence until January 1, 2021, which is the start of the next control period. Additionally, given that the Virginia generators would be just now entering the RGGI-linked program, the banking adjustments that have been calculated by RGGI and are being proposed to be applied to subsequent years, should not be applied to the Virginia budget. These banking adjustments are based on participants outside of Virginia banking more allowances than anticipated, and not the actions of any generators in Virginia. Such an adjustment should only be applied to existing RGGI participants. Alternatively, if Virginia does not wish to diverge from the bank adjustment process, as we have indicated in the previous section, the initial budget of 28 million tons should be increased to the originally-proposed amounts of either 33 or 34 million tons. This would ensure that applying the banking adjustments will not put unwarranted burden on Virginia's sources. As we stated in previous filings, we feel that there should be consideration given to reliability and resiliency safety valves. Such mechanisms would recognize that over-reliance on intermittent generation or a single fuel such as natural gas which is not easily storable, may negatively impact reliability and resilience. Analyses should be performed to assure that	entities do not currently have a compliance obligation and will only have one year's emissions to cover with allowances in 2021. Also note that there is currently a very large private allowance bank across existing entities covered by RGGI, which means there is currently a general oversupply of allowances in the RGGI market. Indeed, this is the reason for the bank adjustment that will take place in the early 2020s in the RGGI program. In short, Virginia entities are already well positioned to plan for compliance for the single year of 2020. The bank adjustment was part of the IPM analysis of the proposal and that analysis informed the decisions on starting cap level and rate of cap decline. The proposal as a whole, including the bank adjustment, is expected to have minimal cost impacts as stated in the analyses released in connection with the proposal. Thus, the bank adjustment does not necessitate an adjustment to the starting cap level.

	resiliency is maintained and that critical generation resources are not retired because of the impacts of this regulation. In the case where retirement of critical resources is likely, adjustments to the allowance allocations should be contemplated.	
48. ODEC	We generally support the provision establishing that 95% of the budget will be allocated to the generators. Particularly for the Cooperatives, revenues from the consigned allocations will subsequently go back directly to our member-consumers. This is a critical means to reduce the net cost impact on electric consumers. Setting a price on CO_2 emissions as this program does, is enough incentive for all sectors to seek ways to reduce emissions. Even when allocated allowances, utilities will still be incented to pursue low- or non-emitting resources and energy efficiency measures. Not having allowances granted to such sources and forcing electric ratepayers to foot the bill for CO_2 emissions will invariably be a significant cost impact and can be at least somewhat mitigated by allocated allowances to generators as proposed. As stated previously, any utility with a wholesale power contract could be adversely affected by the implementation of a system where their consumers end up paying for the costs of CO_2 emissions and receive nothing in return. This could be resolved by flowing auction revenues through applicable FERC ratemaking mechanisms using FERC Form 1 data. However, this difference, and the complexity of DEQ involving itself in a mechanism of wholesale ratemaking, should merely serve to reiterate our concerns. We further recommend allocation based on emissions, not megawatts generated. Incumbent utilities have made significant investments under the existing regulatory compact to provide power economically and reliably to meet retail loads. Because of these significant investments, there should be an appreciation for the value associated with these investments in	Support for the allocation approach in the proposal is appreciated. The topic of how to allocate allowances under the RGGI program has been discussed at great length during the stakeholder process and through regulatory development process. The output updating method was ultimately selected due to its ability to promote cleaner more efficient power generation, and to react to changes in the Virginia power sector in the future. To the extent that the allowances go back to the generators, it will serve to reduce the impact of participating in the RGGI program on wholesale prices. Everyone bids into the market, so everyone gets the value of the clearing price. The commenter is correct that the allocation of allowances should result in the flow of the allowance value to customers. In the case of long-term power purchase agreements with merchant facilities, the allocation of allowance value is a matter for the parties to those contracts to address. Indeed, the potential for this type of program has been present for several decades, suggesting that parties to any existing agreement had ample reason to account for the value of allowances awarded to merchant power under contract to a utility or other load-serving entity. As such, the allocation method in the proposal should protect consumers by ensuring that the value of allowances awarded to covered entities flow to the customers that have to pay for allowances in their power bills. See also the response to current comment 43.

	electric generating plants. The conditional allocations being allocated on an emissions basis will serve to provide a "glide path" for the existing resources to continue to operate within their remaining useful life, rather than having significant stranded resources which will directly impact our consumers and what they pay for electricity. Coal generators would still be incented to operate as efficiently as they can since the allowance price will set the cost of each ton of CO_2 emitted irrespective of who is given the allowances.	
49. ODEC	RGGI is a consensus organization, and the RGGI Model Rule already provides a structure for participating states to make adjustments and plan for the future. No one can know what the state of the electric utility industry will be in 2030. ODEC strongly disagrees with the provision proposed in 9VAC5-140-6190 C, which obligates Virginia, in the absence of any adjustment, to an arbitrary reduction value for 2031-2040. Requiring an 840,000 ton per year reduction as a hard-and-fast amount is both inconsistent with the intent of ED-11 and the reasonable standard for program review already established by RGGI If Virginia is participating in RGGI because it is a well-established multi-state trading program, why should the board feel the need to diverge from the Model Rule? Additionally, based upon the latest comments submitted by RGGI, RGGI states had some consternation with Virginia diverging from the Model Rule. The last sentence of this section is arbitrary, adds no real value to the program, and should be removed.	As discussed in the current response to current comment 54, DEQ agrees that participation in the RGGI program means following the RGGI protocols developed on a consensus basis with the participating states.
50. Delegate Israel O'Quinn, 5th District	I'm formally registering my opposition to the RGGI rule making process. There is a great deal of disagreement over the policy decision of joining RGGI, and while I am in fact opposed, there is a larger and more pressing issue at stake. The Administration had HB 1273 filed during the 2018 session, and the bill's summary stated in part, "…The regulations are required to comply with the Regional	Delegate O'Quinn's concerns are recognized. As discussed in the initial response to initial comments 76, 139 and 159, and in the current response to current comment 29, it is necessary and appropriate for the board to promulgate state-specific regulations controlling carbon pollution. The board's legal authority to issue regulations controlling air pollution is found in the Code of Virginia at §§ 10.1-1306 through 10.1-

	Greenhouse Gas Initiative model rule…" The bill came before the Commerce and Labor Subcommittee that I chair and during debate on this bill I directly asked Secretary Strickler if this bill was defeated, would the Administration proceed with joining RGGI regardless. His answer was, "yes." After debate on the bill, HB 1273 was defeated 6-4 in the subcommittee. Meanwhile, the General Assembly passed HB 1270, which was a bill explicitly prohibiting the Governor from joining RGGI. That bill was subsequently vetoed by the Governor. During the 2019 session, the Administration made another run at RGGI via HB 2735. That bill summary also stated in part, "…The regulations are required to comply with the Regional Greenhouse Gas Initiative program…" HB 2735 came before the same subcommittee and, after debate, was defeated by a vote of 6-3. In similar fashion to 2018, the General Assembly once again passed a bill (HB 2611) explicitly prohibiting the Governor from joining RGGI. It is clear that the Administration believes they need General Assembly approval to legitimately move forward with RGGI or they would not have had bills filed in successive sessions requesting such authority. But it is also clear that absent that consent, they are willing to move forward without the appropriate authority and operate far outside the bounds of--and in direct opposition to--legislative intent. The Administration has no authority to join RGGI or to promulgate regulations on the matter.	1308; the Office of the Attorney General of Virginia issued an official advisory opinion on May 12, 2017, which concluded that the board is legally authorized to regulate carbon pollution under these sections of the code. On March 14, 2019, Governor Northam vetoed House Bill 2611 on the basis that it was not protective of the environment as well as in violation of two provisions of the Virginia Constitution: Article III, Section 1 (Separation of Powers) and Article IV, Section 11 (Enactment of Laws).
51. Partnership for Public Integrity (PFPI)	We represent 6 environmental organizations based in Virginia and elsewhere. We are writing to express our concern that the Northam administration may decide to exempt CO_2 emitted by burning biomass for electricity, typically forest wood, from the state's plan to cap and reduce emissions from power plants. Dominion operates 5 power plants that could be exempted from the plan, four that burn wood exclusively, and VCHEC that burns coal and up to	As discussed in the current response to current comments 24 and 40, DEQ continues to maintain that the scope of this regulation is limited to fossil fuel combustion. DEQ fully appreciates the concerns associated with biomass. However, the purpose of this particular regulatory action is to establish a trading-ready carbon emissions reduction program for fossil fuel-fired electric generating facilities consistent with the RGGI program, and the re-proposed regulation accomplishes this.

	20% biomass. Allowing CO_2 emissions from biomass combustion to go unregulated–when in fact, wood-burning power plants emit more CO_2 per megawatt-hour than even coal plants–rewards cutting and burning forests for energy, when restoring and expanding forests is actually essential in the fight to reduce GHG. Virginia should show leadership by accurately counting CO_2 emissions from burning biomass. In previous comments, several environmental organizations provided 2 ways to accomplish this goal: directly count biomass-related CO_2 emissions from power plants, or use a net emissions methodology that calculates emissions assuming some CO_2 is offset. We urge you to adopt one of these approaches. According to the IPCC, reducing GHG emissions by 45% from 2010 levels by 2030 is critical in order to keep global temperature increase from exceeding 1.5°C above pre-industrial levels. Virginia's plan to reduce CO_2 emissions by 30% between 2020-2030 is an important step forward in reducing GHG emissions. However, the plan should not at the same time incentivize cutting and burning forests for energy. The IPCC is clear that avoiding dangerous climate change requires not just reducing emissions, but increasing carbon uptake. Forest growth represents the only significant terrestrial sink for carbon dioxide emissions, and reducing the forest sink by harvesting forests for energy increases atmospheric CO_2 by reducing carbon storage and sequestration. At its meeting in October, the board rightly removed the unexpected express exemption of biomass emissions from plants that co-fire biomass with coal. The body of the revised proposal appears to reflect that change by correctly renewing coverage of co-firing plants. However, it remains unclear whether the agency intends to cover co-fired biomass emissions because the summary of the revised proposed rule	Note that none of the current RGGI states covers biomass units, making the proposal consistent with the current RGGI program.

	states that "other substantive changes in the re-proposed action include…exemption of fossil fuel units that co-fire with biomass from CO_2 accounting." The Governor and DEQ would be on solid scientific and policy ground in clearly covering woody biomass emissions. Arguments that biomass CO_2 emissions should not be counted or that biomass should be treated as carbon neutral are often based on the claim that if forestry residues are used as fuel or pellet feedstock, emissions from combustion are no greater than the emissions from letting the material decompose, rendering the material effectively carbon neutral. However, even under such best-case scenarios, current science shows burning biomass has significant net emissions that persist for decades. In 2015, U.S. Representatives Don Beyer and Gerald Connolly criticized a proposed EPA policy that would have counted biomass waste products or "sustainably harvested" biomass as emitting zero carbon dioxide under CPP. Like Virginia's proposed plan, the CPP was intended to reduce CO_2 emissions from power plants. Rep. Beyer said he shared the concern of Virginia-based environmental groups that if biomass were exempted from regulation under the CPP, "Virginia will become known as a state that harvests forests to reduce its dependence on coal, rather than one that develops renewable technologies that clearly reduce emissions, such as solar and wind." Rep. Connolly wrote that "the decision to treat biomass as carbon-neutral may have unintended consequences that could actually undermine and inhibit our ability to reduce carbon emissions." Rep. Beyer cited a 2015 Washington Post story about how the European Union's treatment of bioenergy as carbon neutral has driven forest clear-cutting in the U.S. southeast to manufacture wood pellets that replace coal in the E.U. Multiple scientists also weighed in on	

	the importance of counting bioenergy emissions. Virginia has indicated that it needs to treat biomass as carbon neutral to be consistent with RGGI. But that is a factually incorrect understanding of what RGGI does. The 9-state program in fact requires participants to count emissions from biomass when it is co-fired with a minimum amount of fossil fuel, providing an exemption for emissions from sustainably harvested biomass. Virginia can improve on the RGGI policy and show truly robust climate leadership by counting all CO_2 emissions from biomass at commercial plants of 25 MW and above, and not granting exemptions that allow biomass to be treated as zero emissions. We urge the accurate count of CO_2 emissions from biomass from commercial electric facilities of 25 MW and greater.	
52. A.G. Randol III, VA Scientists and Engineers for Energy and Environment; Charles Poindexter	The re-proposal is even more draconian than the initial proposal. The re-proposal extends the emissions cap 10 more years to 2040 and lowers the initial cap from 34 million tons CO_2 in 2020 to 28 million metric tons without any valid justification. DEQ must withdraw the proposal for the following reasons. 1. The bills that require General Assembly approval of any proposal to limit emissions from power plants or transportation were passed, including HB 2269 and HB 2611. The bills that attempted to provide a legal framework for RGGI were defeated, including HB 2735 and SB 1666. The introduction of this legislation confirms that there is no legal basis for this regulatory overreach. All of the bills that proposed a moratorium on fossil fuels were defeated. Further more, the board has not met the requirements of § 10.1-1308 of the Code of Virginia. CO_2 is not an air pollutant, it is a fertilizer for plants. Pollutants from power plants are controlled by federal law under the NAAQS. RGGI is more restrictive than applicable federal requirements and conflicts with the federal ACE rule.	1. See the initial response to initial 76. 2. See the current response to current comment 20 for a discussion of the SCC analysis. 3. See the initial response to initial comment 61.

	2. SCC staff has critiqued the DEQ analysis as follows. RGGI has not published any prices beyond 2030 even though the re-proposal requires reductions through 2040. Virginia is a net purchaser of electricity from PJM and the RGGI scheme will increase our dependence on PJM. Net purchases from PJM in 2020 are projected to be 7M MWh (8.2%) growing to 19.7M MWh (21.4%) in 2040. PJM will require additional generation not less. DEQ's claim that consumer bills will fall is incorrect. DEQ modeled Virginia as a deregulated market, which it is not. DEQ does not capture the costs of premature plant retirements ($780 million) or the cost of replacement capacity ($1.3 billion plus financing costs and profit margin). DEQ relied on models and assumptions not suited for analysis of the proposed regulation. The PLEXOS model is an integrated energy model that simulates the Virginia power market and is used by the SCC. This is the model that should have been used. DEQ omitted the customer bill impact of increased fuel costs, prematurely retiring generating units and the additional costs for fossil fuel units that continue to operate. DEQ used a discount rate 3x lower than the standard used by the SCC (weighted average cost of capital) which results in understating the true costs of future capital investments. RGGI penalties will lead to higher PJM energy prices imposing costs across the entire PJM grid. Other states in PJM may have a cause of action against Virginia to demand compensation for these arbitrarily imposed billions in costs. DEQ does not account for the businesses and industries that are forced to leave the state because of higher electricity prices. 3. Electricity rates in RGGI states are well above the rates in Virginia. Driving rates higher under RGGI will penalize Virginia consumers for no demonstrable benefit. The residential	

	electricity rates in Virginia are lower than the rates in every RGGI state.	
53. RGGI	The RGGI states continue to applaud Virginia's important steps toward implementing a market-based program to reduce GHG emissions, and note that the re-proposed rule addresses many of the points on which the RGGI states commented when Virginia proposed the original version of the rule. In particular, the RGGI states recognize that this revised rule contains a reduced starting CO_2 allowance budget; a change in line with the RGGI states' earlier comments that opportunities existed to make the rule more ambitious. The RGGI states find that a 2020 starting budget at or below the proposed 28 million short tons demonstrates comparable stringency with the existing program. As previously emphasized, the participating states recognize the many benefits of an expanded trading market, including increased economic efficiency and mitigation of the possibility of emissions leakage. Participation in RGGI has helped the participating states create jobs, save money for consumers, and improve public health, while reducing power sector emissions and transitioning to a cleaner energy system. If implemented successfully, expanded RGGI participation will serve to amplify these benefits.	Support for the proposal is appreciated.
54. RGGI	Aside from the starting budget, other aspects of program design remain important in ensuring that any new entrant's participation in the RGGI market is fully compatible with our existing program. The RGGI states require that each participating state promulgate a CO_2 budget trading program regulation that is consistent with the RGGI 2017 Model Rule. In the re-proposal, the language specifying Virginia's base budget reductions between 2030 and 2040 is inconsistent with the RGGI 2017 Model Rule. Accordingly, the RGGI states strongly urge Virginia to adopt a consistent budget trajectory to the	The proposal has been revised accordingly. DEQ agrees that participation in the RGGI program means following the RGGI protocols, which are developed on a consensus basis with the participating states. In addition, DEQ is required by state law to review its regulations every 4 years. These requirements taken together will ensure that no premature conclusions are drawn as to what the cap ought to be in 20 years' time.

	other participating states. In the event that Virginia, or any participating state, wishes to effect changes in the region's long-term cap trajectory, the appropriate vehicle is the periodic RGGI program review process. Through this process, the participating states consider an appropriate trajectory for continued emissions reduction and arrive at a consensus decision supported by discussion, analysis, and stakeholder engagement. In previous program reviews, the states have twice reached consensus on plans to secure additional long-term emissions reductions. We have committed to commencing the next program review by 2021.	
55. RGGI	Modify the definition of "conditional allowance" by correcting "sources" to "source," and by striking the last sentence which is redundant (there is already exists a separate definition for "conditional CCR allowance").	The proposal has been revised accordingly.
56. RGGI	Use consistent terminology to refer to conditional allowances. See, for example, the proposed definition of "allocate." "CO_2" should be removed from "CO_2 conditional allowances" in order to match the regulation's definition of "conditional allowance." This error also appears in 6020 C "allocation year," 6215 B.1, B.2, B.3; 6220 A; and 6250 A.1.	The proposal has been revised accordingly.
57. RGGI	Use the term "conditional allowances" where applicable. See, for example, the proposed definition of "allowance auction." The RGGI states suggest that in this usage, the term "CO_2 allowances" should be replaced with "conditional allowances." According to the definitions in the proposal, the allowances would become CO_2 allowances only after they have been sold. This error also appears in the definitions of "CO_2 emission containment reserve allowance," "CO_2 emission containment reserve trigger price," "reserve price," "undistributed CO_2 [sic] allowances," "unsold CO_2 [sic] allowances," "Virginia CO_2 Budget Trading Program adjusted budget," and "Virginia CO_2 Budget Trading Program base budget," and in	The proposal has been revised accordingly.

	6210 H, H.3; 6211 heading; 6215 heading, A; 6250 heading, B, C; and 6420 A.1, A.5, B.1.	
58. RGGI	At 6190 B, the phrase "an allowance to be used for compliance purposes" should be replaced with "a CO_2 allowance once it is sold to an auction participant" in order to match the definition of a conditional allowance.	The proposal has been revised accordingly.
59. RGGI	The definition of a "CO_2 CCR allowance" should be revised per the following in order to reflect the fact that conditional CCR allowances become CO_2 cost containment reserve allowances after being sold at auction: "CO_2 cost containment reserve allowance" means an allowance that has been sold at an auction for the purpose of containing the cost of CO_2 allowances. CO_2 CCR allowances are subject to all applicable limitations contained in this part."	The proposal has been revised accordingly.
60. RGGI	Revise the definition of "conditional CCR allowance" as follows: "Conditional CCR allowance" means an allowance that may be offered for sale when the CCR is triggered. If any conditional CCR allowances are unsold, they may be offered for sale in future auctions during the same year. Conditional CCR allowances offered for sale at an auction are separate from and additional to conditional allowances allocated from the Virginia CO_2 Budget Trading Program base and adjusted budgets. Conditional CCR allowances are subject to all applicable limitations contained in this part."	The proposal has been revised accordingly.
61. RGGI	The term "CO_2 CCR allowance" should be replaced with "conditional CCR allowance" per the revised definition. This error also appears in the definitions of "Virginia CO_2 Budget Trading Program adjusted budget," and "Virginia CO_2 Budget Trading Program base budget," and in 6210 B, C, C.1, C.2, C.3; and 6410 A.1, A.2, B, B.1, B.2, B.3, B.4, B.5.	The proposal has been revised accordingly.
62. RGGI	Revise the definition of "allocate" or "allocation" per the following to avoid using the word "allocate" within the definition: "Allocate" or "allocation" means the determination by the	The proposal has been revised accordingly.

	department of the number of conditional allowances recorded in the conditional allowance account of a CO_2 budget unit or the Department of Mines, Minerals and Energy (DMME) pursuant to…."	
63. RGGI	Sections 6230 A and 6250 A.1 refer to a "conditional allowance account," but there is no corresponding definition in section 6020 C. The RGGI states recommend defining the "conditional allowance account" as a general COATS account established by the department for CO_2 budget sources and DMME or its contractor where conditional allowances allocated to CO_2 budget sources and DMME are held until auction.	The proposal has been revised accordingly.
64. RGGI	Because DMME would not need a compliance account, revise 6230 A to refer to a "conditional allowance account" as follows: "Upon receipt of a complete account certificate of representation…the department or its agent will establish a conditional allowance account and a compliance account for each CO_2 budget source for which an account certificate of representation was submitted, and a conditional allowance account for DMME."	The proposal has been revised accordingly.
65. RGGI	Amend the definition of "conditional CCR allowance" to remove reference to a "CCR account": "Conditional CCR allowance" means an allowance that may be offered for sale when the CCR is triggered. If any conditional CCR allowances are unsold, they may be offered for sale in future auctions during the same year."	The proposal has been revised accordingly.
66. RGGI	6210 A and C refer to "the Virginia Consignment Auction Account" and "the Virginia Auction Account," although neither term is defined. If there will be a single auction account for Virginia consignors, the term "Virginia Consignment Auction Account" should be defined. The rule should also stipulate the following. Conditional allowances and conditional CCR allowances allocated for a calendar year will be automatically transferred to the Virginia Consignment Auction Account to be consigned to auction.	The term "Virginia Consignment Auction Account" has been selected and the proposal has otherwise been modified appropriately.

	Following each auction, all conditional allowances sold at the auction will be transferred from the Virginia Consignment Auction Account to winning bidders' accounts as CO_2 allowances. Conditional CCR allowances sold at auction will be transferred to winning bidders' accounts as CO_2 CCR allowances. Unsold conditional CCR allowances will remain in the Virginia Consignment Auction Account to be re-offered for sale at auction within the same calendar year. Conditional CCR allowances remaining unsold at the end of the calendar year in which they were originated will be made unavailable for sale at future auctions.	
67. RGGI	The definition of "adjustment for banked allowances" should be replaced by the text below. The term "control period" should be replaced by "initial control period" to match the definition of the period from January 1, 2020 to December 31, 2020. The March 17, 2021 date should also be changed to March 15, 2021, in order to match the RGGI Model Rule. The "March 17, 2021" error also appears in 6210 E. "Adjustment for banked allowances" means an adjustment applied to the Virginia CO_2 Budget Trading Program base budget for allocation years 2021 through 2025 to address allowances held in general and compliance accounts…that are in addition to the aggregate quantity of emissions from all CO_2 budget sources in all of the participating states at the end of the initial control period in 2020 and as reflected in the CO_2 Allowance Tracking System on March 15, 2021.	The proposal has been revised accordingly.
68. RGGI	The defined term "initial control period" should be included when referencing requirements for a control period. This applies to the definitions of "CO_2 allowance deduction," "CO_2 allowance transfer deadline," "CO_2 budget emissions limitation," "compliance account," "excess emissions" and "ton," and 6050 C and	The proposal has been revised accordingly with some minor modifications.

	D; 6170 A; 6200 A, B; 6260 A, A.1, A.2, A.3, B, B.1, C.1, C.2, D. The RGGI states also recommend including new subsections to address initial control period in 6050 C and 6260 D.	
69. RGGI	At 6020 C, the RGGI states recommend that the control period from 2021 through 2023 be referred to as the "fifth control period" in order to align with the term used in the existing program. It can be clarified that the fifth control period is the first control period in which Virginia will participate. In addition, the interim control period start date should say "2021." "Control period" means a three-calendar-year time period. The fifth control period is from January 1, 2021 to December 31, 2023, inclusive, which is the first control period of Virginia's participation in the CO2 Budget Trading Program. The first two calendar years of each control period are each defined as an interim control period, beginning on January 1, 2021.	The proposal has been revised accordingly.
70. William Shobe, University of Virginia	I will not discuss the change in the treatment of industrial sources except to say that it is consistent with the structure of RGGI, exempting industrial generators that generate electricity primarily for internal use rather than for sale to the grid. Such exemptions are common in cap and trade programs to prevent leakage of emissions in trade-exposed industries. The changes proposed by DEQ are appropriate. DEQ made a number of corrections to its original assumptions used in its IPM modeling for the rule. The corrected assumptions included a renewables build-out more consistent with current practice and policy, a more realistic growth rate in electricity demand, and lower natural gas prices. As a result of the more realistic modeling assumptions, the IPM results show a much lower cost of achieving emission reductions. The baseline policy run shows Virginia	Support for the proposal is appreciated. As discussed in the current response to current comment 54, Virginia agrees that the establishment of reduction beyond 2030 must occur under RGGI's consensus process.

	business-as-usual emissions remaining steady at 29 million tons per year. The baseline 9-state RGGI market is quite slack, with allowance prices at or near the auction reserve price, and the full 10% retirement through the ECR mechanism. In fact, several million tons of allowances remain unsold at the reserve price and are retired. The model runs with Virginia joining at the lower cap of 28 million tons in 2020 still show some relative slack in the RGGI market. The full 10% of allowances in the ECR are retired, although no allowances are retired due to a failure to meet the auction reserve price. The prices of allowances are somewhat higher in the lower cap scenarios, but still quite modest at under $5 per ton of CO_2 (in 2017 dollars). This is about a tenth of the social cost of carbon measure developed to guide current decisions about investment in CO_2 emission reductions. It is important to note that the new, lower cap is not binding on Virginia for cumulative emissions during 2020-2030. The new annual cap levels will not be binding on Virginia emissions until around 2028, at which time, firms will have accumulated a large bank of allowances, which will not be fully depleted by 2030. This does not mean that there is no cost to current emission reductions, only that they are very modest because the cap takes a number of years to fall to levels that are actually binding on emissions. The ability of generators to comply early and accumulate a bank of allowances for later compliance greatly reduces the present value of compliance costs. The results from the IPM model runs are somewhat hard to interpret, since the IPM modeling does not correctly reflect key provisions of the proposed rule. In particular, the IPM model makes the key assumption that all allowances in RGGI (including	

	Virginia's) will be sold at auction. It does not accurately reflect the free allocation of allowances to generators and, most importantly, it does not account for the output-based allocation of allowances. My information on this comes from Dr. Chris MacCracken, the lead modeler responsible for the IPM model runs at ICF. Dr. MacCracken noted that, while it might have been possible to account for output-based allocation, the normal implementation of the IPM model does not do so, and no such special accommodations were made in the modeling of Virginia joining RGGI. The failure to account for output-based allocation would change both the amount of leakage of generation from Virginia into non-capped states in the PJM RTO and the competitiveness of Virginia generation in the states that are members of both PJM and RGGI. One clear conclusion is that total CO_2 emissions are lower with output-based allocation than they would be without it due to reduced leakage and that this improved emission performance is accomplished at very modest cost. My conclusion is that Virginia joining RGGI at the lower cap of 28 million tons in 2020 is environmentally effective, with little expected leakage into the uncapped portion of PJM. The reductions are achieved for under \$4.50/ton of CO_2, a very modest cost for emission reductions consistent with what Virginia would need to do to bring its electricity sector in compliance with U.S. emission reduction obligations under the Paris Climate Accord. It is extremely important that Virginia make every reasonable effort to make its rule consistent with the rest of RGGI. It is only be working together as a block that states can achieve the most cost-effective reductions in emissions. When the Air Board added emission reduction provisions for the period from 2030 to 2040, it violated	

	this principle of comity with the other RGGI states. The history of RGGI makes it abundantly clear that the principle of establishing caps for the next decade based on the best available evidence on compliance costs and then periodically revising those caps downward as justified by newly available evidence has worked extremely well. The two rounds of reductions already in place and the reductions to take effect in 2020 provide ample demonstration of the value of this consensus-based, incremental strategy. The board's addition of ad hoc, distant future reductions that are inconsistent with the RGGI model rule, violates the RGGI comity principle and unnecessarily complicates Virginia's relations with the RGGI states. The board's actions were not based on any evidence but are, rather, numbers plucked out of the air with no basis in modeling or analysis. The change provides no assurances of additional reductions over what would be achieved through the normal RGGI process of periodic review and revision. This change was made against DEQ's best advice and in spite of a clear signal from RGGI representatives that the change would violate RGGI comity. As a result, the changes to the proposed rule that refer to reductions beyond 2030 should be returned to the language in the original proposed rule. Our objective should be to work with RGGI states to achieve the greatest joint reductions possible. It is a disservice to that objective to make ad hoc, purely symbolic statements about distant future reductions, when the RGGI states already have an effective mechanism for revising future caps in response to the evidence as it evolves over time.	
71. Southern Environmental Law Center (SELC) on behalf of Appalachian Voices and	As stated in our comments on the original proposal, we support a 2020 emissions baseline that best achieves DEQ's goal of reducing statewide carbon pollution. SELC agrees the re-proposed 2020 base budget of 28	Support for the proposal is appreciated.

Wetlands Watch	million tons does just that. The updated and revised modeling assumptions show that Virginia's CO_2 business-as-usual emissions will be 28 million tons of CO_2 in 2020. This baseline appears far more accurate than the originally proposed base budgets of 33 or 34 million tons, which were significantly higher than recent actual emissions. The new modeling relied on more current data and more realistic assumptions, incorporating increases in renewable energy and energy efficiency coming on line in Virginia as a result of the 2018 GTSA, new demand projections, updated natural gas prices, new RGGI states, and significant new clean energy deployments in the RGGI states. As a result, the updated model produced a more accurate business-as-usual scenario for 2020 than originally proposed, which relied on outdated assumptions. The GTSA requires Dominion and Appalachian Power to propose $1.01 billion in energy efficiency investments by 2028. Energy efficiency programs can significantly reduce peak demand. As we noted previously, a study of Virginia's possible energy efficiency future by Applied Economics Clinic found that under a medium efficiency scenario, total annual electricity sales in Dominion's territory could actually decrease. Indeed, the study shows annual efficiency savings between 1,813 GWh and 2,840 GWh by 2028 under low efficiency or medium efficiency scenarios, respectively. Given these significant potential demand savings from energy efficiency initiatives, it is clear that the re-proposed base budget of 28 million tons, which factored in future energy efficiency investments in Virginia, is more realistic than the original budgets. DEQ's decision to include these investments in the revised modeling is also consistent with a recent ruling from the SCC. In December 2018, SCC rejected Dominion's 2018 IRP in part due to	

	the failure to include $870 million in proposed energy efficiency investments in the IRP load forecasting. SCC insisted, and Dominion agreed, that a primary purpose of energy efficiency measures is to reduce load. As such, SCC required Dominion to assess the impact of the GTSA energy efficiency investments on load forecasts in its revised IRP. Through the GTSA, the General Assembly also announced its intention to develop 5,000 MW of wind and solar projects in the state by 2028. As a result, Virginia's in-state generation fleet will necessarily become less carbon intensive, helping to achieve the carbon reductions proposed. The originally-proposed base budgets did not include this increase in renewables as an assumption and therefore overstated future carbon emissions in the state. The new base budget of 28 million tons, which assumes 5,000 MW of renewables by 2028, is a more accurate reflection of future CO_2 emission levels. DEQ's consideration of new demand projections also produced a more realistic base budget. An updated demand projection is consistent with SCC findings in its December 2018 Final Order on Dominion's IRP. DEQ relied on Dominion's 2017 IRP load forecast in its original modeling; however, SCC concluded in December 2018 that Dominion's load forecast has been overstated for years, despite generally flat actual demand. Indeed, Dominion's load forecast was almost double PJM's projections. In light of this finding, and in light of decreased demand in RGGI states, SELC supports DEQ's decision to update demand projection and agrees this resulted in a more accurate beginning base budget and future reduction goals. The proposed base budget of 28 million tons--based on better modeling and more realistic demand projections--is well supported by the record.	
72. SELC	The proposal unambiguously applies	DEQ disagrees that the applicability of

	to fossil fuel-fired units that co-fire with biomass. In particular, the regulation defines "fossil fuel-fired" as "combustion of fossil fuel, alone or in combination with any other fuel, where the fossil fuel combusted comprises, or is projected to comprise, more than 5% of the annual heat input on the Btu basis during any year." The regulation then states that "[a]ny fossil fuel-fired unit that serves an electricity generator with a nameplate capacity equal to or greater than 25 MWe shall be a CO_2 budget unit, and any source that includes one or more such units shall be a CO_2 budget source, subject to the requirements of this part." Together, these two provisions make clear that the regulations cover all units that co-fire fossil fuel with biomass, so long as the fossil fuel comprises more than 5% of the annual heat input. The only co-fired units that would not be subject to the requirements of the regulation are units where biomass accounts for 95% or more of the annual heat input, with fossil fuel accounting for 5% or less. Importantly, an owner of a co-fired unit subject to the regulation must obtain sufficient CO_2 allowances to offset all of the unit's CO_2 emissions. The proposed regulation makes clear that an owner or operator must hold allowances for "total CO_2 emissions . . . from all CO_2 budget units at the source." Since co-fired units that burn less than 95% biomass are by definition a fossil fuel-fired unit and a CO_2 budget unit, an owner or operator must have CO_2 allowances to offset all emissions from such a unit. We support this approach. Inclusion of all CO_2 emissions, regardless of fuel type, best achieves the goals of these carbon reduction regulations. Additionally, attempting to distinguish between CO_2 emissions from various fuel types would be difficult to implement and enforce, causing a significant administrative burden on both covered sources and DEQ. Thus, requiring that CO_2 Budget	biomass in both the proposal and re-proposal is unambiguous and has modified the re-proposal accordingly; see the current response to current comments 24 and 40 for further discussion. Every attempt has been made to make the regulation consistent with the applicable Virginia mandates as well as those of the RGGI program, including biomass applicability. Reducing the fossil fuel threshold from 10% to 5% is needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.

	Sources hold allowances for all CO_2 emissions makes good sense from a policy perspective and furthers the goals of the regulations. While we support the proposed regulation's coverage of co-fired biomass units, we reiterate our request that DEQ amend the regulation so that all biomass units with nameplate capacities equal to or greater than 25 MWe are subject to the requirements, not merely co-fired units. The science is clear: burning wood for electricity is not inherently carbon neutral and results in an immediate net increase of atmospheric CO_2 for decades to centuries. While including co-fired biomass units in the regulation is a good start, there is no principled reason to exempt other biomass units. Biomass units generate CO_2 emissions just like fossil fuel-fired and co-fired units, and should be covered in order to better reduce the carbon emissions.	
73. SELC	SELC reiterates its support for the set-aside to assist DMME in efforts to abate and control air pollution through energy efficiency programs. This set-aside will play an important role in both furthering the purposes of the regulations and offsetting the costs. In addition to reductions in demand, energy efficiency programs can result in lower costs for customers. In the study by Applied Economics Clinic, low efficiency or medium efficiency scenarios in Virginia could decrease customers' annual electric bills by $41 to $92 in 2028, with cumulative customer bill savings totaling $800 million-$1.7 billion between 2018-2028. The medium efficiency scenario can deliver up to 5.74% average reduction in bills in 2028. The set aside will play a key role in continuing to lower demand and, in turn, carbon emissions in Virginia, and will also be an important part of reducing program costs. We also reiterate our suggestion that a 10% set-aside would produce more benefits than it would increase costs for covered entities.	Support for the proposal is appreciated. DEQ agrees that energy efficiency is a cost-effective way to reduce carbon emissions. Once the program has operated for a period and can be evaluated through future program reviews, an increase in the set-aside may be considered at a future date.
74. Sierra Club	The re-proposed rule is	Support for the proposal is appreciated.

	unquestionably needed in order to protect the public by reducing CO_2 emissions from power plants located in Virginia and to do so by creating a CO_2 emissions market linked to the existing RGGI market for CO_2 emissions. Reducing CO_2 emissions is critical to protecting Virginia's citizens, natural resources, infrastructure and economy. Since comments were last submitted, a multi-agency, federal team issued the Fourth National Climate Assessment. That assessment leaves no doubt about either the link between climate change and human GHG emissions, including CO_2, or the urgency of taking actions to reduce those emissions. We request that the entire assessment be incorporated into the record, as it underscores the urgency to act. Another report recently issued by the IPCC further underscores the dangers of inaction or delayed action. It concludes that in order to avoid the dangers from increasing global average temperatures by 1.5°C, it is necessary to reduce GHG emissions by 45% by 2030 and to achieve zero-net CO_2 emissions by 2050. The proposed rule is thus directionally correct, but plainly insufficient and will need to be strengthened in the future.	Note that participation in RGGI as well as state-required program reviews will enable DEQ and the public to monitor program process and consider the appropriateness of any cap.
75. Sierra Club	In our April 2018 comments, we urged DEQ to set the initial base budget below 30 million tons and to revisit this initial budget in early 2019. We appreciate DEQ's responsiveness to this request and its current proposal to set the initial base budget at 28 million tons. This figure is consistent with modeling sponsored by NRDC and conducted by ICF using the IRP. It is also consistent with the trends in Virginia's power sector described in our previous comments, including the rapid decline in coal-fired generation in Virginia and flattening retail loads. The 28 million ton cap represents a far more realistic forecast of 2020 emissions from covered sources in Virginia and support this revised initial base budget. At the same time, note that the annual allowance budget in the current RGGI states has	Support for the proposal is appreciated. Participation in RGGI as well as state-required program reviews will enable DEQ and the public to monitor program process and the appropriateness of any cap.

	consistently been undersubscribed since the inception of the program. Most recently, 2018 emissions from CO_2 budget sources in the current RGGI states were 15% below the 2018 cap of 70 million tons, in line with the RGGI state's emission cap for 2023–five years ahead of schedule. To protect the integrity of the program to continue to provide climate and environmental benefits, it will be critical to continue to monitor the appropriateness of the cap level in conjunction with the other RGGI states and make appropriate adjustments in future program reviews.	
76. Sierra Club	In the re-proposed rule, any generating unit that burns more than 5% fossil fuels would require allowances to cover all of its CO_2 emissions, including emissions from co-fired non-fossil fuel. We strongly support requiring CO_2 allowances for all CO_2 emissions from generating units crossing the 5% fossil-fuel threshold regardless of the specific fuel to which the CO_2 emissions may be attributed. On the other hand, DEQ's Public Notice states that one of the substantive changes in the proposed rule "is an exemption of fossil fuel units that co-fire with biomass from CO_2 accounting and it specifically requests comments on coverage of CO_2 emissions from units that co-fire with both fossil fuel and non-fossil fuels." While we do not see such an exemption anywhere in the re-proposed regulation, we do comment on this issue and oppose any such exemption. We oppose any exemption for CO_2 emissions from burning biomass. In addition to CO_2 budget units that co-fire with fossil fuels, we urge that the final rule include, as CO_2 budget units subject to the allowance-holding requirement, generation units that combust biomass without fossil fuel. All biomass produces CO_2 emissions when burned, and biomass burns less efficiently than fossil fuels thereby producing more CO_2 per unit of	See the current responses to current comments 24 and 40 for further discussion of biomass. As discussed in greater detail in the current responses to current comments 24 and 40, this is a fossil fuel regulation. Reducing the fossil fuel threshold from 10% to 5% is needed for consistency with the RGGI Model Rule and to ensure Virginia's ability to participate in the program.

	energy generated. Whatever may be said about using quick-growing crops as biomass, wood-based biomass is the least likely to result in CO_2 recapture within a time frame helpful to avoiding the looming climate crisis. Like all biomass, woody biomass produces more CO_2/MWh generated than burning coal or natural gas. In addition, if full recapture through regrowth of woody biomass does occur, it will be decades into the future. The recapture will also be followed by a new round of cutting and burning so another major pulse of CO_2 emissions will promptly follow. EO 11 addressed CO_2 emissions from electric power facilities, without saying that CO_2 from biomass would be excluded from coverage by Virginia's rule. Further, while the RGGI model rule covers fossil fuel-fired generation units (XX-1.2, definition of "unit" and XX-1.4), the model rule provides the option of, but does not require, excluding the units' emissions from combustion of biomass and limits that exclusion option to eligible biomass (XX-1.2, definition of "eligible biomass" and XX-6.5(b)(1). Exclusion of non-fossil-fuel emissions is not necessary for consistency with either EO 11 or with RGGI. Second, there is no legitimate reason to exclude biomass-based generation from the requirement to obtain allowances. The premise for exempting CO_2 emissions from burning biomass is that the emitted CO_2 will eventually be recaptured by regrowth of the feedstock and that future recapture is somehow sufficient to mitigate the climate damages from current CO_2 emissions. Those assumptions are faulty in several respects, particularly as they relate to wood-based biomass. CO_2 emissions per MWH of electricity generated from biomass are substantially higher than from coal and natural gas because biomass burns less efficiently. Co-pollutants from biomass combustion--e.g., particulates--are large in quantity and harmful to human health. If waste	

	wood is included in the mix, toxic and metal pollutants can also be emitted. Adverse climate and health impacts from burning biomass will not be neutralized by sequestration of CO_2 through regrowth, even assuming that the biomass is eventually replaced with comparable forests. Exempting biomass from carbon prices amounts to a harmful subsidy for CO_2 emissions from biomass. That subsidy of free carbon pollution rights would undercut beneficial investments in zero-carbon alternatives, such as solar, wind and energy efficiency, which mitigate climate harms in both the near-term and long-term. The subsidy is particularly unjustifiable given that biomass emits more CO_2/MWH than fossil fuels. There is no support for the implicit assumption by biomass-advocates that forests will be regrown in a sustainable way or in sufficient quantities to recapture that CO_2 is emitted during the life of this program. RGGI purports, in the option that it allows for excluding emissions from eligible biomass, to limit the exemption of biomass to sustainably harvested biomass. However, adopting that approach would require DEQ to adopt sustainability regulations and commit personnel and resources to monitor and enforce sustainability the next 50-100 years. Past investments in large biomass facilities do not deserve special treatment any more than past investments in fossil fuel-fired facilities. CO_2 emissions are harmful in both cases. At a minimum, all new plants burning biomass without fossil fuel should be required to acquire allowances for all CO_2 emissions, just like fossil fuel-fired plants are required to cover all CO_2 emissions. Third, the recent IPCC report recognizes that we need to achieve a 45% CO_2 emissions reduction economy-wide by 2030 and achieve net zero emissions by 2050. It makes no sense to subsidize biomass emissions of CO_2 by exempting them from the requirement to obtain CO_2	

	allowances. With the inevitably slow growth of replanted forests and future cuttings of those trees, exempting woody biomass will help to defeat the 2030 and 2050 goals for CO_2 reductions. The climate crisis will never be resolved if previously built woody-biomass facilities (whether or not they co-fire fossil fuel) are granted exemptions or if incentives are created to build new wood-fired plants or to operate existing ones more. Fourth, changing the rule to exempt CO_2 from non-fossil fuels would require adoption and enforcement of a new regime of measurement, accounting and reporting to segregate fossil-fuel and non-fossil-fuel CO_2 emissions from covered generation. Without such an additional layer of measurement, accounting, reporting, inspections and auditing, the rule simply would not work for co-fired units.	
77. Sierra Club	CO_2 emitted now or over the next few decades will heat the atmosphere and oceans for millennia. It does not matter whether the emissions come from biomass or any other materials. There is thus no reason to exempt emissions from burning solid wastes or any other fuel. In the case of co-firing with municipal wastes, there are added issues. A significant portion of the heat input for an incineration generation unit burning municipal solid waste comprises plastics, often supplemented by natural gas, petroleum, or coal. Because plastics are made from the hydrocarbons in natural gas, petroleum, or coal and 9VAC5-140-6020 C defines "fossil fuel" as "natural gas, petroleum, coal, or any form of solid, liquid, or gaseous fuel derived from such material," fossil fuel includes, on its face, plastics. Further, municipal solid waste-based generation not only involves co-firing of fossil and non-fossil fuel, but also such generation results in significant emissions of CO_2, as well as extremely harmful co-pollutants. As of 2015, plastics comprised 13.1% of municipal solid waste in the U.S. and	There are costs and benefits associated with WTE facilities; however, plastics are not, in common parlance, considered to be fossil fuels, nor are all plastics derived from petroleum. Ultimately, municipalities must make decisions about the most environmentally protective means of handling their waste, and follow current state and federal pollution control requirements.

	15.9% of municipal solid waste combusted for energy. Because plastics have significantly higher heat content than other material in trash, their share of incinerator heat input likely comprises more than their percentage by weight. Consequently, under the 5% fossil-fuel threshold for units to be covered units, existing and new incinerator generation units would likely be CO_2 budget units and covered by the requirement to hold allowances. Inasmuch as such units produce CO_2, emissions while generating electricity, they should be covered by the rule. That will tend to help reduce overall CO_2, emissions and not, by exempting them, undercut zero-carbon alternatives.	
78. Sierra Club	The costs of the proposal for a consignment auction are minimal and the benefits are great, particularly when Virginia considers the costs and harms from continuing business as usual. Actual experience by current members of RGGI demonstrates that benefits have outweighed costs, their residents have experienced improved health outcomes, and that actual costs have consistently come in well below earlier forecasts. Moreover, the costs incurred in conducting a consignment auction are minor compared to the revenues from the sale of consigned allowances, even as incentives are created to find cheaper, cleaner energy sources. On the benefit side, Virginia and its residents and businesses are already experiencing direct and indirect harms from human-caused climate changes. These are especially notable along its coastal areas, in rising health harms from heat-illnesses and smog, and in harms to property and agriculture from extreme precipitation and storm events. Virginia faces much more severe harms as a result of climate change. The growing harms include those to its coastal and along tidal estuaries; to the health of its citizens who face greater direct harms from temperatures and pollution; to public and private property from increased flooding and wind damage from	Support for the proposal is appreciated.

	storms and extreme rain events; to its agriculture and viniculture from heat and weather disruptions; to its natural heritage, including forests, streams and wildlife; and to its economy, which will be directly harmed by the aforementioned disruptions and further harmed by delaying investments in the GHG reductions that will become more urgent and disruptive by delaying them. Not only will Virginians benefit from reducing CO_2 emissions sooner rather than later, their economy will benefit from incentivizing low-emission investments rather than high-emission investments that will likely be stranded in the future. The longer we wait, the worse the transitional costs will be. As noted above, according to the IPCC, reducing GHG emissions by 45% from 2010 levels by 2030 is critical in order to keep global temperature increase from exceeding 1.5°C above pre-industrial levels. The certainty of harms and the nature and magnitude of those harms are spelled out in greater detail in two recent publications as part of the 4th National Climate Assessment. These documents, which are incorporated by reference, leave no doubt about the dangers posed by climate change and about the reality that climate change is already harming the U.S., including Virginia.	
79. Sierra Club	Farm and forest land preservation are threatened by climate change. The proposal will promote farm and forest land preservation by making progress in addressing climate change. The co-benefits of reducing co-pollutants from dirty power plants will also likely help farms and forests. If the final rule were to exempt CO_2 emissions from biomass, the result could undercut forest land preservation by subsidizing, continued and increasing power generation and CO_2 emissions from woody biomass. Harvesting woody biomass would encourage harm to forests and the lands that will be disturbed by continued or increased harvesting. Meanwhile, subsidization of CO_2 and other	The commenter's concerns are acknowledged; however, as discussed elsewhere, DEQ's directive is to address fossil fuel-fired power plants.

	pollution from biomass would undercut reductions in CO_2 emissions from fossil fuel generated electricity. This could also undercut preservation of farm land by incentivizes expansion of tree farming for the purposes of feeding wood pellets or other wood products to biomass-fired power generation. It could also encourage diversion of land dedicated to food production to energy production. That would not be in the public interest.	
80. Sierra Club	As defined in § 2.2-4007.1 of the Virginia Code, small business means a business entity that is independently owned and operated, and employs fewer than 500 full-time employees or has gross annual sales of less than $6 million. No company covered by the proposed rule that would be deemed a small business under this definition. Any power plant having generating units of 25 MW or more will have gross annual sales well over $6 million. Further, a trading mechanism is inherently designed to achieve goals with the least financial and administrative burden. The re-proposed rules generally follow RGGI, which has successfully functioned for a decade. Economies in RGGI states have grown since the RGGI's implementation.	Support for the proposal is appreciated. DEQ agrees with the commenter's assessment of small business applicability.
81. Sierra Club	We appreciate the inclusion of 9VAC5-140-6440, which recognizes the need to both evaluate the impact of the program on environmental justice communities and also for meaningful participation from these communities. First, we recommend that when DEQ evaluates impacts on these communities that the evaluation considers not only direct emissions of CO_2 but also impacts from co-pollutants as well as the cumulative impacts from CO_2 budget sources and other polluting facilities. In conducting evaluations to assess any adverse impacts on communities, California's AB32 Adaptive Management Plan is a good example for a state planning to undertake such an evaluation. Co-pollutants can have serious health consequences for people in their vicinity. When evaluating impacts of	Support for the proposal is appreciated. Virginia will be the first RGGI member state to explicitly address environmental justice in its RGGI implementation rule. As discussed in greater detail in the initial response to comment 55, DEQ has a robust community involvement program, and the addition of environmental justice review and analysis in this regulation builds on this important commitment. Further discussion of Virginia's environmental justice efforts is provided in the current response to current comment 33.

	co-pollutants DEQ should look at total emissions of co-pollutants from participating fossil fuel-fired electric power generators. There is evidence that a disproportionate number of environmental hazards, polluting facilities and other unwanted land uses are located in communities of color and low income communities. This has almost certainly played an important role in the disproportionate exposure to air pollution experienced by residents of various environmental justice communities. The concept of cumulative impacts refers to the interaction, and the risks created and effects experienced due to the interaction, of multiple pollutants emitted by multiple polluting facilities located in a neighborhood. DEQ must not solely evaluate pollution from participating generators in static isolation. As a starting point DEQ can use EJSCREEN to map environmental concerns in order to identify issues for further analysis. EJSCREEN's supplementary maps feature provides information on environmental concerns and sources of air and water pollution derived from EPA databases. EPA's Framework for Cumulative Risk Assessment provides guidance on undertaking a cumulative impacts assessment when evaluating both chemical and non-chemical stressors that may be relevant to identifying environmental justice concerns. Second, we recommend that if DEQ's evaluation shows adverse environmental or socioeconomic impacts, or would add to cumulative impacts to communities that already face environmental hazards, DEQ include measures to avoid or mitigate these impacts, and do so in coordination with these communities. A range of options to be considered could include the adoption of regulatory requirements, coordination with other agencies to provide additional incentives for energy efficiency or other emission reduction activities within the community, or	

	modifications to the regulation. Third, we recommend that the DEQ develop and implement a plan to ensure increased participation of EJ communities consistent with the National Environmental Justice Advisory Council's Model Guidelines for Public Participation, which updated its Model Guidelines for Public Participation in 2013. The document included critical elements of effective community engagement, several of which we urge DEQ to draw upon in its efforts to develop and implement a plan to ensure increased participation of environmental justice communities in the review pursuant to 9VAC5-140-6440.	
82. Sierra Club	In 9VAC5-140-6190 C, the rule wisely states that, absent a future amendment, annual reductions of CO_2 allowances will continue in the period 2031-2040 at the same rate as in prior years. We understand that RGGI has questioned this provision. This provision is uniquely important for Virginia. In order to make reasonable judgments about applications to build generation, storage and transmission, utilities and the SCC need clear guidance from environmental regulators that CO_2 limits will continue to decline after 2030. A rule requiring 10 years of CO_2 reductions followed by flat CO_2 limits thereafter does not go far enough. Generation, transmission and storage decisions that assume no CO_2 reductions after 2030 would have badly skewed assumptions about the economic life-spans and operating costs of possible projects. When considering applications to build new electrical generation, the SCC's powers are limited by permits granted by DEQ. If DEQ grants permits to electric utilities to emit a specified level of CO_2, then the law prescribes that "[i]n order to avoid duplication of governmental activities,… the Commission shall impose no additional conditions with respect to such matters." Thus, unless Virginia's	As discussed in the current response to current comment 54, DEQ agrees with RGGI that participation in the RGGI market must be fully compatible with the existing RGGI program, which is a consensus organization. Regularly performed program reviews in concert with the other RGGI states are essential in order for the program to function properly, and an individual state going beyond those protocols is incompatible with the consensus basis of the organization. Virginia's control of CO_2 is not limited to participation in the RGGI program, which is one element in a suite of efforts to control this and other GHG pollutants. Effective participation in RGGI means operating within RGGI's unique program requirements and restraints. This does not limit the state's ability to control GHG by other means. For example, DEQ has recently initiated an investigation into additional controls on natural gas transmission. Moving forward, other actions may be considered as well. RGGI has operated successfully for 10 years, and DEQ sees no reason to disrupt this process or attempt to go beyond existing program review additionally required by RGGI requirements and Virginia law.

	final regulations prescribe a CO_2 reductions for the period 2031-2040 (preferably longer), utilities will argue that the SCC's review of proposed new carbon-polluting projects must assume that CO_2 emissions limits will not decline after 2030. It will not be enough that RGGI plans to periodically consider further reductions of CO_2 emissions. Nor will it be enough that there is a scientific consensus that CO_2 emissions be sharply reduced until net-zero emissions are achieved as early as 30 years from now. By prescribing flat CO_2 emissions caps after 2030, DEQ could create a fictional basis for future evaluations of certificates of public convenience and necessity. Virginia has legally-protected monopoly utilities that own nearly all the generating capacity that supplies retail energy in the state. Unlike competing generators in other states, Virginia utilities do not bear the financial risks of building projects that are later required to shut down or throttle back due to revised environmental regulations. As a general matter, they are able to impose risks of SCC-approved construction projects on customers. Because generation lasts for decades, it would be a mistake to discourage Virginia from adopting regulations that show continued CO_2 reductions well beyond 2030. To do so would send misleading signals to the SCC and Virginia's electric markets. This would cause higher costs to consumers and harmful CO_2 emissions for decades, and could erect potential barriers to Virginia's agreeing with RGGI to implement future reductions. Thus, creating an illusion that CO_2 emissions limits will remain flat after 2030 would be very harmful to utility regulation and consumers. Virginia's proposal to presumptively require continued reductions beyond 2030 is consistent, not inconsistent, with RGGI's model for continuous progress reducing CO_2 emissions.	

	First, for the years 2020-2030, Virginia will reduce CO_2 allowances at a rate equal to 3% of the first year, just as provided for in its discussions with RGGI. Second, while Virginia's proposed schedule for continued reductions beyond 2030 is needed, Virginia will obviously work with RGGI to make reasonable adjustments in order to remain linked to the RGGI market. Adopting provisions, at this time, that would require continued reductions in 2031-2040, does not prevent DEQ from changing the pace of reductions to meet the emerging needs and the outcome of future negotiations with RGGI members. Indeed, Virginia will be far better positioned to make adjustments to the post-2030 emissions levels, if it clearly puts utilities, customers and others on notice now that they should expect further reductions after 2030 and plan accordingly. DEQ's ability to work with RGGI to extend reductions in the future would be hampered if misleading signals now led to stranding utility assets. Third, it should be recalled that Virginia is far behind RGGI in its reductions of CO_2 emissions. While RGGI has stated its plan to reduce CO_2 emissions by 65% by 2030, Virginia will be nowhere near that level of reductions. It will have to continue reducing its CO_2 emissions long beyond 2030 just to catch up. Thus, there is no inconsistency. Fourth, it would be unfair for Virginia to be prevented from achieving at least as much total emissions reductions as current RGGI states, particularly given the health and economic benefits that have been achieved by reducing emissions in the RGGI states. Fifth, we know from volumes of scientific studies that much greater CO_2 reductions will be needed as we head toward 2050, just to keep worldwide temperatures from rising 1.5° to 2.0°C. Continued reductions proposed from 2031-2040 would still leave Virginia well short of those goals. Thus, it would be unreasonable for the regulation not to specify a presumptive path for carbon	

	emissions reductions after 2030. Indeed some RGGI members have already announced their intention to cut their CO_2 emissions well beyond the levels set forth in the latest RGGI plans.	
83. Sierra Club	The rule needs to be modified to prevent generators from endeavoring to avoid application by manipulating the size of their units. The re-proposal to cover existing units serving a generator of 25 MWe or larger is generally consistent with RGGI's model rule. However, unlike RGGI's model rule, the re-proposed rule leaves a door open to manipulation of the size of units in order to evade CO_2 allowance requirements. The rule should be clarified to state that the 25 MWe threshold only needs to be crossed once after a fixed historic date to trigger coverage by the rule. To do this, 9VAC5-140-6040 A should be modified to state that the rule covers units serving a generator having a nameplate capacity of 25 MWe or more "at any time on or after" a fixed date. Currently, that provision simply states that fossil fuel-fired units "serving" a generator of at least 25 MWe are covered. Because 9VAC5-140-6040 A specifies no time frame, the re-proposed rule can be interpreted as covering only units serving such a generator at the time the provision is applied and not units if and when they change to serving a different generator with, or modify their existing generator to have, slightly less than 25 MWe capacity. It is not clear that such activity would be barred by Virginia's rule prohibiting piecemeal carrying-out of an operation to evade regulation (9VAC5-20-70). The language of the re-proposed rule may create a loophole for units currently subject to the rule to escape coverage through such actions. In addition, this language is contrary to the approach in the RGGI model rule, which specifies a time frame (i.e., "at any time on or after January 1, 2005") in the applicability provision (in XX-1.4(a)). Alternatively, the "on-or-after"	As discussed in the initial response to initial comment 151, the applicability limit is indeed designed to be consistent with the RGGI Model Rule. 9VAC5-20-70 prohibits circumvention of air quality requirements by constructing multiple facilities in a piecemeal fashion in order to avoid regulation. DEQ believes that the declining emissions cap will encourage the development of renewable energy and energy efficiency, not the construction of multiple smaller facilities which are less efficient. Based on the history of prior emissions trading programs, DEQ also does not believe that there is a significant risk that a CO_2 budget source would go through the considerable cost and effort to de-rate the nameplate capacity of its generators in order to evade coverage under this rule. Finally, there are very few sources and units at the lower end of the applicability level where such a modification would be feasible. The applicability of the rule to new units and the applicability threshold are consistent with RGGI.

	date could be shortly prior to the first notice that a plant might be covered by CO_2 regulations (e.g., January 1, 2014, which would have been shortly prior to the proposal for the CPP, which may have created a regulatory incentive to manipulate a generator's size or configuration). In any event, facilities should not be able to evade compliance by making changes that would alter a facility's size or configuration. The rule should also be modified to require units built after the rule is issued (i.e., new units) serving generators with a nameplate capacity less than 25 MWe to obtain emissions allowances. We suggest the threshold for new generators be set at 15 MWe or not more than 20 MWe. This is needed in order to send CO_2 regulatory and price signals to a broader pool of new generators and to prevent gaming that would undermine the regulation's CO_2 reduction goals and that would be unfair to existing generators covered by the rule. Within the RGGI region, there are examples of recent proposals for multiple generation fossil fuel-fired units each just below the 25 MWe compliance threshold. Since economic efficiencies and operating efficiencies would ordinarily support larger units, the sizing appears clearly to be driven by a desire to emit CO_2 without limits, thereby undercutting public health and the goals of the regulations. A lower size threshold for coverage of new units would better protect the public from emissions of CO_2 and co-pollutants, remove an unintended incentive for building less efficient fossil fuel generators, and protect the integrity of allowance markets. Since developers would have notice of the allowance requirement for new generation, no unfairness would result from imposing a lower size threshold for such generation. Building zero-carbon generation and storage would always be options for designers of new projects. We submit that units	

	placed in service after January 1, 2019 (or, at most, two years after the proposed rule was announced) would fairly be considered new.	
84. Sierra Club	We support DEQ's decision not to implement a regime of offset allowances. Such a scheme would require an extensive set of rules defining the permissible scope offset allowances and a very substantial expenditure of Virginia's administrative resources to assess proposals, to audit and verify actual compliance and benefits, and to bring enforcement actions to police violations. The complexity of offset arrangements is demonstrated by the facts that roughly one-third of the RGGI model rule are devoted to restrictions on, and administration of, offsets and that relatively few offset projects have been approved. The potential benefits would be far outweighed by the costs.	Support for the proposal is appreciated.
85. Sierra Club	Changes needed to clarify and enhance operation of the final rule are offered.	DEQ believes that the commenter's concerns are addressed by meeting the specific technical comments provided by RGGI.
86. Tenaska	The re-proposed regulation presents a base budget of 28 million tons. Actual CO_2 emissions from anticipated covered facilities were about 32.6 million tons in 2018. This would require a 14.1% reduction in two years to comply with the 2020 base budget, an average of 7.1% per year, or more than double the proposed 3% annual cap decline in subsequent years. Tenaska strongly suggests DEQ consider a higher base budget, such as 30 million tons, in the event 2019 emissions are similar. Tenaska continues to strongly favor the "generation updating" approach, whereby covered facilities are allocated allowances according to their respective historical annual net generation (MWh_{net}) as compared to the total aggregate generation from covered facilities, averaged over the immediate three calendar years, updated annually (i.e., on a rolling 3-year average). This approach best meets the intent of the regulation, in	See current comments 30, 39 and 71 for a discussion of the final base cap. DEQ is assisting affected sources in meeting compliance costs by issuing allowances. The amount of compliance costs covered by the allowances will depend on business decisions made by any individual facility. If a facility stays within the budget, it will not incur costs. DEQ agrees that other pathways to CO_2 reductions are important, but the scope of the regulation is limited by executive order of the Governor in accordance with state law. The 5% DMME set-aside as well as other ongoing programs such as GTSA will provide additional incentives for energy efficiency and renewable energy.

	that it incentivizes, or rewards, more efficient units that emit less CO_2 per unit of power produced. As presented several times during the Regulatory Advisory Panel meetings, Tenaska's Virginia Generating Station in Fluvanna County currently operates under a long-term contract with a third party, whereby the third party procures the fuel and purchases the generated electricity. Under the terms of the agreement, Tenaska believes it has the ability to pass through to its customer costs for things such as emissions allowances, whether they be for the Acid Rain Program, CSAPR, or any future carbon trading scheme. However, Tenaska's customer has taken the position that Tenaska does not have such a pass through right. These costs are projected to be $1.45/MWh in 2020 and rising to $1.81/MWh in 2030, representing an average increase of 5% over the projected wholesale power price. To the extent Tenaska's allowance allocation is not sufficient to cover actual emissions and is required to purchase allowances and is unable to pass through those costs to its customer, it will be disadvantaged as compared with other generators that can either recoup those costs or that have no costs due to their location in another PJM state without a carbon pricing scheme (e.g., Pennsylvania and West Virginia). Several current RGGI states and every major proposed federal CO_2 cap and trade legislation have recognized this predicament and provided various forms of relief, such as creating an allowance setaside/reserve account for free allocations or offering allowances at a reduced price. Tenaska requests DEQ also recognize this and either create a reserve account (as currently proposed for DMME to fund energy efficiency projects) sufficient to cover net allowance obligations for LTC holders in the event it is needed or simply exempt long-term contract holders for the life of the applicable	

	contract(s). Tenaska believes the reserve account would be less disruptive to the program as it would alleviate LTC units entering and exiting the program. We encourage DEQ to expand the scope of the regulation to include additional sources and seek meaningful reductions in other sectors of the economy, including mobile sources, if the consequences of climate change are to be avoided. One such way is to remove the exemption in 9VAC5-140-6040 B. CO_2 emissions from such facilities are no less potentially harmful than those from units that generate electricity for off-site use. Neither the RGGI Model Rule nor the environment make such a distinction and neither should DEQ.	
87. Virginia Advanced Energy Economy (AEEE)	Virginia AEE supports the revised regulation. The proposal will help to make our energy economy more secure, clean, and affordable, further bolstering Virginia's economy while reducing emissions. We also support the structure of the regulation, which will allow Virginia to integrate its' carbon market with other state and regional markets. Such integration will help the state reduce emissions through more efficient and cost-effective approaches. In April 2018, we submitted public comments expressing our support for the original draft regulation. Those detailed comments, which contain extensive analysis of the economic dynamics around carbon regulation in Virginia, accompany this submission. The revised regulation largely maintains the original structure of this carbon trading regime. As such our support for the regulation is unchanged and the analysis conducted in 2018 remains applicable. The chief difference between the revised rule and that originally proposed is the starting cap. In 2018, the board proposed a starting cap of 33 or 34 million tons of CO_2 per year. At the time our analysis indicated that, using advanced energy resources, the state would not only meet, but in fact	Support for the proposal is appreciated. As discussed in the current response to current comment 11, DEQ recognizes the value of the voluntary renewable energy market as an important tool in reducing carbon pollution. The structure of the general 5% set-aside will be under the purview of DMME, which is the appropriate state agency to implement renewable energy and energy efficiency programs.
